to an individual there is no custom for it. The case of incapacity produced by age or disease is a case equally open to expectancy in both instances. From the time of his embarking in his profit-seeking occupation a man makes for all such contingencies such provision as his means enable him, and his prudence disposes him, to make. For the securing to individuals any such extraordinary supply at the expense of the public there is, if there be any difference, less demand in the case of an occupation pursued by the rendering of service to the public for hire, than in the case of him whose subsistence as above is derived from commercial dealings with individuals. In the case of a public functionary a man's income is completely certain; certain as to its existence, certain as to its quantity. In the other case it is altogether uncertain in both respects."

—Another objection is, that there is a tendency, under a promise of pensions and rewards, in government servants to endeavor to secure the approbation of their immediate superiors in ways outside the duties of their office for a long enough time or in a sufficiently intense degree for them to obtain the reward. And *vice versa* in the case of the superiors toward their inferiors and superiors both. It is to their interest to remain together for the given time, and as long as they approve of each other reciprocally they are certain of their pension. This gives rise to a class and privileged feeling among the employés, which in turn causes an inattention to and carelessness of the interests of private individuals, more noticeable, and perhaps largely on this account, in the public offices in Great Britain than here, where the government servants have been, if anything, too independent of their official superiors and too dependent on extra-official protection. Mr. Eaton urges, as a reason in its favor in his book, that "the provision it makes for old age and misfortunes, besides promoting a better feeling in the service toward the state, and making effective discipline easier, actually enables the state to purchase the services of its officers at a less cost to the public treasury. The allowances for special merit and the deductions for bad conduct are based on records kept in the departments, and they are considered to have a salutary influence (analogous to promotions, prize money and brevet rank in the naval and military service) in stimulating honorable exertions in the public interest." This is our objection put in another way. It creates an *esprit du corps* among the young people in a circumlocution office like that in an army. The longer the clerks are there the more they become, superiors and inferiors, knit together in interests as against the outside world. An official class, or even aristocracy, is created.

—If a pension is to be obtained at the end of a term of years, the nearer that end comes the harder and more ungrateful it becomes for a superior to dismiss an inferior, often in disregard of the wishes of his own superiors, especially in countries where a free press and a popular assembly give the inferior opportunity for revenge and retaliation. In other words, it may tend to permanence in office, but the permanence is not of a healthy kind, and is not so dependent merely on good work as it would otherwise be.

—Again, it is to be remembered that the people filling the positions go into them at their own request and wish, and they give so much work for so much money. When they first enter, if they find themselves underpaid they may resign, and go into another business. In every country there are more applicants for government positions than

there are positions for them to occupy. It is not necessary, therefore, that any more favorable pay should be given to such employés than to those in another occupation. Nor is there any reason on account of the nature of the work. And in this country, at any rate, the clerks in the public offices would strongly object to any pension fund being instituted if their salary should be lowered in consequence. Most American clerks are quite capable of investing their surplus income themselves, and they would say that they did not need to have the government, and the government had no right to, do it for them.

—Again, it causes poor work in a great many cases. Many men will cling on after their time for usefulness is entirely over, merely to get their pension, or a larger one than they would get if they were to then retire. This often happens in England, although the commissioners do their best to prevent it. We have in this country recently had an example in a very high place, where a justice of the United States supreme court, long past any ability to do any work, insisted on keeping his place until his pension should accrue, and so doing a great injury to the business interests of the country.

—In this country it is very doubtful whether any salaries could be lowered for such a purpose, and so there would be very little economy. The salaries of the United States judges were not lowered when pensions were extended to them. Besides, if our other suggestions are true, if the service became less effective on account of such a system, it would be poor economy to introduce it just to gain a few lapsed pensions. The making money out of its employés in such a way by the government in this country would only create disgust and disaffection on the part of the employés; and, through them, of the public.

—Again, there are computed to be over one hundred thousand civil servants in the employ of the national government in this country, besides the ordinary employés, messengers and lower servants employed about a government office and building, numbering perhaps as many more. This fact alone ought to be enough to deter any one from making any attempt to introduce such a system here.

—The principle suggested by its advocates is to institute a pension fund, like any insurance fund. "The average life of the persons who are to share in the benefits of the fund should be accurately determined, in order to learn how large a proportion of the total number will be able to perform all the requirements, and be able in the end to obtain their portion. This involves a determination of the death rate, the probability of life. From these data may be found the actual sum that must be set aside each year in order that the pensions falling due may be met. If, to take a simple example, it is found that the average number of persons entitled to a pension of say \$500 each year is three, at least \$1,500 must annually be obtained from the pension fund. If such a system were instituted here it would probably be carried on much as the naval pension fund is. The secretary of the navy, as trustee, invests so much of the fund then in the United States treasury as may not be required for the payment of the naval pensions for the then current fiscal year, together with the interest of the preceding year, and he gets 3 per cent. on it. Under section 4759 the privateersman fund is maintained. Two per cent. on the net amount after deducting all charges and expenditures of the prize

money arising from captured vessels and cargoes, and on the net amount of the salvage of vessels and cargoes recaptured by the private armed vessels of the United States, shall be secured and paid to the collector or chief officer of the customs at the port where such vessel comes, or with the United States consul or agent, if out of the United States. And the moneys arising thereupon are pledged by the government of the United States as a fund for the support and maintenance of the widows and orphans of such persons as may be slain or wounded, etc., on board of the private armed vessels of the United States, in any engagement with the enemy. The secretary of the navy is trustee to assign and distribute this fund according to law. (Rev. Stat., secs. 4753, 4754.)

—The history of pension legislation in the United States forms a most interesting and curious chapter, and in no other nation has the principle of rewarding military and naval service been carried to such a limit as by congress. Early in the revolution it was seen that the discipline of the troops depended much upon the characters of the officers placed over them; so congress recommended to the several states that they should use their utmost endeavors to appoint in the service men of honor and of known abilities. On Oct. 7, 1776, as an encouragement for men of that class to enlist as commissioned officers, their monthly pay was increased, and somewhat later it was resolved that those who should continue in the service till the end of the war should receive half pay for seven years from the establishment of peace. This applied only to military service, and was more in the nature of a bounty than a pension, still it contained the germs of a pension system. Meantime, however, owing to the difficulties which arose from the inability of congress to fulfill its obligations save in a greatly depreciated paper currency, it became evident that few officers could remain, even if willing, in active service till the end of the war, without making great personal sacrifices. And, although Washington prepared a scheme of half pay and pensionary establishments, and strongly urged upon congress the necessity of making some provisions, the matter dragged, opposed by some as tending to create a standing army, and by others, because they thought the states should be first consulted. The result was a compromise measure. All military officers, commissioned by congress, who should continue in the service during the war, and not holding any office of profit in the states, should be entitled to receive half pay for seven years after the war, provided that this gratuity should extend to no officer who should not take an oath of allegiance to the United States, and actually reside within the same. The provisions of this act were in 1780 made to apply to the widows and orphans of such officers as had died in service. Non-commissioned officers were to receive a specific reward of \$80 at the end of the war. This measure, however, did not allay the discontent of the officers, and in 1780 an act was passed granting half pay for life to officers who served till the close of the war. It is curious to find a law passed three years later commuting this half pay for life into full pay for five years, and reciting, that "as the officers of the several lines under the immediate command of his excellency General Washington, did, by their late memorial, transmitted by their committee, represent to congress, that the half pay granted by sundry resolutions, was regarded in an unfavorable light by the citizens of some of these states," etc. In 1780 some of the states had already made provisions for their officers. For example, Pennsylvania granted half pay for life, and the result was that the troops from this state were in

excellent condition, few resignations being made, while in the quotas of other states resignations were frequent.

—But it would be a mistake to imagine that the results of these laws were at all in proportion to the promises they contain. When in 1783 half pay for life was commuted into full pay for five years, certificates bearing 6 per cent. annual interest were issued, and because of the refusal of the states to fulfill the requisitions of congress, the value of these certificates became greatly depreciated, falling until they could command but one-eighth of their nominal value. The army was disbanded, and the officers were compelled by their necessities to part with their certificates for whatever they could obtain. At the end of eight years the principal and interest were funded at 3 per cent., but the paper was now chiefly in the hands of speculators, and it was not until nearly forty years had elapsed that congress undertook to do justice to the revolutionary officers. When the matter came up for settlement in 1826, out of 2,480 commissioned officers (exclusive of foreigners) who came out of the war, only 230 were alive. In all that time there existed a deeply rooted opposition to pensions, as a system of favoritism by which those in power made provision, at the public expense, for their friends and followers.

—Up to this point, however, we have been concerned only with the officers of the army. In 1785 congress recommended to the states the propriety of making adequate provision for invalids. In 1788 it was further resolved that "each state shall have credit in its general account with the United States, for such sums as may become due to invalids." Subsequent laws, both of a public and a private character, were passed applying to invalids, and in the organization of the army a like provision was incorporated. By 1806 a general system of pensions had been framed, and in 1808 the United States assumed the state pension obligations. From that time until 1818 the principle was settled that all persons disabled in the course of military or naval service should be provided for at the public expense, whether they had served in the land or sea service of the forces of the United States, or any particular state in the regular corps, or the militia, or as volunteers. The law, however, was surrounded by many safeguards against fraud, and a pension was to be allowed only for disabilities incurred in the service. So limited and confined was it that the abuse arising under it was comparatively unimportant. Abuse, however, there was, and in 1804 it called out the saying that "the revolutionary claimant never dies; he is immortal."

—In 1818 the first departure from this conservative policy was made, and was followed by others in 1820 and 1823. On March 18, 1818, an act was passed granting pensions to all who had served in the army of the revolution "for a period of nine months or longer at any period of the war"; and "who, by reason of reduced circumstances, shall stand in need of assistance from their country for support." Here the principle which limited the granting of pensions to such as were disabled in actual service was abandoned, and the length of service and the poverty of the pensioner are made the conditions on which pensions were hereafter to depend. It was doubtless the intention of the framers of the bill to have its provisions apply only to those who had during the revolution given up their private pursuits and devoted themselves exclusively to military service, and not to men who had rendered casual service; and in support of this view it may be said, that, as originally introduced, the bill would

cover the demands of those who had served for three years, and who stood in need of assistance from the government for their support. During the passage of the bill the three years' requirement was displaced by one of nine months, and in that form the measure became a law. It was estimated that the annual charge upon the treasury would amount to about \$160,000, but the results proved that this estimate was far from correct, and that the door had been opened to frauds so extensive that they became unimportant only in the light of subsequent pension legislation. 27,948 persons applied for the benefit of the act of 1818—a number greater than that of Washington's army at any period of the war, and exceeding the whole number of soldiers that could by the established rate of mortality be supposed to be alive in 1818. The claims of upward of 18,000 were admitted, and it was afterward discovered that fully one-third of this number had no legal claim to government bounty. The money required to pay these claims was between two and three millions annually; the appropriations for this branch of expenditure being in the first year under the act, \$1,847,900, and in the next, \$2,766,440. Then congress interfered, as the country was becoming alarmed. Men who had never served at all, or for very short periods, men who had given away their property to their children, or conveyed it in trust for their benefit; in short, every one who was old enough to have served in the revolution found little difficulty in getting himself placed on the pensions list. To correct this open scandal a law was passed May 1, 1820, which retained the "nine months" and "indigent circumstances" requirements, but provided greater safeguards against fraud by requiring every applicant to submit a schedule of his property and to take the necessary oaths. This caused 6,000 names to be stricken from the list. In 1829 an attempt to pass what was known as the "mammoth pension bill" called out a vigorous protest from Mr. Hayne. Its effects, he said, would be to open the door of the treasury to "mere sunshine and holiday soldiers, the hangers-on of the camp, men of straw, substitutes who never enlisted until after the preliminaries of peace were signed."

—An act of June 7, 1832, was followed by more extensive frauds, and this was adverted to in the president's message for 1834. The provisions of the pension laws had by this time been extended so as to apply to wars other than the revolution, and in subsequent years they were made to include all military service wherever rendered. A list of the wars will be found at the end of this article. The results of legislation are shown in the following brief statement contained in a report to congress made in 1834: "There are supposed to be now living about 42,600 persons who receive pensions or gratuities from the government under different laws. Of these about 3,900 are invalid pensions, 10,500 come under the act of 1818, 700 under that of 1828, and 27,500 under the law of June 7, 1832. The amount expended in the previous year reached three millions of dollars."

—It would be unprofitable even to attempt to trace minutely the effects of the many laws relating to pensions passed between 1832 and 1860. Enough has been said to show that the tendency of such legislation was to pass from a strictly defined and on the whole well-guarded system, to one which allowed extensive frauds, and in reality gave the government's bounty to the undeserving. As the laws were more generally applied, and included a greater and greater number of subjects, the opportunity for fraud was ever present, and was not allowed to pass unnoticed.

—The rebellion, however, gave rise to some pension legislation which deserves more than a cursory notice, because it gives ample proof of the tendency of such laws to run into wasteful expenditure, and also to become a political engine, a device for gaining the votes of the "soldier" population. It may be premised that pensions were offered early in the war to secure volunteers; and further, as every such volunteer was subjected to a medical examination, and was—at least theoretically—allowed to serve only when sound in body, it followed, that, if he were not sound at the end of the war, he must have been disabled or become diseased while in service. This fact becomes important in the light of legislation after the close of the war.

—Since the rebellion the following are the more important laws relating to the granting of pensions to soldiers and their families: July 14, 1862; July 4, 1864; March 3, 1865; June 6, 1866; July 25, 1866; July 27, 1866; July 7, 1870; July 8, 1870; June 6, 1874; June 18, 1874; June 20, 1874; June 22, 1874 (consolidation act); Aug. 15, 1876; Feb. 27, 1877; Feb. 28, 1877; March 3, 1877; March 8, 1878; March 9, 1878; June 17, 1878; June 18, 1878; June 20, 1878; Jan. 25, 1879 (arrears of pensions act); March 1, 1879; June 9, 1880; June 16, 1880; Feb. 26, 1881; Aug. 7, 1882; and in addition to these, countless bills of a public or private nature became laws or were rejected. Under these laws the most liberal provisions were made for those who had suffered, directly or indirectly, while in the army during the rebellion. It is doubtful whether any other nation has provided so liberally for its disabled soldiers and seamen, or for the dependent relatives of the fallen. "If any person, whether officer or soldier, belonging to the militia of any state, and called out into the service of the United States, be wounded or disabled while in actual service, he shall be taken care of and provided for at the public expense." (Revised Statutes, §1639.) This principle has governed the pension legislation of the country almost from the beginning (1792). The government undertook to make good, as far as possible, the loss of health or members, when such loss was incurred strictly in its military or naval service, and to furnish regular pecuniary aid to the families of those whose lives or health were thus sacrificed. From a very simple impulse of justice has sprung an entire system of rewards, or rather of recompense, which has grown to proportions little anticipated by those who framed the first laws. In place of laws for particular emergencies, cautiously limited to retrospective action, we now have statutes which regard on an equal plane all branches of the service, regulars, volunteers and militia, and further providing for the future as well as for the past. The few simple and efficacious safeguards which were imposed upon the earlier laws have been abolished, or so modified as to be, to all intents and purposes null and void, and step by step, as the system was expanded, its benefits have largely fallen to the undeserving, to professional schemers for public plunder. And of this the arrears of pensions act is a notorious example, the history of which throws a strong light upon the methods of shrewd lobbyists who thrive upon the necessities of others. Briefly stated, that history is as follows: The laws then in force, it was claimed, were faulty, and it was expedient to abolish certain inequalities which the pension system was believed to contain. Under the existing acts certain restrictions or limitations were imposed upon the time within which application for a pension should be made. If a man was unable to secure the necessary papers and proofs required by the practice of the bureau within the appointed time, his pension could not be granted until the defects were remedied and the proper documents filed in the department. It thus happened, that, while many

obtained pensions beginning from the date of discharge or disability, a large number of others, who were equally deserving, had their claims for many years delayed, and when allowed drew their bounty from the date of the issue of the proper documents, and not from the date of discharge or disability. The law prevented any dating back, and it was claimed that as a simple act of justice this defect should be remedied and the operation of the system made more equal. "By the act of July 14, 1862, the first on the subject of pensions growing out of the war of the rebellion, it was provided that if the soldier made application within one year after his discharge, his pension should commence with the date of such discharge, but if he failed to make his application until after the expiration of the year, then his pension, when granted, should commence with the date of such application. This was a statute of limitations of one year, and deprived the crippled soldier of one year's pension money or more, if, for any reason, he was not prompt in presenting his claim within the time prescribed. It was a vicious principle with which to begin our pension system. No government can afford to higggle with its preservers over the price of their blood, nor is it a becoming thing to thrust a contemptible statute of limitations, the last resort of a dishonest debtor, into the faces of the maimed who are living, or of the widows and orphans of the dead, in full payment of the most sacred obligations ever incurred by a nation in the history of the world. By subsequent acts amendatory of the act of 1862, the statute of limitation, or the time within which to file an application so as to carry a pension from the date of discharge or death, was extended first to three and then to five years, and it stood at this latter period in January, 1879. The arrears act was designed to eliminate from the then existing law that meanest form of defense to a debt ever interposed by an individual or a government, the defense of the statute of limitations. It destroyed the detestable argument so often heard, that the lapse of time can pay an honest debt; that if you can successfully evade the payment of a claim for a certain number of years, either through your own ingenuity or the ignorance and helplessness of your impoverished creditor, the claim becomes an old claim; then, in the pompous and stupid parlance of the day, a stale claim, and that at this point it is to be considered paid and wiped out."

—It would, however, be a mistake to suppose that the law arose from such philanthropic motives as the sentences just quoted from a speech in defense of it would indicate. In fact, it was nothing more than a piece of selfish and interested legislation, originated by a ring of pension claim agents who made a living by trading upon the necessities of deserving pensioners, and it was by their efforts more than by any other influence, that the arrears act was hurried through congress. In 1871 the total number of applications filed was 43,969; in 1872, 26,396; in 1873, 18,303; in 1874, 16,734; and in 1875, 18,704. The claim agents saw that their business was falling off, and took measures for increasing it. In 1875 and 1876 they had begun their peculiar methods, and were flooding the country with blank petitions. The commissioner of pensions said, in his report for 1878: "A comparatively small number of professional claim agents and claim firms at Washington and some other points of the country, through the intervention of sub-agents, and by extensive advertising, employing for that purpose in some instances sheets issued in the form of periodical newspapers purporting to be published in the interest of the soldiers, the columns of which contained matter in which apparent anxiety for the soldiers' welfare and appeals to their love of gain were cunningly intermingled, always representing the

advertisers as in the enjoyment of special and peculiar facilities for the successful prosecution of claims, and usually adding the suggestion that no charge would be made unless a pension should be obtained." The result of this activity was to bring before congress a host of petitions praying for further legislation. Already a measure providing for arrears of pensions had been introduced into the 44th congress, but it was killed in committee, and in the next congress a like measure promised to experience the same fate, when it was unexpectedly taken up and passed under a suspension of the rules without debate, and apparently without having been considered by the proper committee. The bill was rushed through the senate in the same unceremonious manner, and in the short debate there is an absence of any effort to discover what would be the effects of the bill should it become a law. Making an estimate based upon a communication from the commissioner of pensions prepared three years previously, it was stated that the arrears might amount to nineteen or twenty millions annually. The secretary of the interior thought that \$41,000,000 would be all that was needed to meet the provisions of the new law, and accepting this estimate, the secretary of the treasury asked for authority to issue bonds to that amount. This estimate was prepared, however, after the measure was passed and has received the signature of the president. The pension bureau never made an estimate of the cost of the arrears bill until after it had become a law. Such was the loose manner of framing and discussing an important law.

—The truth, however, was soon seen. The practical operation of the law was to offer a bonus of \$1,000 down, in addition to subsequent periodical payments, to all persons who might thereafter file and prosecute to a successful issue, pension claims against the government. Even while the bill was in the hands of the president, its real results were beginning to be foreshadowed. Secretary Sherman told his associates in the cabinet that it would require an expenditure of \$150,000,000. On Jan. 25, Secretary Schurz read in a cabinet meeting a letter from the commissioner of pensions, saying that the bill would require an immediate expenditure of \$36,000,000, and largely increased annual requisitions. In spite of these damaging statements the president, Mr. Hayes, signed the bill. In February, 1879, Secretary Schurz addressed a letter to congress calling attention to the vast sum probably involved by the arrears act, and urging upon that body, in the most emphatic terms, the necessity of adopting legislation to protect the government against the frauds which the new measure would be sure to encourage. At once the flood gates were opened. In his report for the year ending June 30, 1879, a date less than six months after the passage of the act, the commissioner said that the new claims of invalids, widows, minor children and dependent relatives, had come in at "an unprecedented rate." The claims of invalids, he said, were more than double in number those of any previous year, except 1866 (just at the close of the war), and nearly double that year, while other claims were large in an almost equal proportion. Furthermore, at the time the arrears act was passed there were about 100,000 unsettled claims which were regarded as alive and pending; besides these, there were not less than 80,000 on the files which had been rejected for one reason or another. Among these claims, which were on the files and had not been admitted, were about 45,000 which were counted as dead claims, the claimants having abandoned their prosecution, or died leaving them unsettled. The arrears act not only brought in new original claims at the rate of 10,290 per month for the whole period of seventeen months from February, 1879, to June 30, 1880—while

the average from July 1, 1878, to Feb 1, 1879, was only 1,597 per month—but it revived from thirty thousand to forty thousand old cases which were on the rejected files. The drain on the treasury was greatly increased. The largest annual disbursement previous to the passage of this act was in 1871, and amounted to about thirty-three millions. In 1878 it was \$26,844,415; in 1879, \$33,780,526, in 1880, \$57,240,540; and in 1881, \$50,620,538; In this last year the commissioner estimated that the act would consume, sooner or later, more than \$510,000,000. This piece of legislation, which is little else than a gigantic swindle, has remained unchanged in spite of efforts to overturn it. It was conceived for private advantage, and carried through without consideration or debate, and by means of political pressure. It is the old story of the prætorian guards repeated; the soldiers' votes formed the main object to be secured by its passage.

—One more point deserves attention, as showing the great stimulus exerted by pension legislation. When the bill granting pensions to all the survivors of the war of 1812, and to the soldiers' widows, was before congress, it was generally asserted and believed that the number of persons entitled to such pensions, about seventy years after the war, must necessarily be small. The armies of the United States in 1812-14 had not been large, and the number of people who attain the age of eighty or ninety years can never be very large. Yet in the table we give, we find more than 7,000 survivors and more than 24,000 widows drawing pensions! "Either the war of 1812 must have had a mysteriously vitalizing effect upon those in any way engaged in it, or the passage of the pension bill must have resuscitated a large number of those who, in the ordinary course of nature, had died years ago." And in his report for 1882 the commissioner of pensions makes some interesting speculations regarding the pension population of the country. "The proposition is as follows: How many persons are there now living who served in the army during the late rebellion, or who bore a pensionable relation to those who served, who have not yet applied for a pension? The adjutant general of the United States reports the following aggregate of enlistment for the different periods of service:

60 days...	2,045
3 months...	108,416
100 days...	85 807
4 months...	42
6 months...	26,118
8 months...	373
9 months...	89,899
1 year...	393,706
2 years...	44,400
3 years...	2,028,630
4 years...	1,042
Aggregate...	2,780,178

Taking this as a basis of my calculation, I have endeavored to ascertain the number of individual enlistments; that is, excluding second, third, fourth, and subsequent enlistments of the same person. The result of my investigation and estimate upon this

point shows an aggregate of 2,049,969 different individuals who enlisted for greater or less periods during the war. To this number should be added the number of persons serving in the regular army and navy at the commencement of the war, viz., 16,422. So that the grand total of individual persons who entered the service during the war may be approximately stated to be 2,063,391. Up to July 1, 1882, there have been filed by army invalids, 450,890 applications for pensions. Up to the same date there have been filed 294,277 applications on behalf of the service of deceased soldiers. There have been filed by navy invalids 7,633, and by those representing deceased sailors, 3,294. This makes an aggregate of those who have applied for pension of 756,119 out of the whole number who enlisted, as before stated. As near as I can ascertain, there are about 86,800 representatives of deceased soldiers who have not yet applied for pension, and 1,000,469 survivors of the war who have not yet applied for pension, and 220,000 who died during and since the war, who left no pensionable relatives surviving them. \* \* The general proposition, however, is presented, with the best available information at hand, that there is a surviving soldier population of a little over ten hundred thousand, out of which claims for pension in the future may be made by those who incurred pensionable disabilities."

—In the United States special acts have, as we have said, with great frequency been passed for pensioning any person not falling within the provisions of the law in force at any given time. For instance, cap. 43, approved June 17, 1844: "Be it enacted, etc., that the secretary of war be and he is hereby authorized and directed to pay to Milly, an Indian woman of the Creek nation, and a daughter of the prophet Francis, a pension at the rate of \$96 per annum, payable semiannually, during her natural life, as a testimonial of the gratitude and bounty of the United States, for the humanity displayed by her in the war of 1817 and 1818 in saving the life of an American citizen who was a prisoner in the hands of her people, and about to be put to death by them," etc. In another case Baron de Steuben was granted a pension of \$2,500 a year during life, "which said annuity shall be considered in full discharge of all claims and demands whatever of the said Frederick William de Steuben against the United States." Many of these private acts granted pensions to private individuals who had, like Milly, the Creek woman, performed some act of heroism. They did not fall within the provisions of the pension laws, and form the first exceptions to the rule that in the United States there are no civil pensions. Up to 1869, so far as the writer is aware, such form the only exception. In that year (Statutes at Large, vol. xvi., p. 45), a bill was passed to increase the United States judges, and it provided, among other things, that "any judge of the United States, who, having held his commission as such at least ten years, shall, after having attained the age of seventy years, resign his office, shall thereafter, during the residue of his natural life, receive the same salary which was by law payable to him at the time of his resignation."

—Since then, a new precedent has been created as to ex-presidents' widows. First, Mrs. Lincoln was given one, then Mrs. Garfield, then Mrs. Polk and Mrs. Tyler. The life-saving department has had a pension arrangement made by law for a certain definite period. The internal revenue servants and the railway mail servants also have had endeavors for a pension system made in congress in their behalf. Employés in the quartermaster's and paymaster's departments have received them. Also nurses, and in one case the widow of a professor in the naval academy. The New York municipal

police have also had a pension system introduced for their benefit, recently. Many bills have been introduced for such purposes, the most sweeping being Senator Edmunds', in the 47th congress. Its object was to allow all officers who may retire or be retired, one year's pay; after fifteen years of service, two years' full pay; after twenty years, a pension of half pay; after twenty-five years, two-thirds pay; after thirty years, three-fourths pay; after thirty-five years, four-fifths pay; and after forty years, full pay.

—The subject of civil pensions has already been discussed. It is not contended that so far any but very excusable departures from the rules thus far in force in this country have been made, but every new departure from the same should very closely examined and criticised as long as the rule remains in force. If, after a full discussion, it shall be decided to put in force a system of civil pensioning, it will be an interesting, but at the same time a dangerous, experiment.

—The existing provisions of the pension laws are too numerous to be given in this article, and the reader must be referred to the manuals prepared under the authority of the bureau. A word, however, as to the practice of the department. The applicant for a pension first sends a declaration, of which he can get a blank form from the office, giving the necessary dates and figures and circumstances, in detail. His identity must be shown by the testimony of two credible witnesses, who must appear before the officer. Then, on receiving this, the interior department makes application to the adjutant general and surgeon general or to the navy department, as the case may be, for the applicant's record and evidence as to the disability. If there be none, the applicant must obtain the affidavit of a commissioned officer who had personal knowledge of the facts. If there is no record even that there was a disability, the applicant must obtain the evidence of the surgeon by whom he was treated, and must prove that his own habits had no agency in the production of such disability. If the disability arises from disease, he must, in addition, get evidence from his physician setting forth the history of his disease and disability since its first appearance. The administrator or executor of a soldier is not entitled to arrears if the deceased had filed no application. If claimant died pending application, the pension, when granted, does not belong to the estate, but to the widow or children. If there are none, then the pension lapses, except that the expenses of the claimant's last sickness may be paid. Death is to be presumed in cases where more than two years elapse since the date of the soldier's supposed death in action. No pension in hand or to come, or in whosever hands it is, is liable to attachment, levy or seizure by or under any legal or equitable process whatever. No pensioner may have more than one pension at a time. Helplessness means (act of 1876) dependence on another, and also inability to gain a subsistence by one's own exertions. The abandonment of her minor child by the widow forfeits her title to a pension. Any pledge, mortgage, sale, assignment or transfer of any right, claim or interest in any pension, which has been or may hereafter be granted, shall be void and of no effect. No pension money will be paid to any agent or attorney of the pensioner, and no agent is to recognize any warrant or power of attorney, except in the case of insane or Indian pensioners or those under disabilities. (Act of Aug. 7, 1882.) All pensioners must have been loyal during the war of the rebellion. At the outbreak all the pensioned in other wars who were in the insurgent states were cut off, and also those in the northern states known to be disloyal. In 1867,

widows who could prove their loyalty during the war were restored. A pardon by the president does not restore the right to the former or any pension. As to what constitutes disloyalty, it has been held that compulsory service with the rebels does not. Making clothes and tents for them, does. Applying to the confederate congress for a federal pension does not.

—On the next page we give a table of the pension claims filed and allowed since 1861.

NUMBER OF PENSION CLAIMS FILED AND ALLOWED EACH YEAR SINCE JULY, 1861, AND THE NUMBER OF PENSIONERS AT THE CLOSE OF EACH YEAR SINCE JULY 1, 1860.

Note. — In the "Total number of pensioners on the roll" the survivors are included under the head of "Invalids."

—There are fifty-eight agencies in the United States. Payments are made quarterly, and there is a biennial examination of the pensioners. New York contains the most pensioners, then Pennsylvania, then Ohio; the commissioners have said that there is not a single county or parish in the United States without its pensioner. The average age of our soldiers in 1863 was only twenty-six, and so this state of affairs is likely to continue for some time. Formerly the Washington office kept an alphabetical list of the rejected and admitted pensioners and of the claims filed, but this was found very cumbersome, and now all names are indexed according to their companies and military organizations. In the course of making the change (November, 1880) more than 3,000 duplicate claims for pensions were found, and fifty-three cases in which two pensions had been granted the same person. These new records consist of 176 volumes, of 250 pages each, and have claims for pensions on account of service in 2,268 regiments, 194 battalions, 706 independent companies, 208 batteries, and 46 staff corps. Besides this, the old three-fold invalid, widows and bounty lands divisions were abolished, and everything was arranged by states. The commissioners have therefore evolved a method by which the government may be better protected from fraud, and this they submit every year to congress, which, with equal regularity, pigeon-holes it. This is to have a number of pension commissions all over the country, consisting each of one surgeon and one pension clerk, appointed from Washington, whose duty it shall be in each case to go to any place in their district from which a

claim has been forwarded, and there to summon the claimant and his witnesses, and such other witnesses as they themselves may wish or as may volunteer their testimony, and to examine such evidence thus furnished, and report thereon to Washington. The advantages of this system are, that: 1. "The testimony and proceedings will be public and reliable, facilitating prompt and liberal decisions, and the treasury will be protected from fraud." The claimants' expenses will be rather diminished. 2. "The medical examination will be made by an unprejudiced government surgeon. No one will be made a victim of the ignorance, prejudice or carelessness of a neighborhood surgeon." 3. There need be no more special agents' investigations. "The publicity of the proceedings will operate to restrain fraudulent claims, and give the government a guarantee against their success." The neighbors of any claimant are likely to come forward to expose any fraud in such a matter. Now, the honest claimants who are not able to fill a want in their evidence get injured, while the dishonest ones who fill such a gap by fraud succeed. There will therefore be less perjury, forgery and false personation under such a scheme. The old, and present, scheme "provides for the settlement of claims on *ex parte* testimony exclusively, given by witnesses who are entirely unknown to the office, and whose affidavits are almost universally prepared by claim agents, who can receive no compensation for their services unless the claim is allowed." The examining surgeon is usually the neighborhood practitioner, whose professional interest it is to please the claimant at the expense of the government. (Commissioner's Report, 1877.)

—The following table shows the annual expenditure of the government of the United States on account of pensions, from March 4, 1789, to June 30, 1883 (by calendar years to 1843, and by fiscal years, ended June 30, from that time):

## UNITED STATES SURPLUS MONEY

UNITED STATES SURPLUS MONEY, Distribution of, among the States. The secretary of the treasury (Ingham), in his report to congress, in December, 1829, estimated that the revenues of the government for that year would amount, including the balance on hand on Jan. 1, to \$30,574,666; and the expenditures to \$26,164,595, of which \$9,841,011 was on account of principal and \$2,563,994 on account of interest of the public debt. He also estimated that the public revenue for the next five years would be such as to leave free for application to the payment of the public debt about twelve millions yearly. The amount of debt becoming due or payable during the next five years was \$48,522,869. The surplus, after paying this indebtedness, would be twelve millions. The secretary did not favor a sudden change in the tariff, but recommended such gradual changes as would reduce the revenues to correspond with the existing expenditure. President Jackson, in his message to congress in 1829, said: "After the extinction of the public debt, it is not probable that any adjustment of the tariff, upon principles satisfactory to the people of the Union, will, until a remote period, if ever, leave the government without a considerable surplus in the treasury beyond what may be required for its current service. As, then, the period approaches when the application of the revenue to the payment of debt will cease, the disposition of the surplus will present a subject for the serious deliberation of congress, and it may be fortunate for the country that it is yet to be decided. Considered in connection with the difficulties which have heretofore attended appropriations for purposes of internal improvement, and with those which this experience tells us will certainly arise whenever power over such subjects may be exercised by the general government, it is hoped that it may lead to the adoption of some plan which will reconcile the diversified interests of the states, and strengthen the bonds which unite them. Every member of the Union, in peace and in war, will be benefited by the improvement of inland navigation and the construction of highways in the several states. Let us, then, endeavor to attain this benefit in a mode which will be satisfactory to all. That hitherto adopted has, by many of our fellow-citizens, been deprecated as an infraction of the constitution, while by others it has been viewed as inexpedient. All feel that it has been employed at the expense of harmony in the legislative councils. To avoid these evils, it appears to me that the most safe, just and federal disposition which could be made of the surplus revenue, would be its apportionment among the several states according to their ratio of representation: and should this measure not be found warranted by the constitution, that it would be expedient to propose to the states an amendment authorizing it. I regard an appeal to the source of power, in cases of real doubt, and where its exercise is deemed indispensable to the general welfare, as among the most sacred of all our obligations." It thus appears that President Jackson regarded as unconstitutional the appropriation of money for internal improvements by congress, and, in view of the anticipated surplus, suggested that its distribution among the states would enable them to make such improvements, without the assistance of congress. He intimated that such a distribution would be constitutional, but if there was any doubt on this point, an amendment would remove the difficulty.

—During the session of congress of 1829-30, the duties on tea, coffee, cocoa, salt, and also on tonnage, were reduced, but the reductions were not sufficient to exhaust the surplus after the debt then maturing should be paid. In his message for December, 1830, President Jackson referred to this subject as follows: "In my first message I stated it to be my opinion that it is not probable that any adjustment of the tariff, upon principles satisfactory to the people of the Union, will, until a remote period, if ever, leave the government without a considerable surplus in the treasury beyond what may be required for its current services. I have had no cause to change this opinion, but much to confirm it."

—The secretary of the treasury, in his report for 1832, says: "After Jan. 1, 1833, no part of the public debt, except the remaining fragments of the unfunded debt, of which only small portions are occasionally presented, will be redeemable before the following year; and, though there will be in the treasury during the year ample means to discharge the whole debt, they can be applied only to the purchase of stock at the market prices." The whole public debt was virtually extinguished by Jan. 1, 1835, on which date the balance of available funds in the treasury was \$5,586,282. It was estimated that for the year 1835 the receipts from all sources would be twenty millions: but the actual receipts were \$35,430,087, receipts from the sale of the public lands during that year having greatly increased. In 1834 these receipts were only \$4,857,600, but in 1835 they were \$14,757,600. The receipts from the sales of public lands in 1834-5-6 were \$44,492,381, and the total receipts from this source, from 1796 to 1834, had been but \$44,595,000. The balance left in the treasury at the beginning of the year 1833, was \$2,011,777; in 1834, \$11,702,905, in 1835, \$8,892,858, and on Jan. 1, 1836, \$26,749,803.

—In view of this large balance, and its probable large increase by Jan. 1, 1837, the act of June 23, 1836, was passed, authorizing the distribution of the surplus among the states. As has been seen, this method of disposing of the surplus was favorably suggested by President Jackson in his message for 1829, and again indorsed by him in his message for 1830. In 1836, however, the views of the president appear to have changed. Secretary Woodbury, in his report for 1835, disapproved of the distribution of the surplus among the states, intimating that it was unconstitutional. He said: "The people themselves, it is believed, can best manage all their own money, which they and their representatives think may not be wanted for public purposes; and it would seem to be far preferable to leave it originally in their possession, than to withdraw it for the expensive operation of returning it substantially to the place whence it came, and that probably in a manner not conformable to the constitution, till after the delay of procuring an amendment to it; and even then not expedient, because calculated injudiciously to strengthen the general government, and to render the states more dependent on a great central power for yearly and important resources. Indeed, a reduction in the price of public lands, whose unusually large sales the past year are the source of most of the present surplus, would, if their sales should not thereby be much increased, seem another mode far more natural to obviate the present difficulty. But, before adopting it, this and various other considerations must be weighed, and it must be fully considered whether all the revenue anticipated from them at their present prices would not be necessary, after the great reductions in the tariff in 1842, and whether a resort to a higher tariff would not then become indispensable, if the average

receipts from lands or customs should, from any new legislation, become then much diminished below the estimates which have been submitted on the present occasion." This change in the opinion of the administration from 1829 to 1836 was probably owing to the hostility of the president to the bank of the United States, resulting in the veto of the bill for renewal of its charter on July 10, 1832, and the removal of the United States deposits from the bank by order of the secretary of the treasury of Sept. 26, 1833. (See BANKING IN THE UNITED STATES.)

—In 1835 and 1836 the revenues of the government were deposited with the state banks, the favorites of the administration, and the distribution of the surplus at this time among the states would have deprived these banks of the deposits. In his message to congress of 1836, after the passage of the act of June of that year, regulating the public deposits, and providing at the same time for the distribution of the surplus in the treasury on Jan. 1, 1837, President Jackson said: "Without desiring to conceal that the experience and observation of the last two years have operated a partial change in my views upon this interesting subject, it is nevertheless regretted that the suggestions made by me in my annual message of 1829 and 1830 have been greatly misunderstood. At that time the great struggle was begun against that latitudinarian construction of the constitution which authorizes the unlimited appropriation of the revenues of the Union to internal improvements within the states, tending to invest in the hands, and place under the control, of the general government, all the principal roads and canals of the country, in violation of state rights, and in derogation of state authority. At the same time the condition of the manufacturing interest was such as to create an apprehension that the duties on imports could not, without extensive mischief, be reduced in season to prevent the accumulation of a considerable surplus after the payment of the national debt. In view of the dangers of such a surplus, and in preference to its application to internal improvements, in derogation of the rights and powers of the states, the suggestion of an amendment of the constitution to authorize its distribution was made. It was an alternative for what were deemed greater evils—a temporary resort to relieve an overburdened treasury, until the government could, without a sudden and destructive revulsion in the business of the country, gradually return to the just principle of raising no more revenue from the people, in taxes, than is necessary for its economical support. Even that alternative was not spoken of but in connection with an amendment of the constitution."

—In the meantime Jackson, in his attack on the bank of the United States, had been bitterly opposed by Clay, Calhoun, Webster, and a majority of both houses of congress, by whom many of his acts were regarded as an exercise of arbitrary power. In his first message in 1829 he recommended that the bank of the United States should not be rechartered. In January, 1832, the bank's memorial for recharter was presented both in the house and senate, and, after some debate, the bill for the recharter passed both houses. This bill was vetoed, on July 10, by the president, and the recharter of the bank was made one of the issues of the campaign of 1832. Henry Clay was defeated, and Jackson reelected, and the latter claimed that the result was an indorsement of his policy against the bank.

—During the summer of 1832, Jackson, as a measure of hostility against the bank, conceived the project of the removal of the United States deposits. Benton, in his

"Thirty Years' View," (vol. i., p. 377), says: "General Jackson was not the man to tolerate these illegalities, corruptions and indignities. He therefore determined on ceasing to use the institution any longer as a place of deposit for the public moneys; and accordingly communicated his intention to the cabinet, all of whom had been requested to assist him in his deliberations on the subject. The major part of them dissented from his design; whereupon he assembled them on the 22d of September, and read to them a paper containing his views on this subject. This paper concludes as follows: 'Under these convictions he feels that a measure so important to the American people can not be commenced too soon; and he therefore names the first day of October next as a period proper for the change of the deposits, or sooner, provided the necessary arrangements with the state banks can be made.' "

—Secretary Duane refused to carry out the wishes of the president without a previous reference to congress. Roger B. Taney, then attorney general, was made secretary of the treasury, and issued the order for removal of the deposits on Sept. 26, 1833. The opponents of the administration, looking at the surplus revenue, regarded the propositions made for distribution of the surplus among the states favorably, as tending to deprive the president of a portion of an immense patronage.

—The deposit of the public money in the pet banks had been followed by great financial distress, continuing during the year 1834; and previous to and during that year propositions were frequently made in the public press for distribution of the surplus revenue among the states as a measure of relief. These propositions were first in the form of a distribution of the revenue from public land, then a distribution of the public lands themselves, and finally the distribution of both land and customs revenues.

—During the session of 1835, on motion of Mr. Calhoun, a select committee, consisting of Calhoun, Webster, Benton, Bibb, Southard and King, were appointed to inquire into the extent of executive patronage, the increase of public expenditures, and the number of persons employed or fed by the executive government. The committee assumed that there would be an annual surplus of nine millions for the next eight years. It regarded the disposal of this surplus as a problem to be solved with great difficulty, but one which was important to determine, lest the executive should greatly increase his power by depositing the public funds with the favorite banks. The committee accordingly "reported a resolution so to amend the constitution that the money remaining in the treasury at the end of each year till Jan. 1, 1843, deducting therefrom the sum of \$2,000,000 to meet current and contingent expenses, shall annually be distributed among the states and territories, including the District of Columbia; and, for that purpose, the sum to be distributed to be divided into as many shares as there are senators and representatives in Congress, adding two for each territory and two for the District of Columbia; and that there shall be allotted to each state a number of shares equal to its representation in both houses, and to the territories, including the District of Columbia, two shares each. Supposing the surplus to be distributed should average \$9,000,000 annually, as estimated, it would give to each share \$30,405, which, multiplied by the number of senators and representatives from a state, will show the amount to which any state will be entitled." This resolution was opposed by Benton, who represented the administration in the senate. He argued

that the customs revenues could be largely reduced by changes in their methods of collection; that the revenues from the sale of land could be made to disappear by selling these lands at nominal prices to the people. If, after this, there should still be a surplus, he advocated its use in the construction of fortifications to protect the coasts and frontiers of the country. The proposition of the committee to amend the constitution to authorize the distribution was never brought to a vote. In the spring of 1836, the following paragraph appeared in the "Philadelphia National Gazette": "The great loss of the bank has been in the depreciation of the securities, and the only way to regain capital is to restore their value. A large portion of them consists of state stocks, which are so far below their intrinsic worth that the present prices could not have been anticipated by any reasonable man. No doubt can be entertained of their ultimate payment. The states themselves, unaided, can satisfy every claim against them; they will do it speedily, if congress adopt the measures contemplated for their relief. A division of the public lands among the states, which would enable them all to pay their debts, or a pledge of the proceeds of sales for that purpose, would be abundant security. Either of these acts would inspire confidence, and enhance the value of all kinds of property."

—A bill for the distribution of the revenues was introduced in the senate, and supported both by Mr. Clay and Mr. Webster. It was opposed by Mr. Benton, who introduced an antagonistic bill devoting the surplus revenues to public defenses. The bill passed the senate by a vote of 25 to 20. Being sent to the house for concurrence, it became evident that it could not pass that body, as a majority of its members regarded the project in its form of a distribution as unconstitutional. The friends of the measure in the senate determined to change its form so as to remove the difficulty. Instead of a distribution it was to be a deposit, and the faith of the states was to be pledged to the return of the money.

—There was another bill in the senate for regulating the deposit of public moneys with the state banks, and the proposition in the form of a deposit with the states became sections thirteen and fourteen of this bill, which passed with only six dissenting votes. It passed the house by a large majority, 155 to 38. In the form of distribution it had no chance of passing the house. "It was approved by the president," Benton says, "but with a repugnance of feeling and a recoil of judgment which it required great effort of friends to overcome." Probably, if he had returned it with his veto, it would have had two-thirds of each house in its favor.

—The following is a copy of the 13th and 14th sections of the act of June 23, 1836: "An act to regulate the deposits of the public money. Section 13. That the money which shall be in the treasury of the United States, on the first day of January, eighteen hundred and thirty-seven, reserving the sum of five millions of dollars, shall be deposited with such of the several states, in proportion to their respective representation in the senate and house of representatives of the United States, as shall, by law, authorize their treasurers, or other competent authorities, to receive the same on the terms hereinafter specified; and the secretary of the treasury shall deliver the same to such treasurers, or other competent authorities, on receiving certificates of deposit therefor, signed by such competent authorities, in such form as may be prescribed by the secretary aforesaid; which certificates shall express the usual and

legal obligations, and pledge the faith of the state for the safe keeping and repayment thereof, and shall pledge the faith of the states receiving the same, to pay the said moneys, and every part thereof, from time to time, whenever the same shall be required by the secretary of the treasury, for the purpose of defraying any wants of the public treasury, beyond the amount of the five millions aforesaid: *Provided*, that if any state declines to receive its proportion of the surplus aforesaid, on the terms before named, the same shall be deposited with the other states, agreeing to accept the same on deposit in the proportion aforesaid: *And provided, further*, that when said money, or any part thereof, shall be wanted by the said secretary, to meet appropriations by law, the same shall be called for, in ratable proportions, within one year, as nearly as conveniently may be, from the different states with which the same is deposited, and shall not be called for, in sums exceeding ten thousand dollars, from any one state, in any one month, without previous notice of thirty days for every additional sum of twenty thousand dollars which may at any time be required. Section 14. *And be it further enacted*, That the said deposits shall be made with the said states in the following proportions and at the following times, to wit: one-quarter part on the first day of January, eighteen hundred and thirty-seven, or as soon thereafter as may be; one-quarter part on the first day of April, one quarter part on the first day of July, and one quarter part on the first day of October, all in the same year."

—In his message for December, 1836, President Jackson objected to the method of distribution provided in the law, viz., according to representation, and advocated a method founded on the population of each state.

—On Jan. 1, 1837, the surplus in the treasury, after reserving the five millions required by law, was \$37,468,859.97, and the apportionment among the several states is shown by the following table:

STATES.	No. of elec- toral votes	Amount to be deposited dur- ing the year 1837	Amount of each Installment.
Maine .....	10	\$1,274,451 02	\$318,612.75
New Hampshire .....	7	892,115 71	223,028 93
Massachusetts .....	14	1,784,231 43	446,057 86
Rhode Island .....	4	509,780 41	127,445 10
Vermont .....	7	892,115 71	223,028 93
Connecticut .....	8	1,019,560 81	254,890 20
New York .....	42	5,352,694 28	1,338,173 57
New Jersey .....	8	1,019,560 81	254,890 20
Pennsylvania .....	30	3,823,353 06	955,828 26
Delaware .....	3	382,335 31	95,583 83
Maryland .....	10	1,274,451 02	318,612 75
Virginia .....	23	2,931,237 31	732,809 03
North Carolina .....	15	1,911,676 53	477,919 13
South Carolina .....	11	1,401,896 12	350,474 03
Georgia .....	11	1,401,896 12	350,474 03
Alabama .....	7	892,115 71	223,028 93
Mississippi .....	4	509,780 11	127,445 10
Louisiana .....	5	637,225 51	159,306 38
Missouri .....	4	509,780 41	127,445 10
Kentucky .....	15	1,911,676 53	477,919 13
Tennessee .....	15	1,911,676 53	477,919 13
Ohio .....	21	2,676,347 14	669,086 78
Indiana .....	9	1,147,005 92	286,751 48
Illinois .....	5	637,225 51	159,306 38
Arkansas .....	3	382,335 31	95,583 88
Michigan .....	3	382,335 31	95,583 88
<b>Total .....</b>		<b>\$37,468,859 97</b>	<b>\$9,367,214 98</b>

The table on preceding page, with the exception of the last column, is copied from the report of Mr. Woodbury to congress, of January 3, 1837.

—It will be noticed, that, by the law authorizing the deposit of the surplus, each state was required to authorize its treasurer by law to receive the deposit and to give certificates of deposit therefor. The necessary forms for carrying out this plan were prepared by the secretary of the treasury, and may be found in Ex. Doc. and Reports of Committees, 1st Sess. 25th Congress, Doc. No. 30.

—All of the states named in the foregoing table of apportionment passed laws authorizing the receipt of the deposit, and some took the opportunity of instructing their representatives to protest against, or to endeavor to obtain changes in, some of the features of the law. The legislature of the state of New Hampshire, by resolution, declared that any distribution of surplus was unconstitutional. They instructed their delegates to vote for a reduction of revenue and against any measure for

relinquishment, by the United States, of the sums on deposit with the states. The legislature of the state of Indiana requested its senators and representatives to use their exertions to procure the passage of an act of congress for the relinquishment on the part of the United States of all claims of surplus revenue deposits under act of June 23, 1836. These resolutions show conclusively that these states regarded the money received as a deposit to be likely to be recalled, and not as a gift.

—The first three installments were paid to the states as nearly as possible on the following dates, viz.: one-fourth on Jan. 1, 1837, one-fourth on April 1, and one-fourth on July 1, following. The sums were paid by transfers from the deposit banks. On Nov. 1, 1836, the secretary of the treasury notified the banks of the requisition which would be made upon them to meet the installments due, on Jan. 1, to the several states. On Feb. 18, 1837, he gave similar notification in reference to the next three installments. Forms of the letters sent to each of the deposit banks are given, also, in Document 30, Sept. 26, 1837, before referred to. The installments payable on Jan. 1, April 1, and July 1, were transferred to the states on or near those dates. They amounted in all to \$28,101,645, and proportionate amounts were deposited with and received for by each state.

—In May, 1837, the financial pressure became so great that the banks generally suspended specie payments. The fifth section of the act of June 23, 1836, for regulating deposits of public money, provided that no bank shall be selected or continued as a place of deposit of public money which shall not redeem its notes and bills on demand in specie. On May 1, 1837, the number of the deposit banks was 88, distributed by states as follows:

Maine...	8
New Hampshire...	4
Vermont...	2
Massachusetts...	6
Connecticut...	3
Rhode Island...	2
New York...	16
South Carolina...	2
Georgia...	3
Alabama...	1
Mississippi...	2
Louisiana...	2
Tennessee...	2
New Jersey...	3
Pennsylvania...	8
Delaware...	2
Maryland...	2
District of Columbia...	1
Virginia...	3
North Carolina...	1
Kentucky...	7
Ohio...	9
Indiana...	1
Illinois...	1
Michigan...	2
Total...	88

The number of deposit banks on Nov. 1, 1836, was 89. Their capital was \$77,576,449; United States deposits, \$49,377,986; other deposits, only \$26,573,479. [149](#)

—The difficulties arising from the necessity of discontinuing as public depositories those banks which refused to pay specie, made it apparent that it would be very inconvenient, if not impossible, to transfer the fourth installment of the deposit with the states. Further legislation was deemed necessary in this emergency, and an extra session of Congress was called by President Van Buren. Congress met on Sept. 4. Among other reasons for the extra session, the president in his message mentioned, that "questions were also expected to arise in the recess in respect to the October installment of those deposits, requiring the interposition of congress."

—Secretary Woodbury, in a report made on the safe keeping of the public moneys, on Sept. 23, in answer to a resolution of the house of representatives, said. "This last mode [viz., deposit with selected state banks] ceased by operation of law during the last spring, except in relation to five or six deposit banks which have continued to redeem their notes in specie. The direct losses sustained under it appear to be large. But, in the end, they are not considered likely to amount to anything, though the

disappointments, delays and injuries under it, must, it is manifest, in several cases be great. The indirect losses to the public creditors and contractors have been considerable, and are difficult to be computed." From this it will be seen that only six out of the eighty-eight banks designated as public depositories on May 1, could be used as such in September.

—Benton says, in relation to these payments: "The deposit with the states had only reached its second installment when the deposit banks, unable to stand a continued quarterly strain of near ten millions to the quarter, gave up the effort, and closed their doors. The first installment had been delivered on Jan. 1, in specie or its equivalent; the second in April, also in valid money; the third one, demandable on July 1, was accepted by the states in depreciated paper; and they were very willing to receive the fourth installment in the same way."

—The secretary's report shows that there would be a deficiency in the revenues to meet expenditures of over ten millions of dollars, which would render it necessary either to recall some of the money deposited with the states, or to postpone the payment of the fourth installment due on Oct. 1. The secretary mentioned the inconvenience of paying the fourth installment, arising from the difficulty of transferring from the west and southwest, where the money received from sales of public lands had accumulated. The lack of revenue was his principal reason for urging the withholding or postponement of the fourth installment. Believing the money would be immediately necessary to the government, he thought it would be less inconvenient to withhold payment than to pay and immediately recall.

—On Sept. 11, 1837, Mr. Silas Wright, from the senate committee on finance, reported a bill which provided "that the transfer of the fourth installment of deposits directed to be made with the states, under the thirteenth section of the act of June 23, 1836, be and the same is hereby postponed until further provision by law." The bill was brought up for consideration on the 14th, when he said, that, according to the report of the secretary of the treasury of the 28th ult., there was then in the treasury subject to draft, available and unavailable, but \$8,100,000. If the expenses of the month of September were deducted, which were estimated at two and a half millions, there would be in the treasury, subject to draft on Oct. 1, less than six millions without the transfer of a dollar to the states toward the October installment. If the October installment was to be transferred to the states, all the means in the treasury on the day when that installment was made transferable would not be equal to two-thirds of the amount, and money must be borrowed upon the credit of the United States to supply the deficiency. The largest portion of the funds in the treasury was wholly unavailable; they were in the western and southwestern banks, and experience had already shown, that the drafts of the treasurer upon these banks would not be received in payment by the public creditors, neither would the states, other than those in which the banks were located, take these drafts, and give their obligations for a repayment of the amount in money in pursuance of the provisions of the deposit law. The transfer to the states, therefore, could not be made, even to the amount of the funds in the treasury subject to draft, by reason of the character of the funds to be drawn upon. The whole means in the treasury on the first day of October next would be from three and a half to four millions less than the transfer required. If congress should insist upon

this transfer, it must authorize a loan of money upon the public credit in order that that money when loaned, may be deposited with the states for safe keeping. Mr. Webster thought that it was a mere question of convenience, the distributed money would go to all the people, and any deficiency in the treasury must be supplied by all the people. He thought the most convenient way was to pay the installment, and provide for the necessities of the treasury by other means. Mr. Preston opposed the bill on the ground that many states had already appropriated the money, and had undertaken public works on the strength of it, etc. Mr. Crittenden, of Kentucky, opposed it on the same ground. By other senators the deposit act was treated as a contract which the United States was bound to carry out. Mr. Buchanan proposed an amendment, the effect of which, it was urged, was to change the character of the deposit act and make it a distribution measure. By the act it was the duty of the secretary of the treasury to call for a return of the deposit when needed by the federal treasury. The amendment superseded this, and enacted that the deposits should remain until called for by congress. Mr. Niles pointed out the effect of this amendment. He said the majority of those who voted for the deposit act did so because it was a deposit and not a distribution, and merely withdrew the public moneys from the banks and deposited them with the states. The amendment would change the deposit to a loan, or, more properly, a grant, to the states. Mr. Buchanan's amendment, however, passed by a vote of 32 to 12, and thus the recall of the deposits already made was taken from the hands of the secretary and placed with congress.

—In the house of representatives the disposition to regard the deposit act as a contract was even stronger than in the senate. Mr. Caleb Cushing argued that it had all the features of a contract, that it was a "contract of deposit." It was a contract in honor, and, as far as there could be a contract between the United States and the states, a contract in law. On the other hand, it was argued very forcibly that neither in honor not in law was there any reason for paying the fourth installment when there was no surplus in the treasury. Mr. Halsey, on the same side, said, "In reference to the deposit act, if a contract, it was a contract based alone upon the distribution of an existing surplus, not wanted for the ordinary or extraordinary expenditures of the government. The structure was reared upon that rock, and was so understood at the time the statute was enacted. The money to be distributed was out of a surplus fund. Where was there a surplus fund? There was none." The opponents of the bill, apart from the argument of contract, mainly founded their arguments on the fact that the states had been induced to undertake public works and other engagements by the promise of the money, and the inconvenience to which they would be put by withholding the fourth installment. It was justly observed by their opponents, that the states should have regulated their action by the actual terms of the law of congress, to which they agreed when they accepted the deposits. The opposition to the bill was persistent, the debate was long, and many members were participants, among whom were Adams of Massachusetts, Fillmore and Sibley of New York, Bell of Tennessee, and Wise of Virginia. It finally passed the house by the close vote of 119 to 117. A motion to reconsider was made by Mr. Pickens, and carried. On reconsideration, Mr. Pickens moved to amend so that, instead of postponing the payment indefinitely until further action by congress, it be postponed to Jan. 1, 1839, a day certain. This amendment was agreed to and concurred in by the senate, and the bill finally passed in that form.

—The effect of the postponement of the payment to a fixed day has been held by some to bind the United States to such a payment; and the making the withdrawal of the first three installments received by the states dependent on an act of congress, has, by the same kind of construction, been regarded by some as altering what was originally a deposit to a gift.

—As Jan. 1, 1839, approached, it became apparent that there would be no funds in the treasury available for the deposit of the postponed installment. The secretary of the treasury, in his report for December, 1838, stated that the available balance on Jan. 1, 1839, would be \$2,765,342 only, and at the date of the report the treasury notes outstanding amounted to over \$7,754,560. He said, "It will be perceived by these statements that no surplus balance will probably exist either on Jan. 1, 1839, or during that year, to be deposited with the several states for safe-keeping as a fourth installment under the deposit act of June 23, 1836." Since Jan. 1, 1839, there has never been a time when the United States had in its treasury a surplus over and above all its debts and estimated expenditures. The amount deposited in the first three installments with the states, has always been carried as funds of the treasury unavailable; and, under the terms of the acts relative to its deposit, it could now be recalled at any time by an act of congress.

—General John A. Dix, secretary of the treasury, in a letter to the chairman of the committee on ways and means, of Jan. 18, 1861, called attention to the fact that "there are deposited with twenty-six of the states, for safe-keeping, over twenty-eight millions of dollars belonging to the United States, for the payment of which the promise of these states is pledged by written instruments on file in this department. The annual statement of receipts and expenditures for the year ending June 30, 1860, represents this amount as part of 'the balance in the treasury' on that day. \* \* I refer to this final resource as an available one, should the public exigencies demand it. It is not doubted that the greater portion of the amount so deposited would be promptly and cheerfully paid should an exigency arise involving the public honor or safety. If, instead of calling for these deposits, it should be deemed advisable to pledge them for the repayment of any money the government might find it necessary to borrow, loans contracted on such a basis of security, superadding to the plighted faith of the United States that of the individual states, could hardly fail to be acceptable to capitalists." (See UNITED STATES NOTES.)

—It is easy to see that there can be no constitutional authority for the claim that this money, already in the possession of the states, irrevocably belongs to them, since, according to the constitution, it is still in the treasury of the United States. The only method of taking money out of the treasury is by an appropriation by congress, upon which the secretary of the treasury is authorized to issue his warrant, and no such method was ever adopted in relation to this money. The whole object and intention of the act was to deposit the surplus, not distribute it, as it has been seen that a distribution act was known at the time to be unconstitutional. Upon the delivery of the money the treasurer of each state gave to the United States, not a receipt, but a *certificate of deposit*, subject to the future requisition of the government. The amount of the deposit has always been held among the "unavailable funds of the treasury," and is annually so reported among other like funds, as may be seen by reference to

page 383, Finance Report, 1882, and previous reports. But whether a deposit or a distribution, no constitutional method has been taken to authorize the payment of the money out of the treasury. Moreover, it was a deposit of surplus and surplus only, and when the surplus did not exist was suspended by act of congress until a certain date; and, when at that date there was still no surplus, the deposit was again withheld by the executive, and, on the same principle, has been withheld ever since. Congress at any time can authorize the withdrawal of the whole amount from the states, and it doubtless could authorize the perpetual withholding of the fourth installment in view of the fact that at some time in the future, after the national debt is paid, there may be a surplus similar to that which existed Jan. 1, 1877.

—Benton, in his *Thirty Years' View*, thus refers to the use made of the deposits by the different states: "All sorts of plans were proposed for the employment of the money; and combinations, more or less interested or designing, generally carried the point in the universal scramble. In some states a pro rata division of the money per capita was made; and the distributive share of each individual, being but a few shillings, was received with contempt by some, and rejected with scorn by others. In other states it was divided among the counties, and gave rise to disjointed undertakings of no general benefit. Others, again, were stimulated, by the unexpected acquisition of a large sum, to engage in large and premature works of internal improvement, embarrassing the state with debt, and commencing works which could not be finished."

—A claim has been made within a few months (1884) upon the secretary of the treasury, under authority of an act passed by the legislature of the state of Virginia for the deposit of the amount of the fourth installment (\$732,809,33) under the act of June 23, 1836. A similar claim has also been made by the treasurer of the state of Arkansas, through Senator Garland of that state, to which the secretary replied, on Oct. 8, 1883: "I find that the tradition of this department for over a dozen years has been to consider that act as obsolete, or at least not imperatively effective during a season of large public federal indebtedness. I can for the present follow in the path of my predecessors in the office of the secretary of the treasury. It is not improbable that I may ask the attention of congress to the matter in the next annual report from this department."

## UNIVERSITIES

UNIVERSITIES. *Purport of this Article.* In Europe the university has its definite character, well understood by educated men, although it is not easy to define its functions within the limits of a single sentence. In the United States, on the contrary, the word is used carelessly, as if it were quite unimportant to remember its real significance. Sometimes it is applied to a strong institution which combines the four traditional faculties; and sometimes to schools of a very low grade, or to those which promote but a single department of knowledge. There are indications in many parts of this country that the true idea is hereafter to be more clearly recognized; generous gifts for such purposes have been made by states and individuals; and legislation has been sought in order that the university may hereafter be developed on a proper basis. In this epoch of munificent foundations, it is of the utmost importance that correct ideas should prevail among us; for, otherwise, the United States will remain behind the other countries of christendom in the highest department of education.

—*Meaning of the Word.* Something may be gained by retrospect. The word university, which, in these days and in all the modern languages of Europe, has an educational meaning, was primarily a word of wider use. In its Latin origin it signified the entirety, the whole, the unit made up of individuals; thus *universitas incolarum oppidi* meant the community—*universitas canonicorum*, the company of canons. It was nearly equivalent to our word society or corporation. Gradually it was restricted to a society of teachers and scholars, and more especially a society in which several faculties were combined. Hence it came to signify an association in which all branches of knowledge were taught, especially the highest educational body in a city or country—the supreme "high school." Sometimes *universitas* pointed to the governing authority of the corporation, while in contrast *studium generale* indicated its teaching function. *Societas magistrorum et discipulorum* was early employed as an almost synonymous phrase. In modern times the buildings, libraries, museums and other possessions of the corporation are often spoken of as the university. But in all legitimate uses of the word the idea has never been lost sight of, that the university is an organization for advanced instruction in the chief departments of knowledge; it is a high school in which the principal arts and sciences are taught. An essential element in its plan is comprehensiveness, or breadth; it is a unit made up of many constituents; a confederation under a sovereignty.

—*To be distinguished from other Words.* Hence it is acknowledged by the best authorities, that a single faculty, whether of law, medicine, theology or philosophy, does not constitute a university. Such a faculty, however far its instructions may be carried, is too narrow to claim legitimately the title which belongs to a different and broader organization. Universities must also be distinguished from learned societies (like the Royal society, the French institute, the American academy, etc.), in which no instruction is offered; and they should never be confounded, as they often are in this country, with colleges (corresponding to the German *gymnasia*, or the French *lycees*), in which youth are trained by well-known methods for the higher work of more advanced students. The university (like Oxford and Cambridge) may well include one

or more colleges in its organization, as the greater includes the less, but the higher authority of the greater should always be recognized—as it is, for example, by such titles as these: Trinity college in the university of Dublin; the university of McGill college in Montreal; the college of agriculture in the university of California; and Adelbert college in the Western Reserve university at Cleveland.

—In every true university, all departments of learning should find a congenial home as members of one family governed by one authority. Within their precincts, pupils trained for freedom by preparatory discipline should be encouraged to go forward in the pursuit of science, as deep as they will, as far as they can. The dangerous effects upon the mind of an individual, of his devotion to a single subject, will be counteracted by living among men who attach equal, if not superior, value to very different studies. With occasional exceptions, it may be stated, as a rule, that the self-taught man suffers from disadvantages which the society of other scholars tends to remove. Association in studies of a superior character, under some recognized combining and coordinating authority, is the most efficient method which is known for the development of talents, and also for the promotion of knowledge. Hence, under all phases of organization, the purpose of the university has remained the same; namely, to collect, weigh, perpetuate and disseminate systematic knowledge on important subjects, by the employment of eminent scholars in the instruction of properly qualified youth.

—*Origin of Universities.* It is commonly said that universities had their origin in the thirteenth century, but this date can not be considered exact, nor can any one foundation claim unquestioned priority. The faculty of philosophy can be traced as far back as the sixth century when its courses included the *trivium* (grammar, logic, rhetoric), and the *quadrivium* (music, arithmetic, geometry, astronomy), the seven liberal arts, of which a liberally educated man should be the master (*artium magister*). A mnemonic hexameter<sup>150</sup> thus recalls the sequence:

GRAMM. loquitur; DIA vera docet; RHET. verba colorat;  
MUS. cant; AR. numerat; GEO. ponderat; AST. colit astra.

In the eleventh and twelfth centuries, when the dawn of better things began to follow the mediæval darkness, schools of law grew up (as at Bologna), and of medicine (as at Salerno), and of theology in the monastic foundations. The first clear indications of the general study of philosophy are seen in Paris, where at length the four faculties began to co-operate in the government of students, and where, in 1209, the word university was employed in connection with the affair of Amaury de Chartres.<sup>151</sup> It is found in use, a few years later, at Oxford, where an aggregation of colleges had been growing up for many years, perhaps (though not certainly, nor even probably) since the days of King Alfred. The university of Paris early exerted an influence upon the organization of other high schools. Its methods, its regulations, its usages, were adopted in distant countries, and may now be traced in the history of English, Scotch, German and American foundations.

—*Modern Notions of the University.* From this retrospect, let us turn to some of the modern statements of the proper scope of a university. Discussions on this subject

have been rife in Germany, France and Italy, but for our purposes citations will only be drawn from British writers: for it is on the basis of English educational experience that American high schools have been organized.

—In an article which was published in October, 1837, by Sir William Hamilton, the Scotch philosopher, the following remark is found: "We shall find no difficulty in proving that university, in its proper and original meaning, denotes simply *the whole members of a body* (generally incorporated) *of persons teaching and learning one or more departments of knowledge*; [152](#) and *not* an institution privileged to reach a determinative circle of sciences, and to grant certificates of proficiency (degrees) in any fixed and certain departments of that circle (faculties)."

—In his efforts for the foundation of a Catholic university in Ireland, John Henry Newman, now cardinal, published, in 1852, a series of "Discourses on the Idea of a University," which begin with this sentence: "The view taken of a university in these discourses is the following: That it is a place of *teaching universal knowledge*. This implies that its object is, on the one hand, intellectual, not moral; and on the other, that it is the diffusion and extension of knowledge rather than the advancement. If its object were scientific and philosophical discovery, I do not see why a university should have students; if religious training, I do not see how it can be the seat of literature and science."

—In 1868, during the discussions which related to the reorganization of Oxford, Goldwin Smith, then about to withdraw from his connection with that university, wrote as follows: "Experience seems to show that the best way in which the university can promote learning and advance science is by allowing its teachers, and especially the holders of its great professorial chairs, a liberal margin for private study; by this, by keeping its libraries and scientific apparatus in full efficiency and opening them as liberally as possible, by assisting, through its press, in the publication of learned works which an ordinary publisher would not undertake, and by making the best use of its power of conferring literary and scientific honors."

—While the proposal was under consideration to establish the Victoria university in Manchester (in 1882), Professor A. W. Ward brought forward some interesting evidence from the German renaissance, saying, among other things: "The renaissance age was in its way singularly alive to the uses of associated study; and if I may speak of different times, I may say in passing that there is no side of modern university life better worth not only preserving, but developing, than that of *combination in study*. Between teachers and learners, the laboratory and the seminary; among learners, their own associations connected with the studies of their academical life—are the real and necessary supplements of the lecture room." And again: "A well-organized system of university education should carefully lead from a common basis of sound general training to the several main branches of study, and in these again leave room for the closer pursuit of special lines of research."

—In a consideration of the "Future of English Universities," Professor James Bryce (1883) urges that these foundations should aim to attract and educate the whole nation [meaning all classes of the nation]. Secondly, he argues that "it is their business to

offer to all comers the best possible teaching on every subject—that is, to attract the most learned, skillful and energetic men, give them a platform to speak from, set them to teach, both by public oral instruction and by showing pupils how to study, and give them every motive of honor and interest for doing their best as teachers." Thirdly, he speaks of what can be done for the advancement of letters and sciences; and finally, he calls attention to the importance of "bearing a part in movements for improving the education and raising the culture of those who can not come to the university as students."

—This modern conception of the university is most completely worked out in the German empire and in Austria, where, under the control of each state (Austria, Prussia, Baden, Saxony, etc.), the system of public instruction is crowned by one or more universities. Those Germans only can gain access to the lecture rooms who bring the certificates of thorough preparatory discipline, though foreigners are welcomed on terms less rigid. The ultimate authority is the government, which is bound to supply the requisite financial support, has the appointment of professors, and prescribes the general regulations. But within these limitations the professors are free to give such instruction and by such methods as they think wise, and their wishes are usually, if not always, considered by the sovereign authority in the state. In fact, the professorships make the university. As a rule, the universities have four faculties—philosophy, law, medicine and theology. Sometimes there are two divisions—Catholic and Protestant—in the faculty last named; and, in a very few instances, the faculty of philosophy has been subdivided, but the general sentiment at the present time is adverse to such sections.

—The universities of Switzerland, Sweden, Norway, Holland, Russia, etc., are largely influenced by the example of Germany and Austria. The development of universities in England has been quite different. Oxford and Cambridge have perpetuated the idea of collegiate discipline under university control; but, whatever may be the nominal rule, actually the colleges control the university. The Scotch universities have other peculiarities. Ireland has still a different system. France, again, has an organization of its own. Until 1875 (when a law was passed making university education free), there was but one university in France, and that had control, under the government of the state, of all the faculties. It has lost its exclusive powers, but is still an administrative, teaching and examining authority, with jurisdiction over the public foundations, not alone in Paris, but throughout the state.

—*The Essentials of a University.* Gathering up the experience of the past, and comparing it with what is now in progress, it is safe to say that these are the essentials of a university which shall be worthy of its noble name. The first requisite is a superior staff of teachers—men gifted with unusual powers, proficient in particular departments of learning, trained to habits of exact inquiry, and skilled in the art of presenting what they know. It is the business of such men to inspire as well as to inform their pupils; to show the right method of study, as well as to bring forth ascertained results. This function is best exercised by meeting students face to face. A library can never take the place of an assembly of living teachers, though books are made efficient by the teacher's presence. Even in the advancement of knowledge, experience has shown that the most successful agents are superior teachers engaged in

the tuition of superior scholars. The university must therefore, in the second place, bring together a company of pupils qualified to profit by the guidance of the professors. For both, in the third place, books, collections, instruments and buildings must be liberally provided. Fourthly, examinations must be held, in order to ascertain what progress has been made in study. The bestowal of academic degrees and prizes should be made to stimulate intellectual exertion, and to protect the public against pretentious ignorance. In the fifth place, universities may be called upon to pronounce opinions for the benefit of the public upon important matters in dispute. Sixthly, universities should promote the publication of learned treatises which would not otherwise see the light, either by the maintenance of a printing press, or by giving their corporate sanction to works of unusual importance.

—*University Education in America.* The condition of university education in America can not be understood without reference to our history. The earliest settlers in New England and in Virginia brought with them the idea of a liberal education as it was provided at the beginning of the seventeenth century by the English universities. At least ninety university men had immigrated to New England prior to 1648, about three-fourths of them being from Cambridge, and one-fourth from Oxford.<sup>153</sup> At that period in England college life completely overshadowed university life. Residence within academic walls, tutorial discipline, ecclesiastical obligations, were much more important elements in the system than the bringing together of eminent professors and requiring attendance upon their lectures. Harvard, Yale, and William and Mary, the three foundations of the seventeenth century, were colleges in the definite and restricted English sense, though they exercised the right to confer degrees, even in faculties where no instruction was provided. Their younger sisters, in New York, New Jersey, Pennsylvania, New Hampshire and other states, were planned upon the New England model. Down to the close of the revolutionary war the highest schools of the colonies were colleges, and nothing but colleges. The year of the peace, 1783, was marked by the foundation of a medical faculty in connection with Harvard college, but it was more than thirty years before the faculties of law and theology were added. In New Haven, also, the medical faculty was the first addition to the college faculty, in 1813, and several years later came the faculties of theology and law. Gradually the college faculties of Harvard and Yale have been greatly expanded, and now correspond closely with the German faculties of philosophy, although engaged in the instruction both of graduate and undergraduate students. It thus appears that the two foundations which have become at the present time the most completely organized universities in this country, include a group of faculties grafted upon a college stock. The same mode of development is in progress elsewhere, with more or less success. For want of a better name, this type may be called "the collegiate university." As the foundations were laid in the interests of the church, the term ecclesiastical university might be thought more appropriate. It is still the form of development preferred by many of those who have watched the steady and successful growth of the older institutions.

—But it is not the only type. As early as 1812, the state of Maryland authorized the college of medicine (incorporated four years before) to annex to itself "the other three" colleges or faculties, viz., law, divinity, and arts and sciences. Of these faculties two have continued until now. Upon a similar plan, in 1826, the university of Virginia

was organized by Thomas Jefferson, who disregarded the historic foundation of William and Mary for an institution of much broader scope. He brought out the continental notion of a university as quite distinct from the college. He did not favor the ecclesiastical organization which prevailed in the original American establishments; but induced the state, as a purely civil government, to give name, funds and authority to the university of Virginia. The success of this institution had much influence, especially in the new states, where, however, the traditions of New England were still powerful. Thus the second type, "the state university," has been developed in Michigan, Wisconsin, California and many other parts of the Union. The bestowal of public lands for university education has greatly helped this class of institutions, but for a long time to come there is likely to be friendly rivalry between the advocates of colleges under ecclesiastical or denominational control and the friends of freer and more comprehensive universities under legislative control.

—A third type of university organization is beginning to appear, quite distinct from the historic collegiate or the modern state universities. Individuals are giving large sums of money to endow universities, organized under special acts of incorporation more or less private in their character. The gift of Rich, in Boston; of Cornell, in Ithaca; of Packer, in Bethlehem; of Johns Hopkins, in Baltimore; and recently of Tulane, in New Orleans, are examples of this tendency. The large funds thus bestowed, at a period when the country is awakening to the need of university work as distinguished from collegiate, are very significant. This type may be called "the privately endowed."

—Mention should also be made of a fourth form of university organization, of which the chief example is the university of the state of New York, wherein, with the authority of the state, a supervision is exercised, of a very gentle but definite nature, over the colleges and seminaries of the state. No instruction is given by this university, and the only degrees conferred are honorary. This is "the supervisory type."[154](#)

—The embodiment of authority in a university is a problem of much difficulty in this country, where the decentralization of civil government is so complete. European precedents have but little value here. The governing bodies of Harvard and Yale are close corporations, having exclusive responsibility for their proceedings under their charters. For the state universities, trustees or regents are sometimes elected by popular vote, and are sometimes appointed by the governor or the legislature; they have even been considered civil officers (as in California), liable to be removed or superseded at the pleasure of the legislature. Gradually the usage is coming into vogue of allowing the graduates of an institution to have a voice in the election of the trustees. In some places the president is the head of the legal corporation, as well as of all the faculties. He is the lineal descendant of the ancient rector, or chancellor, and has corresponding powers. In other institutions he is a member of the corporation, but not its head. Elsewhere he has a seat among the trustees, but has no vote. In some places he is precluded from listening to their deliberations, and is only an agent or executive officer. Consequently his functions vary, from those of a king in council to those of a servant in livery. Usually the professorial responsibility is limited to the instruction and government of the students, and does not extend to the selection of

their colleagues, the management of funds, or the construction of buildings—functions retained by the trustees. In consequence of these uncertainties, the educational growth of new foundations has generally been less steady than it should be; a wavering policy has been followed. It has been found difficult to retain the services of good men, particularly in the executive or administrative office; and probably for a long while to come, with now and then an exception, our institutions, especially those of the second type—state universities—will suffer from this fact. Stability is of incalculable value in a seat of learning; instability will sooner or later result in the casting off or slipping away of valuable teachers. In the long run the success of universities will be promoted by entrusting the chief powers to the professorate, with supervision and support from a body of educated trustees.

—University degrees have varied very much in their significance and value. Originally, they were steps in the academic life. The bachelor had attained to one rank; the master or doctor, to a higher. The right to bear these titles was also the right to enjoy certain corresponding privileges; and it was carefully guarded by examinations, certificates and regulations, like other social positions. This dignity of academic titles has diminished in modern times, partly because they have been distributed almost haphazard, as bonbons are thrown to a carnival crowd; partly because they have been conferred by some universities in Germany *in absentia*, and for pecuniary returns; partly because of the extravagant distribution of honorary distinctions, especially in this country, where the height of absurdity has been reached; and partly because so many variations of the academic titles have also been introduced in this country, that their meaning is lost sight of. Fortunately, signs of reaction against these bad usages are visible, and possibly degrees may yet be restored to their former significance.

—From this brief review, it is apparent that the American universities are likely to be the outgrowth of our own free institutions, ecclesiastical and civil, and of the outpouring of private generosity. They are not likely to be based upon English, German or French models, but are to be benefited by the experience of all existing foundations. They are to be truly American, in the sense of being adapted to our schools, our history, our laws, our ways, our land. It may be long before they equal in magnitude and renown the historic foundations of the old world; but if they succeed in enlisting and retaining illustrious and powerful teachers, their success will be assured.

D. C. GILMAN.

## USURY

USURY. When every one produced nearly everything that he consumed, and commerce consisted in almost accidental exchange, loaning was only a friendly service or charitable act. Morality or religion might then have justly branded the greedy man who made a vile use of the distress of his neighbor. But the relations of men to one another increased, and became complicated; in one way or another capital came into existence. Here, a conqueror took violent possession of lands, houses and animals; there, a pirate came to shore loaded with booty; elsewhere, wealth was accumulated by labor and saving. The surplus thus acquired (whether rightly or wrongly) was transformed into capital by the employment which was made of it. For, it is the use for which an object is intended which constitutes it capital. By the force of things the remunerated loan gradually lost part of the reprobation which attached to it, and interest was enabled to establish itself, but not without a struggle. Unfortunately, capital long remained a monopoly, and the loaning of it was necessarily dear, and all the dearer since loans were made in the beginning less by industry than by luxury and dissipation. The capitalist drew from his possessions all that he could; this he had a right to do, a right which, doubtless, he sometimes abused. Hence governments, having been long accustomed to look upon *subjects* as minors, believed themselves obliged to fix the rate of interest. Since then times have changed; labor has become more general; the sciences have pointed out the means of increasing its products by rendering it more efficient; wealth has accumulated in the hands of many; there is competition among lenders; and now luxury is scarcely ever, and industry almost always, the borrower: yet in certain countries prejudice has preserved a restrictive legislation. This is much to be regretted. The hiring of capital differs in nothing from that of any other object; and its price, too, depends on the action of demand and supply, as do the prices of all objects. In this world all abundant things are cheap, and all rare things dear. Human laws are powerless to modify this natural law, to which we may apply the words, *dura lex, sed lex*.

—Restrictive laws on the subject of usury can only aggravate the evil which they propose to prevent. Interest is composed of at least two elements: 1, the remuneration of the service rendered by the loan (or, which is the same thing, the compensation which the lender imposes on himself); and 2, insurance against the risk of loss. Solvent and honest borrowers may, by a combination of unfavorable circumstances, find it impossible to return the principal. There are times in which these circumstances become frequent; and if the law prevents the capitalist from insuring himself against loss by his proportionately raising the rate of interest, one of two things will happen: either the capitalist will abstain from giving credit, or he will raise the rate of interest by the addition of a third element, insurance against the risk of punishment.

—A pretense is made to justify the limitation of the rate of interest, by the obligation of protecting the needy person who borrows. Many objections to this immediately present themselves to the mind. 1. If the borrower agrees to pay the price, the reason is that the service rendered him does not seem to him too dear; a man may borrow at 20 or 30 per cent. if he foresees that he can gain 40 per cent. 2. Is the case that of a

spend-thrift? You can not prevent him from wasting his fortune; if he does not do it in one way, he will in another. 3. Why not put one's self at the lender's point of view also? If the return of the funds he loans seems to him more or less doubtful, why should he not have the right to cover his risk? 4. What difference is there between goods and money? and can not the former be sold legally at any price one wishes? 5. Lastly, admitting that some abuses are inevitable (and where is abuse wanting?), must we interfere with the use which is frequent, nay daily, to reach some abuses which are relatively rare? Are these abuses sufficient to warrant the putting of all those under the guardianship of the law, who for one reason or another desire to borrow? It is of general utility that trade in money should be as free as trade in merchandise; fraud alone should be punished. Moreover, to limit the rate of interest we should know what its *normal rate* is. But who can fix it? The legal rate is 5 per cent. in France, and 10 per cent. in Algeria. What is the legal rate in Turkey? What was the legal rate at Rome or during the middle ages?

—The arguments we have just given have not escaped legislators, and in many countries the crime of usury has been blotted from the penal code, and gradually it will be blotted from the penal codes of all countries. [155](#) (Compare INTEREST.)

MAURICE BLOCK.

[\[Back to Table of Contents\]](#)

## UTAH

UTAH, a territory of the United States. Its area was a part of the first Mexican cession (see ANNEXATIONS, IV.); and at the organization of the territory, by the act of Sept. 9, 1850 (see COMPROMISES, V.), it contained 220,196 square miles. Since its organization it has been largely reduced by portions which have been taken from it and added to Colorado, Nebraska, Nevada and Wyoming. It is now a compact, nearly square territory of 84,476 square miles. Its population, by the census of 1880, was 143,963, so that it is the most populous of the territories, if we except the District of Columbia. Its capital is Salt Lake City, and its governor (1880-84) is Eli H. Murray.

—The American territorial system (see TERRITORIES) is essentially and altogether an adjunct to the federal system. A more complete antipode to the mercantile colonial system of a century ago could hardly be stated or imagined. The American territory is practically under the absolute control of congress; and yet it is never thought of except as on the way to self-governing statehood. It is useless, indeed, is worse than useless, unless it is considered as an inchoate state. And yet here is a territory, already containing the full voting power of a congressional district, whose possible statehood not only is unconsidered, but would be considered only as a worse peril to American institutions than its present absolute government. The territory of Utah is the anomaly of the American system; and the question of its proper treatment is one of the most serious and perplexing problems of American politics. It has two distinct aspects, that of Mormon polygamy, and that of the Mormon hierarchy. In considering them, two features of the American system must be constantly kept in view. 1. The subjects of marriage and divorce are exclusively state concerns. Congress may forbid polygamy in a territory, but, as soon as the territory becomes a state, its legislature acquires entire control of marriage within its jurisdiction. If any of the present state legislatures should abolish their penal laws against bigamy, and either expressly or tacitly permit plural marriages, there is no power outside of the voters of the state which could intervene. 2. Once a state, always a state. When a state once secures the power of self-government, whether by surprise, by secret purchase, or after deliberate consideration, no power can legally revise the action of congress in the admission: even congress is unable to reconsider its action, and the state is equally unable to forfeit its position, except by expressly abandoning its statehood and expressly demanding a return to a territorial condition. (See RECONSTRUCTION.) Mr. S. G. Fisher, as cited below, some twenty years since stated and advocated what he considered as the right of congress to expel a state, or the right of a state to secede with the express permission of the same congressional authority which admitted it: but this view has never been accepted. One of the fundamental provisions of the constitution is, that not even an amendment shall be passed to deprive any state, without its consent, of its equal suffrage in the senate. The population of a state may diminish to almost *nil*, or its moral conditions may be shocking to the rest of the country, but its statehood must continue as long as it demands it.

—*Mormon Polygamy*. The growth and conditions of this institution have been elsewhere stated. (See MORMONS.) The revised statutes of the United States

prohibit polygamy in the territories, and jurisdiction of offenses against the prohibition is in the federal courts of the territories, with a power of writ of error, by act of June 23, 1874, from the United States supreme court to the supreme court of the territory. This was found ineffectual from the difficulty of obtaining evidence; and the stringent "Edmunds Act" was passed March 22, 1882.

—The provisions of the Edmunds act are, in general, as follows: 1. The offense of bigamy (U. S. Rev. Stat., § 5352) is restated, and made punishable by fine and five years' imprisonment. 2. Cohabitation with more than one woman is made a misdemeanor, punishable by fine and six months' imprisonment. 3. Jurymen may be challenged for being guilty of bigamy or of unlawful cohabitation, or for believing it right to commit such offenses. 4. The president is authorized to grant amnesty for past offenses. 5. The issue of Mormon marriages up to Jan. 1, 1883, is legitimated. 6. Bigamy, polygamy and unlawful cohabitation are made bars to voting and to eligibility for election or appointment to any office under the territory or the United States. 7. All the registration and election offices of Utah are declared vacant. 8. Five commissioners are to be appointed by the president, with exclusive power to appoint subordinates for the purpose of registering voters, conducting elections, receiving or rejecting votes, canvassing and returning votes, and issuing certificates. 9. More *opinion* as to the right of bigamy or polygamy is not to be a bar to a seat in the legislature.

—The first election held under the provisions of the Edmunds act resulted in an almost exclusively Mormon legislature, devoted to the maintenance of the corporate right of the church of latter-day saints to hold and enjoy its wealth. It is very evident, that, while polygamy is to be retained as a distinguishing mark for a peculiar people, it is to be practiced only by those who have an exclusively ecclesiastical ambition, and that the church will always take care to have monogamists ready to care for its political interests. No one can suggest any further step in the direction of the Edmunds act, except to make *opinion* a bar to a seat in the legislature. And that would mean the temporary abolition of legal government for Utah, and the relegation of government functions to the moral control of the church, through its unofficial courts of arbitration.

—As a final remedy, it has been proposed to adopt an amendment to the constitution, prohibiting polygamy in the United States, and empowering congress to enforce the prohibition. An amendment to that effect was introduced at the opening of congress in December, 1883, but has not yet been acted upon. It may be that such an amendment, with appropriate legislation to back it, might solve the problem and make it safe to admit Utah as a state. But considerable caution should be felt in coming to this conclusion after our experience with the fourteenth and fifteenth amendments. They were supposed, at the time of their passage, to be so carefully framed that they had transferred the protection of the civil rights of the enfranchised negro race to congress. But the supreme court has decided, in effect, that these civil rights were primarily under the protection of the states; that a diminution of the power of the states must be express to be valid; that these amendments gave to congress only a veto power over unconstitutional state legislation; and that individual offenses are still in the domain of the states. Why may not the proposed anti-polygamy amendment meet the same fate?

Suppose that Utah is admitted after the amendment is passed; and that her legislature as carefully refrains from passing laws permissive of polygamy as from punishing polygamy by individuals. May we not then find that the sixteenth amendment is as much of a practical delusion as its two predecessors? And it will then be too late, it must be remembered, to return Utah to a territorial condition. Surely the hazard of such a chance is too great to be taken.

—The only alternative seems to be to limit the sphere of the states by words that can not be mistaken or evaded, and to add to the powers of congress that of exclusive legislation, by general laws only, on the subjects of marriage and divorce within the United States. Utah might then be admitted with absolute safety, for no legal argument could emasculate such an amendment. Bigamy and polygamy would then be federal crimes; and no marriage would be valid, or its issue legitimate or capable of inheritance *ab intestato*, unless the marriage had been contracted according to the forms prescribed by a federal statute. Growth of population, wealth and culture in Utah would only increase the force of the influences, material and moral, which would aid the amendment to enforce itself. This remedy, succeeded by the immediate admission of Utah as a state, seems to the writer the only remedy for polygamy in the territories which holds out a fair promise of final and permanent success. It is open to the objection that a two-thirds majority in both houses of congress, or simple majorities backed by the president, might force free-love on the United States. But, if that time should ever come, all would be lost; and our posterity would be too busily engaged in guarding fundamental interests to have time to spare for Utah. The danger is on a par with that of the suspension of the privilege of the writ of *habeas corpus*; and is only one of a class of dangers which a democratic republic must meet and surmount or die.

—*The Mormon Hierarchy*. Federal officials, who have honestly endeavored to execute federal laws in Utah, are almost unanimously of opinion that a greater danger than polygamy is in the Mormon hierarchy, supported by the immense resources of rigidly exacted tithes, bulwarked by the fanatical obedience of the people, and willing, if it could see its way clear, to turn secret into open rebellion. Governor Murray, late in 1883, gave very forcible expression to this view in a newspaper interview, and urged strongly that the whole territory should be placed under an absolute military despotism until the hierarchy should be crushed out. One who has not been upon the spot must speak with diffidence upon such a subject. But, from all the information open to reach, it seems probable that this view is only the natural outcome of unsuccessful contest, and that the fate of the Mormon hierarchy is conditioned by that of Mormon polygamy in the following fashion—Polygamy seems to be primarily purposed to make the Mormons a "peculiar people," to give them a sense of homogeneity which the other elements of their "faith" will not supply, and thus to secure an obedience founded on faith rather than on force. Secondly, it has divided the Mormon leaders into polygamists, with church ambitions, and monogamists, with political ambitions. To the polygamists are given the present and future honors of the church, and the pleasure and profit of managing an enormous church revenue, without responsibility of accounting, except to the hierarchy. To the monogamists are assigned the present political honors of the territory, and the future political honors of the possible state. It is plain, from the results of the Edmunds act, that the

monogamists, though at present of a humbler rank, are not only important, but absolutely essential, to the polygamists. Without the political auxiliaries, the hierarchy would be powerless; with them, it can endure patiently, labor, and wait with hope. To cut off the political auxiliaries would be to cut off hope. It seems to the writer, then, that the mistake has been in aiming all operations at the polygamists, while every blow fell harmless on the monogamous shield before them. The true policy would be to strike at the monogamists, to push them into a compulsory choice between their allies and their own hopes of political preferment. What blow would do so more effectually than the passage of the marriage and divorce amendment, followed by the admission of Utah as a state? If a record of conviction for bigamy, or for aiding a bigamous marriage, is to be a bar to office-holding, to citizenship, and even to voting, how long will political leaders, in the hot conflicts of real state politics, hold to an organization which can not even provide them with votes? Whichever side the church takes, it must bring votes in its hands. Mormonism is a democracy of revelation, in which a revelation is tested by its general acceptance. A new monogamous revelation would thus be the inevitable result of the gift of statehood, if we could give it safely; and such a revelation would only result in the disappearance of the Mormons as a "peculiar people," and the downfall of the hierarchy. Separate the political monogamists from the ecclesiastical polygamists by the marriage and divorce amendment; fling the apple of discord among them by granting statehood and introducing state politics; and it seems evident that the problem of the hierarchy will be found to be only an outgrowth of the problem of polygamy, and that they stand or fall together.

—It is not intended to make polygamists and ecclesiastical leaders exactly coincident classes. Some of the ecclesiastical leaders are certainly monogamists, but they are exceptions.

—Authorities will be found under MORMONS. See 9 *Stat. at Large*, 453 (act of Sept. 9, 1850); Fisher's *Trial of the Constitution*, 173.

ALEXANDER JOHNSTON.

## UTILITY

UTILITY. This word has the same meaning in politico-economic language as in the usual vocabulary. What it designates, in things, persons or acts, is the power they have of rendering us some service, the service, for instance, of sparing us certain privations, inconveniences or suffering, or of procuring for us satisfactions and enjoyments. Economists, however, employ the word in the plural, when, instead of considering utility as an abstraction, made up of every distinct particularity, they look upon it as it exists in different objects with differences of nature and destination.

—The first distinction to be made between utilities is, that there are natural and artificial utilities. Natural utilities are those which supply the necessities of our existence without our having to do anything to obtain them. Such are the utilities furnished us by the air which surrounds us, by the heat and light which the rays of the sun bring to us. These utilities are the work of nature entirely. Nature makes them a gratuity to us. Artificial utilities are those which we obtain only at the price of more or less painful efforts. It is for us to learn to produce them, and we never acquire their possession and use, except for some consideration or on the performance of certain services.

—Political economy has scarcely anything to do with natural utilities. It may say that they are not all spread in the same measure over all parts of the globe; that there are no two regions in which heat, the force of the wind, water or arable land, is distributed in exactly like proportions, and that such a fact exercises a necessary influence on the modes of the activity, the facility of the development and the destiny of the populations of those regions; but here ends what political economy has to say about them. We are here in presence of a phenomenon whose essence it is not given to man to change, for it emanates from laws over which his will can not possibly have any efficient action. Everything, on the other hand, which relates to artificial utilities belongs to the domain of political economy, and challenges its investigation.

—To produce utilities is all that it is in the power of men to do. When nature placed matter at their disposal, it did not wish that they might have the power to add one single particle to it. All they can do is to change the place of, to separate, to combine and to transform the elements of matter in such a way as to cause them to acquire properties which they do not possess in their raw state. The labor of men consists only in giving the things on which it is brought to bear qualities and forms which adapt them to use; more than this, human labor can not do. Nature has reserved creative power to itself entirely; to men it has granted only the power to utilize its gifts.

—It is easy to conceive that human labor can propose to itself no end but that of producing utilities. All labor involves pain and fatigue, and no one would surrender the sweets of rest if he had not in prospect the compensation which is the reward of labor. But there is no work which can reap reward unless it produces fruits endowed with some quality. Mistakes may, indeed, be made in this respect; it may be, that, from ill-advised endeavors, the results which the men who made them promised

themselves may not come; but these are mere accidents. In the normal state of things, there is no labor which has not the production of pretty manifest utilities for its object, utilities sufficiently desired by others to make the advantage of disposing of them compensate for the sacrifices necessary to the obtainment of them.

—In proportion as nations become enlightened and wealthy, they strive to produce utilities more diverse and in greater numbers. After those utilities which serve to satisfy the principal necessities of life, they create others which answer only factitious wants and tastes, which grow more and more elegant and refined. It is the eternal task of nations to seek for and endeavor to obtain all that can add to the well-being already acquired, to the satisfactions already enjoyed; and the better they accomplish this task, the higher is the degree of power and prosperity which they attain.

—Artificial utilities, those which are the fruit of man's own labor, have given rise to distinctions. At first they were divided into material utilities and immaterial utilities. The former are these utilities which man communicates to matter, which he fixes and incorporates in matter either by changing its place or form; the latter are those which do not assume a form either tangible or ponderable. These latter again have been divided into two categories. To the first of these categories belong such utilities as are incorporated in persons, and fit them to render services to themselves or to others. Utilities attached to talent, to information or knowledge, are of this kind, as are also utilities whose use is beneficent and profitable. To the second category belong those utilities which emanate from services and acts that produce no change in the productive capacity of persons or in the condition of things. Of this latter kind are the utilities which result from the labor of judges, soldiers, public functionaries, physicians, lawyers, musicians and actors. These utilities may answer to very real social wants; but they have not, at least in appearance, directly reproductive effects; neither are they susceptible of accumulation or duration.

—Utility is produced under forms so diverse that it would be easy to add to the number of these classifications and to establish new subdivisions among them. But it is in view of the correlations and affinities which exist between utility and wealth that the classifications we have made have been admitted; and the ideas or notions to which they answer merit serious attention. The term utility is a generic one; and everything which, it matters not by what way or in what manner, has the power of satisfying our wants or relieving our sufferings, of contenting our desires, or contributing to our pleasure, possesses the quality characterized by the term utility. The meaning of the word wealth is a more restricted one. Although there can be no wealth whose basis is not utility, utility alone does not suffice to constitute wealth; it constitutes wealth only by allying itself in things to certain qualities of a particular order. Most assuredly natural utilities are indispensable to us; but as every one uses these utilities at pleasure, and gathers them without cost of any kind, and as they are not susceptible of private appropriation, it would be wrong to apply the term wealth to them. What constitutes wealth is *exchangeability*, it is the value things owe to the possibility of procuring us, by our delivering them to others, this quantity or that of other things. All economists, however, do not admit that exchangeable utility, or utility having a price, is sufficient to give things the name of wealth; they claim, that, in order that that name should properly belong to the things in which this utility is to

be met with, these things should, besides, be susceptible of accumulation and duration; in other words, that they should exist under a material form. It is easy to see, that, according to the definition given to the word wealth, the number of utilities which is admitted to constitute a part of it, must increase or decrease, and that the classification adopted by some writers should not be adopted by others. Be this as it may, the question of immaterial products and unproductive labor is the one that suggests itself *à propos* of utilities. Of artificial utilities, there are some which are not converted into material wealth or into the means of producing material wealth; such utilities are considered by some writers as unproductive; and, in the eyes of these writers, the labor to which the utilities just referred to is due is in as much disfavor as sterile labor. Whatever the distinctions that may be established among the different kinds of utility, it is a mistake to suppose that there can be any utilities which do not contribute more or less actively to the production of all the others. All the utilities which man succeeds in realizing have the same destination, the improvement of his lot; they all assist one another, combine with one another, and mutually fecundate one another, in such a way that those least material are as much as the others essential to the formation and accumulation of wealth, and serve as much to produce it.

—Take wealth in the form under which that name can be least denied it, the form of utilities fixed and incorporated in material objects: such wealth can be produced only with the aid and concurrence of immaterial utilities. It is intellectual conceptions that the workman realizes in his action on matter; it is the knowledge he has acquired that decides the success of his work; and the more precise and extensive this knowledge is, the more fruitful are his efforts, and the more do these efforts increase the things they are intended to produce. But in what does knowledge consist if not in the acquisitions of the mind? And is it not certain that the nations which possess most knowledge are those which obtain material wealth in greatest abundance? Assuredly nothing is more indispensable to the production of material wealth than the formation and accumulation of the capital the employment of which that production necessitates. But it is to the action of utilities of the moral order that the creation of capital is due. It is love for one's family, temperance, economy, and care for the future, which determine or permit the making of savings. If these qualities were wanting, no one would lay by, in order to reap a remote advantage from them, resources whose consumption would increase the well-being of the present; and there can be no doubt that the countries in which these qualities are found are always those in which capital continually extends its conquests and increases wealth most rapidly.

—Many economists admit rightly that the knowledge, skill and constancy of artisans and workmen are as much a part of the wealth of a country as the tools, machines and instruments which they use. Doubtless these kinds of utilities contribute powerfully to the formation and increase of wealth; from the point of view of the production of material wealth, there are, however, between them and the utilities which become incorporated in persons, differences only as to the modes in which their action respectively becomes manifest. And, in fact, that labor may produce wealth, it is not sufficient that it be enlightened, active and intelligent; it is further necessary that those who perform it be certain of reaping the fruits of their endeavors. But it is to insure this very certainty that the work of judges, magistrates, and even of armies, is intended; and such is the utility which results from the performance of such work. If

the laborer, the manufacturer and the merchant display all the activity of which they are capable; if they make savings in order to extend the field of their operations; if they seek for and apply to production better and better processes, it is only because they have faith in the efficacy of the services of all those who are charged with guaranteeing the security of person and property. The utility produced by the prosecution, sentencing and punishment of crimes and misdemeanors, does not vanish, as is supposed, with the acts in which it is embodied; on the contrary, it continues to subsist in the minds of all, intimidating these who might be tempted to do wrong, and demonstrating to others that neither violence nor spoliation can attack them unpunished, and that they may devote themselves to their work in security. We have seen the services rendered by the agents of authority cease to keep their habitual course; and, at that very instant, we witnessed, too, the production of wealth affected by languor and discouragement; so true is it that in the kind of utility which these services produce, is to be found the most indispensable stimulant to the success and energy of industrial labor.

—We may boldly assert, that nothing which is useful, nothing which serves to enlighten minds, to quicken the moral sense, to propagate healthy habits, or to guarantee peace and security among a people, can be without effect on the success of the efforts employed in producing material wealth. Those immaterial utilities even which seem the least productive; those even the obtaining of which, according to eminent economists, instead of making nations richer in material products, impoverish them to the amount of the sum total of material products consumed by the men employed in the service of the public, contribute their share to the formation of wealth; so true is this, that the formation or production of wealth would become impossible if the immaterial utilities above referred to were either entirely wanting or not to be found in the proportion required by the wants which they serve to satisfy.

—We have still to examine one other correlation of utility with wealth. It is certain that utility is a necessary condition to wealth. A product incapable of rendering any service whatever, unfit for any use, would find no one willing to give anything whatever for it; it would, consequently, be wanting in all exchangeable value, that is, in the quality, lacking which, it could not become wealth. This constant association of wealth and utility could not fail to attract attention; and, therefore, many writers supposed that there must exist between them relations such that the one might serve as a measure for the other. Although this error is refuted in the article VALUE, we can not pass it over in silence here. Although the utility inherent in things depends, so far as the estimate made of it is concerned, on circumstances momentarily variable, it is none the less certain, looked at from the general point of view, that it has its measure marked by the species of wants to which it relates. Thus, that utility exists in the highest degree in those things which supply the prime necessities of life, necessities which must be provided for under pain of inevitable death. It exists, in an inferior degree only, in the things which merely serve to defend us against privations and sufferings which do not jeopardize life, and in a degree still lower in those things whose use has no effect out to procure us pleasure or amusement. This gradation of utilities, based on the very nature of the evils or perils attached to the non-satisfaction of the wants which they enable us to satisfy, is simple and easy to understand. There is no one who does not recognize and assert that utility is much greater in the

alimentary substances, without which we would have to suffer the deadly pangs of hunger, than in the products to which we owe enjoyments, the privation of which would be attended by neither pain nor harm.

—But if utility finds its measure in the greater or lesser absolute exigency of the wants of our nature, that measure is far from being found again in the value itself of the things we may use, and far from contributing, according to their degree of distinction, to make those things integral parts, more or less considerable, of public or private wealth. It is in vain that the bread which nourishes us and the woollens that cover us are of prime necessity to us: that does not prevent an object which, at best, is good only to relieve for a moment the ennui of the person who buys it, being paid for at a price infinitely higher. The reason of this is, that there are men rich enough to give full rein to tastes and desires which others are entirely ignorant of or can not satisfy. Those to whom it is easy to provide for the most essential wants of life, think of procuring all the enjoyments compatible with the size of their fortune. It is not enough for them to be well fed, comfortably lodged and warmly clothed; they offer incense to pleasure, and seek it in everything. They must have things which charm the eye, which afford them delicate impressions and sensations, whose possession flatters their vanity, which sometimes borrow all their attraction only from a fancy or from the caprice of a moment; and the value conferred on these objects by what those who desire them are willing to give in exchange for them, assures to them, among things considered wealth, a much greater place than they would occupy if nothing but the quantum of real utility they contain were taken into consideration.

—It is only when the products indispensable to the satisfaction of the wants of existence are lacking that the utility which they contain makes its empire felt, and becomes the dominating principle of their value. When the things which can be dispensed with without peril or injury cease to be supplied in sufficient quantity, fewer of them are bought, and the rise in the price of them has its limit in the reduction of the number of those who ask to acquire them. The same is not the case with those whose use no one can give up without running the risk of death. In times of famine men dispute the means of subsistence with one another. The rich, to procure bread, sell everything which ministers only to their pleasure. The poor despoil themselves of their furniture, their clothing and their shoes. People must then perish or assuage their hunger: each sacrifices to the first of all wants, that of self-preservation, everything which is not of a nature to satisfy that want. Such cases present themselves in besieged cities when their stores are exhausted, and in deserts when, devoured by thirst, the merchants crossing them give for a few drops of water the treasures carried by their camels. But in the normal condition of things, when all kinds of utility are to be found in their customary proportion, their particular destination or quality has no influence on the value at which they figure in exchanges or at which they are estimated in the sum total of wealth. What operates, then, across the variations in price due to the fluctuations of supply and demand, is the amount of the cost of production of each.

—These considerations suffice to show in what the correlation which exists between utility and wealth consists. If value attaches to things only on condition that they be gifted with the utility which alone has the power to render them exchangeable, the

value in attaching to them by no means takes for its measure the character of that utility. It is the quantity of other things which each of them permits us to obtain that determines its value; and a precious stone, a pearl or a jewel which serves only to adorn the lady who wears it, has, with like weight and quantity, a thousand of times the value of the wheat or fuel without which we should fall victims of hunger or cold, but which costs little to produce, abounds in the markets, and sometimes has to wait for purchasers.

—To resume. Nature gratuitously gives up to men certain utilities which all enjoy equally: it imposes on them the necessity of creating the others. Their labor can produce only artificial utilities, and never has any end but to produce such utilities. The utilities which human labor obtains are of various kinds: some, becoming fixed and incorporated in matter, communicate to it the qualities which constitute wealth; the others are not realized under a material form; they attach to the persons of men, fitting them to render services to themselves or to others, or they attach to acts or services the performance of which has for effect to insure to the individuals or nations to whom they belong, satisfactions, advantages or guarantees, the absence of which would infallibly react in an injurious manner on their interests and on their well-being. It must be remarked, that, although immaterial, these utilities contribute actively to the formation as well as to the accumulation of the products which constitute material wealth; from which it follows, that, even considered solely in their relations to that wealth, the labor by means of which it is obtained has a character of productiveness not less real than the labor which acts more directly on matter itself.

—Utility is one of the constituent conditions of wealth; it is inseparable from wealth, but can not furnish a measure of wealth. The utility inherent in things is greater in proportion as the wants to which they are fitted to give satisfaction are more urgent and intense; the wealth inherent in things, on the contrary, is greater in proportion as the cost of production of the latter is greater.

HIPPOLYTE PASSY.

## UTOPIA

UTOPIA (from the Greek, that which exists in no place, nowhere). The word is the invention of Thomas More; the title given by him to one of his works which soon became celebrated; but the thing is much older than the name. By utopia is meant a certain organization of society and of the state, to which imagination and the spirit of system contributes not most but everything, without examining whether it is realizable in a given place or time, and without investigating whether or not it is compatible, even in a general way, with the moral and physical conditions of human nature. It follows from this, that the utopia necessarily changes character according to the system which produces it. And, in fact, there are religious utopias and philosophical utopias; idealistic and sensualistic, sensual and even materialistic utopias. Lastly, there are utopias which have their origin in pantheism; and this is true of the greater number of utopias. The pretension of Gregory VII, to make christendom a republic entirely subject, in things temporal as well as spiritual, to the sovereign authority of the holy see; a pretension afterward developed in a systematic form by the great theologians of the thirteenth and fourteenth centuries, is a religious utopia. The republic of Plato is a philosophical, and, moreover, an idealistic utopia. On the other hand, we observe the inspiration of sensualism in the doctrine of Fourier, the inspiration of materialism in the "Leviathan" of Hobbes, and in the "Positivist Catechism" of Auguste Comte, and that of pantheism in the reveries of Campanella and Saint-Simon. The utopia is, therefore, different from the ideal, although the ideal may sometimes be found in the utopia. The ideal which applies to society, as well as to the individual, raises us above what we are, to show us what we should be, and, therefore, can be. The utopia deceives us in regard to both, by placing before our eyes a chimerical goal, which may at the same time be a type of debasement and servitude; for it is impossible to create a new form of society, without concerning ourselves with the government adapted to it, and the best suited to preserve it. We, therefore, can not admit the distinction made by some publicists between the social utopia and the political utopia. Every utopia is necessarily both political and social.

## οὐ τόπος

—The age of utopias does not begin, as is generally supposed, with Plato; it is much more remote. It would not be difficult, for instance, to demonstrate that the republic of the Hebrews, such as we may represent it to ourselves in accordance with the institutions and the laws of the Pentateuch (see MOSAISM), was in great part a utopia which was never realized; that that sacerdotal race, a *people of priests*, who acknowledged no sovereign but God, never existed; that the periodical restoration of inheritances to their primitive boundaries and of slaves to liberty, any more than the perfect equality of fortunes, was never put in practice. But we are quite willing to accept as the extreme bound of antiquity the history of Greek philosophy. Even in that history Plato is not the first utopist. Aristotle ("Politics," book ii., ch. v., vi.) introduces us to two utopists, more ancient than Plato, one of whom, Phaleas of Chalcedon, gave social order, as its principle, the most perfect equality, and the other

of whom, a celebrated architect called Hippodamus of Miletus, having introduced regularity and symmetry into the construction of cities, desired to impose these same qualities on the organization of the state. Thus he demanded that the citizens, to the number of ten thousand, should be invariably divided into three classes: artisans, laborers and warriors; or, according to other testimony, into magistrates, warriors and workmen; and that a distinct portion of the territory of the republic should be allotted to each of these three classes. The two probably belonged to the Pythagorean school, which both commanded and practiced a community of goods. But no one before Plato knew, as well as he did, how to give a body to these imaginary conceptions, and to make the most of them by the graces of poetry and the power of dialectics. We know that he has connected his name with two entirely distinct utopias, one of which is developed in the "Republic," and the other in the dialogue on the "Laws." Both, according to his own avowal, belong solely to the world of ideas, but the second is nearer to reality than the first. The first has for its object perfect unity, the unity which consists in entirely melting the existence of the individual into that of society, and the real person of the individual into the ideal person of the state; the second, in default of unity, is satisfied with equality, which is also a means, but an inferior means, to hold together, under the empire of a common law, the different parts of the body social. All the elements of which the two Platonic constitutions are composed are explained, and, to a certain extent, excused, in these two primary ideas. Thus, the three classes of citizens, or rather the three *castes* of the "Republic," answer to the three faculties of the human soul, the magistrates to the intellect, the warriors to the will or the sentiments, and the laborers to the appetite. And because the appetite should be subordinate to the sentiments, and the sentiments to the intellect, the same hierarchy should exist in the classes which represent them. The most important of these classes is, beyond contradiction, the class of warriors; for the rôle of the lowest class is reduced to obedience; and the magistrate or philosopher, once he has performed his task, once he has founded the city on the supreme laws of the intellect, has nothing more to do. This explains why it is that the warriors should afford us the expression of the ideal unity of which we have just spoken. Hence the community of goods and women which Plato, by restricting it to them, considers a sacrifice, and not a privilege.

—It is evident that in this organization the human person and individual liberty count for nothing. They are not quite so entirely annihilated, but they are still oppressed under the régime of equality presented to us in the "Laws." For instance, the division of the territory having to remain invariable, it is necessary that the number of citizens fixed by Plato at 5,040 should be invariable likewise. So much the worse for the children born in excess of that fatal figure. They will be forced to emigrate. Sterile families will be obliged to complete their number by adoption. The law will see to it that personal wealth shall not disturb the equilibrium of fortunes. It will trammel industry, commerce and the increase of capital in such a way that industry, commerce and the increase of capital will become almost impossible. *A fortiori*, the burden of the law is felt in what concerns marriage, the education of children, and wills. It prescribes, as it did in Sparta, meals in common, prohibits travel, except in certain cases of necessity or of the public interest, subjects to the inspection of the authorities the most intimate relations of life, and lays down the most inflexible rules for all the occupations it is so good as to allow the citizens to engage in.

—Pagan antiquity affords no other examples of the utopian spirit; for we can attach no value to a few lost fragments like those of Hecatæus of Abdera, of Evemerus and Theopompus, which are evidently only reminiscences of the ideas of Plato; and, as to the "republic" of Cicero, it is less a work of the imagination and spirit of system than of patriotism and the political passion; it contains only a partial apology for the old institutions of the Roman republic.

—The middle ages bring us to the religious utopias, of which the boldest and most brilliant is assuredly the utopia of Gregory VII. Universal theocracy never existed except in the ambition of that great pontiff. The condition of the world at the period in which it was produced, and the general state of society, have always made it an unrealizable dream. But after it had met with the resistance of facts, the idea of Gregory VII. entered the domain of speculation. It took possession of philosophy and theology through the works of Thomas Aquinas, of Giles of Rome, and notably through the *De regimine principum* and the treatise *De ecclesiastica potestate*. Another utopia, hatched at the same epoch, between the end of the twelfth and the beginning of the thirteenth century, but which savors perhaps as much of philosophy as of religion, is that which bears the name of the abbé Joachim, and which is described in the "Eternal Gospel" (*L'Évangil éternel*). Joining the pantheistic principles of Amaury de Bène and of David de Dinant to some misconstrued texts of the Gospels, the adherents of this doctrine expected the reign of the Holy Ghost or of love to succeed the Son, as the Son had succeeded the Father. During this last period of our history, for which the two preceding periods had only paved the way, all differences and inequalities were to disappear from the earth, even the difference between vice and virtue; for all the passions were to be sanctified; the flesh and the spirit reconciled with one another, or rather, confounded together, were to cease their struggle for pre-eminence; and the suppression of war and a community of goods and of women were to make all men one family.

—With the renaissance the purely philosophical utopia reappeared; and it was the minister of a despot, the chancellor of Henry VIII., Thomas More, who, in calling it back to life, gave it its real name. Everything in Thomas More's book is not chimerical. It contains an extremely profound and sensible criticism of the politics, the political economy and legislation of his time. And even when he seems to abandon himself to the caprice of his imagination, when with complaisance he gives us an exposition of the laws and institutions of the country of Utopia, there is a distinction to be made between its political conception and its social organization. The former is simply a representative government, with a leaning toward the republic, having a senate, an assembly of the people, a president appointed for life, and election to all the degrees of power, spiritual as well as temporal. The latter is summed up in communism, with some of the elements which subsequently served in the construction of the phalanstery system. This is sufficient to convince us that the communism of Thomas More does not flow from the same philosophical system as that of Plato. The latter remains as much an idealist, even in its most deplorable applications, as the former inclines to sensualism. It is no longer with a view to their moral perfection, but in the interest of their common happiness, that men, according to the English philosopher, should renounce property. It is sufficient that this end be proposed to them for labor, grown both more pleasant and more fruitful, to satisfy all

the wants of society. The day in this system was to consist of only six hours: three hours before dinner and three hours before supper. Fatigue was to be avoided by diversity of occupation; every citizen, exercising several professions at the same time, might alter natively pass from one to the other. He would, therefore, have leisure enough to give himself up to all the enjoyments of study and conversation, and to taste the pleasures procured by the fine arts.

—Thomas More, however, does not carry the illusion so far as to believe that all trades, without distinction, could lend themselves to this combination. He recognizes that there are rude and repulsive trades, which are carried on only from necessity. But these trades are to fall to the lot of the public slaves, reduced to that condition in expiation of their crimes, or purchased by the state in foreign countries. Thus we see the utopian spirit resuscitating, in the bosom of Christianity, the institution of the helots. We must remark, however, that the citizens themselves are not treated much better. The law, like the discipline of a barracks, or the rule of a monastery, intervenes in all the details of life. It prescribes what their clothing, their food, their work and relaxation shall be, and leaves not the least place for freedom or intellect.

—If Thomas More thinks little of liberty, he has at least some regard for morals. He respects marriage, and, to a certain extent, preserves the rights of conscience by basing the national religion on deism. No such consideration for them is to be found in the system of Campanella, which is easy to account for, since pantheism is its basis. Pantheism confounds man, nature and God; it does away with the individual, and recognizes only the collective existence of society. This is precisely what Campanella does in his famous "City of the Sun." All the actions, and even the sentiments and thoughts, of its imaginary subjects, are submitted to an absolute authority. The chief of this solar people is something like the Supreme Father in the Saint-Simonian system, that is, he is both a monarch and an infallible pontiff, a man clothed with the attributes of God. Under him are three ministers in the departments of wisdom, of power, and of love; and under these three ministers are divers classes of magistrates set over all the virtues and all the faculties, who assign to each man his rank, his task, and, according to the manner in which he performs it, his share in the enjoyment of the common goods; the community is not here confounded with equality. And so, although women are in common, they can be enjoyed only in accordance with the rules established by the minister of love affairs, and only on the days, at the hours and under the circumstances most favorable to the improvement of the human race. Despotism was always dear to Campanella. In his "Discourse on the Spanish Monarchy," written many years before the "City of the Sun," he reaches this conclusion: the only and the true monarch of the world will be the sovereign pontiff; all peoples will constitute only one flock under the staff of only one shepherd; the king of Spain will play the part of the dog charged to bring back to the fold the sheep which have strayed away, and to devour them if they resist!

—At the same time that Campanella was taking up the ideas of Gregory VII, and paving the way for those of Saint-Simon, Bacon was writing his "New Atlantis"; but there is no reason why we should concern ourselves here with that work, since it relates more to the reformation and reorganization of learned societies than to the reorganization and reformation of the state. It offers, as it were, an anticipated plan of

the institute of France. Hobbes and Harrington had another aim. It is laws and institutions which they pretended to make over from top to bottom, after a preconceived model which they present us with, Hobbes in the "Leviathan," and Harrington in the "Oceana." Although diametrically opposed to each other in their principles, since the former, in the name of materialism, invites us to servitude, whereas the latter, appealing to our moral dignity, urges us on to the conquest of liberty, these two writers have this in common, that their views do not extend beyond the domain of politics. Nevertheless, both are utopists; for the unity of power, as Hobbes conceives it, the absolute monarchy which disposes of men's bodies and souls, of conscience and interests, of religion and of the state alike, is not more easy to realize than the perfect equilibrium between power and property which Harrington seeks to effect, and which he bases on the agrarian law, as if the agrarian law was not itself a source and instrument of oppression.

—The *Histoire des Severambes*, by Denis Vayrasse, containing only a mixture, without any consistency (being, so to speak, only a weakened echo of them), of the two systems of More and Campanella, it may be said that the history of utopias in the seventeenth century closes with the two creations of Fenelon, the *Bétiqus* and the *République de Salente*. The first of these presents us not so much with a hope for the future as with a souvenir of the past. It is a classical reminiscence of the Arcadia of the poets. It transports us among a pastoral people like those who lived under the fabulous sceptre of Saturn. It introduces us to men who have none of the passions, and consequently none of the vices, of humanity; who have put everything in common, since they possess nothing, and have scarcely any wants; and to children, enjoying the peace and innocence of their tender years, while nature, like a kind mother, relieves them of all care and trouble. The *République de Salente* unveils to us much more clearly the real thought of the illustrious archbishop. It is the picture of a people, who, with no industry but agriculture, were able to attain the highest degree of perfection and happiness. Population is to that people the source of all wealth, and war the source of all misery. This is the very reverse of the maxims which guided the government of Louis XIV. But there is something more in Fenelon's republic. It is, despite the simplicity of its life and customs, an aristocratic state, the citizens of which, divided into seven classes, are distinguished from one another by their conditions, their occupations, their rights, their clothing even, and in which the first rank belongs to birth. It is the ideal republic of Plato modified by Christian morals and by the prejudices of race borrowed from feudalism.

—The eighteenth century, independent and fruitful in every other matter, was only slightly inventive in social and even in political utopias. Rousseau and Mably confined themselves to reproducing, with some necessary development, the institutions of Lycurgus. Theirs was a retrospective utopia. Morelly, in his *Code de la Nature*, is only Rousseau's echo, while Babœuf proposed to become Rousseau's testamentary executor. All, while they never tired talking of liberty, succeeded only in imagining a system of slavery on the foundation of demagoguery and communism.

—The first half of the present century it is that witnessed the birth of the boldest, the most radical and the most brilliant utopias: Saint-Simonism, Fourierism, positivist socialism and the atheistic theocracy of Auguste Comte. Even a summary exposition

of these different doctrines would carry us beyond the limits allotted to us here. (See SOCIALISM.) But we must remark at least, that, while these doctrines are no less chimerical than the ideas of Plato, of Thomas More, Campanella, Hobbes and Rousseau, they are not, at bottom, more liberal. The tendency of Saint-Simonism is to reestablish, to the advantage of pantheism, the universal theocracy of Gregory VII. He hands over the destinies, not only of the state, but of humanity, to the discretion of one man, who is at once prince, pontiff and infallible arbiter of the works of human thought. There is no refuge from this universal despotism, since both property and the family have ceased to exist. Fourierism also destroys these two fundamental institutions: property and the family. The former it would replace by shares of stock delivered by the state to each in proportion to his labor, his talents and his capital. Of the latter, thanks to the consecration of *free love*, not a trace would be left. Nevertheless, it is not directly by the establishment of despotism, but indirectly by license in morals and the letting loose of all the passions, that Fourier annihilates liberty. To Fourier man is only a kind of machine, of which passion is the motive power, and which, putting itself in gear with an analogous machine, produces the effect desired without its knowledge. He reaches fatalism by the way of sensualism, and from sensualism he draws the most extravagant and unclean consequences that can present themselves to human thought. Lastly, in the materialistic Utopia of Auguste Comte, the priests of humanity, or rather of atheism, have a power no less exorbitant than the power of the Saint-Simonian Supreme Father. They have the right of life and death over all works of the mind, old and new, existing or to come into existence. They are the absolute masters of public education and of the state itself. They dispose, besides, of the honor of citizens, and regulate private life after their fancy, leaving to the lay power only the looking after of material interests. The proletariat Comte makes a public institution. *Majorats* and *substitutions* he re-establishes under another form, and extends them not only to landed but to commercial and industrial property.

—The conclusions to be drawn from this succession of chimeras are these: that the progress and perfecting of social institutions are not sudden creations, issuing full-fledged from a human brain, and governed by one single idea, but the fruit of experience and time, of the thoughts and the efforts of a long series of generations; that no society is lasting or perfectible except the society which is founded on the liberty which respects the rights of the individual, and leaves him responsible for his acts and for the government and use of his faculties; that liberty is inseparable from property, and that it is impossible to preserve or suppress the one without preserving or suppressing the other; that liberty and property, in turn, suppose the moral dignity and the inviolability of the human person. Utopias have this advantage, that they bring these truths into greater relief, and compel the human mind never again to separate the progress of the social order from the conquests of civil and political liberty.

## V

### VALUE

VALUE. The notion of value is one fundamental in political economy; but unfortunately there is no politico-economical idea which requires so much effort of the power of attention and so much patience to be thoroughly understood. The reason of this is, that the phenomenon to which it relates is purely relative, and consequently difficult to characterize. In order to acquire a just and precise idea of value, we must therefore enter into explanations of some length.

—The things whose possession is necessary, useful or agreeable to us, are numerous and various; and we can obtain those which we ourselves need only by parting with others of which we have the disposal. Hence exchanges, which, by determining in what quantity one thing is accepted or delivered in return for another, have the effect of establishing a relation of value among all things. Can you, for example, get one hectolitre of wine for one hectolitre of wheat? If you can, the fact that you can, assigns to these two products their relative value. They figure in the exchange as equal quantities, and the one has the same value as the other. Suppose that from some cause, however, we have to give, not one hectolitre, but 120 litres of wheat for one hectolitre of wine; this establishes a new ratio between the quantities exchanged, and the values are no longer the same. The value which the wheat possessed relatively to the wine fell just in proportion to the increase in the number of litres to be delivered in exchange for one hectolitre of wine; the value of the wine, on the contrary, increased in proportion to the diminution in the quantity of it to be furnished in order to procure one hectolitre of wheat. What one of the products has lost in value the other has gained, and this in exactly the same proportion. What we have just said of wine and wheat, is true of all possible products. They all give rise to exchanges, and each of them obtains a value founded on the quantity either of another product, or, in general, of the other products for which it can at any given moment be exchanged.

—The advance of civilization long since did away with barter. The more numerous and diverse products became, the more men realized the necessity of choosing one of them to serve as a medium of exchange; and coined money was chosen for this office, because it possesses certain qualities in a greater degree than any other. Money is one of those things which men desire because of the services which they render, and for which, when in need of them, they give a certain amount of other things. This fact, while it gives to money a certain value in each of the other products, gives also to each of these a value in money; determined by the amount which is required to procure them. Thus, the amount of money which all these products command, *i.e.*, the price which is given for them, constitutes a common denominator of the value which they have in commercial transactions, and it is only necessary to compare their prices to know their relative value. If a hat is worth three dollars, this price, compared with that of sugar, of cloth, of a plow, or of any object whatever, shows how much of these different products can be obtained for it, and consequently what value hats acquire

from the quantity either of some particular product or of other products in general which their possession confers the power of acquiring. The existence of an intermediary which assures to the values attached to the various products a term of comparison equally applicable to them all, and which renders it easy to follow the fluctuations in their values, is an immense advantage. But it is important to bear in mind that prices and values are very distinct things. (See PRICES.) Prices express only the quantity of coined money which each product is worth, and this quantity is subject to changes which have their own special causes, but which, while they modify prices, have no influence on the relation of values that exists between the products themselves. Thus we see everything in value is relative. It is the relation existing between two things exchanged, a relation which depends upon the respective quantities which each must deliver to the other in order that the exchange may be made on equal conditions, a relation of which (from the very fact that these conditions must be equal) one of the terms (wherever there is a relation, there must be at least two terms) can not be affected in any sense whatever, without the other term being affected at the same moment in a contrary sense. It is essential that this purely relative character of value be clearly understood, if we would not fall into a multitude of economic errors, so great a part does value play in the speculative part of the science. Among the many consequences which flow from the idea of the relativity of value, there are two which we will single out, if only to throw a little more light on a subject naturally intricate and abstract: one is, that there are only values, and there is no such thing as a collective value, formed by the union of particular values, susceptible of division, degree or measure; the other is, that there can be no such thing as a general rise or fall of values. And in fact, the values in things being only the expression of the quantity of other things which can be obtained in exchange for them, it is impossible that values should increase in the one case without diminishing in the other. The moment it becomes necessary to give more wheat in order to have a given quantity of wine, we give less wine to procure a given quantity of wheat. The fall in the value of wheat produces the rise in the value of wine, and it is thus in all exchanges. There is no rise of values which does not suppose a fall, and in like manner no fall which does not suppose a rise.

—It has taken much time and reflection to free the theory of value from the complications which rendered it uncertain and obscure. In vain did the first economists examine the question; they did not succeed in presenting its solution under forms sufficiently clear and precise. It would be wrong to blame them for this. To the difficulties met with in the analysis and definition of every relation (ratio), when neither of its terms has anything fixed in it, there were added others, in the case of these first economists, caused by the very imperfection of the language they were obliged to use. In common parlance, the word value had different significations. It was used indifferently to designate, at one time, the degree of utility inherent in the use of things; at another, the power of acquisition which these things possessed with regard to other things; at another still, their money price. Hence came, in the ideas suggested by the word value, associations which prevented people from noting differences and distinctions between these ideas, without the noting of which it was impossible to reduce them all to their essential meaning.

—What economists first thought of was the necessity of attaching to the word value qualifying terms intended to characterize each of the meanings which it owed to usage. The French economists of the last century resolved to apply the term usual value (*valeur usuelle*) to that quality which gives things the capacity directly to satisfy the wants of those who possess them, and venal value (*valeur vénale*) to those qualities which give things that capacity only by means of exchange. This was the course taken by Adam Smith also. What the physiocrats called usual value, he designated as value in use, and value in exchange what they called, less correctly, venal value. The moment people introduced into science two distinct meanings for the word value, instead of reserving it, as the most eminent economists do now, to express only the ratio of quantity between things exchanged, it became necessary to make use of adjectives to determine which of the two significations they intended to give to the word, each time they used it. But even this care could not sufficiently obviate the grave inconvenience of using one and the same generic term to express qualities and circumstances which in themselves have nothing in common. Conceptions which involved the idea of value remained undecided; men's minds were confused by applying the idea of one kind of value to another, and the way was opened to confusions which seriously impaired the progress and authority of the science.

—It will be necessary to call attention to several of these confusions by reason of the place which they occupy in the writings of the older economists, and which they have retained even in the works of some of their successors. Some observations upon the most serious of these confusions will serve, on the one hand, to guard us against certain errors into which it is easy to fall, and on the other, by showing what value is not, will make it easier to perceive what it really is.

—We will mention only those which it is important to call attention to. We may consider them as follows: the confusion of value with price; the confusion of value with certain circumstances by which it is influenced; the confusion of value with wealth; and, as a consequence of this last, confusion in the search for an undiscoverable measure of value.

—It was easy, and even natural, to a certain extent, to confound values and prices, since, considering them from product to product, the ones serve to measure the others. In the ordinary course of facts we begin by exchanging the products which we have to dispose of, for their value in money, then we give the amount of money received for the other things which we wish to procure, and it is certain that the value in money of these things really corresponds to their relative value. An article that is worth two dollars in money is worth twice as much as that which is worth only one dollar, and if the exchange were made in kind, we would have to give double the quantity of one to obtain the other. But we must bear in mind that prices merely express the relation that exists between the quantities for which money, and other products, are reciprocally placed in the balance, and this relation remains subject to the empire of circumstances which may affect the disposable quantity of money. If money is abundant, it will be more freely offered for each of the products which it is used to purchase; then its value decreases, and prices rise. If money, on the contrary, becomes scarce, less of it will be given in exchange for other things in commercial transactions, its value will

increase, and prices, on the contrary, will fall. Thus, unlike values, which can neither increase nor decrease simultaneously, prices, which are the simple results of the comparative value of money and all other products against which it is exchanged, undergo fluctuations peculiar to themselves, and they may all rise or fall at once. The confusion of prices and values has been the unfortunate cause of rendering nations which were not wanting in scientific worth, singularly obscure. It has led economists to conclude from prices to values, and from values to prices, to suppose them governed by the same laws, and subject to the same accidents, and to attribute to the amount of prices, an influence which it should not have. Hence proceeded errors which deservedly esteemed economists have not always avoided, and of which the works of Ricardo himself afford but too many examples.

—One of the most frequent confusions, and one which, by its generality, has proved much more prejudicial to the science, is that which confounds value with some of the circumstances that concur in giving value to things. This is the immediate result of the many different acceptations given to the word value. Writers employed the expressions "value in use" and "value in exchange"; thenceforth it was natural that people should imagine that there must exist between the two kinds of value some secret affinity, some link or bond of union covered by some higher principle, common to both, and they set to work to find that principle. Adam Smith believed he discovered it in materiality and duration: Ricardo, in labor; J. B. Say, in utility; others, in rarity, etc., etc. The inevitable consequence was, that they mistook the very nature of value, and forgot its origin and character; and nevertheless, among the masters of political economy, only a few of the more recent have succeeded in completely escaping from an illusion produced by the use of an inexact and vicious terminology.

—The observations suggested by these errors are applicable to all such affinity except rarity. What is value? As we have already said, it is simply a ratio of quantity between products exchanged, and it is perfectly clear that it can not be found outside of this relation. Doubtless, when, in order to obtain a product, we consent to give others which belong to us in exchange for it, what determines us to do so is some quality in the product itself which pleases us, and which is not to be found, or which is found only in a smaller proportion, in those which we give in return for it. This is the reason for every exchange that is made: there would be no exchange if all things possessed the same qualities, and could procure for us the same enjoyments, and satisfy the same wants; and it is surprising that this simple remark did not suffice to prevent men from connecting with this or that particular quality of things the principle of their value.

—There are things which in order to answer to the wants in view of which we seek them, should possess materiality and duration; there are others which must have absorbed a great deal of labor in their making, and others again which must be susceptible of immediate consumption: we exchange them for one another because our wants and our tastes are different, and because, if to build a house, we must have materials whose duration will resist the ravages of time; we must have, in order to feed ourselves, bread and meat, which do not last, and for our recreation, theatrical representations, concerts and amusements, which produce but a passing emotion, and leave no trace except in our remembrance.

—Utility is essential to the value of things, in this general sense, that we give nothing for any of them but upon condition of finding, in their possession or in the use which we make of them, some pleasure or enjoyment; it may be well to recall, however, that the nature of the wants which they are intended to satisfy has no influence on the more or the less of value which attaches to them. We must first provide for the most imperious necessities of life, and obtain the means of satisfying them; but, this once done, each one takes into consideration other consumers, and this consideration is ampler in proportion as he can accord them more. The wants of the intellect and of the heart, love of the arts, taste for luxury, the promptings of pride or vanity—all concur in determining the esteem in which things are held; and it is not uncommon for men to pay for a flower, or ribbon, or the pleasure of hearing a violinist, for instance, a price equivalent to a considerable quantity of the products without which we would have to suffer the deadly attacks of cold or hunger.

—What gives at times an immense value to products, whose deprivation causes neither inconvenience nor physical suffering, is the price that is put upon them by those who are able to obtain them, and the sacrifices men make in order to possess them. There are men rich enough to gratify their every fancy; and, no matter what the things which their fancy craves, these things from the moment they are sought after and there is a demand for them, acquire, equally with other objects, a real value, based upon the amount of other things which men give in order to obtain them. Although there is nothing that is indifferent in the feelings and tastes which dictate the employment of wealth, from the standpoint of morality, of the future and of social progress, nothing can prevent the objects which serve to gratify frivolous and even blamable desires from having the value of the objects for which they can be exchanged.

—Among other consequences following the opinion that value should have a fundamental principle in one of the material qualities inherent in things, there is one consequence which has given rise to so many controversies, that we can not pass it over in silence here. It has been asked whether it were possible that immaterial things, acts, efforts, services, which are not realized under a tangible and durable form, could have a value; and a goodly number of writers have answered in the negative. The services of governments, of magistrates, of the clergy, of physicians, and of members of the bar; instruction given by masters, professors and artists—all these and many other similar things have been declared without real value; and this despite the fact that it was very evident that those who felt the want of these services did not hesitate to give, in order to obtain them, large quantities of things to which value was attributed because of their materiality. This erroneous opinion has now, however, but few adherents. It is recognized that nothing which men prize sufficiently to give a price for, can be devoid of value, and that those things which are called immaterial have, like all other things, a value proportioned to the quantity of each of the different things which they put those who dispose of such immaterial products in a way to procure for themselves. This error regarding immaterial services has not been confined to the question of value; we meet with it also in essays upon production, wealth and labor.

—Rarity deserves special mention. It is not, like materiality, duration, labor, or utility, a quality substantially incorporated in things, it is merely the effect of a disproportion between the quantity in demand and the quantity obtainable, and it, therefore, exercises an effectual influence on the value of the things of which it is either the ordinary or the accidental lot. What causes rarity is the impossibility of increasing a thing at the pleasure of those who wish to obtain it; hence they vie for its possession, and give in exchange for its a much larger quantity of other things than they would if it were more abundant. This it is that assures a very great value to certain products which are found in small number;—this it is also which for a moment gives an extraordinary value to the most common products, such as wine, wheat, wool, cloth, or glass, when, by some accident, the want of them is felt. But rarity, besides being at all times an evil, is, like value itself, only the effect of a relation, and can exist only on condition that it (rarity) does not become general. When bread is more scarce than usual, it acquires an increase of value, but this increase it acquires only because the products given in exchange for it lose in relation to it some of their own proper value, and lose this only because they retain their accustomed abundance. If they became rare or scarce at the same time and in the same proportion as bread, the relation between the quantities exchanged would have suffered no alteration, and their respective values would have remained the same. Rarity acts only privately, only to the extent that it is confined to certain products in opposition to others; and to elevate rarity into the dignity of the general principle of value, is to make a strange mistake; for it is evident, that if rarity extended at the same time to everything offered in exchange, its effects would disappear immediately.

—The confusions between value and wealth do not lead to consequences of so much importance. They spring from correlations which have a real existence, and it is easy to explain them. Private wealth is in proportion to the value of the things of which it is made up. Lands, houses, capital, merchandise, in a word, everything which belongs to individuals, is susceptible of exchange, and consequently possesses the value resulting from the amount of things of another kind which it can be used to obtain. In order to know, therefore, the amount of his wealth it will be sufficient for an individual to ascertain the value in money, the price, of each of the things which he possesses, and then to compare the sum of these prices with what it will enable him to procure in other things. But the correlation between private wealth and the value of the different elements of which it is made up, does not extend to real, positive and general wealth. This latter constitutes a whole, and for want of a term of comparison (because it is not exchangeable) it can not be estimated in any manner. If the things comprised in the sphere which general wealth embraces have all the value which is conferred on each one of them by its particular power of acquisition with regard to other things, the same can not be said of the mass; for this mass admits of no comparison which would permit us to assign it a value, and it would be vain to attempt to find, in the variable relations of exchange that exist between its constitutive parts, an expression which would cover them all. Hence we must have recourse to circumstances entirely foreign to the value which the elements of general wealth receive solely from the exchanges to which they give rise, if we wish to estimate the extent of the wealth of nations in general, or of a nation considered separately.

—However, it will not be without some utility to explain still more the differences which necessarily distinguish value from wealth. Wealth, taken in its aggregate, is the possession of those things by means of which men attain to the satisfaction of their wants, and the more abundant these things are, the greater wealth is. Therefore, it is by its ratio to the wants which it is destined to satisfy, that we must estimate wealth, and this ratio can not be affected by the ratios which exist between the things that constitute it. Not that wealth can increase without modifying the preexisting ratios of value. Wealth increases only to the extent that the efforts of labor, becoming more ingenious and more fruitful, produce a greater amount of some one of those things whose use is either necessary, agreeable or useful to us; from which it follows that this thing offered and delivered in exchange for others in a greater quantity than before, loses something of its relative value, and causes these other things to gain in relative value. Thus every advance in wealth has the effect of reducing the value of the products which it increases, and of raising the value of the products on which it has no effect. This is an eminently beneficial change to the people among whom it takes place; but from the point of view of value the change has no effect, because the value of each thing depends on relations one of whose terms can not increase without the others decreasing.

—It is so difficult for the mind to see in value only the effect of a ratio of exchange, that for a long time most of the economists were preoccupied with the idea of discovering some measure for it. This was a seeking for the impossible. It would have been necessary to find a value to measure value, and where could a value be found which was not itself the result of a ratio, and, because the result of a ratio, as changeable and variable as the other values to which it was sought to make it serve as a comparative measure or standard? But the search for this measure of value has been so common that we can not pass it over without remark.

—Among the things which have attracted attention as specially fitted to serve as a measure of values, coined money, human labor and wheat have been accorded the preference. But it was not given to any one of the three to act as such measure better than the others. When money was taken as the measure of values, it was indeed possible to find what was the value in money of each product at a given moment, and thus to find a comparative term applicable to all products; but it was not possible to discover in money itself a fixed value protected from the variations which are the effects of causes operating on the quantities of the products which have just come into the market to be exchanged one against the other. It was plain that gold and silver, of which money is made, like all other products, varied in value, according to their greater or less abundance in the market, and that they had a very unequal power of acquisition at different epochs, and were also subject to the empire of circumstances, which at one time rendered their extraction more costly, and at others made their consumption greater or more necessary.

—And so of human labor, in which Smith had placed the origin of value, and which he had pointed out as the one thing which afforded its most exact measure. Human labor is unquestionably an element in all production of wealth; but it in no wise follows that its value is absolute, and, that in the relation which it holds to the things against which it is exchanged, it constitutes a term fixed and constant. On the

contrary, labor is more or less in demand, and is better or worse compensated at different periods; this is clearly demonstrated by the frequent fluctuations of wages.

—As to wheat, two reasons caused it to be considered that it might serve as a measure of value. One of them was the supposition that the same quantity of wheat must have served at all times to satisfy equal wants of nutrition per individual; the other was the supposition that alimentary products must have preserved, in exchanges, a fixed value, since such products have the power always to create for themselves the demand necessary to correspond to the extent of their supply. The first of these suppositions is erroneous; for wheat is far from having been at all times and in the same quantity an object of man's consumption; the second is true only within certain limits, and in what concerns not any special product, but the aggregate of all the products which minister to the wants of subsistence. Be this as it may, the value of wheat is, and always will be, a relative one, dependent upon the action of circumstances, among which we may reckon the extension and progress of agriculture, and the amount of manufactured products for which it can be exchanged, an amount which tends to increase in proportion as the labor required to produce them increases in power and skill.

—The efforts made by economists to discover a measure of value, prove how difficult it is to disentangle the idea of value itself from the complications by which it is surrounded, and with which it presents itself to the mind. Many writers, even of our own day, have not succeeded in doing so, and it would be easy to cite comparatively recent works in which tendencies to suppose in things the existence of an absolute value still subsist. We must of course make due allowance for the lack of precision in the form under which every fact of relation manifests itself to the mind; but even more allowance must be made for the imperfection of the terminology in use. So long as the word value is used in different senses, we expose ourselves to a confusion of ideas, and the wisest plan would be to take a decided stand in this matter. John Stuart Mill proposes to use the word value to express only the effect of the relation in virtue of which products are bartered one for another, in proportion of such and such a quantity of the one against such and such a quantity of other things. There is nothing more necessary in the interest of science, nor is there anything easier. We have the word *price* to designate the value of things in coined money; we have the terms *immediate* or *direct utility*, and other expressions to designate what is so improperly called value in use. It is easy to reserve for each thing an expression which maintains in language the distinction itself, the special sense which belongs to it.

—Let it be distinctly understood, therefore, that through the rest of this article we shall use the word value only in its real sense. It shall be used to express only the quantity either of a thing or of the things in general which a thing serves to obtain; in other words, the power of acquisition which it exercises by means of exchange.

—Upon what conditions may things be considered to possess value? On what foundations does the property which renders them exchangeable, rest? What are the circumstances which determine in what quantity one thing shall be given for another? The meaning of the word value once clearly determined, these questions become simple, and are easily solved.

—First of all, it is plain that nothing is exchangeable except upon condition, first, of possessing qualities which render it desirable, and second, of being obtainable only at the cost of some effort and pains. No one gives any of those things which every one may have without labor, and value belongs only to those things whose possession costs labor and fatigue. The man who wishes to obtain a thing compares the satisfaction which it will afford him with the sacrifices he must make to obtain it, and decides to part with such or such a quantity of other things which belong to him, in order to procure it. It matters little what motives prompt him to acquire it, whether an imperative want, a frivolous taste, or a simple caprice, the thing has the value at the moment of what he consents to give for it. The diamond for which a value equal to a thousand hectolitres of grain is offered and accepted, has as much value as these thousand hectolitres. In like manner, a hundred kilogrammes of salt are worth no more than the lesson of a dancing master, or the service of a hair dresser, if the price paid for the lesson or the service is sufficient to enable us to buy the same quantity of salt.

—The qualities which render things desirable, the impossibility of obtaining them without personal labor, or without giving in exchange for them other things which have cost personal labor: such are the conditions which confer value on things. The extent or the measure of the value of a thing depends upon the greater or less difficulty which those who covet or need it find in procuring it. It is this that makes the momentary value of a thing depend upon the relation existing between its supply and the demand for it. If a product is not to be found in sufficient quantity to supply all the demand for it, those who desire it enter into competition for its possession; they give in exchange for it more of other products, or of the money with which other products are bought, and, as a consequence, its value rises. If the contrary happens, that is, if a product enters the market in a greater abundance than there is a demand for, its value falls. Those who possess it can not keep it forever; they are obliged to dispose of it, in order to procure other things which are necessary to them, and find themselves constrained, in parting with it, to be content with a smaller quantity of the products they receive in return. Thus it is the condition of supply and demand which assigns to each thing its power of acquisition over other things. All things increase in value when the demand for them is greater than the supply of them; all diminish in value when the supply of them is greater than the demand for them; hence the variations of price to which things are subject, variations which, by expressing the differences that arise in the sums of money against which those things which experience them are exchanged, express like differences in the quantities of other things which these sums enable one to obtain.

—Besides, it must be remarked that the demand for a thing naturally extends or contracts in proportion to the modifications which its value undergoes. When there is a lack of a product it grows dearer; and as then there are many persons to be found whose desire to procure it is checked by the increase of the sacrifices which they must make to obtain it, the demand, checked by its increase in value, is restrained within the limits set by value itself. In like manner, when the price of a thing decreases, purchasers increase in number, and its value descends only to the point necessary that such a product may be found in the market in a quantity proportioned to the supply. Hence the fluctuations of value occasioned by the changes in the relation of supply

and demand, have for effect the maintenance of an equality between the two terms of that relation; that is, an equilibrium between supply and demand.

—We must not, however, infer from this fact that there exists any proportionality whatever between the movements of value and the differences in quantity of the things supplied. Everything depends, in the effect produced on the value of the goods, whether by the increase or the decrease of the supply, on the nature of these goods, and on the kind of wants they are intended to satisfy. All goods are not equally necessary to life; and if there are some the demand for which is greatly curtailed because their value has risen even ever so little, there are others, the demand for which people are not nearly so free to lessen. The value of wheat doubles the moment the quantity that can be delivered decreases one-fifth, and is trebled, when this quantity is reduced one-fourth. Wine does not increase in value in the same proportion when the quantity supplied diminishes, for the reason that its consumption is less indispensable; and the products which it is still easier to do without increase in value much less than wine when their supply diminishes. On the other hand, the qualities which render products more or less easy to keep in the state required for use, exert a sensible influence upon the decrease in their value. In case of an extraordinary or superabundant harvest, there are crops which are abandoned to the first comer who wishes to take them, because the owner can not utilize them all himself, and because the price at which he is compelled to sell them will not pay the cost of transferring them to the nearest market. What we are warranted to assert is this, that value is fixed by the relation existing between supply and demand; that it usually increases or decreases in such a way as to equilibrate the two terms of that relation, but in no wise in proportions conformable to the differences expressed in the figure of the quantities supplied.

—How decisive soever the influence exercised by the momentary state of supply and demand may be, the value of things has none the less its own *raison d'être*, and a measure which, in despite of the accidents which serve to expand or contract it, constantly tends to return to its normal dimensions. Vainly do the fluctuations of supply and demand succeed one another in contrary directions, these fluctuations necessarily end by compensating one for the other, and the point at which they meet marks the natural value of things.

—What assigns a natural value to things is the fact that it costs something to produce them; that is, the onerosity which attaches to their production. This is true of all things, except of those the quantity of which can not be increased, or which can not be sufficiently increased to keep up with the demand for them. With this one exception, all things are exchanged against one another in accordance with the amount of cost necessary to fashion them for the use of, and to transport them to, the consumer. Those which cost most are exchanged in a lesser numeric quantity, against those which cost less, and thus the differences in their costs of production of various articles are balanced. (See COST OF PRODUCTION.)

—Before attempting to show that this can not be otherwise, we must first recall what constitutes the cost of production. This cost is twofold: part of the cost of production is constant and unavoidable, and enters, though in unequal amounts, into all

production; part is accidental, arising from artificial or special causes, and does not attach to all production. The first part of the cost of production here referred to consists in the expenses of labor and in the expenses attached to the employment of capital. There is nothing whose production does not require a certain amount of both these expenses. In the productions of the humblest artisan, days of labor and the consumption of capital under various forms, figure. Raw material has been purchased and transformed; tools and implements have been deteriorated; there have been risks and losses which must be covered; and, in addition to all this, there is the interest which must be paid on the capital employed: it is necessary that the thing produced should be exchanged on such conditions as shall restore to the producer the wages due to his own personal labor, as well as the wages due to the labor of his workmen, if he employs any, and the profit required to bring back to him the portion of capital which he was obliged to sacrifice during the course of his labor. Suppose a product, which, in order to reach the consumer, costs six francs for workmen's wages, and four francs in profits for the preservation of, and interest on, the capital invested in it; the natural value of this product will be the sum of these two amounts; that is, ten francs. Thus the natural value of various products depends upon the proportion in which wages and profits enter into the sum total of their cost of production. All products tend to exchange one against another in proportion to this natural value; and this natural value is the value which continues to subsist for all products as their mean value, whatever departures from such mean value the momentary fluctuations caused by the variations of supply and demand may make in it.

—The reason of this is plain. No industry could subsist if the commodities and goods which it furnishes the public were not taken at the price which the cost of production requires. An industry which could not recover in full the total of its outlay would soon fail. Hence from the moment that any product ceases to exchange against other products in a quantity sufficient to balance the expenses which must be borne by those who make it, we notice that its manufacture begins to be restricted; and the restriction does not stop until it reaches the point at which the reduction in the supply of the product causes it to regain the value in which it was lacking. On the contrary, if a product receives in other products more than the equivalent of its real cost, the profits assured to those who deal in it cause a speedy increase in its production, and the increase in the amount offered very soon deprives it of its value to the extent that such value is exaggerated. Thus it is that the value in things, whenever it departs from its natural point, is finally brought back to it. Competition diminishes in industries which are not sufficiently remunerative, and the supply diminishes with it; competition increases in those industries which are uncommonly remunerative; labor and capital abandon industries which are losing, to engage in those which are gaining; and, owing to this continual change, the value respectively of the products exchanged continues to be, or becomes again, in the case of all products, the value determined by the amount of the cost incurred in their production.

—We do not mean to say that all products of the same kind, considered apart from all others, obtain in exchange merely the equivalent of their own cost in other products. Far from it; there are some which obtain much more, and for this reason: the quantity of each product which can and should be produced is determined by the demand for it, and its value always rises high enough to assure its supply in that quantity. But the

conditions of labor are not in all respects equal or similar. They are less favorable in some places than in others, and when these places are called upon to furnish the market a contingent, without which the supply would be inadequate, it is the expenses which production necessitates in those places that determine the general value of products. It follows that this value corresponds, not to an average cost, but to the cost of the part of the product which reaches the market after having required the greatest amount of the different costs. In the actual state of demand that portion has its outlet just as the others have, and among similar products it is the dearest which regulate the value of all, thus adding to those which are cheaper a value greater than their cost of production. This fact is deserving of all the more attention, because many modern writers have overlooked it when discussing the large profits reaped by certain producers, and still more frequently when discussing the subject of rent.

—It is, for instance, a common opinion that the rent of land contributes to raise the price of the means of subsistence, and that it would be otherwise under combinations different from those which up to the present time have governed property. Nothing, however, could be more decidedly false. Like all other products, those of the soil owe their value to the demand for them. All lands are not equally fertile; they can not all produce on the same conditions, and whenever the wants of consumption are such that recourse must be had to lands of inferior quality, their products must necessarily be paid for at a price which will compensate for the cost attached to the cultivation of such lands. In a country like France, in which wheat has, on an average, a value of a little more than eighteen francs per hectolitre, there are lands on which its value is not twelve, and on these lands the excess of the value for which the wheat is exchanged over the costs at which it is harvested is a rent which accrues to the owners of these lands. But this rent has no influence upon the accrued value to cereals; it is simply the effect of that value. The population of France could not do without that part of the wheat crop which could not be produced at a cost less than eighteen francs per hectolitre, and it is this part which assigns to the other parts their natural value. If the demand for the means of subsistence should increase to such an extent as to require the cultivation of lands on which wheat could not be produced except at an average cost of twenty francs per hectolitre, its value would rise still higher, and with it the rent which the land paid to those who owned it.

—The superaddition of value, which the wants of consumption confer, as compared with the products of their cost, or the products of the major part of the land, exists also in the case of a multitude of different industries. Thus it is the cost of extracting ore from those mines in which such cost is greatest, but whose product is necessary in order to meet the demand, which fixes the value of the ore. The same is true in manufacturing industries; the demand for the articles which they produce raises the value of these articles to a figure necessary to pay for the products of those manufacturing industries which are carried on, it matters not for what reason, at the greatest expense; and the higher net cost which is peculiar to these latter, assures to the articles of all the other industries a value which exceeds the real amount of their cost of production.

—But, if the value of the things which are susceptible of indefinite increase finds its rule and measure in the cost of the production of those of them which in order to

reach the people who want them cost most, it is otherwise with the value of the things whose quantity it is impossible to increase at the desire or whim of the public. Their rarity exercises an influence on the value of the latter; and raises their value in a proportion which has no relation whatever with what they cost or did cost to produce. A work of art from the hands of one of the old masters, the autograph of an historic personage, or some object which he used during his lifetime, a jewel, a piece of armor, a bronze, a statue found under the lava of Pompeii or among the ruins of Athens or Rome, has an immense value; and there are persons who, to obtain one of these products, would part with a quantity of things in which had been invested a thousand times more wages and profit on capital than was invested originally in the product they purchase. In like manner precious stones, pearls of the first water, gold and silver and other precious metals, possess a value far in excess of what it cost to discover and extract them. Nature did not create them in sufficient quantity to satisfy the desires of all. So also, wines, fruits and tobaccos of certain choice brands, which possess special qualities that cause them to be eagerly sought after, possess in exchange a value far superior to that which their cost of production would give them. They can not be increased; their supply has forced limits; and the desire of obtaining them induces people to give much more for them than it costs to produce them.

—Besides rarity, there are artificial circumstances which affect the value of things and help to increase it beyond what the cost of production would warrant. Such are taxes (except taxes on land, in so far as they affect only the rent), monopolies and restrictions on the freedom of trade. Every tax has the inevitable effect of increasing the price of the merchandise or product upon which it is imposed. The person who pays the tax must be reimbursed; he adds the amount of the tax to what the article costs him, and in exchange he receives back the amount which he paid the state in addition to the natural value of the thing. Such are the effects on the value of things of the taxes levied on them before they reach the consumer, no matter for what reason, at what moment or under what form such taxes are levied. The treasury of the state can levy nothing on them without increasing the cost of their production, and consequently without increasing in an equal measure the value for which they are sold. The effect of monopolies is equally pronounced, and more lamentable. Monopolies are of different kinds; some are established for the benefit of the state, and serve as a source of revenue for it. Of this kind is the monopoly on tobacco in France; the government alone purchases the product in the crude state, manufactures it, and furnishes it for sale at a price which assures the state an annual revenue. Whatever superaddition of value such monopolies give to the products which they affect, is warranted if they serve to relieve a country of other taxes which would cause still greater inconveniences, and this must be borne in mind when considering these monopolies. Patents also constitute a monopoly in favor of the patentees; they may be a just remuneration for the labor and sacrifice to which an invention was due; but it is only by exaggerating the value of the patented article that they exercise any influence. Producers who are free from all competition are masters of the market, and it is an easy matter for them so to manage as to sell only at a large profit on the cost of production. The exclusion of foreign merchandise, through custom house duties intended to reserve the home market for home producers, has to a certain extent the same effect as patents. Consumers are forced to pay a higher price for the protected products than they can be bought for elsewhere, and are subjected to sacrifices which

could and should be spared them. This alteration of the natural relations of value between exchangeable products is a real evil; nothing could be more prejudicial to the proper employment of productive forces, and thereby to the progress of social power and wealth. Such acts can be justified only by the necessity of defraying public expenses; but the products whose cost of production and value are to be artificially increased by the imposition of duties, should be carefully selected. The more these products are necessary for the satisfaction of wants common to all, the less those classes who consume scarcely any other products, and who have only the labor of their hands to give in exchange therefor, will have of them, and the more difficult it will be for them to reach that degree of well-being without which their condition can not be improved.

—Value, relative in its very essence, and based for each thing solely upon the quantity of another thing, or of other things in general, which it enables one to obtain, can not be affected by any of the circumstances which act equally upon all things at once. Its elements are labor and capital. It is the very quantity of these two things which every product absorbs before becoming a fit object of consumption that fixes its relative value; and no matter what the rate of wages or profits in a country may be, as the relations of exchange between the products can not be changed by that rate, neither can values be changed thereby. This is not the case, however, when the rate of one of the elements of production only is modified, and this because all products do not contain it in a like proportion. When wages increase, the value of those things into whose cost of production it more largely enters, naturally rises, and the value of those which require less manual labor than capital is comparatively lessened. The contrary is true when the rate of profits increases. In this case, those things whose cost absorbs more capital than labor increase in value, and obtain a greater quantity of other things in exchange. Such fluctuations in the respective value of things are of frequent occurrence, and when they happen it is easy to determine their cause. It will be noticed, however, that, in the ordinary course of facts, there are things whose value tends to fall gradually. These things are those whose manufacture requires more capital. The reason of this is, that, as civilization advances, capital accumulates in such a way that those who possess it are forced to content themselves with smaller profits.

—Such are the laws which govern value, and preside over its distribution among things. Value is not a quality incorporated in things, but is for each product the effect of a relation of exchange, the effect of the quantity of other products it serves to obtain; and this relation is determined, at any given moment, by supply and demand. But, while supply and demand regulate the values of the moment, there is, none the less, for those things whose number may be increased indefinitely at man's pleasure, a natural value, which, despite all the fluctuations to which that value is subject, always prevails in the end. This natural value results from the cost of production, and is determined by the amount of labor and capital employed in the production. A clear understanding of these general principles suffices to enable us to solve all questions pertaining to value, no matter how complicated they may seem to be.

HIPPOLYTE PASSY.

## VAN BUREN

VAN BUREN, Martin, vice-president of the United States 1833-7, and president 1837-41, was born at Kinderhook, N. Y., Dec. 5, 1782, and died there July 24, 1862. He was admitted to the bar in 1803, and served in the state senate 1813-20, in the United States senate 1821-8, as governor in 1829, as secretary of state 1829-31, and as minister to Great Britain 1831-2, this latter nomination being rejected by the senate. (See ALBANY REGENCY, NEW YORK.) On his return he was successively elected vice-president and president, but was defeated in 1840. (See BANK CONTROVERSIES, IV.; LOCO-FOCO; INDEPENDENT TREASURY.) In 1844 his disapproval of the annexation of Texas cost him the democratic nomination; and his New York supporters were naturally in an attitude of armed neutrality toward the new administration. This state of things verged naturally toward open war; Van Buren was nominated for president in 1848; and his nomination was successful in defeating Cass, the regular democratic nominee. This result compelled a compromise between the two factions, but it left Van Buren definitively out of politics until his death. (See BARNBURNERS; ANNEXATIONS, III.; FREE-SOIL PARTY; DEMOCRATIC PARTY, IV.)

—Van Buren is commonly known as a master of political intrigue, the democratic "little magician"; as the one who introduced into the national civil service the debauching influences which had for thirty years controlled the civil service of his own state; as the forerunner of that class of mere politicians which has since 1829 generally supplanted the previous race of trained statesmen; as a smooth, easy and adroit manager of political machinery, without political principles, constitutional training, or scruples in party warfare, revering in politics only the Albany regency, and Martin Van Buren as its prophet. All this must be admitted, but only in part. That Van Buren had political principles and the courage to maintain them, even in opposition to his own party, is shown by his opposition, in the New York convention of 1821, to the popular idea of universal suffrage, to "cheapening the right of suffrage by conferring it with an indiscriminating hand upon every one, black or white, who would be kind enough to condescend to accept it"; by his opposition, in the same convention, to the equally popular proposal to exclude the blacks from the right of suffrage; by his refusal, during the panic of 1837, to violate his political creed by recommending interference by government with the course of business; and by his refusal in 1844 to compass his own nomination to the presidency by indorsing the annexation of Texas. On the whole, he may be set down midway between the earlier and the later schools of politicians, with defined principles derived from his education among the former, and yet with sufficient power of adaptation to make use of the vicious machinery of the latter.

—See Holland's *Life of Van Buren*; Dawson's *Life of Van Buren*; W. A. Butler's *Martin Van Buren*; Emmons' *Life of Van Buren*; Abbott's *Lives of the Presidents*, 241; 3 Parton's *Life of Jackson*; 2 Hammond's *Political History of New York*; Jenkins' *Governors of New York*, 346; 4 Tucker's *United States*, 294; Bradford's *Federal Government*, 434; 2 von Holst's *United States*, 147; 2 *Statesman's Manual*, 1153 (for

his messages). There is a pen portrait of Van Buren in 2 von Holst, 149. Mackenzie's *Life and Times of Van Buren* is a collection of stolen private letters of Van Buren and others, giving a painful interior view of "practical politics" in 1819-37.

ALEXANDER JOHNSTON.

## VERMONT

VERMONT, a state of the American Union.

—The boundary between Massachusetts and New Hampshire (see those states) was long disputed. It was settled in 1740; but, before that time, both colonies had made large grants of land to intending settlers in the disputed territory. After the settlement, a new question came up. New Hampshire, believing that her territory extended at least as far west as that of Massachusetts, claimed all the territory west of the Connecticut river, covered by the present state of Vermont, and, pursuing the usual policy in such cases, continued to make grants of land therein, in order to fill it with settlers devoted to her interests, and dependent on her supremacy for the title to their lands. In 1749 New York appeared as a claimant, though on what ground it is hard to see. She had acquiesced in the western boundary of Massachusetts and Connecticut, as a compromise of their charter claim of the Pacific ocean, or at least the Mississippi, as a western boundary; but New Hampshire had no such charter claim. The fact seems to be that neither New York nor New Hampshire had any rightful claim, and that this territory had been overlooked, and was within the limits of no colony. In 1764 New York obtained an arbitrary decision of the king in her favor, and at once undertook to make the settlers on the "New Hampshire grants," as the territory now began to be called, pay for their land anew. All the judicial machinery of New York was brought into requisition to oust the settlers who refused to pay, and, although the king in 1769 ordered the issue of further New York grants to cease for the time, the New York courts did not cease to harass the settlers. The latter resisted the New York authorities boldly; organized militia forces; selected headquarters, marked by a liberty pole surmounted by a wild cat grinning defiance toward New York; and maintained their independence of both the claimants. Throughout the revolution they maintained a separate warfare against the British, and toward its close there were even some negotiations looking to a separate peace; but the final treaty of peace in establishing the northern boundary of the United States, recognized the "New Hampshire grants" as included in the new nation.

—Jan. 17, 1777, a convention at Westminster declared the grants to be an independent state, by the name of "New Connecticut." A new convention at Windsor, July 2-8, 1777, gave the state the name of Vermont, and adopted the Pennsylvania constitution of 1776, with some few changes, prominent among which was a prohibition of slavery. (See ABOLITION, I.) The preamble contained a full statement of the grievances by reason of which Vermont had refused to submit to New York's jurisdiction. New Hampshire made little opposition to Vermont's proceedings, and Massachusetts recognized the new state in 1781; but New York's opposition was sufficient to prevent her admission to the Union. In 1781 Vermont proceeded to admit to her assembly delegates from the southwestern part of New Hampshire and the northeastern part of New York, east of the Hudson; but, though she disavowed these annexations in the following year, New York still prevented her admission. But New York was wearying of the struggle. Her assembly in 1786 voted final compensation to her worsted adherents, and in 1789 appointed commissioners to acknowledge the

independence of Vermont. Jan. 6, 1791, a state convention decided to apply for admission, and the state was admitted by act of Feb. 18, to take effect March 4.

—CONSTITUTIONS. The provision for a "council of censors," to meet once in seven years and revise the constitution, which was abandoned by Pennsylvania in 1790, was retained by Vermont until 1870. By their proposition of amendments, and their ratification by state conventions, the original constitution (see PENNSYLVANIA) has since been slightly modified. In 1836 the original single house was divided into a senate and house of representatives, both elected annually, in the former by counties, and in the latter by towns. In 1870 the term of office of the legislature, governor and other state officers was extended to two years; the council of censors was abolished; and its powers to impeach state officers and to propose amendments were transferred to the legislature. In 1882 the manufacture or sale of intoxicating liquors was prohibited.

—GOVERNORS. Moses Robinson, 1789-90; Thomas Chittenden, 1790-97; Isaac Tichenor, 1797-1807; Israel Smith, 1807-8; Isaac Tichenor, 1808-9; Jonas Galusha, 1809-13; Martin Chittenden, 1813-15; Jonas Galusha, 1815-20; Richard Skinner, 1820-23; Cornelius P Van Ness, 1823-6; Ezra Butler, 1826-8; Samuel C. Crafts, 1828-31; William A. Palmer, 1831-35; Silas A. Jenison, 1835-41; Charles Paine, 1841-3; John Mattocks, 1843-4; Wm. Slade, 1844-6; Horace Eaton, 1846-9; Carlos Coolidge, 1849-50; Charles R. Williams, 1850-52; Erastus Fairbanks, 1852-3; John S. Robinson, 1853-4; Stephen Boyce, 1854-6; Ryland Fletcher, 1856-8; Hiland Hall, 1858-60; Erastus Fairbanks, 1860-61; Frederick Holbrook, 1861-3; John S. Smith, 1863-5; Paul Dillingham, 1865-7; John B. Page, 1867-9; Peter T. Washburn, 1869-70; John W. Stewart, 1870-2; Julius Converse, 1872-4; Asahel Peck, 1874-6; Horace Fairbanks, 1876-8; Redfield Proctor, 1878-80; Roswell Farnham, 1880-82; John L. Barstow, 1882-4.

—POLITICAL HISTORY. A large part of the state's original population came from Connecticut, whence the proposed name of "New Connecticut"; and the subsequent drift of their descendants to the neighboring state of New York accounts for many Connecticut names, such as Seymour, Phelps and Chittenden, in both the other states. Most of this immigration was democratic, so that the state's politics inclined toward the democratic party; and this tendency, and the likelihood that Vermont would vote for New York city as the national capital, will help to account for New York's acquiescence in her admission. The administrations of Governors Tichenor and Martin Chittenden are the only distinctive federalist periods; and yet the federalists were strong enough to control the legislature, and thus obtain the state's electoral votes for Washington and Adams in 1792, and for Adams and Pinckney in 1796 and 1800. The political revolution of 1800 so far intensified political interest in the state that its majority took better care of the electoral votes, and they were thereafter cast for the democratic candidates until the downfall of the federal party. But the politics of the state had little of the bitterness which elsewhere characterized this period. Governor Chittenden's action in recalling, in 1813, a brigade of the state's militia from the service of the United States, was the only circumstance that ruffled the surface of events; and in the following year the state's participation in the Hartford convention was confined to one county and a single delegate. Immediately after the close of the

war the federalist vote began to decrease rapidly, so that in 1813 Gov. Galusha received 15,243 votes out of a total of 15,992, and thereafter the federal party in the state had practically no existence. Until 1815 it was about on an equality with its opponent in every county, and in a heavy majority in the southeastern part of the state.

—As Vermont had been the first state to abolish slavery within its own limits, it was one of the first to declare war upon it without. In the United States senate, Dec. 9, 1820, resolutions of the Vermont legislature were presented, declaring that slavery was a moral and political evil, to be tolerated only of necessity, and that congress had the right to inhibit its extension by the admission of new slave states. (See COMPROMISES, IV.) These resolutions were the guide of the state's policy until the downfall of slavery. During and after the election of 1824 the Jackson candidates were always hopelessly beaten, and the "Adams republicans," even after 1827, regularly defeated both the Jackson and the anti-masonic candidates. About 1831 the national republicans and anti-masons practically united, and the state's electors in 1832 were chosen as anti-masons, with the understanding that they would vote for Clay if their votes could elect him. This contingency did not occur, and the state's vote was cast for Wirt. (See ANTI-MASONRY.) From this time the combination of national republican, anti-masonic and other elements, soon to be known as the whig party, controlled the state, and on the dissolution of the whig party the republican party at once succeeded to it. In effect, the state's last democratic electoral vote was cast in 1820. Since that year the democrats of the state have seldom polled more than 25 per cent. of the total vote in national elections; and, even in the great whig overthrow of 1852, the whig electors obtained a majority of the popular vote, Massachusetts, the only other northern whig state of that year, only giving a plurality. The state's political history is therefore invariably a part of that of the whig and republican parties.

—In state elections the result has regularly been the same. The only elections that have ever been in the least degree doubtful were the triangular contests of 1843-52, between the whigs, the democrats and the abolitionists; but even in these the result was always a plurality for the whig candidates for state offices, and their final election by the whig legislature. The election of 1847 will fairly represent most of them: Eaton (Whig), 23,933; Dillingham (democrat), 18,059; Brainard (abolitionist), 7,163. But it must be remembered that Vermont whigs were usually quite as strongly anti-slavery as the abolitionists, differing from them only on the question of action. Thus, Gov. Wm. Slade was considered a whig in his own state, but a thorough abolitionist out of it. On the formation of the republican party all distinction disappeared, and the party vote rose again to about 75 per cent. of the total. In 1882 the legislature stands as follows: senate, thirty republicans, no democrats; house, 225 republicans, thirteen democrats.

—As in several other states, the heavy and certain majority for one party has hindered the national elevation of Vermont's leading men, among whom may be specified the following: Stephen Roe Bradley, democratic United States senator 1791-5 and 1801-13; Dudley Chase (uncle of Salmon P. Chase), democratic United States senator 1813-17 and 1825-31, and state chief justice 1817-21; Nathaniel Chipman, state chief justice 1789-91 and 1794-7, United States district judge 1791-4, and United States

senator 1797-1803; Martin Chittenden, federalist congressman 1803-13, and governor 1813-15; Jacob Collamer, state judge 1833-42 and 1850-54, whig congressman 1843-9, postmaster general under Taylor 1849-50, and republican United States senator 1855-65; George F. Edmunds (republican), member of the state house of representatives 1854-9 and senate 1861-2, United States senator 1866-87, one of the most prominent members of that body, and one of the candidates for the republican presidential nomination in 1880; Horace Everett, whig congressman 1829-43; Solomon Foot, whig congressman 1843-7, and republican United States senator 1857-66; Hiland Hall, whig congressman 1831-43, and state judge 1846-50; Matthew Lyon, democratic congressman 1797-1801, afterward from Kentucky, 1803-11, most noted for his rough-and-tumble fight on the floor of the house in January, 1798, with Roger Griswold, a Connecticut federalist, and for his trial and imprisonment later in the year, under the sedition law; George P. Marsh, whig congressman 1843-9, and minister to Italy 1861-82; Justin S. Morrill, republican congressman 1855-67, and United States senator 1867-85; Samuel S. Phelps, state judge 1831-8, and whig United States senator 1839-51 and 1853-4; Luke P. Poland, state judge 1848-65, republican United States senator 1865-7, and congressman 1867-75; Samuel Prentiss, whig United States senator 1831-42, and federal district judge 1842-57; William Slade, whig congressman 1831-43, and governor 1844-6; and Isaac Tichenor one of the leaders of the original independent government, state judge 1791-6, federalist United States senator 1796-7 and 1815-21, and governor 1797-1807 and 1808-9.

—The name Vermont, equivalent to Green Mountain, seems to have been suggested in 1777 by Dr. Thomas Young, of Philadelphia, to the leaders of the infant republic of "new Connecticut," and at once adopted.

## VETO

VETO (IN U. S. HISTORY). I. BEFORE THE CONSTITUTION. The power in the executive to apply some check to the absolute power of the legislative, is an evident necessity in a national government. Franklin long ago noted that absolute power, if it must be granted at all, had better be granted to the executive than to the legislative. "A single man may be afraid or ashamed of doing injustice; a body is never either one or the other, if it is strong enough. It can not apprehend assassination, and by dividing the shame among them, it is so little apiece that no one minds it." The only question is whether the executive should possess a power of absolute, final prohibition of legislation, or a qualified and limited check. The *veto*. "I forbid," of the Roman tribunes, was absolute; the American veto is qualified.

—By the theory of the British constitution the crown has an absolute veto on all legislation; no bill can become a law without the royal signature. Since 1692 the power has never been exercised, and its exercise now would probably provoke a revolution. Instead of it, an adverse vote of the house of lords has been used as a sort of veto upon the action of the house of commons; but its exercise, in matters on which the commons are obstinately bent, is now qualified by the tacit understanding, that "it is well enough once, by way of a joke, but it must not be repeated." Sometimes the way toward the final capitulation of the lords is smoothed by admitting unimportant amendments; sometimes a small majority is swamped by the creation of new peers. In 1871, when the lords obstinately resisted the bill for the abolition of the purchase of military commissions, the Gladstone ministry took the unusual step of putting the principle of the bill in force by royal warrant, as an act of prerogative. The lords, thus pressed, passed the bill with a spiteful vote of censure on the ministry. In any event, the veto of the lords is a very limited one.

—But in the colonies, before the American revolution, the veto power of the crown was enforced with double rigor. In Connecticut and Rhode Island the governors were chosen by the colonies, and had no veto power. In other colonies the governor, whether appointed by proprietors or by the crown, had an absolute veto on the colonial legislature; and the crown had an absolute veto on the action of the governor and legislature. The veto was constantly used by governors to extort money or favors. In Pennsylvania, says Franklin, "it became at last the regular practice to have orders on the treasury in his favor presented along with the bills to be signed, so that he might actually receive the former before he should sign the latter." In many of the colonies, as in South Carolina, the persistent veto of the governor led to his expulsion before hostilities fairly broke out. In others, as in Virginia, the persistent veto of acts to check the slave trade formed one of the most prominent of revolutionary grievances. All of them agreed, in the declaration of independence, on the following, as the first of the reasons for a separation: "He has refused his assent to laws the most wholesome and necessary for the public good; he has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained, and when so suspended he has utterly neglected to attend to them; he has refused to pass other laws for the accommodation of large

districts of people, unless those people would relinquish the right of representation in the legislature, a right inestimable to them, and formidable to tyrants only; he has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures; he has dissolved representative houses repeatedly, for opposing, with manly firmness, his invasions on the rights of the people; he has obstructed the administration of justice, by refusing his assent to laws for establishing judiciary powers." With such an experience of the veto power it is not strange that only one of the original state constitutions (Massachusetts, in 1780) gave its governor even a qualified veto power, and that in the articles of confederation there was no executive veto. Indeed, the articles went to the other extreme. By requiring the assent of nine states to important acts of legislation, they really gave an absolute veto to any minority of five states; and, by requiring the assent of every state to amendments, they gave a veto power to each state. In these respects they more resembled the constitution of the Polish diet, with its *liberum veto*, its power reserved to each member to veto absolutely any bill introduced into the house. Nullification (see that title) was a subsequent effort to revive and strengthen this state veto, in the interest of slavery and a section.

—II. IN THE FEDERAL CONVENTION. The introduction of an executive power into the new scheme of government necessarily brought with it a veto power. Randolph's "Virginia plan" gave the veto power to the executive "and a convenient number of the national judiciary," to be final, unless overridden "by—of the members of each branch." Pinckney's plan contains a veto provision so like that which was finally adopted that it must have been altered after its first introduction. The "Jersey plan," as it had no executive, had no veto provision. June 4, Gerry proposed as a substitute for Randolph's veto provision, "that the national executive shall have a right to negative any legislative act which shall not afterward be passed by—parts of each branch of the national legislature." Hamilton moved to strike out the last fifteen words, so as to make the negative absolute; this was rejected unanimously. Butler moved that the executive have power to suspend any law for—days; and this was rejected unanimously. The blank in Gerry's motion was then filled by "two-thirds"; and the whole was adopted by a vote of eight states to two. In this form it was reported from the committee, June 19; was sent to the committee of revision July 26, and reported by them almost in its final shape, except that the time for retaining bills was "seven days," instead of "ten days, Sundays excepted," and that it applied only to bills, and not to joint resolutions, orders and votes also, as the final revision made. Aug. 15, "two-thirds" was changed to "three-fourths," by a vote of six states to four, and one divided; but the change was reconsidered and reversed, Sept. 12, by an exactly similar vote. The whole was then made a part of article I., section 7. (See CONSTITUTION.)

—But during these deliberations other questions had been under consideration. Randolph's plan of uniting the judiciary with the president, as a "council of revision," was again offered by Wilson, June 6 and July 21, and voted down. Aug. 15, Madison proposed to give the veto power to either the president or a majority of the supreme court judges, to be overridden by two-thirds of each house, if either the president or the court should veto a bill, or by three-fourths of each house, if both should veto it;

but this was also rejected, and this plan was dropped. Another provision, that of a veto upon the state legislatures, was warmly urged from first to last. The sixth resolution of the "Virginia plan" gave Congress power "to negative all laws passed by the several states contravening, in the opinion of the national legislature, the articles of union, or any treaty subsisting under the authority of the Union, and to call forth the force of the Union against any member of the Union failing to fulfill its duty under the articles thereof"; but, by the eighth resolution, the council of revision was to have a veto on the congressional veto, unless the latter should be repeated by the requisite majority. May 31, the first part of the scheme was agreed to, "without debate or dissent." Madison, June 8, wished to extend the national veto to inadvisable as well as unconstitutional laws. He "could not but regard an *indefinite* power to negative legislative acts of the states as absolutely necessary to a perfect system. Experience had evinced a constant tendency in the states to encroach on the federal authority. A negative was the mildest expedient that could be devised for preventing these mischiefs. The existence of such a check would prevent attempts to commit them." This extension of the veto was voted down, three states to seven, and one divided. The original provision of the sixth resolution was retained in the report of the committee of the whole, June 13. July 17, the veto on state laws came up for consideration, and Madison again urged it strongly. Gouverneur Morris "was more and more opposed to it. It would disgust all the states and a law that ought to be negatived will be set aside in the judiciary department." This excellent suggestion was at once heeded. The exceedingly dangerous veto power over state laws was dropped forever, and instead of it the "supreme law clause" of the constitution was adopted. Under this, the federal judiciary has exercised, with little notice or danger, a veto power over state laws which congress could hardly have attempted without civil war. (See JUDICIARY.) Aug. 23, after the senate had been made a part of the constitution, Charles Pinckney moved that power be given to two-thirds of each house to negative state laws; but six states to five refused to send the proposition to the committee. In a single case, that of state impost laws, a power of "revision and control" was reserved to congress, Sept. 15. (See INTERNAL IMPROVEMENTS.)

—Hamilton's plan, as read June 18, and still more as finally elaborated for preservation by Madison, would have made the executive veto power a tremendous instrument. It provided that "the governor or president of each state shall be appointed under the authority of the United States, and shall have a right to negative all laws about to be passed in the state of which he shall be governor or president, subject to such qualifications as the legislature of the United States shall prescribe"; and that "no bill, resolution or act of the [national] senate and assembly shall have the force of a law until it shall have received the assent of the president, or of the vice-president when exercising the powers of the president; and if such assent shall not have been given within ten days after such bill, resolution or other act shall have been presented to him for that purpose, the same shall not be a law; and no bill, resolution or other act, not assented to, shall be revived in the same session of the legislature." This proposition was never formally offered, and could never have been passed; but it is an instructive example of a "high-toned government," according to federalist ideas.

—As finally adopted, the veto provision gives the president power to return, with his objections, to the house in which it originated, any bill or joint order resolution or

vote, of the two houses. If the vetoed bill is then passed again by two-thirds of each house, it becomes a law; if not, it is a nullity. If the president does not return the bill, with objections, within ten days (Sundays excepted), it becomes a law, unless congress adjourns within the ten days, in which case it shall not be a law. This last stipulation gives the president an absolute veto on all bills, etc., passed during the last ten days of a session of congress: he has only to retain them, as it were, in his pocket, and they are a nullity, even though nine-tenths of both houses should desire to pass them over the veto. This potent executive weapon, angrily called a "pocket veto" at the time, was first employed by Jackson at the close of the session of 1829-;30. He had vetoed the Maysville road bill (see INTERNAL IMPROVEMENTS), but many of his supporters in congress were in favor of internal improvements, and he chose to employ the pocket veto on two similar bills passed afterward. When, in 1833, he disposed of Clay's distribution bill in the same manner, the whigs evolved the ingenious theory that the "adjournment" mentioned in the constitution, which made a pocket veto possible, meant only a voluntary adjournment by congress; that the close of a two-years term of service was not an adjournment in this sense, since the constitution, not congress, prevented the return of bills; and that bills retained by the president at the end of a congress became law without his signature. This notion was never vigorously pressed, however. Evidently, it would put the president at the mercy of a mere majority in congress, which would only need to time the final passage of a bill so late on March 3 of their last year as to make it physically impossible for the president to use his veto power.

—It has also been questioned whether the "two-thirds of each house," requisite to pass bills over the veto, is two-thirds of the number elected, or of the number present. The latter was undoubtedly the intention; for the constitution provides that a majority of each house shall be a quorum to do business, and refers repeatedly to this quorum as "a house." In but one case, the power of the senate to advise and consent to treaties, does it use expressly the words "two-thirds of the senators *present*"; but the treaty power is rather executive than legislative, and this provision can hardly have any bearing on the plain intent of the constitution in matters of simple legislation.

—The American veto system seems to have struck the safest middle line, and attempts to modify it elsewhere have generally proved injurious. The French constitution of 1789 gave the king a veto power, with a provision that the passage of a law three years in succession should override the veto; but this was a failure, for the impatience of the people could not wait three years for a compliance with their will. The Mexican constitution of 1824, in addition to the presidential veto of the United States, gave each house a qualified veto on the other, as follows: if a bill, passed by one house and rejected by the other, should again be passed by the first house by a two-thirds vote, it could only be rejected by a two-thirds vote of the other house. But this had only its natural effect of hurrying on a revolution by a powerless majority. One modification, the power to veto single clauses, given by the confederate constitution of 1861, fairly deserves consideration. (See RIDERS, I.)

—III. UNDER THE CONSTITUTION. The first exercise of the veto power was by Washington, April 5, 1792. (See APPORTIONMENT.) Until 1830 there were but nine vetoes, two by Washington, none by Adams or Jefferson, six by Madison, and

one by Monroe. The most important of these were Madison's veto of the bill to establish a United States bank, Jan. 30, 1815 (see BANK CONTROVERSIES, III.), his veto of the internal improvement bill, March 3, 1817, and Monroe's Cumberland road veto, May 4, 1822. (See INTERNAL IMPROVEMENTS, II.) Jackson vetoed nine bills, including Clay's distribution bill, which he formally vetoed, Dec. 5, 1833, after giving it a pocket veto at the preceding session. Most of these vetoes were put on internal improvement bills; but one, July 10, 1832, was upon a new United States bank bill, and another, June 10, 1836, was upon a bill fixing a day for the meeting of congress. This frequent use of the veto power by Jackson furnished the bond which united a great number of elements into the whig party, and gave it a name. (See WHIG PARTY, II.) The whig animosity to the veto power was revived by its exercise during Tyler's administration. He vetoed two United States bank bills, Aug. 16 and Sept. 9, 1841 (see BANK CONTROVERSIES, IV.); two tariff bills, June 29 and Aug. 9, 1842; a bill for harbor improvements in eastern states, June 11, 1844; and a bill for building two revenue cutters, Feb. 20, 1845, on account of ambiguity in the language. Polk vetoed two bills, a river and harbor bill, Aug. 3, 1846, and a bill for the settlement of French spoliation claims, Aug. 8, 1846; but an internal improvement bill, passed March 3, 1847, which had been disposed of by a pocket veto, was formally vetoed at the following session, Dec. 15, 1847. Pierce used the veto nine times, on a bill appropriating lands for insane poor, May 3, 1854; an internal improvement bill, Aug. 4, 1854; a French spoliation claims bill, Feb. 17, 1855; an appropriation for the Collins ocean mail steamers, March 3, 1855; two special internal improvement bills, May 19, 1856, another May 22, and two others, Aug. 11 and Aug. 14. Buchanan vetoed a homestead bill, June 22, 1860, in which the price of lands had been reduced by southern senators to so low a figure (25 cents an acre) as to provoke a veto. Lincoln regularly stated any minor objections which he held to any bill in the message approving it; and congress usually obviated the objections by supplementary legislation. June 23, 1862, he vetoed a bill to allow the circulation of bank notes of less than \$5 value in the District of Columbia. July 12, 1862, while approving a confiscation bill, he transmitted a veto message already prepared, the necessity for which had been removed by a subsequent explanatory resolution of congress. Up to this time the veto power on legislation had been final, since the two-thirds majority necessary to override it had not been obtained.

—The accession of Andrew Johnson, a southern democrat, to the presidency, with a congress in which the republicans had a strong majority, but would not have a two-thirds majority if all the insurrectionary states should be allowed to send democrats to the senate and house of representatives, made a conflict inevitable. Congress was determined to secure, while it had the power to secure, the right of negroes to suffrage; and the president was as determined to obstruct reconstruction, unless the southern delegations were admitted at once, when the republican two-thirds majority would be at an end, the veto would be as potent as it had always been, and the president could control the course of reconstruction. From February, 1866, until March, 1869, there was an almost continuous storm of vetoes, most of them upon reconstruction bills, or bills extending the principles of negro suffrage in various directions. During 1866 there were the vetoes of the first freedman's bureau bill, Feb. 19; of the civil rights bill, March 27; of the Colorado bill, May 15; and of the second freedmen's bureau bill, July 16; and, on the adoption of the 14th amendment, a

message was sent to congress, June 22, suggesting that there were "grave doubts" as to the power of congress to frame an amendment while eleven states were refused representation. In 1867 there were the vetoes of the bill regulating suffrage in the District of Columbia, Jan. 5; of the second Colorado bill, Jan. 29; of the Nebraska bill, Jan. 30; of the tenure of office bill, March 2; of the reconstruction bill, March 2; and of the supplementary reconstruction bills of March 23 and July 19. In 1868 there were the vetoes of the bill regulating appeals on habeas corpus, March 25; of the bills for the re-admission of Arkansas, June 20, and North Carolina, South Carolina, Florida, Georgia, Alabama and Louisiana, June 25; and of the joint resolution denying validity to the electoral votes of unreconstructed states. (See, for further particulars, RECONSTRUCTION, and titles of bills mentioned.) Many other bills, which the president neither wished to sign nor cared to veto, were left ten days, and became law without his signature. Congress left him little opportunity for "pocket vetoes," but on his retirement from office, March 3, 1869, he had such an opportunity, and used it, in the case of three bills, which were immediately afterward passed again, and signed by President Grant.

—President Grant's two vetoes were those upon the bill to increase the amount of "greenbacks" to \$400,000,000, and to authorize the issue of \$46,000,000 in national bank notes, April 22, 1874, and the bill to repeal the increase of the president's salary to \$50,000, April 19, 1876. Various circumstances made President Hayes' term of office more prolific in vetoes. In addition to a distinct group of vetoes (see RIDERS, II.), were those upon the bill to authorize the coinage of silver dollars, February 28, 1878; the bill to restrict Chinese immigration, March 1, 1879; and the bill to fund \$700,000,000 of the national debt at 3 per cent., March 3, 1881. President Arthur vetoed a bill to restrict Chinese immigration, also a river and harbor bill of about \$20,000,000, in 1882.

—IV. IN THE STATES. Four of the states, Delaware, North Carolina, Ohio and Rhode Island, have never given their governors the veto power. In eight others a very limited veto power has been given, which may be overridden by a majority of the whole number elected to each house. These are as follows, the year in which the veto was granted being added: Alabama, 1819; Arkansas, 1836; Connecticut, 1818; Indiana, 1816; Kentucky, 1799; New Jersey, 1844; Vermont, 1836; West Virginia, 1872. In twenty-four others, a two-thirds vote is required to override the veto: California, 1849; Colorado, 1876; Florida, 1865; Georgia, 1789; Illinois, 1870; Iowa, 1846; Kansas, 1859; Louisiana, 1812; Maine, 1820; Massachusetts, 1780; Michigan, 1835; Minnesota, 1857; Mississippi, 1817; Missouri, 1875; Nevada, 1864; New Hampshire, 1792; New York, 1821; Oregon, 1857; Pennsylvania, 1790; South Carolina, 1865; Tennessee, 1870; Texas, 1836 (republic), 1845 (state); Virginia, 1870; Wisconsin, 1848. In Maryland (1867) and Nebraska (1875) a three-fifths vote is requisite. But one state, Kentucky, has changed from a two-thirds vote (1792) to a majority vote (1799). The following states, now requiring a two-thirds vote, as above, required only a majority vote at first: Florida, 1838; Illinois, 1848; Missouri, 1820. Connecticut, Maryland, South Carolina, Tennessee, Virginia and West Virginia were without the veto power until it was granted in the years mentioned above. In Nebraska a two-thirds vote only was needed from 1866 until 1875. In Illinois, 1818-;48, the veto power was given to the governor and supreme court judges, to be reversed by a

majority vote; and in New York, 1777-;1821, to the governor, chancellor and supreme court judges, to be reversed by a two-thirds vote. In Vermont, 1786-;1836, a suspensory power until the following session was given to the governor and council. In the states the tendency generally has been to increase the strength of the veto power by making the votes of two-thirds of all the members elected requisite to override it, and, further, by giving the power to veto single sections of appropriation bills. (See RIDERS, III.)

—The veto messages until 1858 are in the *Statesman's Manual*: since that time they must be sought under their dates in the *Congressional Globe* and *Congressional Record*. See also 4 Franklin's *Works*, 283; 4 Elliot's *Debates*, 620; 5 *ib.*, 108, 130, 151, 190, 205, 385, 534, 560, 588-;9: 2 Curtis' *History of the Constitution*, 57, 264; 4 *Whig Review*, 325; 9 *ib.*, 16; 10 *ib.*, 111; 14 Benton's *Debates of Congress*, 494; 3 Webster's *Works*, 416; 1 *ib.*, 267; 1 Colton's *Life and Times of Clay*, 496; 1 Kent's *Commentaries*, 226; *Federalist*, LI., LXXIII.; Story's *Commentaries*, § 878, and note to § 1566 (Madison's letter of June 25, 1831, on the veto); Poore's *Federal and State Constitutions*.

VICE-PRESIDENT. (See EXECUTIVE, V.; ELECTORS, SENATE;  
ADMINISTRATIONS.)

[\[Back to Table of Contents\]](#)

## VIRGINIA

VIRGINIA, one of the thirteen original states of the American Union. Its area formed part of a general grant of James I., April 10, 1606, to two companies, controlled by a general council appointed by the king, the whole grant covering the Atlantic coast from north latitude 34° to north latitude 45°. The special grant to the "London company," with which we have to do, included the mainland and islands between latitude 34° and latitude 41°, or from about Cape Fear to Long Island sound; and the special grant to the "Plymouth company" extended from latitude 38° to latitude 45°, or from the mouth of the Potomac to the northern boundary of Vermont. Between latitude 38° and latitude 41°, where the grants conflicted, neither company was to plant a colony within 100 miles of a colony previously planted by the other. Under this grant settlement was begun at Jamestown, May 13, 1607, May 23, 1609, a supplementary charter defined the limits of the colony, as stated below. March 12, 1611-12, a further charter gave power to convene a colonial assembly, or "great and general court," with power to legislate, provided the laws were not contrary to the laws and statutes of England; and under this charter the first legislative assembly in America met at Jamestown, June 30, 1619, being composed of a council named by the company, and a house of burgesses (see ASSEMBLY) elected by the towns. In 1624 the company was suppressed by a writ of *quo warranto*, its powers were assumed by the king, and Virginia remained a royal province until 1776. During the commonwealth period, it remained loyal to the crown, and for three years after the death of Charles I. his son was acknowledged as king of Virginia, so that at the restoration this colony claimed to be the new king's "Old Dominion." Its loyalty availed it little. A charter was refused it; the quit rents and the control of the church of England, its established church, were lavished upon court favorites; and in 1676 the tyranny of Gov. Berkeley drove the colonists into a rebellion, headed by Nathaniel Bacon, which was suppressed with vindictive punishment. "The old fool [Berkeley]," said Charles, "has taken away more lives in that naked country, than I for the murder of my father." With the exception of this episode, the colony grew quietly, but strongly, into a populous, rich, slaveholding, Episcopalian commonwealth, with a strong desire for self-government; and at the outbreak of the American revolution it was unquestionably the leading state. Its lower house was dissolved by Gov. Dunmore, May 25, 1775, while preparing a protest against the Boston port bill; but the members met the next day and inaugurated the revolution by proposing a congress. (See CONGRESS, CONTINENTAL.) In the following year, May 6, they again met as usual; but, as the governor had run away, and the regular government was suspended, they organized as a "provincial congress," and framed the first constitution of the state of Virginia.

—BOUNDARIES. The charter of 1609 defined the colony's limits thus: from point Comfort, all along the seacoast to the northward 200 miles, and all along the seacoast to the southward 200 miles, "and all that space and circuit of land lying from the seacoast of the precinct aforesaid, up into the land throughout from sea to sea, west and northwest." The boundary lines were evidently not to be parallel lines: one was to be a westward line, and the other northwesterly. If the new colony was to have any

limits whatever on the west it would seem most natural that the northerly boundary should be the westward line, and the southerly boundary the northwestward line, to intersect it. Virginia would thus have been a comparatively small colony, of a triangular shape. But the colony, resting on the words "from sea to sea," and interpreting them to mean "from the Atlantic to the Pacific," instead of from the Atlantic around the compound boundary line to the Atlantic again, made the southern boundary the westward line, and the northern boundary the northwestward line, thus making her territory grow constantly wider as it went westward. She was compelled, indeed, to yield to the royal prerogative of taking back presents, and her 200-mile limits were interfered with on the south by the grant of Carolina (see NORTH CAROLINA), and on the north by the grant of Pennsylvania and Maryland. (See those states.) To these encroachments she submitted patiently, conscious that her charter, as she interpreted it, contained an abundant reward for her patience. A line drawn northwest from the western boundary of Maryland will show the extent of Virginia's claims to the western part of Pennsylvania, and to the whole territory northwest of the Ohio—indeed, her "northwest line" might have stretched on and included Alaska, but for the subsequent (1762) fixing of the Mississippi as the western boundary of the colonies. Her claims to the northwestern territory were finally abandoned. (See TERRITORIES.) Her Pennsylvania boundary was finally arranged by mutual consent in 1780, by continuing Mason and Dixon's line five degrees to the west, and thence due north, thus giving Virginia the "pan-handle" in the northwest. For her boundaries with North Carolina, Tennessee, Kentucky, West Virginia and Maryland, see those states.

—CONSTITUTIONS. 1. The provincial congress, June 12, 1776, adopted a bill of rights, which has been retained in subsequent constitutions, but modified in 1867. Its most important sections were the third, which declared the right of the people to alter, reform or abolish their government at their own wills and the fourteenth, that no government separate from or independent of the government of Virginia should be erected or established within the limits thereof. The two were in effect a declaration of independence. (See STATE SOVEREIGNTY.) June 29, the first state constitution was adopted, without a reference to popular vote. It provided for a general assembly, consisting of a senate of twenty-four members, chosen by districts, to serve four years, and a house of delegates (see ASSEMBLY), chosen by counties and towns, to serve one year, for a governor and council of eight, chosen annually by joint ballot of the two houses; and for a judiciary, to be appointed by the legislature during good behavior. This constitution remained in force for half a century, until the growth of the western part of the state, and its unfairly small representation in the legislature, compelled a general revision. 2. A new constitution was framed by a convention at Richmond, Oct. 5, 1829-Jan. 15, 1830, and ratified by a popular vote of 26,055 to 15,563. It fixed the number of the house of delegates at 134, 31 to the twenty-six counties west of the Alleghanias, 25 to the fourteen counties between the Alleghanias and the Blue Ridge, 42 to the twenty-nine counties between the Blue Ridge and tide water, and 36 to the counties, cities, towns and boroughs on tide water; and the number of the senate at 32, thirteen of the districts being west and nineteen east of the Blue Ridge. The proportional representation of the great divisions was not to be changed by the legislature. The governor was now to hold office for three years, and the judges were to be removable by a two-thirds vote of both houses. 3. A new

constitution was framed by a convention at Richmond, Oct. 14, 1850-Aug. 1, 1851, and ratified by a popular vote of 67,562 to 9,938. Its principal changes were, that the governor was to be elected by the people for four years; the judiciary was to be elected by popular vote for terms of twelve and eight years, and removable by a vote of a majority of the members elected to both houses; the number of the house of delegates was fixed at 152, chosen for two years, and apportioned among the counties, and the number of senators at 50, chosen by districts for four years; and, in default of the adoption of an equitable principle of apportionment by the legislature, a very complicated scheme was drawn up for reapportionment in 1865, which the course of events overruled. The principle of an obsolete statute of 1805 in regard to slavery was thus transferred to the new constitution: "Slaves hereafter emancipated shall forfeit their freedom by remaining in the commonwealth more than twelve months after they become actually free, and shall be reduced to slavery under such regulation as may be prescribed by law"; and "The general assembly may impose such restrictions and conditions as they shall deem proper on the power of slave owners to emancipate their slaves." 4. After the separation of West Virginia (see that title), the state government which had consented to it was transferred to Alexandria, where a convention from the counties within the federal lines, Feb. 13-April 7, 1864, framed a new constitution, which was not submitted to popular vote. It abolished slavery, fixed the number of the house at not less than 80 nor more than 104, to serve two years, and the number of the senate at not less than one-fourth nor more than one-third the number of the house; and disfranchised those who had held office under the confederate government, or been members of the confederate congress or of rebellious legislatures. 5. The fifth constitution was framed by a convention at Richmond, Dec. 3, 1867-April 17, 1868. It added four new clauses to the original bill of rights, providing that the state should ever remain a member of the United States of America; that the people thereof are part of the American nation; that their paramount allegiance is due to the constitution of the United States and laws of congress passed in pursuance thereof; that slavery shall never exist in the state; and that all its citizens have equal civil and political rights and public privileges. It gave the right of suffrage to "male citizens" over twenty-one on twelve months' residence in the state; made disfranchisement a penalty for dueling; gave the veto power to the governor, and the election of judges to the legislature; and regulated the government of cities. The constitution was ratified by a popular vote of 210,585 to 9,136, July 6, 1869. At the same election the disfranchisement clauses, which had caused the long delay in ratification, and which were submitted to separate vote under an act of congress of April 10, 1869, were rejected. In 1876 an amendment was adopted requiring the payment of a capitation tax before voting, disfranchising for petit larceny, and empowering the legislature to remove dueling disabilities by a two-thirds vote. The capitation tax was subsequently abolished by another amendment.

—GOVERNORS. Patrick Henry, 1776-9; Thos. Jefferson, 1779-81; Thos. Nelson, 1781; Benjamin Harrison, 1781-4; Patrick Henry, 1784-6; Edmund Randolph, 1786-8; Beverley Randolph, 1788-91; Henry Lee, 1791-4; Robert Brooke, 1794-6; James Wood, 1796-9; James Monroe, 1799-1802; John Page, 1802-5; Wm. H. Cabell, 1805-8; John Tyler, 1808-11; James Monroe, 1811; George W. Smith, 1811-12; James Barbour, 1812-14; Wilson C. Nicholas, 1814-16; James P. Preston, 1816-19; Thos. Mann Randolph, 1819-22; James Pleasant, 1822-5; John Tyler, 1825-7;

William B. Giles, 1827-30; John Floyd, 1830-34; Littleton W. Tazewell, 1834-6; Windham Robertson, 1836-7; David Campbell, 1837-40; Thos. W. Gilmer, 1840-41; John Rutherford, 1841-2; John M. Gregory, 1842-3; James McDowell, 1843-6; Wm. Smith, 1846-9; John B. Floyd, 1849-52; Joseph Johnson, 1852-6; Henry A. Wise, 1856-60; John Letcher, 1860-64; William Smith, 1864-5; Francis H. Pierpont, 1865-8; Henry H. Wills, 1868-70; Gilbert C. Walker, 1870-74; James L. Kemper, 1874-8; F. W. M. Holladay, 1878-82; Wm. E. Cameron, 1882-6.

—POLITICAL HISTORY. For the century succeeding the opening of the conflict with the mother country, 1760-1860, the whole policy of Virginia is expressed in the declaration of her bill of rights, "that no government separate from or independent of the government of Virginia should be erected or established within the limits thereof." Under the colonial system the resistance to encroachment was directed against the king's governors, and under the constitution against the federal government; and the only period during which the Virginia policy ever had full and free play was that of the confederation and the few years of loose alliance that preceded it, 1775-89. Size, population, wealth and concurrence of sentiment among leading men made Virginia the great exponent of "state sovereignty." (See that title.) For such a rôle her colonial history went far to prepare her. The character of her immigration, its sympathy in blood, breeding and prejudices with the English royalist party of 1620-80, and the final impress given to the mould by the establishment of a state church, were all calculated to make Virginians fully conscious of their own importance, and ready to maintain their individual opinions. Further, the necessarily backwoods character of Virginia life, the absence of any such object of loyalty as a personally present king, and the introduction of negro slavery, tended to exaggerate in the Virginian the personal characteristics of his English prototype, while it took away the checks which had operated upon the latter: and the English royalist was metamorphosed into the Virginia democrat. Virginia democracy was thus not based on any Calvinistic view of the universal equality of men in their infinite inferiority to their Maker; nor in any theoretical love for humanity: it was rather a general agreement by all white Virginians to recognize one another's feeling of individual importance, and to support the state government under which that feeling found the safest shelter. John Randolph's exclusive application of the expression "my country" to Virginia, only voiced the conscious or unconscious feeling of all Virginia democrats.

—The political history of the state until 1881 was therefore that of the democratic party. Its electoral votes and its state government were steadily of one party, and only an occasional congressman among the opposition varied the general rule. The state's ratification of the constitution in 1788 was only accomplished by a meagre majority of ten votes (see CONSTITUTION, II.); and it is safe to say that the majority was only obtained by a sense of the insecurity of Virginia's title to western lands if a general scramble for the territories should be brought on by a failure to organize national government. (See TERRITORIES.) The inauguration of the new government marked Virginia's importance. Washington's presidency was due only to himself: the positions of Jefferson and Randolph in the cabinet, and of Madison as leader in the house, were due to Virginia's leadership among the states. There was thus developed at once the seed of what soon came to be known as the "Virginia influence," hard to define exactly, and yet very apparent in the politics of the time. Throughout the

controlling tide-water counties of the state, where genealogy was a science held in the highest esteem, where immigration had almost ceased to bring new and confusing strains of blood into the established stocks, and where exhaustion of tobacco lands had not yet begun to banish the old families, nearly every leading man was related more or less distantly to most of his competitors; the different congeries of families were just far enough removed to deaden any ambitious struggles for clan supremacy; the opinions of Jefferson, Madison, Monroe, Page, Giles, Bland, Taylor, Tazewell, the Nicholases, the Randolphs, and other democratic leaders, came to subordinate leaders with the force of family as well as political sympathy; and the whole formed the shadowy but powerful "Virginia influence," which made or destroyed presidents until 1825. From the beginning of Hamilton's centralizing policy (see FEDERAL PARTY, I.), the Virginia influence stood stiffly against it, and thus became the corner-stone of the new democratic party. From Virginia proceeded most of the efforts which gradually gave the new party control of the south and a "fighting chance" in the middle states. When federalist partisanship in 1798 threatened what Hamilton considered "a tyranny," the half-uttered counter-threat of forcible resistance came from Virginia and her daughter, Kentucky. (See KENTUCKY RESOLUTIONS.) When the federal party was finally overthrown, in 1800-1, Virginia and New York took the same places in the dominant democratic party that Virginia and Massachusetts had held in the revolutionary struggle. The former state was still able, from its pre-eminence in the country and party, to name the president, while the vice-president was generally given to the latter. The "Old Dominion" of colonial times thus became the "Mother of Presidents" under the constitution.

—The Virginia influence was not altogether undisputed, even in its own state. The greatest of Virginians, Washington, was a federalist, and so were John Marshall, Charles Lee, Henry Lee, and (after parties had fairly developed) Patrick Henry. The general prevalence of the Virginia influence in national affairs after 1800 soon wiped out the last trace of federalism in Virginia, but at the same time it prepared the way for a Virginia schism. As the leaders, Jefferson and Madison, became more absorbed in national politics, more dependent on northern democrats, and more neglectful of their state, an ultra Virginian faction, "republicans of the old school," or "quids," appeared, headed by John Randolph, and including also Tazewell and John Taylor. Their public defection took place in March, 1806, and from that time they spared no effort to secure the presidency in 1809 for Monroe, a candidate of far less ability than Madison, but recommended by his long absence from national politics and his supposed devotion to his state. But the defection was a failure. In January, 1808, the Virginia legislature nominated Madison for the presidency, and the nomination was repeated, two days afterward, by the congressional caucus. (See CAUCUS, CONGRESSIONAL.) A caucus of Monroe members of the legislature nominated him, and the federalists supported him in the state; but the Monroe ticket was badly defeated in Virginia, and unheard of elsewhere. The Virginia influence was thus still triumphant: Monroe himself submitted in 1811 by entering the cabinet of Madison; and his former supporters either followed him, or kept up a filibustering opposition to the war of 1812.

—But the general spread of democratic ideas, and the decrease of the state's comparative importance, had already doomed the influence of Virginia. In 1817 it was

hardly able to nominate Monroe for the presidency, and its lame success in that year, as well as in 1821, was due mainly to the influence of tradition upon the new men and new states in politics. Republics are not always ungrateful, and it was not until the last Virginia leader had been duly honored that the field was field to be fairly open for others. From that time Virginia was no longer to be the "Mother of Presidents." With one accidental exception, the sceptre was to be transferred to other states. In 1790 she was the first of the states in population: in 1830 she was third, New York and Pennsylvania having outstripped her. Changes had also been taking place within the state. The western part of the state (now West Virginia) had more than three times as much population in 1830 as in 1790, while the eastern part of the state had increased very little; and yet the apportionment of representation remained fixed as in 1776. The crying need of a reform in this respect brought about the convention of 1829, one of the most distinguished assemblages of able men that ever met in any state. The desire of each section to be well represented sent to the convention Madison, Monroe, Marshall, John Randolph, Giles, Mercer, Tazewell, John Taylor, Garnett, Leigh, and all the ablest men of the state. The object of the delegates of the western and middle sections was to base representation on white population only for both houses; the eastern delegates wished for the "federal basis," including three-fifths of the slaves. The former plan, as in South Carolina (see that state) would have given the taxing power to the western and middle sections, while the east held the taxable property. At first the convention inclined toward compromising by giving a white basis of representation to the house, and a federal basis to the senate; but in the end the eastern delegates succeeded in establishing the artificial apportionment already detailed, which deprived their section of comparatively little political power. Slavery had been the secret of the difficulty. East and west of the Blue Ridge the white population was not far from equal; but the latter section had comparatively few negroes, while the blacks outnumbered the whites in the former, and three-fifths of them counted under the federal basis, which governed quite closely the apportionment as it was settled. The constitution had hardly been adopted when Virginia was startled by an unsuccessful negro insurrection in Southampton county, near Norfolk, in August, 1831, under the lead of one Nat Turner. When the legislature met, the western delegates at once took the insurrection as a text, and an animated debate followed for several weeks, in which every plan for abolition was proposed and advocated. At last this extraordinary discussion, the only one of its kind ever held in a southern legislature before 1865, was stifled, and never revived—Until about 1835 democratic control of the state was hardly disputed: the popular vote for Jackson in 1832 was 75 per cent. of the total vote. During Jackson's second term the whig party of the state was developed, and, though it never fully controlled the state, it was able to give its opponent battle on even terms for nearly twenty years. It contested every county of the state: in the eastern part it gained votes through the desire of many slave-holders for a system of internal improvements which should offset the exhaustion of land, and check emigration; in the western and middle sections it was aided to some extent by the traditional opposition to the usually democratic tidewater counties; and the nullification element, John Tyler being its best known exponent, gave it some assistance. At first it was strong enough to elect Tyler and B. W. Leigh to the United States senate, and to make Gilmer governor; and in 1840 its presidential electors were defeated by only 1,392 votes out of 86,394. Thereafter it remained an opposition party, with about 47 per cent. of the total vote. Its best known leaders were Tyler,

Leigh, John Minor Botts, Preston, Stuart and Faulkner, those of the democrats being W. C. Rives, Dromgoole, Mason, Hunter, Boccock, Letcher and Wise. After 1849 the whig vote decreased, and after 1853 most of its former leaders became democrats. But some, not choosing to take that course, adopted the "know-nothing" organization (see AMERICAN PARTY), and contested the state with about the former whig vote. The proportionate popular vote may be seen by the results of the elections for governor: (1855) Henry A. Wise, democrat, 83,424, Thos. S. Flournoy, "American," 73,244; (1859) John Letcher, democrat, 77,112, Wm. L. Goggin, "American," 71,543. In spite of the large minority vote, the democrats continued to control the legislature and all but one or two of the congressmen.

—As the sectional disputes of 1850-60 began to verge evidently toward war, Virginia strove hardest to avert that calamity. (See BORDER STATES) The struggle for the state's electoral vote in 1860 was won by the old whig element (see CONSTITUTIONAL UNION PARTY), the popular vote standing 74,681 for Bell, 74,323 for Breckinridge, 16,290 for Douglas, and 1,929 (in western Virginia) for Lincoln. The special session of the legislature in January, 1831, called a peace convention of all the states (see CONGRESS, PEACE); appointed commissioners to ask the president of the United States and the governor of South Carolina to keep the peace for sixty days; and, in calling a state convention, provided that its action should be submitted to the people for ratification or rejection. These pacific measures were due solely to the general dislike of secession by the people, who knew that in case of war their state must be the battle ground; and the real feeling of the state politicians was better shown by the passage of numerous resolutions of a covertly warlike nature—appropriating money to arm the state, and threatening forcible resistance to any attempt by the federal government to coerce any seceding state. The convention met Feb. 13, and for two months debated the various propositions offered. It was so divided that any resolution asserting the abstract right of secession was sure of a small majority in favor of it, while any resolution looking to the practical exercise of the right was equally sure of a slight majority against it. April 17, the deliberations were brought to a crisis by President Lincoln's call for troops. (See INSURRECTION.) Under the excitement of the moment, and the stimulus of still greater mob excitement in Richmond, an ordinance of secession was passed, by a vote of 88 to 55, to take effect when ratified by the people, May 23. But the new order of Virginia politicians, unsafe guides in any such crisis, had no great confidence in the popular vote, and proceeded in a course which no one has ever attempted to defend on any constitutional theory. The convention, April 25, ratified the constitution of the confederate states, and, by its commissioners and A. H. Stephens, commissioner from the confederate states, formed a "temporary convention," placing the state's whole military force under the president of the confederate states. Both measures were to be void if the popular vote in May should be against secession; but the irruption of confederate troops made the election a farce. In this lawless fashion the secession of Virginia was accomplished. It was followed by a counter-revolution, which permanently deprived the state of its western section. (See WEST VIRGINIA.) When West Virginia had been admitted as a state, its original revolutionary government was transferred to Alexandria, where it remained until the close of the war, claiming to be the government of Virginia, but receiving obedience only from the counties within the federal lines.

—Throughout the war, Richmond was the capital of both the state and the confederacy, and all the political feeling of the state was concentrated upon the prosecution of the war, with very little friction between the two authorities. In May, 1865, President Johnson refused to recognize Gov. Smith, and the Pierpoint administration took its place without dispute, and held it for two years. During this time the state's idea of reconstruction was fully carried out; the constitution of 1864, with its prohibition of slavery, was accepted, but the test oath was abolished, the proposed amendment to the constitution of the United States was voted down, and stringent vagrant acts were passed for the control of the freedmen. In March, 1867, the state government came under the reconstruction laws. (See RECONSTRUCTION.) The reconstruction convention, in framing a new constitution, disfranchised all persons who had held office of even the lowest grades under the state or confederacy until 1865, and enforced the disfranchisement by providing for a stringent test oath and registry law. In a large part of the state it would thus have been impossible to find qualified office-holders, and no attempt was made to put the constitution to vote until a new act of congress allowed a separate vote on the objectionable clauses. They were rejected, and the state was readmitted, Jan. 26, 1870.

—For nearly ten years the state remained democratic in all elections, the dominant party taking the name "conservative." The republican vote was at first large, but was continually in the minority, except in the election of four of the nine congressmen. In 1874 the democrats secured eight of the nine congressmen, and thereafter the republican vote was of little importance. The most troublesome problem for the successive legislatures was that of the state debt. It amounted, Jan. 1, 1871, to \$47,390,840.93, of which about \$37,200,000 was for debt contracted before April, 1861, and for lapsed interest thereon. March 30, 1871, a bill was passed to fund two-thirds of this amount (leaving one-third as the proportion of West Virginia) into bonds whose coupons should be receivable for state taxes. The popular objections to this seem to have been mainly as follows: that the receipts from state taxation, at the rate of fifty cents on \$100, were regularly about \$2,500,000 per annum; that the expenses of government and public schools were about \$1,600,000; that the interest on the funded debt would be about \$1,800,000; and that the state was absolutely unable to increase the rate of taxation so as to make up the deficit. The whole question evidently hinges on this last assertion, whose truth can not well be proved or disproved: it is only certain that no such assertion would have been made by the ancient commonwealth. The passage of the funding bill at once went into politics, and the next legislature, March 7, 1872, repealed the "tax coupon" feature of the law. But, before the repeal, about \$17,000,000 had been funded in tax coupon bonds, and the state court of appeals decided that a repeal as to them would be a breach of contract and unconstitutional. Still, the legislature was unable or unwilling to lay taxes sufficient to pay the interest, and the constant receipt of coupons for taxes kept the treasury in a state of chronic bankruptcy. In 1873 an act was passed to pay one-third of the interest, after government expenses should have been paid—a proviso which effectually nullified the law. In 1877 a final effort was made to increase revenue by a liquor law (the Moffett act), which compelled liquor sellers to register sales by means of a mechanical register upon the counter: but this only produced about \$500,000 annually, insufficient to make up the deficit. In March, 1878, a bill was passed offering to the bondholders refunding bonds with interest at 3 per cent. for eighteen

years, and 4 per cent. for thirty-two years thereafter. The probability of a settlement on some such basis crystallized the opposition into a "readjuster" party, led by William Mahone. It made some little effort in the election of 1878, though Gov. Holliday, the debt-paying candidate, was elected by 101,940 out of a total vote of 106,329. In the following February the "readjuster movement" took complete shape, as the final "McCulloch bill" was being perfected. This act, passed March 28, 1879, and accepted by the bondholders, provided for forty-year refunding bonds, with interest at 3 per cent. for ten years, 4 per cent. for twenty years, and 5 per cent for ten years, coupons receivable for taxes. The interest would thus have been about \$900,000 annually for ten years, and there would have been little danger of a deficit. But the readjusters, in addition to the standing claim of inability to levy a higher rate of taxation than fifty cents on \$100, denounced the tax coupon feature of the act as "against public policy, and degrading to the state and people." On this issue they obtained a popular majority in the election of November, 1879; and by a coalition of their forty delegates with the seventeen republican members they obtained a majority in the lower house of the legislature. They have since controlled the state, though the "debt-paying" electoral ticket, recognized by the national democratic committee, was successful in the presidential election of 1880. In December, 1879, Mahone was elected United States senator, and when his term began, in March, 1881, he at once ranged himself with the republicans, declaring that he had been elected as a readjuster, not as a democrat. Since that time, the fusion of the readjusters and republicans has been complete, and has controlled the state. In November, 1881, it elected Governor Cameron by a vote of 111,473 to 99,757 for the "funder" candidate, Daniel, and obtained a majority in both branches of the legislature. Riddleberger, who was the framer of the bill passed in 1873, was sent to the United States senate for the term beginning in 1883. But the defection of a few of their number during the session prevented the readjusters from carrying out their debt programme, and the future of the party is very uncertain. Its leaders are supported by the national administration, which is republican, and yet the fusion between readjusters and republicans has never been more than a mechanical mixture, and there are many signs of its breaking asunder. While it lasts it at least secures the free exercise of the right of suffrage to the negro voters of the state.

—In addition to the names of Jefferson, Madison, Marshall, Monroe, John Randolph, Tyler, Wirt and Washington (see those names), the following have been among the more prominent of the state's political leaders: William S. Archer, whig congressman 1820-35, and United States senator 1841-7; Philip P. Barbour, democratic congressman 1814-25 and 1827-30, and supreme court justice 1836-41; Theodorick Bland, anti-federal delegate to congress 1780-83, and congressman 1789-90; Thomas S. Boccock, democratic congressman 1847-61, confederate congressman and speaker of the house 1862-5; Alexander R. Boteler, whig and "American" congressman 1859-61, confederate congressman 1862-4; John Minor Botts, whig congressman 1830-43 and 1847-9, and an open opponent of secession throughout the rebellion; James Breckinridge, federalist congressman 1809-17; Matthew Clay, democratic congressman 1797-1815; George C. Dromgoole, democratic congressman 1835-41 and 1843-7; John W. Eppes, democratic congressman 1803-11 and 1813-15, and United States senator 1817-19; Charles J. Faulkner, whig and democratic congressman 1851-9, and minister to France 1859-61 (see WEST VIRGINIA); John

Floyd, democratic congressman 1817-29, governor 1830-34, and a leading nullificationist; John B. Floyd (son of the preceding), governor 1849-52, secretary of war under Buchanan, and brigadier general in the confederate army; William B. Giles, democratic congressman 1790-99 and 1801-3, United States senator 1804-15, and governor 1827-30; Thomas W. Gilmer, governor 1840-41, congressman 1841-4 ("Tylerized" whig, afterward a democrat), and secretary of the navy under Tyler; Wm. L. Goggin, whig congressman 1839-43, 1844-5, and 1847-9; John Goode, confederate congressman 1862-5; democratic congressman 1875-81; Benjamin Harrison (father of Pres. Harrison), delegate to congress 1774-8, and governor 1782-4; Patrick Henry, the state's popular leader in the revolution, delegate to congress 1774-6, governor 1776-9 and 1784-6, leader of the antifederalists in the Virginia convention of 1788 (see CONSTITUTION, II.), and afterward a federalist; Robert M. T. Hunter, democratic congressman 1837-43 and 1845-7, United States senator 1847-61, confederate senator 1862 (see CONFEDERATE STATES); Eppa Hunton, confederate brigadier general, democratic congressman 1873-9 (see ELECTORAL COMMISSION); Arthur Lee, congressional commissioner to France and Spain 1776-80, and delegate to congress 1782-5; Henry Lee, a cavalry officer in the revolution, delegate to congress in 1786, federalist governor 1792-5, and congressman 1799-1801; Richard Henry Lee, delegate to congress (see DECLARATION OF INDEPENDENCE) 1774-80 and 1784-7, and United States senator 1789-92; Benjamin Watkins Leigh, whig United States senator 1834-6, then resigning rather than obey "instructions" from the legislature; William Mahone, confederate major general, organizer of the "readjuster" party, and United States senator 1881-7; George Mason, a revolutionary and anti-federal leader (see CONSTITUTION, II.); James M. Mason, democratic congressman 1837-9, United States senator 1847-61, and confederate commissioner to Great Britain; John Y. Mason, democratic congressman 1831-7, secretary of the navy under Tyler and Polk 1844-9, and minister to Great Britain 1854-9; Charles F. Mercer, democratic congressman 1817-39; Wilson C. Nicholas, democratic United States senator 1800-4, congressman 1807-9, and governor 1814-16; Edmund Pendleton, delegate to congress 1774-5 and president of the Virginia convention of 1788; William B. Preston, whig congressman 1847-9, secretary of the navy under Taylor, confederate senator in 1862; Edmund Randolph, delegate to congress 1779-82, governor 1786-8 (see CONVENTION of 1787; CONSTITUTION, II.), attorney general and secretary of state under Washington, who requested him to resign in 1795 for official misconduct; Peyton Randolph, delegate to congress and president of that body 1774-5; Thomas Mann Randolph, democratic congressman 1803-7, and governor 1819-22; William C. Rives, democratic congressman 1823-9, minister to France 1829-32 and 1849-53. United States senator 1833-4 and 1836-45, and confederate congressman 1861-4; James A. Seddon, democratic congressman 1845-7 and 1849-51 (see CONFEDERATE STATES); Andrew Stevenson, democratic congressman 1823-34, speaker of the house 1827-34, and minister to Great Britain 1836-41; Alexander H. H. Stuart, whig congressman 1841-3, secretary of the interior under Fillmore; John Taylor, democratic United States senator 1792-4, and 1803, and 1822-4 (see authorities under CONSTITUTION, IV. c); Littleton W. Tazewell, democratic congressman 1800-1, and United States senator 1824-32; Abel P. Upshur, state judge 1826-41, and secretary of the navy and of state under Tyler; George Tucker, democratic congressman 1819-25, professor of political economy in the state university 1825-45, and a standard historian; Henry St. George Tucker, democratic

congressman 1815-19, thereafter chancellor of the Winchester district, president of the court of appeals, and professor of law in the university until 1845; John Randolph Tucker, state attorney general 1857-65, and democratic congressman 1875-83; and Henry A. Wise, democratic congressman 1833-44, minister to Brazil 1844-7, governor 1856-60, and confederate brigadier general.

## WAGE FUND

WAGE FUND, The. The wage fund is the term used to characterize that theory of the distribution of wealth which became prevalent in England shortly after the close of the Napoleonic wars; which was generally accepted upon English authority by American economists, and remained in full virtue unchallenged for nearly half a century. It never crossed the British channel, however, and is practically unknown to the political economy of continental Europe.

—This theory made the capitalist employer to be the residual claimant upon the product of industry. Rent was to be first deducted, the amount thereof to be determined, in the main, according to the Ricardoan formula, with more or less of concession or remission by landlord to tenant, under the influence of personal good feeling or of a public sentiment prescribing a kindly and considerate treatment of the actual cultivators of the soil. Next, wages were to be deducted, the amount thereof to be ascertained, according to the wage-fund formula, of which we are now to speak. There were to remain: profits, composed of interest on the capital employed (including a premium for the insurance of capital against extraordinary risks), and of the remuneration of business management. Profits constituted the share of the product of industry going to the capitalist employer, who, after paying rent and wages, as indicated, retained all the rest as his own. This view of the relation of the several parties to the distribution of wealth was summed up by De Quincey in the saying: "Profits are the leavings of wages," rent not being here mentioned, inasmuch as De Quincey has in view the production of wealth upon the lowest grades of soil, which pay no rent.

—We find no trace of the wage-fund doctrine in Adam Smith's "Wealth of Nations," published in 1776. Dr. Smith, indeed, writes of "the funds for the maintenance of labor"; but while he thus recognizes the need the laborer has of a pre-existing body of wealth from which he is to be sustained during the period while his labor is bearing its fruit in harvested or marketed products, he did not intimate that the laborer's remuneration was strictly limited to the amount thus required for his immediate sustentation; he did not allege that no part of these funds might be the laborer's own, accumulated from the savings of previous years; he did not assume that these funds were so fixed and definite in amount as to be independent alike of the industrial quality of the laboring class and of any efforts they might put forth to increase their share of the product of industry. So far was Adam Smith from holding this view, that he expressly stated that "the wages of labor are the encouragement of industry, which, like every other human quality, improves in proportion to the encouragement it receives."

—Even Mr. Malthus, in his work of 1820, although he gave great prominence to the laborer's need of provisional maintenance during the interval between the rendering of the service and the realizing of the product, failed to intimate any constant or any

necessary relation between the funds so employed and the aggregate capital of a country.

—Yet at this time the industrial condition of England had become such through the effects of the Napoleonic wars, and of the ill-devised pauper legislation of parliament, as strongly to suggest the doctrine which was, in 1824, to be announced by Mr. James Mill, and was, for nearly fifty years, completely to dominate all theory of the distribution of wealth, so far as English and American political economy was concerned.

—The wars which, with the intermission of a single year, raged from 1793 to 1815, by checking the importation of grain, drove cultivation in England down to inferior soils, thus raising the proportion of the aggregate produce going in rent to the landlords. The frequent and violent fluctuations of prices through all this period, according to the fortunes of battle by sea and by land, threw no small part of the wealth of the kingdom into the hands of the speculating as distinguished from the producing class. And while these causes were working to prejudice especially the interests of labor, the volume of wealth to be distributed was diminished by the waste of war.

—But it is doubtful whether the effects of all these causes, acting in conjunction to depress the condition and degrade the character of the mass of the English people, were equal to the deleterious influence of the changes in the poor law system of the kingdom, by which the workhouse test for able-bodied paupers was abandoned; by which appropriations were made from public funds, to supplement wages; and by which a premium was put upon births, and an even higher premium upon illegitimate births.

—So efficient for evil were the causes described as operating during this period, that, by the close of the Napoleonic wars, the working classes of England had been reduced to extreme and apparently hopeless misery. Accumulation by the laborer had been rendered impossible, and he was thus rendered completely dependent upon the employer, who was required to advance the whole of his subsistence, in anticipation of the crops or the goods being harvested or marketed. At the same time the average efficiency of the industrial agent had been so impaired, by both moral and physiological causes, and the market for labor had become so crowded, that the laborer's share of the ultimate product rarely exceeded in any degree the sums so advanced in provisional maintenance.

—Under these conditions the subsistence fund became, in fact, precisely equivalent to wages; and it is not at all surprising that English economists, contemplating the state of things reached in their own country, should have come to regard the subsistence fund and wages as necessarily identical, and, in so doing, have evolved the notion of a wage fund.

—The first distinct statement of the doctrine under consideration, is that of James Mill, in his work of 1824. The "Political Economy" of J. R. McCulloch, published in the following year, contains a positive assertion of the necessary dependence of wages

upon the proportion which the whole capital of a country bears to the whole laboring population. Mr. John Stuart Mill, in his great work of 1848, makes the doctrine of a wage fund the keystone of his theory of the distribution of wealth. The following is his statement: "If wages are higher at one time or place than at another; if the subsistence and comfort of the class of hired laborers are more ample, it is and can be for no other reason than because capital bears a greater proportion to population. \* \* The rate of wages, which results from competition, distributes the whole wage fund among the whole laboring population." Let us add the statement of this doctrine given by Mr. Mill, twenty-one years later, when its validity had been rudely questioned. "There is supposed to be, at any given instant, a sum of wealth which is unconditionally devoted to the payment of wages of labor. This sum is not regarded as unalterable, for it is augmented by saving, and increases with the progress of wealth; but it is reasoned upon as, at any given moment, a predetermined amount. More than that amount, it is assumed that the wage-receiving class can not possibly divide among them; that amount, and no less, they can not but obtain. So that, the sum to be divided being fixed, the wages of each depends solely upon the divisor, the number of participants." ("Fortnightly Review," May, 1869.)

—The first challenge of the dominant theory of wages in England came from a barrister little known to fame, Mr. Francis D. Longe, who, in 1866, issued a pamphlet entitled "A Refutation of the Wage-Fund theory of Modern Political Economy, as enunciated by Mr. Mill, M. P., and Mr. Fawcett, M. P." This pamphlet attracted little attention; not one of the reviews noticed it; and when, three years later, Mr. W. T. Thornton attacked the wage-fund doctrine, he appeared wholly ignorant of its existence. Yet the earlier work was the abler of the two, and nearly covered the whole case against the current economic doctrine. That doctrine, as we have seen, stood upon the asserted need, on the part of the laborer, of provisional maintenance, to be afforded by the capitalist, out of funds previously accumulated. As Prof. Fawcett had stated in his "Manual of Political Economy," "laborers while engaged in any particular industry can not live upon the commodity which their labor is assisting to produce. The plowman who tills the soil, from which in the following autumn the harvest will be gathered, is fed with the wealth which his master has saved, or, in other words, the master pays his laborer's wages from the wealth he has previously saved." That is, because the master must needs pay the laborer something before the harvest, he can not possibly pay him anything after the harvest! To say that the laborer derives a provisional maintenance from the master's capital, is, in Prof. Fawcett's view, precisely equivalent to saying that the laborer derives his wages, his entire wages, from this source. Mr. M'Culloch has left the same assertion of the natural and necessary equivalency of subsistence and wages.

—Upon this open point in the position of the economists Mr. Longe fell with incisive force, He insisted upon the distinction between "the wealth or capital available for the maintenance of laborers," and "the amount of wealth available for the purchase of their work." "The amount of money," reasons Mr. Longe, "which a farmer can afford to advance for the maintenance of laborers, without using the money he gets from the sale of his stock or crops, is unquestionably limited by the amount of wealth at his disposal from other sources; but the amount of money or wealth which the farmer can

afford to pay, or contract to pay, as wages, is limited only by the amount of money for which his crops will sell."

—Although Mr. Longe's pamphlet did not even receive the honor of a notice in the reviews, Mr. Thornton, when in 1869 he advanced nearly the same arguments against the current economic doctrine, and, as I must think, with less of clearness and force, achieved an overwhelming triumph. Through an article in the "Fortnightly Review" of May of that year, Mr. John Stuart Mill, after stating the wage-fund doctrine, in the terms already quoted, and adding, "this series of deductions is generally received as incontrovertible: they are found in every systematic treatise on political economy, my own certainly included," proceeded completely to renounce these life-long views. He declared that Mr. Thornton had deprived of all scientific foundation the doctrine so long taught by "all or most economists"; that Mr. Thornton had shown that the barrier (the wage fund) which had "closed the entrance to one of the most important provinces of economic and social inquiry," is but "a shadow which will vanish if we go boldly up to it."

—Mr. Mill's recantation of the wage-fund doctrine produced a deep impression. The "London Quarterly Review" (July, 1871) characterized the wage fund as "a thing, or un-thing (to borrow a German idiom), which is henceforth shunted fairly out of the way of future discussion of all questions affecting labor and labor's wages."

—Yet Mr. Mill's surrender was not wholly acquiesced in by the professional economists. Prof. John E. Cairnes, in his masterly work of 1874, undertook the rehabilitation of the economic doctrine of wages; and, with much care and pains, sought to show that something which might not improperly be called a wage fund, though widely different from the wage fund of the two Mills, of M'Culloch and of Fawcett, does exist, and does limit the amount that can be paid in wages. But the prestige of the old doctrine was destroyed, and the result of successive assaults has been its practical abandonment by the English economists. Prof. W. Stanley Jevons, in the second edition of his theory of "Political Economy," published in 1880, after referring to the general consent of his brethren to give up what was once the keystone of the orthodox theory of the distribution of wealth, writes: "In this matter of wages, the English economists have been living in a fool's paradise. The truth is with the French school."

—In the foregoing sketch of the rise and fall of this economic doctrine, have been intimated the nature and direction of the arguments which have compelled the practical abandonment of it by the economists of to-day. Its great importance in the history of political economy, however, and the fact that it is still found in most of the systematic treatises on the shelves of our libraries, and even in the treatises now used as text books [156](#) in our colleges, render desirable a compact recital of the objections to this theory of the origin and the limit of wages.

—In the first place, the reason for holding this theory of wages assigned by the Messrs. Mill, by Mr. M'Culloch and by Prof. Fawcett, proves to be no reason at all, in view of the distinction first presented by Mr. Longe, between the amount advanced by the employer for the maintenance of the laborer, and the amount to be paid, first and

last, for the laborer's services. It is seen at once, in the light of this distinction, that the mere fact that the employer must pay the laborer something, in advance of the harvest, constitutes no reason whatsoever why the employer should not pay the laborer something more, on the completion of the harvest.

—But, again, this doctrine assumes, in all the statements of it we have quoted, that the laborer is always and necessarily dependent on the employer for the entire amount of his subsistence. Now, this state of things did, in fact, exist throughout England, during the period when the doctrines in question came to be formulated. Probably the doctrine would never have arisen but for that state of things. But this condition is not involved in the nature of the relation of the laborer to his employer; nor have there been wanting examples, on a large scale, of the ability of the working classes to accumulate vast sums out of their earnings; witness the deposits of our American savings banks!

—But the wage-fund theory might be true were all the reasons adduced in support of it conclusively proven to be false. Let us, then, examine without prejudice from the mistakes of its advocates, the proposition that wages are paid out of capital, and that the possible amount of wages in any country, at any time, is determined by the amount of capital then and there existing.

—Why does an employer pay wages at all? Surely not to expend a fund of which he finds himself in possession, and of which he regards himself as trustee; but to purchase labor. Why does he purchase labor? Not at all that he may keep it employed; as it might be employed in carrying burdens first up-stairs and then down-stairs again, but he purchases labor as a means to the production of wealth. Why does he produce wealth? Merely that it may be produced, as might be the case had he no personal part in its ownership, no interest in its use or enjoyment? Surely not: unless the most exceptional of mortals, he produces wealth, not for the sake of producing it, but with a view to a profit to himself, individually, therefrom. The mere fact that a person has capital at his command no more constitutes a reason why he should use it in production when he can get no profits, than the fact that the laborer has arms and legs constitutes a reason why he should work when he can get no wages. It is, we see, for the sake of future production, that laborers are employed; not at all because the employer has possession of a fund which he must disburse. Is it not, then, the value of the product, such as it is likely to prove, which determines the amount of wages the employer is both able and willing to pay? If so, it is production, and not capital, which furnishes the motive for employment and the measure of wages.

—But, if production furnishes the measure of wages, the amount so to be paid can not be irrespective of the industrial quality of the wages class, since production varies necessarily, and varies within a wide range, according as that industrial quality is high or low. Therefore, the wage-fund doctrine is false, for it teaches that the rate of wages depends solely upon the proportion which the amount of capital bears to the numbers of the laboring population, altogether irrespective of their industrial quality.

—But even were we to waive consideration of the industrial quality of a laboring population, would it then be true that the amount of possible wages is determined in

and by the amount of capital existing; and that the wage fund so constituted forms a predetermined dividend, the divisor of which is to consist of the number of laborers? Precisely this is involved in the wage-fund doctrine, as it was taught, without qualification, down to a recent period. In 1864 Prof. Fawcett delivered a course of lectures in Cambridge university, in which he laid down the following rule: "The circulating capital of a country is its wage fund. Hence, if we desire to calculate the average money wages received by each laborer, we have simply to divide the amount of this capital by the number of the laboring population." The fallacy of this is seen the moment we realize that the purpose for which labor is employed is, not the distribution of a pre-existing fund, but the creation of values, the production of new wealth. This being so, the dividend can not be predetermined irrespective of the number of laborers, since the quantity or amount of the product of industry must itself depend upon the number of laborers. More laborers will produce more wealth—whether proportionately more or not, is aside from the question: fewer laborers will produce less wealth—whether proportionately less or not, we need not here inquire. Therefore the wage-fund doctrine is again shown to be false.

—The only virtue the doctrine we have been considering ever possessed, for practical uses, was in its assertion that an economic reason must exist for any and every advance of wages. Doubtless this explains why some economists still cling to the doctrine, as fearing that if it be abandoned, there will be no barrier against foolish and mischievous claims by the laboring classes for increase of remuneration or reduction of the hours of work. But the proposition that production furnishes at once the motive to employment and the measure of wages, equally establishes a barrier to every claim on behalf of the working classes which can not present a substantial economic reason. The one view of the origin and limit of wages, equally as the other, opposes itself to all demands, in the interest of labor, which are made merely under the impulse of compassion, or philanthropy, or the enthusiasm of humanity.

—The only difference between the two theories is, that by the one the economic force which limits wages is found in the amount of capital, while by the other it is found in the value of the product of industry, to which land, capital and labor jointly contribute. Which rule would be more consonant to sentiments of natural justice is not at issue, though here the preference clearly lies on the side of the rule we propose; the question is, Which corresponds the more closely to the reason of the case and to the just import of industrial statistics? On this issue the movement of economic opinion since 1866 has been overwhelmingly against the wage-fund doctrine.

FRANCIS A. WALKER.

## WAGES

WAGES. The word wages, in its popular use, signifies the remuneration of hired labor. As so used, it is more or less disparaging, being commonly placed in contrast with the words salaries, fees, honorarium, etc., by which it is sought to denote the remuneration of services of a higher or more intellectual character.

—To the economist, however, the word wages has no special reference to manual, as distinguished from intellectual, effort. That term in economic literature has two significations, the one much wider than the other. By the first is embraced, not only the wages of manual labor, hired by an employer; not only the avails of unhired manual labor, as of the smith working in his own shop, or of the peasant proprietor tilling his own lot of ground (due exception being made of rent and interest); not only the salaries of school teachers and public officials, the fees of lawyers and physicians, and the honorarium of the artist; but, also, all sums accruing to the employers of labor, through their own personal supervision and direction of the processes of industry. In a word, wages, in this largest sense, embraces all the material rewards of human exertions and sacrifices which are directed to the production of wealth, as distinguished only from the remuneration paid for the use of land and the remuneration paid for the use of capital.

—In the second and narrower economic sense, while retaining in all other respects the significance attributed to it above, the word wages becomes exclusive of the sums accruing to the employer of labor, as such, who, under the four-fold division of industrial activity specially characteristic of the present age, leases land, so far as this may be essential to his operations, and pays therefor rent; borrows capital, and pays therefor interest; hires labor, paying therefor wages; and has remaining in his hands, out of the product of industry, an amount of wealth, greater or less according to his activity, his enterprise, his prescience, his prudence, and, also, in some measure according to his good or evil fortune.

—The difference, then, between the two senses of the word wages, is found wholly in the fact that the former includes, while the latter excludes, the remuneration received by the employer, as such. The two alike exclude rent and interest, proper. Throughout the present article the word will be used in the latter and more restricted sense, the remuneration—viz., profits—which is received by the employer of labor, as such, forming the subject of a separate investigation.

—The questions relating to wages may be discussed under two titles, General Wages and Particular Wages: the former having reference to the problem of the distribution of wealth between the wages class, as a whole, and other claimants upon the product of industry; the latter, to the problem of the distribution of the aggregate amount of wealth paid, or possibly to be paid, in wages, among the several classes of wage receivers. We shall take up these two divisions of the subject in inverse order.

—I. PARTICULAR WAGES. In any consideration of the comparative remuneration of individuals or classes, it is of the highest importance to preserve the distinction expressed by economists as that between real and nominal wages. Real wages are the remuneration of the laborer, as reduced to the necessaries, comforts or luxuries of life. These are what the laborer works for; these are truly his wages. The money he receives is only a means to that end.

—Real may differ from nominal wages by reason of: *First*, variations in the purchase power of money. This is a consideration of prime importance, in the comparison of wages, as between one epoch and another. *Second*, varieties in the form of payment. Wages, though generally reckoned in money, are, to a very large extent, not paid in money. Especially in agriculture, the world over, full payment in money is highly exceptional. The forms, other than money, in which labor is remunerated, are various, the chief among them being rent, where cottages or tenements are provided for the laborer and his family, whether in agricultural or mechanical industry; board, mainly confined to unmarried laborers; and, lastly, a great variety of allowances, perquisites and privileges, such as definite quantities of certain kinds of food, drink or fuel, furnished by the employer; such as the hauling to the laborer's house of wood, coal or peat by the employer's teams, the keep of a cow, the right to take flour at millers' prices or at a fixed price whatever the market rate, the gleaning of fields, etc., etc. So numerous and diverse are the forms of payment of wages to hired laborers in agriculture, that anything like an exact comparison between the rates of real wages in different countries or districts often becomes practically impossible. *Third*, opportunities for extra earnings, by the head of the family, or by its other members. Thus, a weaver or spinner earning twenty shillings a week, may find places in which his wife and minor children may earn an equal sum, making the income of the family forty shillings. A carpenter or coal-heaver, on the other hand, receiving twenty-five shillings a week, may find himself unable to add anything to the family income through the labor of wife or child. It is evident, therefore, that in any comparison of wages, the total income of the family should be taken as the unit. *Fourth*, the greater or less regularity of employment. Varying regularity of employment may be due to the nature of the individual occupation, or to the force of the seasons, or to social and industrial causes of a general nature. In agriculture, for example, the nature of the operations involved, and the difference of seasons, cause great irregularity of employment. The rate of wages during the third quarter of the year is generally more than twice that during the first quarter. In this respect, however, there is great difference between different countries. An English farmer is plowing while a New England farmer is hauling wood on the ice and snow. In some countries agricultural operations are spread over eight months; in others, they are confined to four. In the fisheries, also in the so-called building trades, and in most out-door avocations, there is great irregularity in the matter of employment during the different periods of the year. On the other hand, there is nothing in the force of the seasons, or in the nature of the operations involved, to prevent weaving, spinning, shoemaking, paper-making, etc., from proceeding uniformly through twelve consecutive months. Industrial causes, also, like strikes, lock-outs, panics, and so-called hard times, produce great differences in the real rate of wages, where the same nominal rates exist. *Fifth*, the longer or shorter duration of the power to labor. This consideration is of prime importance, both as between nations and as between the classes of persons pursuing

different avocations within the same country. It is evident, that, if two persons begin to labor productively at the same period of life, and continue at work in the same occupation, at the same nominal wages, until death or final disability, the one receives the higher real remuneration who lives and works the longer, since the cost of his maintenance during the period of unproductive labor is properly to be charged upon his wages during the productive period. In the foregoing respect, there are wide differences among nations, which must enter to greatly affect the real remuneration of labor. Dr. Edward Jarvis has stated, that, for every thousand years expended in the developing period upon all who are born, including both those who die, and those who survive to the age of twenty, the consequent laboring and productive years are, in Norway, 1,881; in Sweden, 1,749; in England, 1,688; in the United States, 1,664; in France, 1,398; and in Ireland, 1,148. Moreover, as between different occupations in the same country, there are wide differences in the duration of the power to labor, which must be taken into account in adjusting nominal to real wages. The eminent actuary, Dr. Neison, states that the influence of occupation upon life is so considerable that the mortality in one avocation exceeds that of another by not less than 239 per cent. Taking the period of life, twenty-five to sixty-five, Dr. Neison finds that the mean mortality in the clerical profession, in England, is 1.12 per cent., in the legal, 1.57; in the medical, 1.81. In domestic service, the mortality among gardeners is but .93, among grooms, 1.26; among house servants, 1.67, among coachmen, 1.84. Of the several branches of manufacture, paper shows a mean mortality of 1.45; tin, of 1.61; iron, 1.75; glass, 1.83; copper, 2.16; lead, 2.24; earthenware, 2.57; the mortality among those operatives in the last-named branch of industry, who are known as china-scourers, due to the inhaling of the fine dust floating in the air, being positively frightful. Among the different kinds of mining industry, the range of this effect is even greater, the mean mortality of iron miners being 1.80; of tin miners, 1.99; of lead miners, 2.50, due to the prevalence of asthma and chronic bronchitis; and of copper miners, 3.17, due largely to the excessive heat prevailing in this class of mines. Even these figures, striking as they are, do not exhibit the full effect of the cause under consideration, since the occurrence of permanent disability among operatives of certain classes is out of proportion to the actual occurrence of death. In some of the agricultural districts of England, owing to wretched food and still more wretched lodgings, the laborer, though often long-lived, is early crippled and doubled up by rheumatism.

—The foregoing heads embrace the chief causes which are commonly adduced in reduction of nominal to real wages, *i.e.*, of money wages to wages expressed in terms of what Mr. Malthus calls "food, clothing, lodging and firing." In satisfaction, however, of still other desires of the laborer (using that term in the large sense attributed to it at the beginning of this article), and consequently forming a possible part of his real, as distinguished from his nominal, wages, enter certain other elements which may be found in a high degree in one occupation and in a low degree in another. Such is agreeableness of situation or of work; such is reputableness, or even distinction attaching to the performance of certain services. These are most influential causes in producing differences between real and nominal wages, in not a few departments of labor. One great object for which wealth is expended is to command social consideration. If, then, a certain position of itself gives authority or dignity, this may constitute, to one person, or even to many persons, a fair equivalent for a portion

of the remuneration which, in a different avocation, he might expect and be able to exact. A judgeship is often accepted by eminent lawyers who have been accustomed in their professional practice to earn several times the salary of that office. "Forty pounds a year," wrote Adam Smith, in the last century, "is reckoned at present very good pay for a curate, and there are many curacies under twenty pounds a year. There are journeymen shoemakers in London who earn forty pounds a year, and there is scarcely an industrious workman of any kind, in that metropolis, who does not earn more than twenty." The conception of dignity which thus gives preference to one occupation over another, may be wholly false or mistaken, without losing anything of its power to influence the actions of men, which is all the economist has to consider. Thousands of young men, in every large American city, stand around the marts of trade, hoping, by some chance, or by influence or solicitation, to crowd themselves into hard-worked and ill-paid places as clerks, because they deem manual labor degrading, although a skilled mason or carpenter earns twice or thrice as much, and that in a shorter day of labor. On the other hand, there are avocations which are exceptionally unpleasant to the senses, or exceptionally dangerous to life and limb, or exceptionally discreditable, and which, on this account, would naturally, were all other conditions constant, command a higher rate of remuneration. If, in some instances, those who pursue such avocations do not only not receive higher wages, but are compelled to accept a smaller, perhaps a much smaller, remuneration, this is not because the force just adverted to does not operate, but because it is counteracted by another cause, viz., that large numbers of persons are, by reason of ignorance, or misfortune, or disrepute, debarred from more favorable employment, and shut up to one or another avocation of the class described.

—Assuming the proper reduction of nominal to real wages, by allowances on the several foregoing accounts, we next come to inquire what are the causes which produce the wide differences which exist in the wages of labor, as between different countries, and as between particular avocations within the same country.

—As between different countries, the tendency to equality of wages within the same or closely corresponding avocations, varies with the readiness with which emigration or immigration, which we may call the flow of labor, takes place. Between no two countries, however near, and however similar in social or political conditions, is the flow of labor sufficiently easy to secure a close approximation to equality of wages. Adam Smith, in his day (1776), declared that man is, of all sorts of luggage, the most difficult to be transported. "A difference of prices," he says, "which is not always sufficient to transport a man from one parish to another, would necessarily occasion so great a transportation of the most bulky commodities, not only from one point to another, but from one end of the kingdom to another, almost from one end of the world to another, as would soon reduce their prices more nearly to a level." Mr. Ricardo, writing a generation later (1817), assumed that the flow of labor from country to country would be so tardy and difficult as practically to leave the laboring classes to enjoy or to suffer the industrial advantages or disadvantages of their respective countries, without any important influence as the result of immigration or emigration. John Stuart Mill, writing still a generation later (1848), just at the beginning of an age of wonderful progress in the arts of transportation and the communication of news, noted "a visible tendency toward a freer migration of labor

and capital, to take advantage of better opportunities of employment and investment." One generation later still, we may say, that, in 1883, the tendency pointed out by Mr. Mill acquires strength from year to year; but that the flow of labor still remains, as between country and country, so difficult and so tardy as to allow very great differences in real wages to remain, through long periods, but little affected by emigration or immigration.

—As between different avocations within the same country, the earlier economists, like Smith and Ricardo, assumed a substantial equality of real wages; and in this they were followed, though with more or less qualification, by John Stuart Mill. In his great work of 1874, Prof. Cairnes, writing with especial reference, we may suppose, to English conditions, proposed his theory of "non-competing groups." "What we find," he said, "is, in effect, not a whole population competing indiscriminately for all occupations, but a series of industrial layers, superimposed on one another, within each of which the various candidates for employment possess a real and effective power of selection, while those occupying the several strata are, for all purposes of effective competition, practically isolated from each other." Prof. Cairnes held the practical isolation of these industrial groups to be not less complete than the isolation which Mill had attributed to the several commercial countries of his day; and he proceeded to apply to such groups, *mutatis mutandis*, Mr. Mill's law of international values. Whether Prof. Cairnes' view of the structure of industrial society, within any given country, say, England, will be found in all respects just, or not, it is evident that it contains enough of truth to deserve the careful attention of the student of wages. It is doubtless in this direction that the largest contribution to economic science now possible might be made by a competent investigator.

—All the foregoing remarks relative to the rates of wages prevailing in different countries, and in different occupations within the same country, presuppose a practical equality in the powers and qualifications of laborers. In addition, however, to the difference in real wages produced by resistance to the flow of labor from country to country, or from one group of avocations to another group within the same country, are the effects upon the real remuneration of labor within particular avocations, produced by the differences in the powers, the faculties, and the aptitudes of individuals within the same country, and within the same great group of occupations. The rate of wages within any particular avocation will be determined exclusively by the operation of the principle of demand and supply.

—Now, in economics, the words demand and supply alike have reference, 1, to a certain article, and, 2, to a certain price. Demand means the quantity of a given article which would be taken at a given price. Supply means the quantity of that article which could be had at that price. Applying the term supply, in the sense indicated, to any given market for labor, we find that supply reaches its maximum in the number of persons who are capable of rendering the service which is required, and its minimum in the number who are both capable of rendering that service and are willing to do so at the price which the demand for the service causes to be offered. The maximum supply of labor so determined, may, in a given occupation, be so small as, given a large demand for the service to be rendered, to allow a very high rate of wages to be reached, and to be maintained and even increased from generation to generation.

Thus, the demand for the services of opera singers of the highest class was, forty years ago, so great as to permit the wages of a prima donna to equal the income of a lord; yet, during the entire human generation that has intervened, this magnificent premium upon operatic art, although open freely even to the peasantry of every land, has not sufficed to reduce, in the slightest degree, the price of such services. On the contrary, that price has steadily risen, under the influence of enlarged demand, until \$2,000 is paid for an evening's singing. In a similar way, the wages of the lawyer of the first class is almost wholly uninfluenced by the presence of large numbers of persons of the same profession who would be rejoiced to earn a tenth or a twentieth part of his income.

—Those who perform manual labor, again, seem, as one looks over the face of industrial society, to be organized into certain not very clearly defined "non-competing groups," to use Prof. Cairnes' phrase, within each of which the tendency to the equalizing of wages is in continual, if irregular, progress; but between any two of which, movement is so slow and difficult as to produce painfully small results, even from age to age. If we study the body of skilled artisans, in any country where caste does not exist, and the spirit of tradition is not very strong, we find that the interchange of the trades of carpenter, cabinet maker and carriage builder, for example, is freely made: that these trades, though less freely, interchange with those of blacksmith, mason and plumber, wherever strong reason exists for diminishing the supply of labor in one trade and increasing that supply in another. All the while, however, there is found below the class of skilled artisans a vastly greater class, consisting of factory operatives, of day laborers, etc., who are compelled not only to work for half the wages of the skilled artisan, but also, by what would seem, from almost unvarying recurrence, to be a moral necessity, to bring up their children, in the main, to take their own low places in the industrial order, however crowded and uncomfortable those places may be. Indeed, it may be said that the less desirable the place which the parent fills in life, the smaller his ability to provide for the advancement of his offspring.

—The services performed by the laborer of this last-indicated general class vary almost infinitely in form. So much, however, are the several recognized avocations within this group alike in the demands they make on the mental and physical powers, that a certain movement of labor exists, tardy and difficult, it is true, so tardy and difficult, indeed, as often to allow an individual who has been unfortunate in seeking employment, or has put himself at disadvantage by bad habits, to be cast down into the industrial grade which lies beneath; yet still the tendency to the equalization of wages here continues to operate appreciably, in spite of all obstructions.

—Below the class described as including the ordinary factory operative, the ordinary day laborer, and others receiving an approximately equal remuneration, is found a great body of the more or less helpless, the more or less unfortunate, the very ignorant, the men and women of vicious habits, the weak, the crippled, and the "broken men" of the higher industrial grade. These constitute the lowest stratum of the industrial order. Movement, here, in the nature of change, whether of place or of occupation, is very tardy. A member of this class may with great difficulty pass from one avocation to another within his grade; it is most unlikely that he will ever, by any

exertion of his powers, or any effort of self-denial, rise out of the class in which he was born or into which he has fallen.

—We see, in the rude sketch here offered of modern industrial society, as existing, say, in England, how it is that the supply of labor within certain avocations, or groups of avocations, is restricted, so that, after making all needed allowances in reduction of nominal to real wages, the average remuneration of one class may be twice that of another, four times that of a third, though only a small fraction of that received by the members of a class still more fortunate; how it is that this may not only be at a given time, but that the causes which create these differences of condition may go on operating to produce inequality faster than competition can perform its leveling work; and that, thus, the range of wages, wide as it may be at any given time, shall steadily increase from year to year, and from generation to generation.

—It is the effect of education, and, in a lower degree, of political franchises, by promoting the communication of news, from man to man and from place to place, by promoting self-reliance and power of initiative on the part of individuals, and by promoting self-respect and social ambition throughout the community, to promote, also, the flow of labor under economic impulse. Such causes, so far as they produce such effects, are strictly economic causes, to be recognized by the economist, and incorporated in his theory of the distribution of wealth.

—The operation of the forces thus set in motion is clearly to be seen in such countries of the old world as Saxony, Switzerland and Scotland, rising to its maximum probably in the United States of America, where alike the inertia of the laborer and the external resistance to his migration in search of the best market for his services, are so far reduced as to become almost inconsiderable. Nine and a half millions of the native inhabitants of this country at the present time reside in states other than those in which they were born.<sup>157</sup> Doubtless an even greater number of those who reside within the states of their birth, are found in alien counties. If we consider only the heads of families in the United States, I personally believe, although no adequate statistical data are available to corroborate this opinion, that not more than one-fourth are to be found within the towns or parishes in which they were born.

—Such a complete subjection of the laborer to economic impulse has, of course, no power to reduce those inequalities of wages which are due to differences in physical or mental strength, activity or persistence. It has no great power to reduce those inequalities which result from early mistakes and misadventures, or from vicious habits and courses, always most influential causes in arranging men upon the industrial scale; yet it has a certain unmistakable efficiency in this direction, through affording the opportunity to blot out a bad record and to begin a new career without prejudice. But over all those inequalities of wages which result from accidents of condition or circumstances, the force indicated has irresistible sway.

—And this, too, is to be taken into account, that in the degree, and in more than the degree, in which the laborer, by change, whether of place or of occupation, secures an increase of his own remuneration, does he also promote the general production of wealth. Whenever the laborer, by the exercise of courage and intelligence, breaks

away from the spot or the kind of work in which he has found an inadequate remuneration, and seeks and finds a better market, he does not only that which is best for himself, but that which is best for others. He not only gets more by resorting to the new place or the new trade, but, in the very act of doing so, he gives more also. If in that market his service bears a higher price than elsewhere, this is, of itself, a proof that his service is there in greater demand, more needed, the subject of an intenser want. By all the difference which the change works in his own condition, and, doubtless, by even much more than that difference, is the general industrial system re-enforced and stimulated by that change.

—Hence we say, that freedom and facility of industrial movement as seen at their maximum in the United States, do not only reduce the range of remuneration, as between the classes naturally less favored and those more favored, but it also, by enhancing the productive power of the community, raises the remuneration of the whole body of laborers.

—II. GENERAL WAGES. The question, what portion of the product of industry passes, by the normal operation of economic laws, into the hands of that one of the co-operating agents of production whom we call, in economic discussion, the laborer, was, until fifteen years ago, deemed to have been conclusively and definitively answered by the accepted political economy of England and America. That answer made the capitalist employer to be the residual claimant upon the product of industry. Rent was first to be deducted, the amount to be determined according to the Ricardoan formula. Next, wages were to be deducted, the amount to be determined by the wage-fund formula. There were to remain profits, composed of interest upon capital and of the remuneration of business management. These constituted the share of the capitalist employer, who, after paying rent and wages, according to the formulæ indicated, retained all the rest of the product of industry as his own. In the article next preceding, we have traced the rise and fall of the wage-fund doctrine, and have stated the arguments which have led to its general abandonment by the economists of England and America, opening the way for a philosophy of wages. So long as that doctrine was accepted, wages remained purely a question in long division, and no philosophy of wages was possible. To what view of the distribution of the product of industry economic opinion will ultimately incline, can not be predicted with confidence. In 1871, Prof. Stanley Jevons, decisively rejecting the notion of a wage fund, advanced the proposition that "the wages of a laboring man are ultimately coincident with what he produces, after the deduction of rent, taxes, and the interest of capital." Upon this statement of the law of wages, Mr. Henry Sidgwick, in an article in the "Fortnightly Review" of 1879, remarked as follows: "It is to be observed that it does not attempt to settle the distribution of produce as between employers and employed, except so far as the employer's share consists of interest. That is, it does not help us to determine what Mill calls 'the wages of superintendence.' Now, it is just this latter that, in our practical discussions, usually appears the most prominent element of the problem. What English workmen grumble at, is not the rate of interest, but the undue extra profits which they suppose the employer to be making." Accepting as correct the judgment of Prof. Sidgwick, that the one undetermined point in the theory of the distribution of wealth is that which relates to the "wages of superintendence," the writer of the present article now proceeds to offer a view of

profits, in their relation to the other shares of the product of industry, which, if it shall be accepted as based upon a just generalization of the facts of modern industrial society, will indubitably yield a complete and consistent theory of distribution, according to which the laborer, and not, as by the exploded wage-fund doctrine, the capitalist employer, is made the residual claimant upon the product of industry.

—The line of argument which appears to lead to this momentous conclusion is as follows: The successful conduct of business, under free and active competition, must be due either to exceptional abilities or to exceptional opportunities. Whether due more to one than to the other of these causes, could make no difference with what is to follow; just as it makes no difference in the matter of rent, whether the advantages, for productive purposes, of any piece of land under consideration be due to superior fertility or to proximity to market. As the economist, in writing of rent, is wont, for convenience of reasoning and simplicity of illustration, to attribute the productive advantages of land solely to superior fertility, assuming all tracts in question to be equally near the market, so, in the further progress of this paper, the more or less successful conduct of business will be attributed to the possession of higher or lower abilities, all employers being assumed, for convenience of reasoning and simplicity of illustration, to occupy industrial positions equally eligible. When we shall have passed over the field, it will then appear that all our conclusions, upon the foregoing hypothesis, would hold equally true upon the assumption that all differences in the degree of business success were due to differences of industrial opportunity, and not at all to differences of business ability.

—Since, however, it can not be a matter of indifference to the social philosopher whether the power to secure profits be due more to exceptional abilities or to exceptional opportunities, it may be worth while to pause one moment to point out that the former are much the more efficient cause of profits. To justify this assertion, it will be enough to refer to the notorious fact that the great majority of all business houses in the United States which have achieved marked success have been founded by men who owed little or nothing to opportunity, perhaps by those who had to contend at the outset against positive disadvantages or actual misfortunes; while, on the contrary, great houses, enjoying high prestige, wide connections and vast accumulated wealth, are frequently brought to the ground, under the successors of the original founder, for no other reason than that the management, which had been wise and brave and strong, became, in other hands, vacillating, purposeless and unintelligent, or perhaps no worse than merely commonplace and tied to routine. So overwhelming is the preponderance, in this country at least, of business houses owing much or everything to ability, and little or nothing to unearned opportunities or advantages, that no American [158](#) is likely to dispute the proposition that the former are much the more efficient cause of profits.

—Attributing, then, for convenience, the successful conduct of business to ability alone, we have to note, that, were the number of men of a high order of business ability throughout any large community more than sufficient to do all the business of all kinds which there required to be done; were these men, however much surpassing other members of the industrial society, among themselves equal in all respects which concern the conduct of business; and were this class, thus constituted and endowed, so

clearly and conspicuously marked that no one of their number should ever fail to be recognized as belonging to it, while, on the other hand, no one lacking business ability in this degree should esteem himself capable of conducting business or be so esteemed, with a view to his obtaining credit, by those who have capital to loan or goods to sell: were these several conditions to be all completely realized, we should then have a situation closely analogous to that which exists in the case of a community around which is found good land, of uniform quality, in amount more than adequate to raise all the produce required. The result would be, either that the employing class would, by forming a combination and scrupulously adhering to its terms and its spirit, create and maintain a monopoly price for their services in conducting the business requiring to be done, which is so improbable as to be altogether out of our contemplation, or else they would, by competing among themselves for the amount of business to be done by them individually, bring down the rate of profits to so low a point that the remuneration of each and every one of this class would be practically equal to what he could earn for himself in other avocations, either as an independent laborer, working in his own shop or on his own lot of land, or, as a wage laborer, hired by some one of his own intellectual class, no more qualified in any way than himself to conduct business. Under such conditions, profits, as distinguished from wages, would be destroyed. The persons actually remaining in the conduct of business would, indeed, earn their subsistence—otherwise the function could not be performed; but, economically speaking, it would make no difference to them whether they did this as employers or as employed.

—In fact, however, the qualifications for the conduct of business are not equal throughout all of a sufficiently numerous class.

—First, we have those rarely gifted persons who, in common phrase, seem to turn everything that they touch into gold; whose commercial dealings have the air of magic; who have such power of insight that they almost appear to have the power of foresight; who are so resolute and firm in temper that apprehensions and alarms or repeated shocks of disaster never cause them to relax their hold or change their course; who have such influence and command over men that all with whom they have to do acquire vigor from the contact, and work for them as they would not work for others.

—Next below, but far below, the class described, we have that much more numerous body of men of business, who possess a high order of talent, merely; whose success is easily comprehended, even if it can not be imitated, by their less gifted competitors; men of natural mastery, sagacious, resolute and prompt in their avocations.

—Then, descending further in the scale, we have men who on the whole do well or pretty well in business; men who enjoy a harmonious union of all the qualities required for the conduct of affairs, though possessing those qualities each in but a moderate degree; or else in whom some defect, mental or moral, impairs a higher order of abilities; men who are never masters of their fortunes, are never beyond the imminence of failure, and yet, by care and pains and diligence, win no small profits from their business, and, if frugality be added to their other virtues, accumulate in time large estates.

—Lower down in the industrial order are a multitude of men who are found in the control of business enterprises, for no very good reason that can be seen by those who know them; men of checkered fortunes, sometimes doing well, but more often ill; some of them, perhaps, filling a place which would not otherwise be filled, but more commonly in business because they have forced themselves into it under a mistaken idea of their own abilities, perhaps encouraged by the partiality of friends who have been willing to place in their hands the agencies of production, or entrust them with commercial or banking capital.

—Now, in my view of the question of profits, we find, in the lower stratum of the industrial order, as thus sketched, a "no profits" class of employers. Notwithstanding all the magnificent premiums of business success, the men of real business power are not so many but that a great part of the posts of industry and trade are filled by persons inadequately qualified, who consequently have a very doubtful career, and realize for themselves, first and last, a very meagre compensation, so meagre that, for purposes of scientific reasoning, we may treat it as constituting no profits at all. Live they do, partly by legitimate toll upon the business that passes through their hands; partly at the cost of their creditors, with whom they make frequent compositions; partly at the expense of friends or by the sacrifice of inherited means. This bare subsistence, obtained through so much of hard work, of anxiety, and often of humiliation, we regard as that minimum which, in economics, we can treat as *nil*. From this low point upward we measure profits, just as we measure rent upward from the line of the no-rent lands, or lands whose selling price represents an annual interest of only a few cents an acre.

—If the view of the employing class here presented fairly corresponds to the facts of industrial society, profits, manufacturing profits, for example, are, granted only perfect competition, not obtained by deduction from the wages of mechanical labor, any more than rent is obtained by deduction from the wages of agricultural labor; and, secondly, manufacturing profits do not constitute a part of the price of manufactured goods, any more than rent constitutes a part of the price of agricultural produce. All profits are drawn from a body of wealth which is created by the exceptional ability of the employers who receive profits, measured upward from the line of the no-profits employers, just as rents are drawn from a body of wealth created by the exceptional fertility of the rent lands, measured from the level of the lands which bear no rent. The normal price of manufactured goods, of any particular description, is determined by the cost of production of that portion of the supply which is produced at the greatest disadvantage. If the demand for such goods is so great as to require a certain amount to be produced under the management and control of persons whose efficiency in organizing and supervising the forces of labor and capital is small, the cost of production of that portion of the stock will be large, and the price will be correspondingly high; yet it will not be high enough to yield to employers of this grade any more than that scant and difficult subsistence which we have taken as the no-profits line.

—The price at which these goods are to be sold, however, will determine the price of the whole supply, since, in any market, at any given time, there can be but one price for different equal portions of the same commodity. Hence, whatever the cost of

production of those portions of the supply which are produced by employers of higher industrial grades, they will command the same price as those portions which are produced at the greatest disadvantage, just as wheat produced on rich lands at a cost of three shillings a bushel is sold for the same price with wheat produced on comparatively sterile lands, at a cost of six shillings a bushel.

—Profits, therefore, do not enter into the price of any commodity; for the price of each and every commodity is fixed by the cost of production of that portion of the supply which yields no profits.

—Do profits come out of wages? Not at all. The employer of the lowest industrial grade, the no-profits employer, must pay wages sufficient to hire laborers to work under his direction. The employer of a higher industrial grade will pay the same wages, no less, no more; but, selling his goods, so far as they are of equal quality, at the same prices as the employer who makes no profits, he will yet be able, by careful study of the sources whence his materials are drawn; by a comprehension of the ever-varying demands of the market; by steadiness and self-control; by organizing force and administrative ability; by energy, economy and prudence, to accumulate a clear surplus, after all obligations are discharged, which surplus is called profits, just as the cultivator of the better soils has a surplus left in his hands, after paying wages for labor and interest for capital, which surplus, in this case called rent, goes to the owner of the soil, as such, be he the actual cultivator or another person.

—It will have been observed, that, throughout this discussion, I closely assimilate profits with rent. I believe this to be a sound and just view of the origin of profits and of their relation to the other shares of the product of industry. If this view shall be approved as correct, the demand of Prof. Sidgwick will be met, and we shall have, for the first time since the destruction of the wage-fund doctrine, a complete and consistent theory of the distribution of wealth. By this theory the residual claimant upon the product is not, as under the old economic doctrine, the capitalist employer, but the laborer. Subject to three several deductions of a definite nature, the wages class will, upon the assumption here made of perfect competition, supplying all the conditions of a really good market, receive all they have helped to produce.

—*First.* Rent is to be deducted. On the lowest grade of soils there is no rent. On the more productive soils, rent, at its economic maximum, equals the excess of produce after the cost of cultivating the no-rent soils has been deducted; this rent, as has been said, does not affect the price of agricultural produce, nor does it come out of the remuneration of the agricultural laborer. We thus see that the first deduction to be made from the product of industry is of a perfectly definite nature. Rent must come out before the question of wages is considered. The laborer, as such, can not get this, or any part of it, by any economic means. It must go to the owner of the lands unless confiscated by the state, or ravished away by violence.

—*Second.* From the product of industry must be deducted a remuneration for the use of capital. That remuneration must be high enough to induce those who have produced wealth to save it and store it up, instead of consuming it immediately for the gratification of personal appetites or tastes. This may imply, in one state of society, an

annual rate of interest of eight per cent.; in another, of five; in another, of three. The only reason, industrially speaking, for interest being paid at all, is, that by the use of capital production may be enhanced; and the interest so paid is, theoretically, only a part, often, such is the force of competition among would-be lenders, a very small part of the excess of product so generated. Since the product remaining after the payment of interest is always, in theory, equal to what would have been the product had interest not been paid (that is, had the capital for the use of which interest is paid, not been employed), and since, in fact, the product so remaining is always greater in general, vastly greater—at times inconceivably greater—than the product otherwise would have been, we see that that party to distribution whose claims are residual, that is, which takes all which no other claimant carries away, is benefited by every payment of interest on account of capital used in the production of wealth. Indeed, as high interest, under free competition, shows that the contribution made to production through each successive increment of capital is very large, it may fairly be said that the residual claimant upon the product of industry derives a greater relative benefit through the employment of capital where a high rate rather than a low rate of interest is paid.

—The third and last deduction to be made from the product of industry, before the laborer becomes entitled thereto, is what we have called profits, the remuneration of the employer, the entrepreneur, the man of business, the captain of industry, the merchant, manufacturer or banker, who sets in motion the costly and complicated machinery of modern production.

—If I have rightly apprehended the nature of the employer's function and the source of his profits, those profits would, under free and full competition, not form a part of the price of commodities (price being determined by the cost of production under the most disadvantageous conditions, *i.e.*, in this instance, production by the no-profits employers); while no economic means whatsoever would suffice to carry any portion of profits over to wages, even were employers forbidden by law to receive them, just as no economic means can be devised by which rent could be made to enhance wages, even though landlords were forbidden themselves to touch it. In other words, profits consist wholly of wealth created by individual employers, over and above the wealth which would have been produced, in similar industrial enterprises, by the same labor force and capital force, under the control and direction of employers of lower economic efficiency.

—These three shares being cut off, the whole remaining body of wealth daily or annually produced is, according to the economic theory presented, the property of the laboring class: their wages or the remuneration for their services. So far as by their energy in work, their economy in the use of materials, or their care in dealing with the finished product, the value of that product is increased, that increase goes to them by purely economic laws, provided, only, competition be full and free. Every invention in mechanics, every discovery in the chemical art, no matter by whom made, inures directly and immediately to their benefit, except so far as a limited monopoly may be created by law for the encouragement of invention and discovery. Every improvement in their own efficiency as laborers, whether due to quickened zeal, to heightened intelligence or to greater industry, sobriety or thrift, will, by this rule, serve directly to

advance their wages. Unless by their own neglect of their own interests, or through inequitable laws, or social customs having the force of law, no other party can enter to make any claim upon the product of industry; nor can any one of the three parties already indicated carry away anything in excess of its normal share, as hereinbefore defined.

—It will appear, at a glance, how widely the result here attained differs from that which was reached under the old economic theory of the distribution of wealth, according to which from the entire product of the exertions and sacrifices of the industrial community is cut off, first, rent, as determined by the Ricardoan formula; secondly, wages, the laborer's share, as determined by the wage-fund formula, the amount possibly to be paid in this way being irrespective of the number and of the industrial quality of the laboring class. All that remains belongs to the capitalist employer. By such a rule of distribution, no gain in the efficiency of the individual laborer, whether taking the direction of greater energy or of greater economy; no mechanical invention, no chemical discovery, however much the capability of production may be increased thereby, can profit the laborer anything, except as it first enhances the profits of the employing class, and thereby adds to the capital of the wage fund, to be thereafter expended in purchasing labor—In opposition to this view, I hold, that, notwithstanding the formal attitude of the laboring class in industry, as hired by the employing class and working for stipulated wages, the normal operation of the laws of exchange is to make the former, in effect, the owner of the whole product, subject to the requirement of paying the definite sums charged against the product on the three several accounts of rent, interest and profits.

FRANCIS A. WALKER.

## "WALTHAM SYSTEM,"

"WALTHAM SYSTEM," a term much used in connection with the manufacture of cotton and woolen goods during the period from 1814 to 1830. Prior to the war of 1812, the processes of carding, spinning, weaving and fulling, were carried on in separate establishments under different proprietors. But in 1813, in consequence of the inventions of Francis Cabot Lowell, the Boston manufacturing company was enabled to combine all these processes in their establishment at Waltham. Boarding houses for their operatives, and the periodical payment of wages in money, in lieu of payment in provisions and clothing from the factory store, were also introduced. This system was soon afterward introduced at Lowell, and soon became general. The advantages of the Waltham system, alike to manufacturers and workmen, are too obvious to require explanation.

## WANTS.

WANTS. Man alone, of all animate beings, possesses the faculty of constantly adding to his wants, and to the means of providing for them. This double faculty, in course of time, very materially modifies human life, and the life of most organic beings; it completely changes the primitive distribution of the different genera of animals and vegetables, as well as their respective proportions. It is that faculty which, in the words of Buffon, "ends by impressing our ideas upon the face of the earth"; the faculty which has given our intellect the exercise that has so prodigiously developed its power, and without which the human mind would have remained but little above that of the different species of apes. To this faculty we must also attribute the multiplication of our race upon the earth, whose spontaneous productions would not furnish sufficient sustenance for a millionth part of those who now dwell upon it.

—The faculty of increasing our wants should always be joined to that of increasing the means of satisfying them, for these two faculties are inseparable, they stand to each other in the relation of cause and effect, and the latter could never act but under the spur of the former; so that we can not logically deplore, with certain schools of pretended philosophers, the continual extension which is given to human wants by the onward march of humanity, without at the same time censuring the increase of the means of subsistence, and of the goods of all kinds which the second faculty, that is, industry, has procured for us.

—Of all the publicists who have maintained the doctrine of the limitation of wants, J. J. Rousseau is the most radical, and the only consistent one; for he is the only one who, looking upon the faculty of extending our wants as a direful gift, has entirely repudiated, at least in theory, all the goods whose production is due to that faculty. According to him, mankind entered upon the path of degradation, from the very day that they thought of substituting a cabin for a cave in the rocks and the foliage of trees, or determined to add the bow and arrow to their teeth or their nails. (*Discours sur l'origine de l'inégalité.*) If Rousseau had reflected, that, in order to reduce the human race to this manner of living, it would be necessary to sacrifice it almost entirely, he would probably have acknowledged that the advantage of thus elevating a few rare individuals to the condition of the orang-outang, would not be worth such a sacrifice.

—The theorizers of to-day do not push the doctrine of the limitation of wants as far as Rousseau did; and, although they hold the same principle, they assign different motives for it. They consider the generalization of the desire for well-being the principal source of our ills, because it is calculated to develop cupidity, envy and other maleficent motives; and they would counteract it by inculcating austere religious tenets, a contempt for the pleasures of this world, and resignation to present suffering, in anticipation of happiness in a future life. They think of perfecting man's life on earth by contemning and despising it. They assure us that the general observance of their doctrines or precepts is the best means to secure the tranquillity and happiness of nations, and of *strengthening social order*.

—Unfortunately these modern defenders of what Bentham calls the *principle of asceticism*, do not preach by example. Fully provided themselves with all that can satisfy most completely awakened wants, it ill becomes them to censure in the impoverished classes the aspiration to a position more or less nearly resembling their own, unless they first themselves renounce the advantages of their position. This, however, they do not do; they very willingly make use of the goods which they pretend to despise; we generally find them very anxious to escape privation, and none of them has yet been able to persuade himself to live in a Diogenes tub. This contradiction between their theory and their practice gives ground for the belief that their faith in the truth and efficacy of their doctrine is not very lively or sincere, and this is probably one of the causes of the fruitlessness of their preaching.

—But even if they were to join example to precept, as did some of their predecessors in past ages, they would succeed no better than did these in inducing mankind to live a life contrary to their instincts. We can not change the nature of things by ignoring it; it remains what it is despite all our opinions and all our errors. The soul of man, such as God made it, and as it manifests itself during the entire time of its union with the body—from the cradle to the grave—is *an inexhaustible source of desires* (Frederick Bastiat, *Harmonies Économiques*); and a desire is nothing but a seeking for some satisfaction, or a shrinking from some pain, that is to say, *a tendency to well-being*.

—This tendency, therefore, is essential to the soul; it is as intimately connected with, and inherent in, our nature, as the mysterious force which attracts them to the centre of the earth is to heavy bodies. All that the will of man can do is to direct this tendency toward some gratifications rather than toward others; but we obey them in all our resolves, even when we constrain present wants in order to enjoy a future gratification, or impose a hardship upon ourselves to escape still greater ones, or resist the temptation to a physical gratification with a view to intellectual or moral pleasure, or even when we practice the greatest possible renunciation, and deny ourselves all of this world's goods with the hope of thus obtaining a happy existence in a better world.

—Among the infinite variety of directions that may be given to our wants, some are more and some less favorable, some are more and some less opposed to the perfecting or improvement of human life. Thus, for instance, nations whose desires are too exclusively directed toward sensual gratifications, soon degenerate, because it is the nature of such gratifications to weaken the vigor and manhood of those who give themselves over to them without restraint, to degrade their affective faculties, to render them at the same time less fitted for intellectual operations, and thus to weaken the principal element of our power. But too absolute a repression of the instincts which urge us to sensual gratifications would be attended with no less pernicious results. Whether this repression be inspired by religious belief, or prompted by the idea—an idea which bears the impress rather of laziness than of philosophy—that it is better for man to stifle his wants than to have to produce the means of satisfying them, the inevitable effect will be to degrade his most precious faculties by allowing them to remain inactive. For it is to their activity alone that we must attribute the immense development which they have acquired, a development which may be estimated by comparing the most civilized portions of the population of Europe with the tribes that have remained almost in their primitive state of barbarism.

—The science of morals point-out to us the reefs upon which our blind tendencies would wreck us; its duty is to show us as clearly as possible the good or evil courses which wants may take, by discovering and indicating to us all the consequences of our inclinations, whether proximate or remote. Of the many courses which these inclinations may take, there is one which will surely lead to our ruin, and others which lead as surely to the progressive improvement of humanity in every respect. It is the part of morals to tell us whither these different courses lead, in order that, while obeying the irresistible impulse of our nature to seek after well-being, we may be less exposed to losing our way.

—In the present state of science this mission of morals is scarcely even outlined, and the only real progress which we have made in this respect for over a century, is due to political economy.

—But, although political economy has thrown a great deal of light upon the consequences of some of the tendencies and habits of mankind taken collectively, its object is not so much to influence us in the direction of our wants as to enlighten us on the general means of insuring their satisfaction. It is for this reason that it takes these wants as they are, and recognizes *utility* in everything which they cause us to seek, without stopping to examine whether they are rational or not. Those who find fault with it for proceeding in this manner, do not realize that it could not act otherwise without extending its field of investigation beyond measure; that it could not furnish suitable rules to guide us in the choice of our satisfactions, and in the development of our inclinations and tastes, without creating out of whole cloth a science which does not exist. The principles of political economy are in every way independent of the direction our wants take, and they will be none the less true and useful when the progress of morality shall have made the general wants of man better understood, and more strictly conformable to well-being and the perfection of life than they are at present. The natural laws of production, distribution and consumption of the objects of our wants remain the same, no matter what the nature of the satisfactions which these objects procure, and independently of the favorable or injurious results which the habit of these gratifications may have upon individuals and nations. It is with the principles of political economy as with those of mechanics: they remain the same whether applied to the creation of an implement of warfare—an instrument of death and destruction—or suggesting rules for the better employment of the forces employed in the production of means of subsistence. Thus, for instance, the principles of political economy are as well adapted to point out to the savages of North America the general means of obtaining abundantly the alcoholic wants which degrade and kill them, as they are to enlighten civilized nations upon the social conditions most favorable to the increase and diffusion of all that can contribute to the improvement of physical life and of the intellect.

—It is nevertheless true that the progress of morality, without changing anything in the principles of political economy, must aid in rendering the application of those principles more profitable; and the realization of this truth has led most economists to some extent into the domain of morals, while they were seeking to measure the relative extent and merit of different classes of wants, while they were combating the

errors and prejudices which favor luxurious and purely frivolous expenses, and condemning those which tend to enervate and degrade nations.

—The wants of nations are never a fixed quantity, they are constantly varying and generally progressive; but they are endowed with such elasticity, even in what concerns food, that experience has frequently shown that great variations may occur in their yearly alimentary production without exercising any proportionate influence upon the number of the population, that the population may increase without an equivalent increase in the quantity of products, and that an increase of general production may coincide with the stationary state of the population. In this latter case the wants of each are more fully satisfied; in the former cases they are necessarily restricted, and there is, consequently, more suffering.

## WAR DEPARTMENT.

WAR DEPARTMENT. One of the executive departments of the United States government, established by act of Aug. 7, 1789. (1 Stat. at Large, p. 49.) The head of this department, officially designated the secretary of war, has charge of all matters respecting military affairs, under the direction of the president; has custody of all records, etc., relating to the army, the superintendence of all purchases of military supplies, the direction of army transportation, the distribution of stores, etc., the signal service and meteorological records, the disbursement of all appropriations for rivers and harbors and their survey and improvement, and the superintendence and supply of arms and munitions of war. The secretary of war is a member of the cabinet (salary, \$8,000). He is required to make an annual report to congress, with statement of all appropriations and their expenditure, contracts for supplies or services, reports of surveys, and of improvements of rivers and harbors, returns of the militia in the various states, etc.

—The extensive business of the war department is distributed among ten military bureaus, each under a chief who is an officer of the regular army, and receives a salary of \$5,000 while at the head of a bureau. The chief clerk of the department (salary, \$2,750) has charge of the correspondence and accounts, communicates between the secretary and department officers, and has general superintendence of 90 to 100 clerks and other employés attached to the secretary's office. The adjutant general of the United States army is at the head of a bureau of 575 clerks, etc. He issues the orders of the president and the general commanding the army, conducts the army correspondence, the recruiting and enlistment service, issues commissions, receives reports and resignations, is custodian of the voluminous army records of the United States, keeps the muster rolls, and makes an annual report of the strength and discipline of the army. The inspector general, with assistance, inspects and reports the condition of the army at all military posts, as well as the accounts of its disbursing officers. The quartermaster general (132 clerks, etc.) has charge of army transportation, clothing, quarters, equipage, forage, wagons, horses and mules, fuel and lights, stationery, hospitals, medicines, etc. He employs and pays guides, spies, etc., defrays funeral expenses, and has charge of the national cemeteries. The commissary general (38 clerks, etc.) is charged with the subsistence department, army rations, and purchase and distribution of the same. The surgeon general (463 clerks, etc.) has control of the medical department, the selection, purchase and distribution of medicines, records of all wounded, disabled and deceased soldiers, the supervision of army surgeons and of the army medical museum at Washington. The latter contains an extensive exhibit of specimens, representing the effects upon the human body of wounds, morbid conditions, etc., with the complete hospital records of the army, and a very extensive library of nearly 60,000 volumes. The paymaster general (60 clerks, etc.) keeps the accounts and disburses the pay of the army, through a large body of paymasters. The chief of engineers (17 clerks, etc.) is commander of the corps of engineers, charged with fortifications, torpedo service, military bridges, river and harbor improvements, military and geographical surveys, etc. The chief of ordnance (36 clerks, etc.) is charged with artillery and all munitions of war, prescribing models

and modifications of weapons, and their construction, preservation and distribution to the regular army and to the militia of the states. The chief signal officer superintends the signal service, and the weather bureau, with a corps of instruction in signal duties, prepares and issues maps and charts, and publishes daily meteorological reports from the numerous stations of observation, which are afterward consolidated in permanent form. The judge advocate general receives and reviews proceedings of courts-martial and other military tribunals of the army, and furnishes opinions and reports on questions of law, etc., to the secretary of war.

—The war department is conducted at an annual expense for salaries of \$1,936,855 (in 1884), and contingent expenses (including printing) of \$340,000. The following is a complete list of the secretaries of war, with their terms of office:

1. Henry Knox... Sept. 12, 1789
2. Timothy Pickering... Jan. 2, 1795
3. James McHenry... Jan. 27, 1796
4. Samuel Dexter... May 13, 1800
5. Roger Griswold... Feb. 3, 1801
6. Henry Dearborn... March 5, 1801
7. William Eustis... March 7, 1809
8. John Armstrong... Jan. 13, 1813
9. James Monroe... Sept. 27, 1814
10. William H. Crawford... Aug. 1, 1815
11. George Graham... *ad interim.*
12. John C. Calhoun... Oct. 8, 1817
13. James Barbour... March 7, 1825
14. Peter B. Porter... May 26, 1828
15. John H. Estlin... March 9, 1829
16. Lewis Cass... Aug. 1, 1831
17. Joel R. Poinsett... March 7, 1837
18. John Bell... March 5, 1841
19. John C. Spencer... Oct. 12, 1841
20. James M. Porter... March 8, 1843
21. William Wilkins... Feb. 15, 1844
22. William L. Marcy... March 6, 1845
23. George W. Crawford... March 8, 1849
24. Charles M. Conrad... Aug. 15, 1850
25. Jefferson Davis... March 5, 1853
26. John B. Floyd... March 6, 1857
27. Joseph Holt... Jan. 18, 1861
28. Simon Cameron... March 5, 1861
29. Edwin M. Stanton... Jan. 15, 1862
- Ulysses S. Grant, *ad int...* Aug. 12, 1867
- Lorenzo Thomas, *ad int...* Feb. 21, 1868
30. John M. Schofield... May 28, 1868
31. John A. Rawlins... March 11, 1869
- William T. Sherman... Sept. 9, 1869
32. William W. Belknap... Oct. 25, 1869
33. Alphonso Taft... March 8, 1876
34. Jas. Donald Cameron... May 22, 1876
35. George W. McCrary... March 12, 1877
36. Alexander Ramsey... Dec. 10, 1879
37. Robert T. Lincoln... March 5, 1881

## WARS

WARS (IN U. S. HISTORY). I. FRENCH AND INDIAN WAR. This was the first *national* war of the United States, although no such nation as the United States had as yet a formal existence. Previous wars had been waged by but one colony or a few adjacent colonies in combination. They had been the inevitable Indian wars, such as the Pequot war in 1637, or King Philip's war in 1675, waged by Massachusetts and Connecticut, and the Tuscarora war, in 1711, waged by North and South Carolina; or conflicts with the neighboring French and Spaniards, into which the colonies had been dragged by their connection with the mother country. Such were *King William's war*, in 1689-97, in which Massachusetts, Connecticut and New York united to attack Canada by land and sea; *Queen Anne's war*, in 1702-13, in which the fighting was done separately by South Carolina in the south, and by New England, New York and New Jersey in the north; the *Spanish war*, in 1639-42, in which the brunt was borne by Oglethorpe and his new colony of Georgia; and *King George's war*, in 1744-8, in which all the northern colonies took part. In the course of these conflicts, an increasing community of interests had brought an increasing number of the colonies to act together; but none of them had been general, and still less could any of them be called *quasi-national*. The French and Indian war was essentially different from all its predecessors. It was not provoked by European diplomacy, but continued for two years in America before war was declared in Europe. It was not brought on by European interests, but was accepted by the colonies in defense of their own interests. It was waged by all the colonies in common, from New Hampshire to Georgia. In waging it, the first plain distinction appeared between Americans, or "provincials," and Englishmen. (See NATION.) And, as a part of it, the first effort was made to secure a formal union of the colonies. (See ALBANY PLAN OF UNION.)

—In 1748 the Ohio land company was formed, as a Virginia and London speculation. Several of the Washington family were engaged in it, and its object was to develop Virginia's western resources. The peculiar claims of Virginia, from the asserted northwest direction of her northern boundary line, made it doubtful whether the country around what is now Pittsburgh was in Virginia or in Pennsylvania. (See VIRGINIA; TERRITORIES, I.) The Ohio company obtained from the crown a grant of 500,000 acres in this neighborhood, and began preparations to make roads to it through the still unsettled country. The French colonial empire in America then consisted of two settled territories, in Canada and at New Orleans, the two having about one-tenth the population of the English colonies, joined by a line of some sixty forts between New Orleans and Montreal. Many of these forts, such as Detroit and Natchez, have since become the sites of flourishing cities. The country through which the line ran was an Indian territory, with a few French hunters and traders in addition to the garrisons. But the French asserted territorial claims up to the crest of the Alleghanies; and they naturally took alarm as the first feeble wave of English settlement appeared over the mountains. In 1749 they sent an expedition through the present states of Ohio and Kentucky, to bury leaden plates at important points, with the arms of France graven on them, to assert possession of the country, and to warn English traders out of it. In 1752 the rivals came closer together: the Ohio company

built Redstone old fort (now Brownsville), on the Monongahela; and in 1753 the French built forts at Presque Isle, now Erie, and on the Alleghany to the south of it. Late in the same year, George Washington, then a young land surveyor, was sent to Presque Isle by Gov. Dinwiddie, of Virginia, to warn off the intruders. They declined to go, and made active preparations to extend their acquisitions.

—The key of the country was the point at the junction of the Alleghany and Monongahela, now known as Pittsburgh. All parties understood its importance. Late in 1753 Dinwiddie bought from the Indians the right to build a fort there, and sent men to do the work. Early in 1754 came the conflict: the French descended from Presque Isle, drove away the English, and finished the fort themselves, calling it Fort Du Quesne; and the French and Indian war had begun. The battles, such as the defeat of Braddock in 1755, and Johnson's defeat of Dieskau, near Lake George, in the same year, were at first not very creditable to the English and provincials. Their discordant and inefficient efforts were easily foiled by the inferior forces of the abler French leaders. In 1757 Pitt became the head of the English ministry, and order, vigor, sense and success came with him into the English councils. Fort Du Quesne fell the next year, and Quebec in 1759. During the following year the various French forts were taken into possession, and the French empire in America was lost forever. In 1763, by the peace of Paris, Great Britain was formally vested with the jurisdiction of the whole of North America east of the Mississippi, the Floridas being ceded by Spain, the ally of France in the war, in exchange for Havana, which an English expedition had captured two years before. Of her former possessions in North America, France ceded the portion east of the Mississippi to her victorious enemy, Great Britain, and the portion west of that river to her partner in misfortune, Spain.

—The persistence of Great Britain in retaining her conquests from France in North America, and thus relieving her other colonies from the constant danger impending from Canada, was at first sight a great mistake. The French minister for foreign affairs warned the British envoy at the time that the cession of Canada would only clear the way for the independence of the original British colonies; and from 1763 until 1775 French statesmen patiently watched the fulfillment of the prophecy, and were encouraged by the unanimous reports of French agents in North America. It even became the fashion in Great Britain, after the opening of the revolution, to attribute the boldness of the colonists entirely to the cession of Canada. But, after all, the change of jurisdiction in 1763 can not thus be made the universal scape-goat: it but substituted Great Britain for France as an enemy. Burgoyne's expedition would not have been any more dangerous to the colonies under a French than under a British standard. The truth seems rather to be that the cession of Canada would have postponed the day of conflict with the mother country for half a century, if the stupidity of British statesmen had not brought it to a head in 1775. France, Great Britain and all Europe combined could not finally have balked of its prey the Anglo Saxon lust for land; but the cession of Canada to the mother country satiated it peaceably for the time, just as Napoleon's cession of Louisiana in 1803 (see ANNEXATIONS, I.) satiated it again for the time. From this point of view the action of Great Britain in retaining the western territory would seem to have been as blindly wise as her subsequent attempt to "govern" the colonies was blindly foolish.

—II. See REVOLUTION.

—III. See ALGERINE WAR.

—IV. WAR OF 1812. The causes of the "second war for independence," as the war of 1812 is sometimes called, are elsewhere given. (See EMBARGO; DEMOCRATIC PARTY, III.) The internal political difficulties which accompanied it, and the great development of national feeling which followed it, have also been given a separate place. (See CONVENTION, HARTFORD; NATION, II.) It is designed here only to give, in some necessary detail, the course of action which closed it by the treaty of Ghent.

—March 8, 1813, the Russian minister at Washington, Daschkoff, offered to the American government, by direction of the czar, his friendly mediation in the war. Madison accepted it, and nominated, May 29, Bayard, of Delaware (see that state), Gallatin, and John Quincy Adams, then minister to Russia, as negotiators. July 19, the senate confirmed them, except Gallatin, who was secretary of the treasury: the affairs of the treasury were in so critical a condition that the senate refused to sanction his absence from the country. Nov. 4, 1813, while the three American negotiators were in St. Petersburg, one of them unconfirmed, Castlereagh wrote to the secretary of state, declining the Russian mediation, but offering to treat directly, and suggesting London as the place. It is supposed that Great Britain, not caring to offend Russia or to allow that country's friendship for the United States to influence the final treaty, wished to transfer the negotiations from St. Petersburg. In January, 1814, Henry Clay and Jonathan Russell were nominated and confirmed as additional negotiators; and Gallatin, who had by this time resigned the treasury, was confirmed.

—In August, 1814, the place of negotiation was transferred to Ghent; and here the five commissioners met Lord Gambier, Henry Goulburn, and William Adams, on the part of Great Britain. The time was hardly propitious for peace negotiations. On the 30th of the previous March the allies had entered Paris in triumph; in April Napoleon had departed for Elba; and the British government was free to settle accounts with the upstart people whose ships had won more flags from her navy in two years than all her European rivals had done in a century. And so, while negotiations were going on, detachments of Wellington's victorious veterans were being shipped to America, there to seize New Orleans and Louisiana, and make possession of them at least nine points of the final treaty of peace.

—Behind the British negotiators were the clamorous demands of the British war party and war newspapers, demands rising, in some cases, to the banishment of President Madison to some convenient Elba. "Better is it," said the "London Times," "that we should grapple with the young lion when he is first fleshed with the taste of our flocks, than wait until, in the maturity of his strength, he bears away at once both sheep and shepherd." Nevertheless, the first demands of the British negotiators must have seemed to them quite moderate. They were: 1, the creation of a permanent and independent Indian territory, between Canada and the United States; 2, that the northern boundary of the United States should run along the southern shore of the great lakes; 3, that the United States should have no forts on the northern frontier, and

no war vessels on the lakes, while Great Britain should not be so restricted; 4, that enough of the eastern part of Maine should be ceded to enable the British to build a military road from Halifax to Quebec; and, 5, that the right to use the Mississippi, guaranteed by the treaty of 1783, should be renewed to British subjects, while the American right to the Newfoundland fisheries, guaranteed by the same treaty, should be considered lost by the war. In June, as a last concession, the American government had allowed its negotiators to waive the questions of right of search and impressment, on which the war had been begun; but no instructions could cover such demands as these. They aroused the war spirit in America, when they were announced there, to a higher pitch than ever; and the American negotiators themselves lost their tempers.

—After four months of wrangling, a treaty was made in which not a point of the British demands was granted. This result can not be attributed to any friendly feeling between the two sets of negotiators, for they quarreled unremittingly from the beginning to the end of the negotiation; nor to any accord among the American negotiators, for they quarreled with one another almost as constantly. Clay wished to give up the fisheries and save the Mississippi; Adams wished to give up the Mississippi and save the fisheries; and Gallatin alone was busied in keeping the peace among his colleagues and with the British negotiators. The best explanation seems to be that the treaty was due mainly to the high tone taken by Russia and Prussia, at the congress of Vienna, in defense of neutral rights, and the desire of Great Britain to eliminate the United States from possible complications. Nevertheless, it remains very singular that the British negotiators should have signed a treaty without any mention of Louisiana, while the British expedition for its conquest was still in position before New Orleans, with high hopes of success. The treaty even provided that "all territory whatsoever taken by either party from the other during the war, or which may be taken after the signing of this treaty, \* \* \* shall be restored without delay"; so that the lives of Pakenham and his dead were absolutely thrown away, and their victory would have gained no more than their defeat. It is not easy to avoid the feeling that the inside history of the treaty of Ghent is yet to be written.

—The treaty, dated Dec. 24, 1814, at Ghent, and ratified by the senate Feb. 17, 1815, was in eleven articles. The first three provided for peace and the restoration of prisoners; the fourth, fifth, sixth, seventh and eighth, for the northern boundary (see MAINE; NORTHWEST BOUNDARY); the ninth, for the cessation of Indian hostilities; the tenth, for the suppression of the slave trade; and the eleventh, for the exchange of ratifications. It will be seen that the treaty did not touch one of the points on which the United States had declared war. These had been more practically settled: one frigate battle at sea was worth more to that purpose than a host of treaties.

—V. THE MEXICAN WAR. The settlement of Texas by Americans, its secession from Mexico, its annexation to the United States, and its admission to the Union as a state, have been given elsewhere. (See ANNEXATIONS, III.) Before the annexation Gen. Zachary Taylor was stationed in Louisiana, then the southwest frontier of the United States. May 28, 1845, he was ordered to cross the Sabine and take post in Texas, so as to protect it from invasion by Mexico. The apprehended invasion by Mexico did not take place; and, though diplomatic intercourse between Mexico and the United States was interrupted, war did not follow. Corpus Christi, on the western

bank of the Nueces, was then the advanced Texas town; and here Taylor made his headquarters for the rest of the year. The territory between the Nueces and the Rio Grande, a desert in the east but fertile in the west, had been claimed by Texas, but never reduced to possession. During the summer several dispatches were sent to Taylor, authorizing him to advance to the Rio Grande if he saw fit, because of hostile preparations by Mexico, and ordering him, in that case, not to wait for orders from Washington. But Taylor, Oct. 4, in a long dispatch declared that he "did not feel at liberty, under his instructions, particularly those of July 8, to make a forward movement to the Rio Grande without authority from the war department." There the matter rested until the following January.

—In the meantime, Nov. 9, President Polk appointed John Slidell (see LOUISIANA) as ambassador to Mexico, in pursuance of an intimation from Mexico that she would receive a commissioner to settle the Texas dispute. In December the Mexican government declined to receive Slidell in the character of an ambassador, since such a resumption of diplomatic intercourse would imply an abandonment by Mexico of the points in dispute, which had led to the rupture; but the offer to receive him as a commissioner was renewed. This was refused by Slidell. Soon afterward a revolution in Mexico placed a new government in power.

—Before any of these events could be known at Washington, but, as Mr. Buchanan, the secretary of state, admitted, "in anticipation" of them, an order, dated Jan. 13, 1846, was sent to Taylor to advance to the Rio Grande. Taylor arrived at the river March 28, established his camp opposite Matamoras, and was notified by Arista, the Mexican general, after a series of angry communications, that he considered war as already begun. April 26, a party of American dragoons was captured, with some bloodshed, by a superior force of Mexicans. As soon as Taylor's dispatch announcing this event reached Washington, the president sent a message to congress, in which he declared that Mexico had "at last invaded our territory, and shed the blood of our fellow-citizens on our own soil." Two days afterward, congress passed an act authorizing the president to call out 50,000 volunteers; but the gist of the act was in its short and simple preamble: "Whereas, by the act of the republic of Mexico, a state of war exists between that government and the United States." The whigs protested against the preamble, as a falsehood, but it was passed in the house by a vote of 123 to 67, and the whole bill by 174 to 14. In the senate the whole bill was passed by a vote of 40 to 2; five whigs protested against the preamble, and three refused to vote. War had thus begun; and, though the whigs had not been manœuvred quite into an attitude of opposition to it, they were for some time thrown into confusion by their efforts to evade the issue so unkindly thrust upon them. (See WHIG PARTY.)

—The essential facts and dates of the proceedings preliminary to war have been given above. Taken as they stand, they might be considered as a case of blundering into the lucky acquisition of California and New Mexico, for President Polk has not usually been regarded as a very able man. But von Holst, as cited below, has focused upon Polk a great mass of evidence going to convict him of almost Satanic ingenuity in luring Mexico into war. It must be remembered that the Oregon dispute with Great Britain (see NORTHWEST BOUNDARY) was coincident with the series of events above given. It is certain that Mexico was not willing to fight about Texas; and it

seems probable, that, in the beginning, she was no more willing to tight single-handed for even the disputed territory between the Nueces and the Rio Grande. The allegation, then, is that the long delay to order Taylor forward was diligently used in working the dispute with Great Britain apparently to a war point; that Taylor was then ordered forward; that Mexico, relying on Great Britain as an ally, incautiously accepted the gage of war; and that then every point in dispute was given up to Great Britain, peace was settled with that power, and California and New Mexico, the real objects of the war, were squeezed out of the grasp of Mexico. It has been said above that the array of circumstantial evidence is strong: and it is impossible to repress a certain feeling of admiration for the repulsive skill with which the diplomatic combinations were made, if they were really the result of design. The times and seasons were chosen with such consummate adroitness, the advantages gained by them were pressed with such resolute persistence, and the whole scheme was worked out to the end with such a complete repudiation of moral objections to it, that Machiavelli might have been proud to own it as his master-piece. Nevertheless, the conviction remains that Polk had not the ability requisite for the conception of such a plan, and that he was the creature of circumstances rather than their creator. The train of events may fairly have the two interpretations; and, while the first would have been the more natural in the case of Cardinal Richelieu, the second is certainly the more natural in the case of James K. Polk. Given the desire of the government to obtain California and New Mexico in case of war, the constant pressure behind it urging it toward war, and its natural hesitation to base the war on its excessively doubtful claim to the territory between the Nueces and the Rio Grande; and a little occasional *suppressio veri* by the president will explain the whole drift of events without supposing them to be the result of a carefully elaborated plot. But, if the reader inclines to accept the first interpretation, he will find that it is necessary to take Marcy, the secretary of war, not Polk, as the presiding genius.

—During the year 1846 Taylor first drove the enemy in headlong retreat over the Rio Grande, and then followed them and finished the campaign in Mexico. He captured, in Monterey, an army nearly double his own numbers, in spite of very strong natural and artificial defenses. Finally, Feb. 23, 1847, with less than 5,000 undisciplined volunteers, he met and routed more than four times his number, under Santa Anna, at Buena Vista. In the meantime an overland expedition from Fort Leavenworth had captured New Mexico; and the Pacific squadron, aided by Fremont and some irregular land forces, had taken possession of San Francisco and California. The year 1847 ended the war. Scott, with 12,000 men, took Vera Cruz, and forced his way up to the plateau of Mexico before summer set in. In August and September, he beat nearly three times his number in a series of brilliant battles around Mexico, overturned the government, and conquered the peace of Guadalupe Hidalgo, Feb. 2, 1848. ## WASHINGTON, George

WASHINGTON, George, president of the United States 1789-97, was born in Westmoreland county, Va., Feb. 22, 1732, and died at Mt. Vernon, Va., Dec. 14, 1799. In youth he became a land surveyor, and in the French and Indian war he was advanced to the grade of colonel and commander-in-chief of the Virginia forces, distinguishing himself in Braddock's defeat. In 1759 he married Martha, widow of John Parke Custis; and the care of her extensive property occupied him thereafter, though he was for fifteen years a silent member of the house of burgesses of his colony. He was a delegate to the continental congress in 1774-5, and the general anxiety to keep Virginia steady in resistance to the crown induced his appointment as commander-in-chief of the American forces, June 15, 1775. Whatever the motives may have been that governed his appointment, he very rapidly proved his extraordinary fitness for the place, and became the great and central figure of the revolution. The character of no other public man of the time can so successfully submit to microscopic examination. There seems to have been nothing little in him. Great in defeat, he was greater still in success, and the crowning event of his military career was his surrender of his commission to congress at the close of the war. (For the events of the war see the biographies cited below.)

—After resigning his commission, he retired to Mount Vernon, to put his private affairs in order, and to pursue the line of investments in western lands to which he had been attracted during his early military life. In politics he was most interested in the evident and dismal failure of the confederacy. (See CONFEDERATION, ARTICLES OF.) During the revolution he had been the trusted adviser of congress and the state governors, and his correspondence with former political and military associates throughout the country now becomes voluminous. Every conscious step toward the formation of a new government was submitted to his inspection and approval, and when the time was ripe he was almost forced into becoming a delegate to, and president of, the convention of 1787. In that body he said little, but in each case his suggestion was final. On the subsequent question of ratification his influence was still greater. Multitudes of voters, particularly in the northern states, who would have hesitated to accept the legal arguments of the "Federalist," and similar publications on either side, supported the new constitution blindly by reason of their confidence in Washington's sound judgment, their certainty that he would not recommend a scheme of government which he thought to be of evil tendency, and the evident fact that the office of president had been cut to his measure by the convention. Here, as in the revolution, there was no getting on without him; and it is as certain as anything can be that the existence of such a character, from 1775 until 1790, changed the whole course of the history of the western continent, and thus of the world.

—In the elections of 1789 and 1792 all the electors voted for him, and he became president. (See ELECTORAL VOTES, I., II.) No succeeding president has received this national compliment of a unanimous vote, the one who came nearest to it, Monroe, being probably the one who least deserved it. The events of Washington's administrations are elsewhere detailed. (See JUDICIARY; CAPITAL, NATIONAL;

BANK CONTROVERSIES, II.; EXCISE; APPORTIONMENT; GENET, CITIZEN; DEMOCRATIC CLUBS; JAY'S TREATY; WHISKY INSURRECTION; FAREWELL ADDRESS; X Y Z MISSION; FEDERAL PARTY, I.; DEMOCRATIC PARTY, I., II.) He entered office with the impossible expectation that parties would be eliminated from his government; but his underlying consciousness that parties already existed is shown in his careful division of his cabinet offices between Hamilton and Knox on one side, and Jefferson and Randolph on the other. His expectation was of course disappointed; the companionship of Hamilton and Jefferson in the cabinet was, to use the latter's own comparison, like that of two game-cocks in a pit. As Washington was by nature a sincere, though unconscious, federalist, the progress of party division drove the democratic leaders into opposition, and before the end of the second term all possibility, or even desirability, of further keeping the peace between the two parties was at an end. One party had overcome the prejudices of the people by help of Washington's name, and controlled the government by the continuance of the same help. The other party would have been more than human if it had not been impatient at finding Washington always in the way of its attacks upon its opponent. Its leaders successfully restrained themselves in prospect of his approaching retirement; but their impatience is shown by such symptoms as Jefferson's letter to Mazzei, though Jefferson always denied any intention to attack the president personally. The more violent members attacked Washington in plain terms, even accusing him of drawing more than his salary, publishing forged letters to show his desire to submit to the king during the revolution, and calling him the "step-father of his country." Their malice undoubtedly embittered the closing years of his second term, and yet it was only one of the symptoms which showed that the time was past when he was absolutely necessary, and that, having successfully and strongly built the stage, he must now leave it clear for the actors. The firmness of his hold upon the national heart is proved by the venom of the impatient and yet helpless politicians. He might have died in the office if he had wished it: even after his final decision to retire, two electors obstinately voted for him for a third term in 1796.

—Washington was slow of judgment, and anxious to see all sides of a case and to get all possible opinions upon it, but when he had formed an opinion or a judgment, it was his own, and he seldom changed it. Most of the state papers which pass as Washington's were originally written by other hands, though none of them were given to the world until they had been revised, digested and reproduced by him and made thoroughly his own. His letters, however, are his own; and though their editor has pushed his province of correcting them to an extreme, no editing can conceal the essential nature of the writer as shown in them. The strong judgment, the good sense, the calmness and patience, the consciousness of strength and of the ability to control the strength, the absolute freedom from self-seeking in any form, make his letters a monument which will always justify the instinctive popular estimate of him. Other men have surpassed him in particular phases of character and ability; but, in all phases together, his letters will show that he was the greatest man the earth has yet seen.

—A bibliography of Washingtoniana would be altogether too voluminous for our space. The list of books, tracts and medals relating to his death alone fills two volumes, as collected by F. B. Hough in 1865. Among the lives may be mentioned Marshall's, Irving's, Sparks', A. Bancroft's, Lossing's, Ramsay's and Everett's; Custis'

*Private Memoirs of Washington*; and Rush's *Washington in Domestic Life*. See also, Sparks' *Writings of Washington*; 1 *Statesman's Manual* (for his messages); Gibbs' *Memoirs of the Administrations of Washington and Adams*; Trescott's *Diplomatic History of the Administrations of Washington and Adams*; Thacher's *Life and Military Journal of Washington*; Griswold's *Republican Court*; 2 Pitkin's *United States*; 3-5 Hildreth's *United States*; 1 Schouler's *United States*. There is a forcible pen-portrait of Washington at pp. 77 and 114-126 of Schouler as cited above; and in fiction Thackeray has attempted the same thing in *The Virginians*.

## WASHINGTON TERRITORY

WASHINGTON TERRITORY, a territory of the United States. Its area is a part of that doubtful portion of the Louisiana cession (see ANNEXATIONS, I.), whose jurisdiction was long a subject of dispute between the United States and Great Britain, but was finally decided to be in the former by the treaty of 1846. (See NORTHWEST BOUNDARY.) It was originally a part of Oregon territory, and, before the erection of that territory into a state, was set off as a separate territory by the act of March 2, 1853. As at first organized, it contained 193,071 square miles, but transfers to Idaho have reduced it to an area of 69,994 square miles. Its population, by the census of 1880, was 75,116, an increase of 213.57 per cent. in the decade previous. Its capital is Olympia, and its governor (1880-84) is William A. Newell.

—The act of March 2, 1853, is in 10 *Stat. at Large*, 172.

WAYS AND MEANS. (See PARLIAMENTARY LAW.)

[\[Back to Table of Contents\]](#)

## WEALTH.

WEALTH. In the most ordinary acceptance of the term, the word wealth indicates, and always indicated, especially when it was applied almost exclusively to the precious metals, things having *an exchangeable value*; but the greater part of economists have applied it to all *useful* things, even to those which are entirely devoid of such value; but it is always inconvenient in scientific nomenclature to designate by the same word, things which differ by essential characteristics, for such designation invariably causes confusion and misunderstandings. It might easily be shown that a great part of the discussions to which some of the principles of political economy have given rise, was due only to the two-fold meaning given to the words *wealth* and *value*, which made them designate both gratuitous utility, that is to say, a utility acquired without cost or labor, and powerless to obtain anything by way of exchange, and the utility obtained by means of labor, and possessed of an exchangeable value. It will, therefore, be of interest to inquire whether the nomenclature of politico-economical science would not be rendered clearer and more precise if it were once well understood that the words *wealth* and *value* designated only utilities of this last kind, and this is what we shall attempt to demonstrate. But we must first point out the difficulties which result from the two-fold scientific meaning given to these two words, or the lack of precision in the meaning given to each in the definitions of them by the principal economists. The intimate correlation of these two words, and of the ideas which they awaken, will not allow us to treat of wealth without at the same time treating of value; we will, however, as far as possible confine our observations on the latter word to what is necessary in order to elucidate the question of nomenclature which we are considering: the other questions relating to the subject are considered in the article on VALUE.—"Every man is rich or poor," says Adam Smith, "according to the degree in which he can afford to enjoy the necessaries, conveniences and amusements of human life. But after the division of labor has once thoroughly taken place, it is but a very small part of these with which a man's own labor can supply him. The far greater part of them he must derive from the labor of other people; and he must be rich or poor according to the quantity of that labor which he can command or which he can afford to purchase. The value of any commodity, therefore, to the person who possesses it, and who means not to use or consume it himself, but to exchange it for other commodities, is equal to the quantity of labor which it enables him to purchase or command." ("Wealth of Nations," book i., chap. 5.)

—From this we see that Adam Smith at first seems to consider everything useful as wealth, but afterward restricts the qualification to things which have an exchangeable value. "The word value," he says elsewhere, "it is to be observed, has two different meanings; it sometimes expresses the utility of some particular object, and sometimes the power of purchasing other goods which the possession of that object conveys. The one may be called *value in use*, and the other *value in exchange*. The things which have the greatest value in use have frequently little or no value in exchange; and, on the contrary, those which have the greatest value in exchange have frequently little or no value in use. Nothing is more useful than water; but it will purchase scarce anything; scarce anything can be had in exchange for it. A diamond, on the contrary,

has scarce any value in use, but a very great quantity of other goods may frequently be had in exchange for it." ("Wealth of Nations," book i., chap. 4.) Here we have the word value used to express both gratuitous utility and utility which brings a price.—"Everybody knows," says J. B. Say, "that things have sometimes a value in use very different from their value in exchange; that common water, for example, has scarcely any value, although very necessary, while a diamond has a very great value in exchange, although of very little service; but it is evident that the *value of water* is a part of our *natural wealth*, which does not belong to the domain of political economy, and that the value of the diamond forms a part of our *social wealth*, which is the only wealth within the province of the science. The word *exchangeable* is always indispensable, and included in the values with which political economy is concerned; it is unnecessary to repeat it continually, *for it is always understood.*" (*Cours Complet*, t. i., p. 74.) And again he says, "The value which constitutes wealth is not the arbitrary value which a person attaches to a thing he possesses, and which is purely relative to his particular wants; *it is the value given by industry and appreciated by the public.*" (*Ibid.*, p. 306.) Thus J. B. Say understood by value and wealth only what possesses an exchangeable value, and it was probably only by the example of Smith that he was induced to give to gratuitous utility the name of value in use (*valeur d'utilité*), or natural wealth.

—Ricardo fully admits the distinction established by Smith between value in use and value in exchange ("The Principles of Political Economy in Taxation," ch. i.); however, in a letter to J. B. Say he maintains that we ought to give the name of wealth only to the things which have an exchangeable value (*Œuvres diverses de*, J. B. Say, p. 410). In turn J. B. Say writes him: "I can not admit what you and Adam Smith are pleased to call *value in use*: what is value in use, if it is not utility pure and simple? The word utility is therefore sufficient." (*Ibid.*, p. 409.) This remark is well grounded, and that of Ricardo is not less so.

—M'Culloch recognizes that the double meaning given to the two words value and wealth has not always been clearly perceived, and that at often becomes a cause of confusion and errors hence, from the very beginning of his book, he makes it a rule to use the word *value* to signify only exchangeable value, and the word *wealth* only to specify products susceptible of appropriation, and which are obtained only by the use of human labor, and which consequently are not gratuitously acquired, but are possessed of an exchangeable value.—"When exchanges are introduced," says Storch, "the *useful things* or the *values* which we possess may serve us in two different ways: first, *directly*, when we employ them in our own use, and then *indirectly*, when we exchange them for other values. Thus, therefore, the utility of things is either direct or indirect, and so with their value. Notwithstanding the difference of expression, this distinction is the same as that established by Smith, for Storch includes gratuitous utility in direct value.—"What is value? what is wealth?" asks Rossi. "If common sense answers these questions easily, the books answer them in so many different ways that the critics have reason to assert they have not been answered at all. Once more, value is the expression of the *relation which exists between the wants of man and things*. Wealth is a generic term which embraces all the objects in which this relation is verified. Every object that can satisfy a human want possesses a value. The object itself is wealth. Thus value and wealth, without being synonymous, are two

expressions necessarily correlative. Value is the relation; wealth is the aggregate of all the objects in which this relation is realized. This is what common sense tells us, and science has no right to depart from common sense."

—It is quite evident that Rossi confounds here, as in other parts of his course of political economy, the words value, utility, etc. It is to be regretted, that, after having pretended that the books did not at all answer the questions which he propounded, he himself answers them much more imperfectly than those who preceded him. But the confusion which prevented him from forming an exact idea of value is due to the fact that he admitted, with Smith, a *value in use*, which is nothing else than utility, and a *value in exchange*, which is the sole value.

—Frederick Bastiat distinguished perfectly utility from value: utility is what may be called the *expression of the relation which exists between the wants of man and things*. Value, indeed, supposes utility, but admits of still other characteristics. Bastiat distinguishes *gratuitous utility*, that is, the utility we enjoy without labor or previous effort, such as the light of the sun, from *onerous utility*, which is acquired only after a service done. To procure this latter utility we must first overcome a difficulty which stands between the want and its satisfaction; we obtain it by means of the effort or service which by rendering utility onerous prevents it from being transmitted for nothing, and gives rise to value. Exchangeable value is the only value he recognizes; and he clearly demonstrates that the idea which this word expresses must be the result of exchange, and was introduced into the world when two men for the first time agreed to exchange their services or the results of their services. (*Harmonies Économiques*, p. 170, etc.)

—But Bastiat held that the word wealth should be applied to gratuitous utility only. He distinguishes two kinds of wealth: *effective wealth*, which comprises all utilities, whether obtained gratuitously or with the assistance of human effort; and *relative wealth*, which consists exclusively of onerous utilities or utilities which have a price. The more gratuitous utilities increase by the progress of industry, the more effective wealth do nations or the whole human race possess. But the relative wealth of an individual, a family, or a limited agglomeration of individuals, depends upon the amount of values which it possesses, provided the share of the mass of existing wealth, which they can obtain by way of exchange, is proportioned to the sum of these values.

—If we had to distinguish in political economy two kinds of wealth, we would rather admit the distinction made by J. B. Say, between *natural* wealth and *social* wealth, than that proposed by Bastiat, as the former seems to us much more exact; but how can Bastiat, who has so ably proved that exchangeable value is the only value, admit wealth *without value*? An examination of his motives seems worthy of attention, and we hope it will afford us an opportunity of elucidating one of the difficult points of political economy.

—The "science of political economy," he says, "concerns itself with the general welfare of men, with the proportion which exists between their efforts and their satisfactions, a proportion which modifies to advantage the progressive participation

of gratuitous utility in the work of production. The science can not, therefore, exclude this element from the idea of wealth. We may conceive two nations, one of which has more satisfactions than the other; but it has fewer values because nature has favored it, and because it meets with fewer obstacles: which is the richer of the two? Nay more, let us take the same people at two different epochs: the obstacles which it has to overcome are the same, but to-day it surmounts them with such facility (it effects, for instance, the *transportation of its merchandise, carries on its labor and manufactures with so little effort*) that values are, in consequence, considerably reduced. It may therefore adopt either of these two courses, remain content with the same satisfactions as formerly, and turn its progress into leisure. Can its wealth in this case be said to be retrograde, because that wealth possesses less value? Or it may devote its unemployed efforts to increase its enjoyments. In this latter case can we conclude that because the sum of the values of that people has remained stationary, its wealth has remained stationary also? This is a momentous question for political economy. Should it measure wealth by the satisfactions realized or by the values created?" (*Harmonies Économiques*, p. 234.)

—This is really a very specious argument, and one which, if we are not mistaken, will appear unanswerable to many economists; and yet we believe we can show that all this argumentation is based upon an incomplete notion of value, and forgetfulness of some of its essential characteristics. The question is an important one. Is it true, as Bastiat asserts, that a people who by its progress in industry is enabled to procure the same satisfactions as formerly with less labor, thereby reduce the sum of these values? Or is it true that the latter remain stationary, if this same people, continuing to work as much as formerly, obtain more products? Let us see.

—How is the value of a product, of a service, or of an aggregate of products and services, measured? *By the quantity of all other objects having a price which they enable one to obtain in exchange for them.* This is an axiom of political economy which has never been contested.

—Let us now suppose that a people has, without greater effort or more human labor than formerly, succeeded in doubling the quantity of the products of all kinds which minister to its wants: we are told that then the value of these products, although their quantity has been doubled, has not been increased; but what is there to base such an assertion on? How is the value of the products measured *before and after the doubling*? If we measure it as we should do, by the quantity of all objects having a price which *each class* of products enables us to obtain in exchange, we shall inevitably find that in doubling the quantity of all the products we have likewise doubled their total value, since each class of products can be exchanged against a *double quantity* of all the others. But it is said that this double quantity will have no greater value than the single quantity had before. How is this possible? We ask again, what is there to base such an assertion on? Since the value of an object can not be better measured than by the quantity of all other objects having a price which can be obtained in exchange for it, is it not plain that a class of products, which, because it has been doubled at the same time that all others have been doubled, enables us to obtain, in exchange, the double of the latter, has doubled in value as well as in quantity? What misleads the mind, and prevents the clear apprehension of this truth, is

that value is confounded with price, and it is very true, that if the quantity of money did not increase during this doubling of the other products, the price of the latter might have sunk one-half or nearly one-half; but what clearly proves that it is not their value which is sunk, is that if we suppose the quantity of money to have doubled in the same time as the quantity of all the other products, we shall see that the price of these latter, taken as a whole, must have doubled likewise.

—What next hinders the conception and acceptance of the truth we have just stated, is, that many economists continue to suppose, with Adam Smith, that the value of products is measured by the quantity of human labor employed in their creation—an incorrect notion, which has led to many errors, and which prevents those who adhere to it from recognizing the fact that value may be increased without increasing the amount of labor.

—But the greatest obstacle to a proper appreciation of the question we are considering is, in the first place, that it is too easily forgotten that value is a quality essentially relative, which can not vary in one object without varying at the same time, and in an *inverse sense* in all others; so that if sugar or wheat falls in value, all other products necessarily rise relatively to wheat or sugar, and that if iron or meat rise in value all other products fall in value relatively to meat or iron; and in the second place, that in considering the value of products the value of the *unit* is confounded with that of the *class*, and that when the fall in the value of the unit is observed, that fall is attributed to the entire class, and it is not remarked that the decline is compensated for, and often more than compensated for, by the increase in the quantity, as will appear from the following. It is noticed, for instance, that the use of the knitting machine enables us to produce a pair of stockings with half the labor or cost of production that was needed to produce the same pair of stockings when knit by hand; it is said that the value of the stockings has fallen one-half, and this is true so far as the unit is concerned; but is it equally true that the total value of the production of stockings has been reduced by half, since the introduction of the knitting machine? By no means, and it is very probable, on the contrary, that it has more than doubled; the same is true of the production of books compared with that of manuscripts; of the manufacture of thread by machinery, compared with its production by the wheel or spindle: of transportation furnished by the locomotive, compared with that afforded by the peddler. In these different classes of production, the unit has considerably fallen in value, but the entire class represents a value incomparably greater than that which it possessed before the fall. The value of the unit of products has been more or less reduced in Europe since the beginning of the fifteenth century in many other branches of production, but there is probably not a single one which in the aggregate does not furnish a sum of values much greater than it was before that reduction. The value of products taken *en masse* is therefore far from being lessened by the effect of industrial progress, what men detract from the value of the unit, they far more than restore by the increase of the quantity. This evidently escaped Bastiat in the passage which we have quoted. He believed that a like quantity of labor could never produce anything but a like sum of values, and that the only result of industrial progress was to increase gratuitous utility: it is, however, very certain that industrial progress increases at the same time utility, which has a price; for nobody, surely, would hesitate to acknowledge that the most industrious peoples are also the richest in exchangeable values Bastiat was imbued

with the idea that values would go on constantly decreasing from the effect of industrial progress: this may be admitted in the case of various classes of products so far as the unit is concerned; but, so far as the class or the mass of products is concerned, the effect of this progress up to the present time has been to increase its value considerably, and there is nothing which authorizes us to think that it will be otherwise in the future.

—This is not, therefore, so momentous a question as Bastiat imagined it to be; it may be boldly affirmed that wealth consists of objects possessed of exchangeable value, and that it is proportioned to the sum of those values, measured as it should be.

—Although we realize how tiresome such discussions are to the mind, the desire to render them henceforth entirely superfluous by elucidating as clearly as possible the questions with which they are concerned, induces us to beg the reader's attention a few moments longer.

—J. B. Say regarded, as one of the greatest difficulties of political economy, the solution of the question: *As the value of things possessed is what constitutes wealth, why is it, that, the lower prices are in a country, the richer that country is?* The question, it seems to us, is not here put in its true terms; for it would be difficult to show that the countries in which products have the lowest prices are always the richest. In certain large countries, as, for example, in Poland, or in certain provinces of Russia, in America, and Hindostan, the principal products (cereals, meat, wood, wool, leather, etc.) are lower in price than anywhere else; and yet these countries can not by any means be reckoned among the richest. It seems evident to us that the problem which the illustrious French economist meant to propound is this: "*Wealth being made up of the value of things possessed, how can a nation grow wealthy in proportion as it succeeds in lowering the value of its products by reducing the cost of their production?*" J. B. Say answers, that the productive stock of such a nation has then more value, since the services which it furnishes are exchanged for *a greater quantity* of objects of every kind having a price; but this solution is incomplete, for it does not explain why the wealth produced (and no longer the power of producing) is greater in the country in which the progress of industry has reduced the cost of production, and the value of the different species of products, most.

—To give a complete solution to this question, we must recall, first, that value is an essentially relative quality, and then all that we have said above. It results from this that the lowering of value brought about by industrial progress, in the unit of a class of products, does not diminish the value of the entire class, because it is at the very least compensated for by the increase in the quantity produced, while it increases proportionately the value of all other products relatively to that in which it has become manifest, because it allows these to be exchanged for a larger quantity of the products whose value has fallen.

—We repeat, therefore: on the one hand, there is no reduction in the value of the class of products in which the fall has occurred, the increase in the quantity at least compensating therefor; on the other hand, this fall gives a superadded value to all other classes of products. Is not the final result, therefore, an increase in the sum of

values? Thus a fall in the value in the unit of one class of products, may be perfectly reconciled with the increase of sum total of values or wealth.

—This shows why we were able to prove, as we did above, that the doubling of the quantity of all the products obtained without an increase of cost or effort, would necessarily double the sum of their total value, since each class of products would then obtain in exchange a double quantity of all the others.

—What precedes seems to us to have provided sufficiently for the solution of the question of nomenclature which we proposed to ourselves. The quality which renders things capable of satisfying our wants, is called utility. There are utilities like the air we breathe, or the light of the stars, which apply themselves to our wants, without requiring the least preparation or previous effort on our part; moreover, they are not susceptible of private or exclusive *appropriation*, being equally at the disposal of all. We agree with Bastiat, in classing all the utilities of this sort under the denomination of *gratuitous utility*. Others can not be applied to our wants except after some service performed by us; they become the property of those who have furnished that service, and they are endowed with a quality which enables their possessor to obtain other utilities of the same class, but of varied species, when he wishes to exchange them. This is the quality which is expressed by the word *value*. This class of utilities may be comprised under the general term of *utility having a price*.

—Value exists only by labor and exchange; the value of any particular object is measured, not by the quantity of labor employed in producing it, *but by the quantity of all the other objects having a price which can be obtained in exchange for it*.

—It is only the utility which has a price that constitutes *wealth*. The only politico-economical difference between the words *wealth* and *value* is, that the latter designates a quality, as Rossi has remarked, while the word *wealth* indicates the object in which that quality resides.

—There is no value but exchangeable value: what many economists have called *value in use* is only utility. For an object to possess an exchangeable value, it is not indispensable, as Rossi supposes, that it be in circulation, that is to say, offered in exchange; it suffices that it be recognized to have some value if it be offered for sale; thus public monuments, or the clothes we wear, although they are not offered in exchange, still possess an exchangeable value.

—There is no wealth but that which consists in objects possessing utility having a price. What J. B. Say calls *natural wealth* is only *gratuitous utility*.

—When industrial progress enables us without more labor or effort to obtain greater quantities of objects that possess utility having a price, no fall in the sum of values takes place in consequence; for the reduction in value of the unit of the product in which that progress is realized, is immediately compensated for by the additional value acquired, relatively to this object, by all the other products for which it may be exchanged. On the contrary, the result is that the sum of values is increased

proportionately to the surplus obtained in the quantity of products; this we think we have fully demonstrated.

—Wealth, therefore, is really proportionate to the sum total of values, and this sum is itself proportionate to the quantity of products of all kinds, and, consequently, to the amount of gratifications we are able to procure.

—The progress of industry, the increase of our power over natural agents, have not, therefore, as Bastiat supposes, the effect of reducing the sum of the utility which has a price. On the contrary, that progress increases it in proportion as it enables us to increase the objects which possess that utility. And this is the reason why the nations whose industry has made most progress are also the wealthiest, in the only legitimate sense of the word, the wealthiest in the utility which has a price in exchangeable wealth.

—Every reduction in the cost of production, and in the value of the unit of any class of products, is none the less a benefit of that industrial progress; but it is a benefit only because it increases the units of that class, and because it gives an additional value to all the other products.

—It seems to us that our propositions relating to the fixing of the meaning of the words *value* and *wealth* are sufficiently demonstrated.

## WEBSTER, Daniel

WEBSTER, Daniel, was born at Salisbury, N. H., Jan. 18, 1782, and died at Marshfield, Mass., Oct. 24, 1852. He was graduated at Dartmouth in 1801, was admitted to the bar in 1805, and served as a federalist congressman from New Hampshire 1813-17. Removing to Boston in 1816, he served as congressman 1823-7, as United States senator 1827-41, as secretary of state 1841-3, as United States senator 1845-50, and as secretary of state from 1850 until his death. (See FEDERAL PARTY, II.; WHIG PARTY; FOOT'S RESOLUTION.)

—Webster's first great success was in the decision of the Dartmouth college case, in 1819, in which he established the principle that a charter granted by a state legislature was a contract, unalterable without consent of the corporation, unless the power of alteration was reserved in the charter. This success made him one of the foremost lawyers of the country; but it was not until 1830 that he became, by his speeches on Foot's resolutions, one of the recognized political leaders of the country. Northern men were exultant in the belief that their representative had overthrown Hayne, and thus indirectly Calhoun also. Southern writers have never admitted this, their reason apparently being that Webster, as well as Hayne, admitted the validity of the argument from authority, on which state sovereignty (see that title) mainly rests, and that he was unable to meet Hayne's, or (afterward) Calhoun's arguments from this source. No one, however, has ever disparaged the brilliancy and force of Webster's eloquence, and from that time he has been confessedly the foremost orator of America, or, as many have thought, of all time. His speeches have a massive directness which, backed by careful polish, extent and precision of knowledge, and power of repartee, made them almost irresistible, and made him an antagonist to be avoided rather than desired.

—A leader so distinguished had a right to think of the presidency, but from 1833 until 1852 this honor was always just beyond his reach. In 1836 he was nominated for the presidency by the Massachusetts legislature, and received fourteen electoral votes. In 1840 he had no chance against the candidacy of Harrison, as in 1848 he had none against the kindred nomination of Taylor, which latter Webster publicly declared to be "one not fit to be made"; the whig opposition to both these nominations had to be concentrated on Clay, and was then unsuccessful. In 1844, all Clay's other rivals being out of the way, Webster had been discredited with the whigs by his very creditable conduct in remaining in Tyler's cabinet to arrange the dangerous and disputed northeast boundary. (See MAINE.) As the convention of 1852 drew near, it was evident that Clay was out of the field, that southern whigs were suspicious of Seward's influence over Scott, and that Webster's chance was now or never. Under these circumstances his speech of March 7, 1850 (see COMPROMISES, V.) was delivered, which aroused such intense indignation in the north. It is difficult to see now why it should have done so, without taking into account the general northern wrath against slavery, which was just coming to the boiling point; and it is difficult to compare the speech itself with the general course of political oratory which had preceded it, without reaching the conclusion that the audience had changed rather than

the orator, and that the veteran no longer represented the north. If it was the speech of a candidate, it was unsuccessful. The southern whigs, loudly as they had applauded Webster's speech, took Fillmore as their choice, and Webster had but about 30 of the 293 votes of the convention. His death followed closely upon this final failure.

—See Webster's *Works* (and Everett's life of Webster in volume I.); Webster's *Private Correspondence*; Tefft's *Webster and his Master Pieces*; Whipple's *Great Speeches of Webster*; Knapp's *Life of Webster* (1835); March's *Reminiscences of Congress* (1850); Lanman's *Private Life of Webster* (1856); Curtis' *Life of Webster* (1870); 1 Choate's *Writings*; 3, 4 Everett's *Orations*; 1 Whipple's *Essays and Reviews*; Parton's *Famous Americans*; Loring's *Hundred Boston Orators*; 6 *Harper's Magazine*; 31 *North American Review*, 474; 68 *ib.*, 1; 75 *ib.*, 84; 84 *ib.*, 551.

## WEIGHTS AND MEASURES.

WEIGHTS AND MEASURES. It is with proposals to adopt the metric system that this subject now mainly comes up before legislative bodies; and we shall treat it chiefly in this aspect—The English standards for many years subsequent to 1760 were a certain brass weight constituting a troy pound, and a certain brass bar, the distance between two points on which, at a temperature of 62°, constituted a yard. Accurate copies of these were obtained for America in 1827, and have since constituted the standards for the United States. The English standards were destroyed by fire in 1834, but were carefully replaced; subsequently the troy pound has been done away with, and a standard pound avoirdupois substituted. The old unit of capacity was the gallon. It was supposed that a gallon, of whatever commodity, ought to weigh eight pounds; hence the variation of liquid and dry measure, while the further variation of wine and beer measure bears an almost exact proportion to the difference of the troy and avoirdupois pounds. All these standards are still in use in America, but are defined in cubic inches; in England the reforms of 1826 substituted a common "imperial" measure for all the three. Besides these there are more than seventy different units in general use, verified as being determinate multiples or fractions of some one of these standards.

—Up to the end of the last century the systems in use in other parts of Europe were equally chaotic, and bore no relation to one another. Most of them had indeed their foot and their pound, representing somewhat the same length or weight; but there was too much difference in them to be available for anything like exact comparison.

—In the year 1790 the French assembly undertook to lay the foundations of a system in which all the parts should have the simplest mathematical and practical relations to one another, and which should rest ultimately upon some fixed natural standard. Neither of these ideas was new; but they had never—in modern times at least—been put in practice. It was at first proposed to adopt the length of the seconds pendulum as the unit, but finally the ten-millionth part of the earth's quadrant was selected instead, and attempts at determining this were at once instituted. After some preliminary legislation the system was established in France in its present shape in 1799. Its details are familiar; it is only for us to consider the history of its adoption in different countries, whether sudden or gradual, and the advantages and difficulties attending the change.

—In France itself it was not carried through with the completeness which the legislators had expected. The opposition of the lower classes was so great that Napoleon in 1812 adopted a compromise, returning to a certain extent to the old names, but making the pound exactly half a kilogramme, and the foot exactly one-third of a metre. This compromise continued in use till 1840, when, by a decree passed three years earlier, the metric system went into effect in its original form.

—The French conquests at the beginning of this century had extended the use of the system beyond the permanent frontiers of France. In the Netherlands, both Belgium

and Holland, its use continued without interruption after the separation from France. Its use for government purposes continued in parts of Italy; and its effect was never lost in Baden. A large part of the states which had been led to introduce it temporarily under French domination, had adopted it permanently before the middle of the century. Neither there nor elsewhere has the change as a general rule taken place suddenly. Either the use of the metric system has been optional for a time and afterward made obligatory; or it has been first introduced in certain departments, such as coinage, postage, customs, or railway freight charges, and afterward made general; or, very commonly, as a transition measure the old standards of the country have been slightly modified so as to be commensurable with the metric system, as in the case of the metric foot and metric pound above mentioned. The dates of these changes in different countries are shown by table in following column, based largely upon the report of J. K. Upton, 45th Cong., 2d Sess., Ex. Doc. 71, which contains many additional details.

Venezuela .....	-----	1864	1874

Dates in parentheses denote gradual or partial changes.

—The growth of the system has been so gradual that it is hard to divide it into periods. The decisive points in its history were its partial adoption by the German zollverein in 1852; its complete adoption by Germany and Austria, 1868-76; and the establishment in 1875 of the international bureau of weights and measures at Paris, with representatives of all the leading nations, except England and the United States; even including Russia, which has otherwise done nothing in this direction.

—Both in England and in the United States the metric system is used in scientific work; and in the United States the smaller coins have metric weights; but the act

making its use permissive has had no effect upon ordinary business. The subject of making its use compulsory has been agitated in both countries. The British standard commission, in 1869, while admitting the desirableness of the change, deprecated hasty legislation in that direction. In 1877 the house of representatives passed a resolution that the heads of executive departments be asked what objections there were, if any, to making the use of the metric system compulsory. The answers varied exceedingly in their tenor, but the majority were decidedly conservative. The arguments in favor of making the change as soon as possible are the practical convenience of the metric system for calculation and business, the confusion of names under the old system, and the importance of common units in international trade. Against the change is urged the fact that our present standards are well established, that the people are satisfied with them, and that the inconvenience and expense of a hurried change outweigh any practical advantages likely to be felt at present. They are the arguments of conservative feeling, in a case where that feeling is unusually strong.

## WEST VIRGINIA

WEST VIRGINIA, a state of the American Union. Its organization had several peculiarities. Like Vermont, Kentucky, Maine, Texas and California, it had no previous territorial existence; and, like Kentucky and Maine, it was formed from a part of a state already in existence. But, in the cases of Kentucky and Maine, the necessary consent of the legislature of the parent state was so regularly given that no exception could be taken to it; while the existence of West Virginia is based upon a legal fiction by which congress recognized a revolutionary loyal legislature in western Virginia as the legitimate legislature of the state so far as to accept the consent of the former body to the erection of the new state of West Virginia.

—The manner in which the secession of Virginia was accomplished is elsewhere given. (See VIRGINIA.) There had long been a division of interests and feelings between that part of the state west of the Alleghanies and the rest of the state. The former fraction, comprising nearly one-half the territory of Virginia and about one-fifth of her population (355,526 whites and 18,371 slaves), was rather a northern than a southern state in sympathy; its representatives in the Virginia convention opposed secession; and their constituents supplemented parliamentary by forcible opposition. Early in May, 1861, a delegate convention at Wheeling declared the ordinance of secession null and void, and summoned a [Virginia] state convention. It met at Wheeling, June 11, and two days afterward passed an ordinance vacating the state offices arrayed against the federal government. June 20, it elected Frank Pierpont governor of Virginia. July 2, the Virginia legislature, elected under the convention's ordinance, met at Wheeling, and elected United States senators, who were admitted by the senate. Aug. 20, the convention passed an ordinance to create the state of Kanawha, and this was approved by popular vote, Oct. 24. At the same election delegates were chosen to a new convention, which framed the first constitution, now adopting the name of West Virginia. This constitution was ratified by popular vote, April 3, 1862, and in the following month the legislature, representing the forty counties of western Virginia, but claiming to represent the whole state, formally gave Virginia's consent to the erection of the new state. Dec. 31, 1862, West Virginia was admitted by act of congress, the admission to take effect on the adoption of gradual abolition by the new state (see ABOLITION, III.); and the state thus became a member of the Union, June 19, 1863. The whole process of the formation of the state is a difficult problem in American constitutional law. It was evidently revolutionary in the main; but there are many features in it which go to support Sumner's "state suicide" theory. (See RECONSTRUCTION.) After the downfall of the rebellion Virginia admitted the validity of the formation by beginning suit in the supreme court against West Virginia for the restoration of Berkeley and Jefferson counties; but the suit was decided against Virginia in 1871.

—CONSTITUTIONS. The first constitution was framed by a convention at Wheeling, Nov. 26, 1861-Feb. 18, 1862. It provided that the state should "be and remain" one of the United States of America; that only white male citizens should vote; that the senate should consist of eighteen members, chosen for two years, and

the house of delegates of forty-seven members, chosen for one year; that the membership of both houses should be reapportioned by the legislature after each census; that the capital should be Wheeling until changed by the legislature; that the governor should be chosen by popular vote for two years, that the judiciary should be elective; and that no slave should be brought into the state. The last feature was changed to a gradual abolition of slavery as above specified. This constitution also made an attempt to introduce the township system of government for local affairs; but the system was repugnant to the feelings of the people, and was abolished by the next constitution. May 24, 1866, an amendment was added disfranchising all persons who had voluntarily given aid and comfort to the rebellion since June 1, 1861; and the provision of the constitution that no one could hold office unless entitled to vote made the amendment still more sweeping. The capital has since remained at Wheeling, except from April, 1870, until May, 1875, when it was located at Charleston. April 27, 1871, an amendment was ratified by popular vote, striking out the word "white" from the suffrage clause, and also the disfranchising amendment of 1866.

—The present constitution was framed by a convention at Charleston. Jan. 16-April 9, 1872. Its principal changes were the increase of the senate to twenty-four members, chosen for four years, and of the house to sixty five members, chosen for two years; a prohibition of registration laws, and of special legislation in a number of specified cases; the increase of the governor's term to four years (see also RIDERS, VETO); and the abolition of the township system.

—BOUNDARIES. The boundaries of the state are not defined in the constitution, which only specifies the counties of Virginia included within it.

—GOVERNORS. Arthur J. Boreman, 1863-9; Wm. E. Stephenson, 1869-71; John J. Jacob, 1871-7; Henry M. Matthews, 1877-81; Jacob B. Jackson. 1881-5.

—POLITICAL HISTORY. Until 1870 the majority of the voters of the state were republican, and its state officers even of that party. Even in 1860 the republicans had contested two of the counties, and had given Lincoln a popular vote of 1,929 in this part of the state. When war finely began, the republicans, under the name of "unconditional Union men," took complete control of the new state. In 1864 Lincoln received nearly 70 per cent. of the total popular vote; and in 1868 Grant received nearly 60 per cent. But when the war ended, the return of disbanded confederate soldiers, particularly in the southern and eastern parts of the state, introduced a troublesome complication into politics. At first the dominant party met this by the disfranchising amendment of 1866, enforcing it by registration laws and test oaths, and suppressing resistance by force. The result was that in 1869 the number of disfranchised citizens was officially reported as 29,316, the number of actual voters being about 50,000; and as no disfranchised person could hold office, public business was seriously interfered with in many parts of the state. The first sign of compromise was the "Flick amendment," finally adopted in 1871. It was supported by moderate republicans and democrats, as it combined amnesty with negro suffrage, and in the struggle over it the democrats, or "conservatives," carried the state and the lower house of the legislature in 1870, and the senate in the following year. In 1872 Grant carried the state by a majority of 2,264 out of a total vote of 62,366; but since that

time the state has been so steadily democratic that the republicans almost ceased opposition until 1882, when they elected one of the state's four congressmen. In 1882 the legislature was composed as follows: senate, twenty democrats, three republicans, one independent; house, forty-six democrats, seventeen republicans, two independent.

—Among the political leaders of the state have been the following: Arthur J. Boreman, governor (republican) 1863-9, and United States senator 1869-75; Wm. G. Brown, democratic congressman (from Virginia) 1845-9, and Unionist congressman 1861-5; J. U. Camden, democratic candidate for governor in 1868 and 1873, and United States senator 1881-7; Allen T. Caperton, whig member of the state legislature 1853-60, confederate senator 1862-5, and United States senator (democrat) 1875-6; Henry G. Davis, democratic United States senator 1871-8, Nathan Goff, secretary of the navy under Hayes, and republican congressman 1883-5; Frank Hereford, democratic congressman 1871-7 and United States senator 1877-81; John E. Kenna, democratic congressman 1877-85; and Waitman V. Willey, republican United States senator (from Virginia) 1861-3, and (from West Virginia) 1863-71.

## WHEELER

WHEELER, William A., vice-president of the United States 1877-81, was born at Malone, N. Y., June 30, 1819, was admitted to the bar in 1843, and served in the state legislature 1850-51 and 1858-9, and in congress (republican) 1861-77. (See LOUISIANA.) In 1876-7 he was elected vice-president. (See DISPUTED ELECTIONS, IV.; ELECTORAL COMMISSION.) See authorities under HAYES, R. B.

## WHIG PARTY

WHIG PARTY (IN U. S. HISTORY). I. 1829-33. From 1801 until after the presidential election of 1828 the unity of the democratic or republican party was still nominally unbroken. Membership in it was so essential to political advancement that after 1817 all national opposition to it came to an end. In 1824 the nomination of presidential candidates by a congressional caucus was urged on the ground that all the aspirants belonged to the same party: and, even through John Quincy Adams' administration, the "Adams and Clay republicans," who supported the president, and the "Jackson republicans," who opposed him, steadily acknowledged each other's claim to the party name. (See DEMOCRATIC-REPUBLICAN PARTY, III.; FEDERAL PARTY, II.; CAUCUS, CONGRESSIONAL.)

—Notwithstanding this surface unity, there had long been a departure from the original democratic canons, and a break in the dominant party, which first becomes plainly visible after the war of 1812. The idea that the people were to impose their notions of public policy upon their rulers, and not altogether to receive them from their rulers, which the federalists had always detested at heart, had now been accepted by all politicians; but, working under this limitation, a strong section of the dominant party now aimed at obtaining, by Jefferson's methods, objects entirely foreign to Jefferson's programme. This was particularly the case in the northern states, where commerce, banking, and the other interests, not bounded by state lines, on which Hamilton had depended for the building up of nationality, were now supplemented by another, manufactures, non-existent in Hamilton's time. (See NATION.) All these looked to the republican party for a support and protection which the *laissez faire* of the Jeffersonian theory would have refused them. It is, then, very significant of the republican drift that banking was recognized by a national bank in 1816, commerce by a great system of public improvements in 1821, and manufactures by a slightly protective tariff in 1816, strengthened in 1824 and 1828. (See BANK CONTROVERSIES, III.; INTERNAL IMPROVEMENTS; TARIFF.) But this was the federalist policy, with the new feature of a protective tariff, which was at least rudimentary in the federalist policy; and the principal difference between the federalists and the Adams republicans was, that the former intended to be the guides, and the latter the exponents, of the people in carrying out the policy specified. The election of Adams as president in 1824, with his appointment of Clay as secretary of state, long denounced as a guilty bargain, was really the organization of a party, and the work was only hindered by Clay's angry denials of a "bargain." A frank acknowledgment of party birth, with the complete formulation of its principles which was given by President Adams in his annual messages, would have brought an intelligent support; the attempt to retain Jefferson's party name for the Adams faction only served to call attention to their complete departure from Jefferson's theory, and thus repelled every voter to whom "republicanism" was still the touchstone of politics.

—It was not until toward the end of Adams' term of office that any of his followers began to take the step which should have been taken at first, and assumed the name of "national republicans." Even when it was assumed, the assumption was only tentative,

and was confined to a few northern and eastern newspapers. To the mass of the Adams party the struggle still seemed to be only one between two wings of the same party, and the result of the election of 1828 showed which of the two seemed the better "republicans" to the country at large. Adams' electoral vote was that of the old federal party, the vote of the New England states, New Jersey and Delaware, sixteen of New York's thirty-six votes, and six of Maryland's eleven votes. But the popular vote showed a wider strength than the federalists had ever had. Jackson's majority was but 508 out of 8,702 votes in Louisiana, a state whose sugar-planting interest was always to incline it toward a protective tariff; 4,201 out of 130,993 votes in Ohio, where New England immigration and ideas were strong, in North Carolina and Virginia 30 per cent. of the popular vote was for Adams; and his total popular vote, in spite of the practical unanimity of most of the southern states, was 509,097 to 647,231 for Jackson. This was at least an encouraging growth for a party which as yet aimed at a total reversal of the republican policy while retaining the republican name.

—The year after Jackson's inauguration was one of sudden political quiet. The newspapers of the year were busied mainly with internal improvements, the first struggle of the railroad toward existence, and the growth of manufactures. It was not until the beginning of the year 1830 that Jackson's drift against the bank, the protective tariff, internal improvements, and the other features of the Adams policy, became so evident that his opponents were driven into renewed political activity. The name "national republican" at once became general. But the new party was at first without an official leader. In October, 1828, an indiscreet or treacherous Virginia friend of Adams had obtained from Jefferson's grandson and published a letter from Jefferson, written three years before, which named Adams as the authority for the allegation of a federalist secession scheme in 1808. (See EMBARGO, SECESSION.) Adams' newspaper organ, the "National Intelligencer," at once confirmed Jefferson's statement, with some corrections, and asserted that the president had known in 1808, "from unequivocal evidence, although not provable in a court of law," that the federalist leaders aimed at "a dissolution of the Union and the establishment of a separate confederation." The former federalist leaders of Massachusetts, or their sons, at once demanded his evidence, which he refused to give, and the quarrel died away in mutual recriminations. Adams' purpose seems to have been to emphasize his own original "republicanism"; but he only succeeded in alienating from himself the legitimate successor of the federal party. His inability to see that he had created a new party cost him the party leadership, which passed at once to Henry Clay. Adams was out of politics, and, when he entered the house again, in December, 1831, came as an anti-masonic representative; Clay, when he entered the senate in the same month, came as the most conspicuous advocate of the Adams policy. Dec. 12, 1831, the national republicans, in convention at Baltimore, unanimously nominated him for the presidency, and John Sergeant for the vice-presidency. No platform was adopted, but an address to the country formulated the party principles very distinctly in its attacks on Jackson's policy. May 7 following, a "young men's national republican convention" met at Washington, renewed the nominations, and adopted ten resolutions indorsing a protective tariff, a system of internal improvements, the decision of "constitutional questions" by the supreme court, and a cessation of removals from office for political reasons. The popular vote of 1832 was proportionally very similar to that of 1828; but the electoral vote was very different.

Maine, New Hampshire and New Jersey were now democratic; the "unit system" in New York gave the whole vote of that state to Jackson; Vermont gave her votes to the anti-masonic candidates; and the result gave Jackson 219, Clay 49, and others 18. (See ELECTORAL VOTES, XII.) Something was evidently lacking. Support of the United States bank (see BANK CONTROVERSIES, III.) helped the party in the middle and eastern states, but worked against it in the south and west. Support of a protective tariff helped the party in the middle and eastern states, where manufactures flourished, and growers of wool, flax and hemp desired a market in their own neighborhood, but again it exerted an unfavorable influence in the south and west. Too impatient to trust to time and argument for a natural increase of their national vote, and hardly willing to trust to a general system of purchase by "internal improvements" alone, the national republicans began, after the election of 1832, a general course of beating up for recruits, regardless of principle, which was the bane of their party throughout its whole national existence. No delegate could come amiss to their conventions: the original Adams republican, the nullifier of South Carolina, the anti-mason of New York or Pennsylvania, the state-rights delegate from Georgia, and the general mass of the dissatisfied everywhere, could find a secure refuge in conventions which never asked awkward questions, which ventured but twice (in 1844 and 1852) to adopt a platform, and which ventured but once (in 1844) to nominate for the presidency a candidate with any avowed political principles. The "national republicans" formed a party with principles and the courage to avow them; their reckless search for recruits placed their principles at the mercy of their new allies, and the bed became "shorter than that a man could stretch himself on it, and the covering narrower than that he could wrap himself in it."

—II. 1833-53. However heterogeneous was the mass of dissatisfaction in 1833-4, there was community of feeling on at least one point, dislike to the president. In South Carolina, nullification (see that title) had received its death-blow from the president's declared intention to usurp, as the nullifiers believed, the unconstitutional power to make war on a sovereign state; and the bitterness of this feeling was aggravated in the case of their leader, Calhoun, by a preliminary personal dispute with the president. The nullifiers were thus ready and willing to become the allies of the national republicans; and it is asserted by Hammond that Clay's compromise tariff of 1833, which gave the nullifiers a road of retreat, was one consideration for the alliance. The anti-masons of the northern and eastern states (see ANTI-MASONRY) had failed to make any impression in the election of 1832, and in transferring their national allegiance it was easier for them to go to the national republicans, whose leader, Clay, had publicly declared that he had not attended a masonic meeting for years, than to the Jackson party, whose leader was a warm and avowed free mason. In the south, particularly in Tennessee and Alabama, many democrats disliked Van Buren as the predestined successor of Jackson. Their leader was Hugh L. White, and, though his candidacy was at first that of a revolting democrat, his supporters soon came to feel that they were also fighting against the president and his dictation of his successor. In Georgia, the state-rights, or Troup, party, which had ousted the Indians from the state (see CHEROKEE CASE), had really been assisted by Jackson, and opposed by Adams, in accomplishing their purpose. Nevertheless, as a sort of connecting link between the nullifiers and the White party, they became the anti-Jackson party of their state, though their entrance to the general alliance was not perfected until 1835-7. All

these elements, indeed, remained in nominally separate existence throughout the year 1833, though their approach was daily becoming closer. Jackson's removal of deposits from the United States bank, Oct. 1, 1833, in defiance of a previous adverse vote of the house (see DEPOSITS, REMOVAL OF), seemed to the entire opposition such a flagrant executive usurpation of power as could not escape popular condemnation, and the national republican leaders seized upon it as an opportunity for cementing their new alliances. The task seemed difficult, in view of the radically different political beliefs of the two leading elements of the alliance, and it was only made possible by the personal character of the opposition to Jackson, and by the political tact of James Watson Webb, of New York, in finding an available party name. His newspaper, the "Courier and Enquirer," had originally supported Jackson, and had been driven into the opposition by the president's course. In February, 1834, he baptized the new party with the name of "whig," with the idea that the name implied resistance to executive usurpation, to that of the crown in England and in the American revolution (see AMERICAN WHIGS), and to that of the president in the United States of 1834. In reality, the objects of the name were to oppose a verbal juggle to the verbal juggle of the opposite party, to balance the popular name of republican or democrat by the popular name of whig, and to give an apparent unity of sentiment to fundamental disagreement. In all these it was successful. The name "took." Within six months the anti-masons and national republicans had ceased to be, and the whigs had taken their places. In the south the change was slower. It was not until after the election of 1836, in which White was unsuccessful, that the White and Troup parties fairly took the name of whigs; and in South Carolina the nullifiers in general never claimed the name, and at the most only allowed whigs elsewhere to claim them as members of the party.

—In 1836 the party was entirely unprepared for a presidential contest. Harrison was nominated for the presidency, as a "people's candidate," by a great number of mass meetings of all parties, and, in December, 1835, by whig and anti masonic state conventions at Harrisburgh, and by a whig state conventions at Baltimore, the former naming Granger and the latter Tyler for the vice-presidency. Harrison's politics were of a democratic cast, but he satisfied the whig requisite of opposition to the president, while he satisfied the anti-masonic element still better by declaring that "neither myself nor any member of my family have ever been members" of the masonic order. Webster was nominated in January, 1835, by the whig members of the Massachusetts legislature, but he found little hearty support outside of his state. White had now gone so far in opposition that copies of the official "Washington Globe," containing bitter attacks upon him, were franked to the members of the Tennessee legislature by the president in person. The legislature, however, in October, 1835, unanimously re-elected White senator, and by a vote of 60 to 12 nominated him for the presidency. Soon afterward, the Alabama legislature, which had already nominated White, rescinded the nomination, having become democratic. The South Carolina element, having control of the legislature, by which electors were to be appointed, made no nominations, and finally gave the state's electoral vote to Willie P. Mangum, a North Carolina whig, and John Tyler, a nullifier. All the factions of the opposition thus had their candidates in the field, and at first sight their discordant efforts might have seemed hopeless. But all the politicians of the time expected a failure of the electors to give a majority to any candidate, and a consequent choice by the house of

representatives, in which the opposition, though in a numerical minority, hoped to control a majority of states. These forecasts proved deceptive. Van Buren received a majority of the electoral votes, and became president.

—Van Buren's whole term of office was taken up by the panic of 1837, the subsidiary panic of 1839, and the establishment of the sub-treasury system in 1840, to take the place of the national bank and complete a "divorce of bank and state." (See BANK CONTROVERSIES, IV.; INDEPENDENT TREASURY.) Seldom have so many alternations in political prospects filled a presidential term. In 1837 Van Buren entered office with an overwhelming electoral majority, and his opponents prostrate before him; and within two years the whigs "had the loco-focos at their mercy." So poor had the administration grown that Calhoun and his followers ranged themselves with it again, holding that the executive was now so weak as to be harmless, and that the real danger was from the whigs. Preston, of South Carolina, and John Tyler, were almost the only leading nullifiers who nominally remained whigs. To balance this, the White and Troup party had now come into the whig ranks, the former bringing John Bell as its most prominent leader, and the latter John M. Berrien, John Forsyth, Thos. Butler King, Alexander H. Stephens, and Robert Toombs. Before 1840 returning prosperity had changed the scene. The democrats were now more than confident, they predicted the dissolution of the whig party, and declared that they would be satisfied with nothing less, with no mere victory; and, to crown the whole, they were completely defeated in the presidential election of 1840 by the "moribund" whig party. In the accomplishment of this sudden victory, the whig leaders have been reproached with an entire sacrifice of principle to availability, but it is well to remember that their party was as yet no complete vessel, but rather a raft, composed of all sorts of materials, and very loosely fastened together.

—Of the opposition candidates who had been in the field in 1836 it was evident that Harrison was the only available candidate for 1840. The whig party was not homogeneous enough to take its real leader, Clay, or its perhaps still better representative, Webster; nor had it sunk so low in its own coalition as to take a real democrat like White. Harrison was the favorite of the anti-masonic element; his western life and military services gave him strength at the west; and, in a less degree, at the south; and it was possible in the north and east to keep his very doubtful attitude as to the establishment of a new national bank under cover, while laying special stress on his determination to respect the will of the people's representatives in congress, and to spare the veto. This last point decided his nomination, for the whig leaders saw that his name would bring votes, while under cover of it the real contest could be carried on for congressmen, the actual governing power under Harrison's proposed disuse of the veto. And yet it is plain now that the whig party was more homogeneous in 1840 than it thought itself, and that it had a "fighting chance" of success under Clay. Its leaders ought to have learned this, if from nothing else, from the desperate expedients to which they were driven in the effort to dragoon the convention into nominating Harrison. And never was a convention so dragooned. It met at Harrisburgh, Dec. 4, 1839, and was treated as a combustible to which Clay's name might be the possible spark. By successive manœuvres it was decided that a committee of states should be appointed; that ballots should be taken, not in convention, but in the state delegations; that in each delegation the majority of

delegates should decide the whole vote of the state; that the result of each ballot should be reported to the committee of states; and that this committee should only report to the convention when a majority of the states had agreed upon a candidate. The first ballot gave Clay 103 votes, Harrison 94, and Scott 57, and it was not until the fifth ballot that the committee of states was able to report the nomination of Harrison by 148 votes to 90 for Clay and 16 for Scott. In the same fashion Tyler was nominated for the vice-presidency on the following day.

—The "campaign of 1840" was based entirely on Harrison's popularity and the general desire for a change, and under cover of these the whigs carried on a still hunt for congressmen, the real objects of the campaign. In all points they were successful. Log-cabins and hard cider, supposed to be typical of Harrison's early life, were made leading political instruments; singing was carried to an extent hitherto unknown; mass meetings were measured by the acre, and processions by the league; and in November "Tippecanoe and Tyler, too," received 234 electoral votes to 60 for their opponents, and were elected. The popular vote was nearly evenly balanced. The whigs had carried New England (except New Hampshire), New York, New Jersey, Pennsylvania, Maryland, Delaware, Ohio, Indiana, and Michigan, north of the Potomac; and south of it they had carried the "White and Troup party" states, Tennessee, Mississippi and Georgia, the whig states, Kentucky, North Carolina and Louisiana, and had made an exceedingly close contest in Virginia, Arkansas, Missouri and Alabama. Evidently, the conjunction of Harrison and Tyler had kept all the elements of the opposition well in hand. More important still, the new congress, to meet in 1841, had a whig majority in both houses, though the majority was not sufficient to override a veto.

—In spite of its diversity of opinion, the party had now developed a number of able leaders, Clay and Webster at their head, who for the next half dozen years were fast giving their party a definite policy, very similar to that of its most valuable element, the former national republicans. Among these were, Evans, Kent and Fessenden, of Maine; Slade, Collamer and George P. Marsh, of Vermont; J. Q. Adams, Winthrop, Choate, Everett, John Davis, Abbot Lawrence and Briggs, of Massachusetts; Truman Smith, of Connecticut; Granger, Fillmore, Seward, Spencer, N. K. Hall, Tallmadge, Weed and Greeley, of New York; Dayton, of New Jersey; Forward, Meredith and Ingersoll, of Pennsylvania; Bayard, Clayton and Rodney, of Delaware; Kennedy, Cost Johnson and Reverdy Johnson, of Maryland; Archer, Botts, Leigh and W. B. Preston, of Virginia; Graham, Mangum, Rayner, Clingman and Badger, of North Carolina; Legaré, of South Carolina; Berrien, Forsyth, King, Stephens and Toombs, of Georgia; H. W. Hilliard, of Alabama; S. S. Prentiss, of Mississippi; Bell and Jarnagin, of Tennessee; Crittenden, Morehead, Garret Davis, Wickliffe, John White and Underwood, of Kentucky; McLean, Giddings, Vinton, Corwin and Ewing, of Ohio; R. W. Thompson and Caleb B. Smith, of Indiana; and Woodbridge and Howard, of Michigan. Of the old nullifier element, Rives, Wise, Gilmer and Upshur drifted off to the opposite party under Tyler's leadership.

—Harrison's sudden death, and the accession of Tyler, were severe blows to the rising party, for they placed it temporarily under the feet of the remnants of its former allies, the nullifiers, just as it had begun to learn that it had a policy of its own which

nullifiers could not support. But the whigs themselves, and particularly Clay, made the blow needlessly severe. Seeing here an opportunity to secure for himself an undisputed party dictatorship in a war on Tyler, he declared war and carried it on *a l'outrance*. Its bank details are elsewhere given. (See BANK CONTROVERSIES, IV.) In 1842, by the act of Aug. 30, the whigs secured a protective tariff, closely following that of 1832, but only after sacrificing a section continuing the distribution of land to the states (see INTERNAL IMPROVEMENTS), because of which Tyler had vetoed the whole bill. In the elections of 1842 for the second congress of Tyler's term, the democrats obtained a two-thirds majority in the house, a result usually regarded as an infallible presage of the succeeding presidential election. And yet the whigs do not seem to have really been weakened. Their convention met at Baltimore, May 1, 1844, the first and last really representative convention of the party. For the presidency Clay was nominated by acclamation; and for the vice-presidency Theodore Frelinghuysen, then of New York city, was nominated on the third ballot. For the first time the party produced a platform, a model in its way, as follows: "that these [whig] principles may be summed up as comprising a well-regulated national currency; a tariff for revenue to defray the necessary expenses of the government, and discriminating with special reference to the protection of the domestic labor of the country; the distribution of the proceeds from the sales of the public lands; a single term for the presidency; a reform of executive usurpations; and generally such an administration of the affairs of the country as shall impart to every branch of the public service the greatest practicable efficiency, controlled by a well-regulated and wise economy." Even beyond the day of election the whigs were confident of success. But their original ally, Calhoun, had been for some years at work on a project which was, directly and indirectly, to dissolve the fragile bond which as yet united the northern and southern whigs, and made them a national party. It seems wrong to attribute the proposed annexation of Texas (see ANNEXATIONS, III.) entirely to a desire for extension of the slave area: it seems to have been a subsidiary object with southern democratic leaders to throw into politics a question which would cost Clay either his northern or his southern support, and the scheme was more successful even than they had hoped. The popular vote was nearly equal, and the electoral votes were 170 for Polk to 105 for Clay; but in the former were included the thirty-five votes of New York and the six votes of Michigan. In both these states the Polk electors were only successful because the abolitionists (see ABOLITION, II.) persisted in running a candidate of their own. Had their votes gone to Clay, as they would have done but for Calhoun's "Texas question" and Clay's trimming attitude upon it, Clay would have been president by 146 electoral votes to 129, and a very slight popular majority. What added bitterness to the disappointment was, that the democrats had taken a leaf from the whig book of 1840, by being protectionist in some states, and free trade in others; that Polk's majority of 699 in Louisiana was the fruit of about 1,000 unblushingly fraudulent votes in Plaquemines parish; that fraudulent voting and naturalization were charged upon the New York city democrats; and that Texas annexation had cost Clay the vote of all the southern states except Delaware, Maryland, North Carolina, Tennessee and Kentucky. The consequent bitterness of feeling died away, except in one respect, the foreign vote and its almost solid opposition to the whigs. "Ireland has conquered the country which England lost," wrote one of Clay's correspondents after the election; and the permanence of this feeling did much to turn the whig party into the "native American," or "know-nothing" party of after years.

—The question of Texas annexation had not sufficed to destroy the bond between northern and southern whigs, for, while both opposed this and subsequent annexations, the former did so for fear of slavery extension, and the latter nominally on economic grounds, but really for fear of the introduction of the slavery question into politics. But the war with Mexico gave their opponents another opportunity, which they used. The act recognizing the existence of war with Mexico declared the war to have arisen "by the act of the republic of Mexico." The object was to force the whigs to vote against the war, a vote much more dangerous to a southern than to a northern whig, or else array the two elements of the party against one another. The whigs managed to evade it, however, most of them by refusing to vote, some senators by adding formal protests to their affirmative votes; and fourteen in the house and two in the senate (Thomas Clayton and John Davis) found courage to vote against the bill. During the war the whigs voted steadily for supplies to carry it on, on the principle that an American army had been thrust into danger and must be supported; so that the democrats made very little political capital out of it. Indeed, the next congress, which met in 1847, had a slight whig majority in the house, a strong indication of a whig success in the presidential election of 1848.

—But the "Wilmot proviso" (see that title) had been introduced, and it was to find at last the joint in the whig armor. As the effort to restrict slavery from admission to the new territories went on, it became more evident month by month that it would be supported by the mass of the northern whigs, and opposed by the mass of the southern whigs, and month by month the wedge was driven deeper. Men began to talk freely of a "reorganization of parties," but that could only affect the whigs, for their opponents were already running the advocates of the proviso out of their organization. As the presidential election of 1848 drew near, the nomination of Taylor, urged at first by mass meetings of men of all parties, became more essential to the whigs. The democrats, after banishing the proviso men, were sufficiently homogeneous to be able to defy the slavery question; no such step could be taken by the whigs, and they needed a candidate who could conceal their want of homogeneity. In the north Taylor's antipathy to the use of the veto power was a guarantee that he would not resist the proviso, if passed by congress; in the south he had the tact which enabled him to answer an inquiring holder of 100 slaves thus briefly and yet suggestively: "I have the honor to inform you that I, too, have been all my life industrious and frugal, and that the fruits thereof are mainly invested in slaves, of whom I own *three* hundred. Yours truly. Z. Taylor." And his nomination was pressed harder upon the whigs by his declared intention to remain in the field in any event, as a "people's candidate." Nevertheless, when the whig convention met at Philadelphia, June 7, 1848, though Taylor had 111 votes, Clay had 97, Scott 43, Webster 22, and 6 were scattering. It was not until the next day, on the fourth ballot, that Taylor was nominated by 171 votes to 107 for all others. Fillmore was nominated for the vice-presidency on the second ballot, by 173 to 101 for all others. Clay had thus received his discharge from party service, for he was now over seventy years of age, and evidently this was his last appearance before a whig convention. To Webster, also, though five years younger than Clay, the blow was severe, and he publicly declared Taylor's nomination one which was eminently unfit to be made; but he and the other northern whigs finally supported the nomination. Taylor carried all the middle and eastern states (except Maine and New Hampshire), and, in the south, Delaware,

Florida, Georgia, Kentucky, Louisiana, Maryland, North Carolina and Tennessee, and was elected by 163 to 127 electoral votes. In both the north and the south he had also a plurality of the popular vote, the vote for Van Buren (see FREE-SOIL PARTY) preventing him from having a majority. But the election of Taylor was in itself deceptive. It was the result of democratic division in one state, New York, whose thirty-six votes would have elected Cass by an exact reversal of the electoral votes as above given. The division had really very little basis in principle, but was one of those contests between national and state party "machines" which have always been common in that state (see NEW YORK); but it sufficed to elect Taylor, and to give the whigs almost as many representatives in congress as their opponents.

—The meeting of the new congress in 1849 showed the first strong sign of whig dissolution. A half dozen southern whigs, headed by Toombs of Georgia, insisted on a formal condemnation of the proviso by the whig caucus; and when that body refused to consider the resolution, the Toombs faction refused to act further with the party. The loss was not large, but it was the opening which was very soon to be fatal. All through the session, which ended with the compromise of 1850 (see COMPROMISES, V.), the whole body of southern whigs exhibited a growing disposition to act together, even in opposition to the northern whigs, wherever the interests of slavery were brought into question. On the final votes, in August and September, 1850, it is practically impossible to distinguish southern whigs from southern democrats. Not that the northern whigs generally resorted to anything stronger than passive opposition: Thaddeus Stevens' suggestion, after the passage of the fugitive slave law, that the speaker should send a page into the lobby to inform the members there that they might return with safety, as the slavery question had been disposed of, lights up the whole line of policy of the northern whigs during 1850. They saw only that action of any kind must offend either their southern associates or their own constituents, and in either event ruin the party; and like the prudent man who foreseeth the evil and hideth himself, they took temporary refuge in refusal to act.

—Such a policy could not be permanent, and yet most of the northern whig leaders at first thought that they could at least make its advantages permanent; that they could retain their southern associates by acquiescing, however unwillingly, in the final decision, and their northern constituents by their unwillingness to indorse the decision itself. Taylor's death, in 1850, and Fillmore's accession, committed the northern whigs to the official policy of regarding the compromise of 1850 as a law, to be obeyed until repealed, and of opposing any attempt to repeal it as a reopening of the slavery excitement. Webster's speech of March 7, 1850, which is far oftener reviled than read, was really only the first declaration of this policy and one of the least objectionable. But the popular clamor which it excited was largely an indication that northern whig leaders were already out of sympathy with a large fraction of their constituents. In several northern states schisms opened at once, the most prominent instances being those between the "conscience whigs" and the "cotton whigs" in Massachusetts, and the "silver gray" or administration whigs, and the dominant Seward faction in New York. But the general spread of any such schism was not possible. No new leaders had been developed as yet to take the place of the old ones, who still held their hands on the party machinery; reflection, and the absence of further agitation, made the

mass of northern whigs willing to retain their southern wing, if the events of 1850 could be tacitly treated as a past episode in the party history; and the first twenty months of Fillmore's administration went by with a great deal of murmur, but no open revolt. While there was no great disposition to excommunicate men like Seward and Giddings, who retained whig views on every subject outside of the slavery agitation, there was at least a disposition to relegate them to the limbo of "free-soilers" and disclaim responsibility for them.

—In the spring of 1852 the southern whigs again intervened to finally break up the party. For twenty years they had accepted a northern alliance mainly as a point of resistance to southern democracy, and they had now consorted with their old opponents long enough to have lost their abhorrence of them. As the presidential election of 1852 approached, they prepared an ultimatum for the northern whigs which they must have known meant either the division or the defeat of the party. At the whig caucus, April 20, 1852, to arrange for the national convention, a southern motion was made to recognize the compromise of 1850 as a "finality." The motion was evaded, as not within the powers of the meeting, but its introduction was ominous. Northern whigs were willing to yield to such a recognition, tacitly: to do so expressly would have hazarded their majority in every northern whig state. But, when the whig national convention met at Baltimore, June 16, the southern ultimatum was pressed again, and more successfully. The platform was in eight resolutions: 1, defining the federal government's powers as limited to those "expressly granted by the constitution"; 2, advocating the maintenance of both state and federal governments; 3, expressing the party's sympathy with "struggling freedom everywhere"; 4, calling on the people to obey the constitution and the laws "as they would retain their self-respect"; and 7, urging "respect to the authority" of the state as well as of the federal government. Of the remaining three, the fifth and sixth are the last economic declaration of the party, as follows: "5. Government should be conducted on principles of the strictest economy; and revenue sufficient for the expenses thereof ought to be derived mainly from a duty on imports, and not from direct taxes; and in laying such duties sound policy requires a just discrimination, and, when practicable, by specific duties, whereby suitable encouragement may be afforded to American industry, equally to all classes and to all portions of the country. 6. The constitution vests in congress the power to open and repair harbors, and remove obstructions from navigable rivers, whenever such improvements are necessary for the common defense, and for the protection and facility of commerce with foreign nations or among the states—said improvements being in every instance national and general in their character." The eighth and last was the southern ultimatum, as accepted and formulated by the recognized northern leaders, the words "in principle and substance" being interlined in the draft by Webster at the suggestion of Rufus Choate. "8. That the series of acts of the 32d congress, the act known as the fugitive slave law included, are received and acquiesced in by the whig party of the United States as a settlement in principle and substance of the dangerous and exciting questions which they embrace; and, as far as they are concerned, we will maintain them and insist upon their strict enforcement, until time and experience shall demonstrate the necessity of further legislation to guard against the evasion of the laws on the one hand and the abuse of their powers on the other—not impairing their present efficiency: and we deprecate all further agitation of the question thus settled, as

dangerous to our peace, and will discountenance all efforts to continue or renew such agitation, whenever, wherever or however the attempt may be made; and we will maintain this system as essential to the nationality of the whig party and the integrity of the Union." This was the famous resolution that gave rise to the popular verdict upon the party, "died of an attempt to swallow the fugitive slave law." The other resolutions were adopted unanimously: this by a vote of 212 to 70, the latter all from northern whigs.

—Three candidates were before the convention. On the first ballot Fillmore had 133 votes, Scott 131, and Webster 29. On the second ballot, the votes for Fillmore and Scott were reversed, and from this point there was little change until, on the 53d ballot, Scott was nominated by 159 votes to 112 for Fillmore and 21 for Webster. Graham was then nominated on the second ballot for the vice-presidency. Scott's availability was much like that of Taylor, less the latter's popularity: his military services were great, and very little was known of his political opinions. But the whigs were beaten long before election day. In the north the eighth resolution cut deep into the whig vote, and it gained no votes in the south. For some unintelligible reason Scott had been the candidate of the anti-slavery vote in the convention, and he was believed to be much under the influence of Seward: the consequent refusals of southern whigs to vote made the popular vote in southern states noticeably smaller than in 1848. As a result of both influences the whigs carried but four states, Massachusetts and Vermont in the north, and Kentucky and Tennessee in the south, and even these by very narrow majorities. Scott and Graham were defeated; out 71 whigs were chosen out of 234 representatives in the next congress; 22 of these were southern whigs, most of whom, like A. H. Stephens, had publicly refused to support Scott in 1852, and were soon to be openly democrats; and the great whig party was a wreck. The country had no use for it: its economic doctrines were not a subject of present interest, and on the overmastering question of the extension of slavery it could neither speak nor keep silence without sealing its own fate.

—III. 1853-60. For the first few months of Pierce's term there was an unwonted quiet in politics. New men sought to build up a new party on the ruins of the whig organization by utilizing the old whig feeling against the foreign vote (see AMERICAN PARTY); and, as this promised a possible escape from the slavery question, the remnants of the whig party in 1856 indorsed the "American" nomination of Fillmore and Donelson, "without adopting or referring to the peculiar doctrines" of the party which had at first nominated him. But, by this time, most of the former northern whig vote had gone into the new republican party (see its name) under new leaders, while a large part of the former whig leaders had gone into the democratic party. Thus the former element gave the republican party its economic doctrines, while the latter lost all distinction as it changed its habitat. Still, the whig remnants lived on in a few northern states until 1857-8, when they were finally absorbed into the republican party. In 1860 the old whig element in the border states nominated Bell and Everett (see CONSTITUTIONAL UNION PARTY), and was still strong enough to dispute the southern states with the ultra democracy; but the outbreak of the rebellion dissipated this last trace of the once-powerful whig party.

—The history of the party nominally covers a quarter of a century, 1828-52, but it must be confessed that its real and distinct existence covers only about four years, 1842-6, and that its only real party action was its nomination of Clay in 1844, with the possible exception of Clay's nomination in 1831. During all the rest of its history the party was trading on borrowed capital, and its creditors held mortgages on all its conventions, which they were always prompt to foreclose. And yet it had its own office to perform, for in its members, rather than in its leaders, was preserved most of the nationalizing spirit of the United States. (See NATION, III.) In this sense, if we may not altogether accept the epitaph suggested by one of its leaders, that "the world was not worthy of it," we may at least believe that the nation was not ready for it.

—There is no good history of the whig party. Ormsby's *History of the Whig Party* gives so much space to events before 1824 that only the last 200 pages treat of events thereafter, and the treatment is itself of little value. Niles' *Register*, though a periodical, is about the best record of the party, though Wilson's *Rise and Fall of the Slave Power* is more convenient. The *American Whig Review*, published monthly 1844-52, will give the party's view of its own work; and 2 A. H. Stephens' *War Between the States*, 237, will give the inside history of the party's downfall. Its platforms in full may be found in Greeley's *Political Text Book of 1860*, 11-18. See also 2 von Holst's *United States; North American Review*, January, 1876 (W. G. Sumner's "Politics in America"); Wise's *Seven Decades*; 8-16 Benton's *Debates of Congress*; 2 Hammond's *Political History of New York*; Sargent's *Public Men and Events*; Clay's *Works, Private Correspondence*, and Colton's *Life and Times of Clay*; Webster's *Works, Private Correspondence*, and Curtis' *Life of Webster*; Adams' *Memoir of John Quincy Adams*; Everett's *Orations and Speeches*; Seward's *Works*; Coleman's *Life of Crittenden*; Tuckerman's *Life of Kennedy*; Prentiss' *Memoir of S. ## WHISKY INSURRECTION

WHISKY INSURRECTION (IN U. S. HISTORY), a revolt against the execution of a federal excise law, which came to a head in western Pennsylvania and was suppressed in 1794.

—The series of disorders to which the above general name is given, were the outcome of a number of moving causes. 1. The western counties of Pennsylvania, Virginia and North Carolina, among or beyond the Alleghanies, were far removed from the main body of American civilization. The distance to the seaboard was three hundred miles; roads were few and bad; to secure any profit from grain it was necessary to convert it into the more portable form of whisky; and whisky was the money of the community, in the general scarcity of cash. Under these circumstances a tax levied specially upon the distillation of whisky seemed to the mountaineers an invidious selection of themselves for imposition, a singling out of a few counties for taxation in order to relieve the richer east. 2. The people of these counties had been so long exempt from the fetters of the law that they felt the first touch keenly. Lying within an area whose jurisdiction had long been disputed by Virginia and Pennsylvania (see VIRGINIA, TERRITORIES), they had generally escaped any troublesome interference from either state. In 1783 the supreme executive council of Pennsylvania had sent a special agent to remonstrate with "those deluded citizens in ye western counties who seemed disposed to separate from ye commonwealth and erect a new and independent state." Canada was not far away to the north; Spain not much farther to the southwest; and between the two lay the great and unoccupied "northwest territory," to the west of Pennsylvania. Who can tell how many abortive negotiations with agents of one or the other power, with the erection of a new and nominally independent northwestern power as an ultimate object, were never committed to paper, but died with the backwoodsmen who had conducted them? It is certain that, when Genet (see that title) reached the United States in 1793, his infallible instinct for troubled waters at once led him to send his agents to Kentucky and western Pennsylvania; and when the last scene in the present insurrection was being acted, the more reckless leaders showed their hand by urging the formation of a new state. When vague dreams of empire had been so long cherished, it was intolerable that they should be broken in upon by the summons of a federal exciseman, and this sudden dissolving of frontier independence had very much to do with the whole difficulty. 3. In any event, an excise law had always been odious to English and Americans from the necessary power given to officers to enter houses and search. Blackstone had curtly said that "from its original to the present time its very name has been odious to the people of England"; and Noah Webster's predecessor, Dr. Johnson, had defined it as "a hateful tax, levied upon commodities, and adjudged not by the common judges of property, but by wretches hired by those to whom excise is paid." The continental congress, in a proclamation to the people of Canada, in October, 1774, had warned them that they would be "subjected to the impositions of excise, the horror of all free states"; and an English pamphleteer, long before, had said, "We know what a general excise is, and can not be ignorant that it bath an army in its belly." The constitution plainly gave congress power to lay and collect excises; but it was certain that the exercise of the power

would be difficult and dangerous; and the first project of an excise was defeated in congress, June 21, 1790. In the following year, when the project was revived, the Pennsylvania senators were instructed by their legislature to oppose such a law, "established on principles subversive of peace, liberty, and the rights of the citizens." 4. Complicated with all these reasons was a political opposition to the excise, which will be more in place under the main reason for its passage.

—Hamilton's reason for insisting upon the passage of an excise law must be judged from the standpoint of the statesman, not from that of the financier, though a hope of future revenues might have been considered. If we take into account the expense of suppressing the inevitable insurrection which it provoked the excise cost as much for collection as it produced, and the sides of its account were fairly balanced. Hamilton had prescience enough to forecast this immediate result, and yet he felt that great gain would come from the passage of the law. His reason, as given in the letter to Washington cited below, was, that it was necessary to assert at once the power of the federal government to lay excises, which the people were accustomed to look upon as a state prerogative, and that "a thing of the kind could not be introduced with a greater prospect of easy success than at a period when the government enjoyed the advantage of first impressions, when state factions to resist its authority were not yet matured, and when so much aid was to be derived from the popularity and firmness of the actual chief magistrate." But this last paragraph shows that there was an ulterior design, and that Hamilton was endeavoring to find the line of least resistance in exhibiting to the states for the first time that which had never before been heard of, "the authority of the national government." Heretofore, "authority" had been in the state governments, and the functions of the national government, if there ever was any, were to recommend, to remonstrate, to soothe, and to bear rebuffs with patience and becoming humility. Somewhere the new national authority must be first brought upon the stage, and no safer or more undeniably legal opportunity could be imagined than in the suppression of an insurrection against an excise law. To assert that Hamilton willfully sought to provoke as weak a sedition as possible in order to make its suppression easy and certain, would be a hard saying if his object had been personal advantage, or if a hecatomb of innocent victims could be invoked in condemnation of his plans. But neither was true: not only was the success of his plan perfect and bloodless, but there seems to have been no trace of self-seeking in it. He was playing for high stakes (see NATION), and he played, as his antagonists did in 1800-1, with the rigor of the game. That he used opportunity, the disorganization of the opposition, the constitutional permission to lay excises, and the presidency of Washington, with such skill and effect, shows only what a master of the game he was.

—Had Hamilton's purpose been plainly stated, to force an issue on which he could safely introduce the "authority of the national government" to popular view, the excise law would have received little support from a people or from politicians accustomed to regard the states as sovereign and independent, and the federal government as their creature. (See STATE SOVEREIGNTY.) But he took one step after another so skillfully that he ended, as he began, with the almost unanimous support of the people, who concurred in maintaining a national authority which they had hardly dreamed of ten years before. Nevertheless, there were some of the opposition, particularly Jefferson, who detected and vainly endeavored to counteract

Hamilton's design. Their failure was one great moving cause of the rise of the new republican party (see DEMOCRATIC PARTY, I.), but it also helped to give the leaders of the new party the bitter dislike which they always cherished for Hamilton. That he had forced them to learn new ideas was bad enough, but it was intolerable that he should also compel them to kiss the rod to which they had unwillingly submitted. Their evident wrath has given some credence to a notion that some of them had been laying plans for a general disruption of the Union, and that Hamilton's shrewdness in provoking a premature explosion had balked them. The only documentary evidence to this effect is in a passage of an intercepted dispatch of Fanchet, Genet's successor, in 1794 (see RANDOLPH, EDMUND), that the insurrection was "indubitably connected with a general explosion for some time prepared in the public mind, but which this local eruption would cause to miscarry, or at least check for a long time." But the Frenchman's characteristic use of the word "indubitably," his failure to support it by any evidence from Randolph or elsewhere, and the failure of every other attempt to find any such evidence, put his passage out of court. Democratic anger came altogether from the discovery that the power of the federal government must thereafter be considered as a factor in American politics, together with the independence of the states and of the citizen. They could no longer say, as was said in congress in 1794, that their constituents "love your government much, but they love their independence more"; for the federalists could retort, as Tracy, of Connecticut, did to Gallatin in 1796, that, "whatever might be the case in other parts of the Union, his constituents were not of a temper to dance round a whisky pole one day cursing the government, and sneak the next day into a swamp on hearing that a military force was marching against them." In this alteration of the fundamentals of political discussion was the head and front of Hamilton's offending.

—The excise bill became a law March 3, 1791. Little open resistance was made to it in Virginia or North Carolina, but in Pennsylvania the agitation was headed not only by violent men, one Bradford being the most noted, but by abler and quieter leaders, such as William Findley, then and for many years afterward a member of congress; John Smilie, also a member of congress after 1792, and Albert Gallatin. (See his name.) The first meeting to protest against the law was held at Redstone old fort, now Brownsville, July 27. Its proceedings were moderate; but another meeting, Aug. 23, in Washington county, nearest to the Virginia line, and most disordered, resolved to consider as an enemy any person who should take office under the law. Violence could not but follow this, and it began Sept. 6, with the tarring and feathering of a revenue officer. Throughout the winter the disturbance smoldered, but it was so threatening that an act was passed, May 2, 1792 (see INSURRECTION), empowering the president to use militia in suppressing disturbances within a state. With it went another act, May 8, reducing the duties. An attempt to hire an office in Washington county for the revenue officers, in August, led to renewed disorder, and the president felt compelled to warn the rioters, by a proclamation of Sept. 15, to abandon their unlawful combinations. Occasional tarrings and featherings followed throughout the year 1793, but the law itself was not as yet very effectively exercised. Early in 1794 the organization of secret societies began, coincident with the introduction into the house of representatives of a plan to secure and collect the excise duties; and these seem to have made full preparations for resistance. One great reason for the popular dislike to this particular law was, that offenses under it were cognizable only in

federal courts, and that an accused person would therefore be compelled to journey to Philadelphia, at the other end of the state, to answer the charge. To backwoodsmen this was certainly no slight grievance; and congress very justly removed it in the act of June 5, 1794, giving state courts concurrent jurisdiction of excise offenses, so that accused persons might be tried in their own vicinage. But while the law was in process of passage, and before its mitigation could be taken advantage of, some fifty writs were issued at Philadelphia, May 31, against various persons in the western counties. These were served in July; as each was served, the person served joined the mob which followed the marshal; the cry was raised that "the federal sheriff was taking away people to Philadelphia"; and the short-lived whisky insurrection began. The marshal was captured, and sworn to serve no more processes; the inspector fled down the Ohio, and thence around through a wilderness to Philadelphia; and within two days the operation of the law was stopped. It is not known who was responsible for the issue of the writs of May 31, which were the spark for the explosion. There is no evidence whatever that Hamilton had anything to do with it.

—The insurgents, two days after the outbreak, seized the mail from Pittsburgh, in order to ascertain the names of those of their fellow-citizens who were opposed to them. A mass meeting was called for Aug. 1, on Braddock's field. Some 7,000 armed men were present; a county judge presided, and Gallatin acted as secretary; none, even of those who disliked the posture into which affairs were growing, dared to remonstrate; and a reign of terror was begun, Bradford being the ruling spirit. Personal violence was offered to any person suspected of obeying the law, and the more reckless spirits began active preparation to call out the whole force of the counties for a defensive war against the United States.

—The emergency had now come, and the manner in which it was met showed to the dullest understanding the difference between the present government and that which had been balked by Shay's rebellion. (See CONFEDERATION, ARTICLES OF.) The federalist members of the cabinet instantly advised the calling out of militia; and, when Gov. Mifflin of Pennsylvania declined to take the initiative, the "national authority" showed that it no longer was absolutely dependent on the state governments. A certificate of the existence of the insurrection was obtained from a federal judge; a proclamation from the president, Aug. 7, ordered the insurgents to disperse; a requisition for 15,000 militia was issued to the governors of Pennsylvania, New Jersey, Virginia and Maryland; and Sept. 1 was fixed as the date for the departure of the troops. A federal commission of three persons, and a state commission of two, preceded the troops with offers of amnesty on full submission. The mission was apparently a failure. It found Gallatin, Findley, Brackenridge and the other leaders of standing engaged in a desperate effort to induce submission, but impeded by Bradford and the reckless borderers, who terrorized every meeting they attended. Aug. 28, the controlling committee of sixty met at Redstone old fort. Bradford urged armed resistance, but Gallatin, by securing a secret ballot, obtained a resolution, 34 to 23, to accede to the proposals of the federal commissioners. These proposals were mainly that town meetings should be held Sept. 11, that the people should vote yea or nay on the question of submission, that those who voted yea should obtain amnesty by signing a declaration of submission, and that the unanimity of the vote should govern the movements of the troops. Many, however, refused to sign the

declaration, for the reason that they had taken no part in the outrages, and had no need of amnesty; and the reckless part of the insurgents supplemented the meagreness of the vote by a renewal of the outrages, and even by an attempt to seize the commissioners on their way home.

—The report of the commissioners was so unfavorable that the president issued a new proclamation, Sept. 25, giving notice of the advance of the troops, mostly volunteers. Washington accompanied them to Carlisle, where he left the chief command to Gov. Lee, of Virginia. The Pennsylvania and New Jersey troops were led by Govs. Mifflin and Howell; the Virginia troops by Gen. Morgan; and the Maryland troops by Samuel Smith, a member of congress from Baltimore. Hamilton accompanied the expedition throughout. In the meantime a new popular convention, Oct. 2, had sent Findley and another commissioner to the president with unanimous assurances of submission; but the president could see no evidence that the assurances represented any general feeling. Another meeting, Oct. 24, therefore declared that all suspected persons ought to surrender at once for trial, and that it would be perfectly safe to open inspection offices and put the excise laws in operation immediately; and four commissioners were appointed to carry these resolutions to the president. No halt took place in the movement of the troops, however. They arrived in the disturbed district early in November, and their commander, after giving the inhabitants time to obey his proclamation and take advantage of the proffered amnesty, arrested by a general sweep those accused persons who had not yet exonerated themselves. These culprits, however, were insignificant. Bradford and the more violent leaders had fled the country, and the more moderate leaders had protected themselves by taking advantage of the amnesty: as Wolcott, a warm federalist, expressed it, "all the great rogues, who began the mischief, had submitted and become partisans of the government." The result was, that two or three were tried and convicted, and these were pardoned. But there was for a long time an angry feeling that Hamilton, Knox and Judge Peters had acted as a "star chamber" in their manner of taking testimony, and in their sending a number of accused persons to Philadelphia, "to be imprisoned for ten or twelve months without even an indictment being found against them."

—The first show of force had suppressed the insurrection, and the troops returned home, leaving 2,500 men, under Morgan, who encamped in the disturbed district throughout the winter. Its suppression had been almost bloodless, but two persons having been killed, and these in personal conflicts with soldiers for which the soldiers were punished. But the effects were greater than if a "Peterloo" battle had been fought. The early political struggles of the United States are none the less important because they were peaceful; and the bloodless suppression of the whisky insurrection is as significant in its way as the bloody emergence of the English nation from the chaos of the heptarchy. For five years the people had been enjoying all the comforts of a national government without feeling any of the responsibilities which accompanied them; and the politicians had been developing the idea that individual obedience to the federal government under the constitution was to be as fundamentally voluntary as state obedience had been under the confederation, that all Americans were by nature good citizens, and that discontent with a law was *prima facie* evidence that the law was bad and ought to be repealed. The year 1794 completed what the year 1787 began; it revealed a power which, though seldom

exerted, must always be finally decisive. The swiftness and thoroughness with which the resistance had been put down; the evident fact that, as Wolcott said, "the whole resources of the country would be employed, if necessary"; and the reflection that a part can never be equal to the whole: all combined to show the hopelessness of any future insurrection which individual dissatisfaction could be expected to produce. It is clearly within bounds to say, that this single lesson would have been sufficient to free the United States from future danger of insurrection but for the influence of slavery in binding together a number of states in organized insurrection. Its influence is certainly evident in a comparison of the congressional debates before and after it occurred. Before 1794 there is in many of the speakers almost an affectation of voluntary obedience to federal laws, and of monition to others not to provoke resistance. After that year, this characteristic disappears almost entirely, and the debates have no longer the background of possible club law.

—A broader result is easily visible now, though few others than Jefferson and Hamilton saw it then. If a federal army, without the summons of the governor or legislature, was to march through a state to suppress resistance to federal laws within the state, state sovereignty, in its hitherto accepted sense, could hardly be found by searching. Little was said at the time, but when the federal party was finally overthrown, one of the first steps in reform was the abolition of the excise laws by the act of April 6, 1802. (See STATE SOVEREIGNTY.)

## WHISKY RING

WHISKY RING, the popular name for an association of revenue officers and distillers to defraud the government of the internal revenue tax on distilled spirits. The nature and natural effect of this tax are so fully described elsewhere that it is needless to do more than refer to them. (See DISTILLED SPIRITS.) It is only intended to enter a little more minutely into the formation and operation of the ring.

—The ring had its origin in St. Louis, when the "liberal republican" movement had achieved its first success. (See MISSOURI, LIBERAL REPUBLICAN PARTY.) The distillers were assessed by the revenue officials for money with which to secure the support of an influential St. Louis newspaper. The ring soon widened, and in 1874 it had spread into national proportions. Distillers who refused to enter it were watched, and entrapped into technical violations of law. Then, having become liable to seizure, they had to choose between ruin and surrender to the ring. There were branches at Milwaukee, Chicago, Peoria, Cincinnati and New Orleans, and an agent, who has not been legally identified, at Washington; but the headquarters of the ring were still at St. Louis. It had acquired so large an influence in the national republican party, that, when the new secretary of the treasury, Bristow (see ADMINISTRATIONS), issued an order to transfer supervisors, which would have thrown the ring into confusion, the politicians obtained a direct countermand of the order from the president. The special treasury agents were corrupted, and the ring maintained its ground.

—When the statistics of the St. Louis merchants' exchange for 1874 were published, a comparison of the shipments with the revenue returns showed that about \$1,200,000 of taxes had not been paid. Nevertheless, the secretary of the treasury was unable to reach the individuals at fault, for the ring had prompt information from the department itself of any step toward investigation. Early in February, 1875, the editor of the "St. Louis Democrat," Mr. George Fishback, sent a message to Mr. Bristow, offering to furnish him with a trustworthy agent, who would unearth the frauds. The secretary accepted the offer, and Mr. Fishback named Mr. Myron Colony, secretary of the cotton exchange. Mr. Bristow appointed the solicitor of the treasury, Mr. Bluford Wilson, to co-operate with him, and the work was begun.

—At first the attempt was made to watch the operations of suspected distilleries, the amount of grain carried in and of liquor carried out; but the officials and distillers discovered the attempt, and suspended the frauds until they had organized gangs of ruffians and driven away the detectives. Then Mr. Colony, under pretense of collecting statistics of the city's receipts and shipments, placed a man at each landing and freight depot, to copy bills of lading. The copyists were ignorant of the purpose of their employer, and were directed to copy the records of all staple articles, *including whisky*. Finally, by assorting the bills, Mr. Colony had a description of all shipments of liquors by each distillery for three months, with the serial numbers of the stamps. Comparison with the official returns of course laid the whole fraud bare; and, within a month after Mr. Colony's appointment, he had made all the leading houses of St. Louis liable to seizure. The work was then transferred to special agents of the internal

revenue bureau most of whom were kept in ignorance of the real object of their investigations; and a new commissioner of internal revenue, ex-senator Pratt, of Indiana, was appointed. Under his direction, experts compared the returns of other distilleries with the records already obtained, and thus the secretary was enabled, through his agents, to work up similar frauds at Milwaukee and Chicago, and to discover the manner in which the distillers, by connivance of the officials, accomplished the frauds, by shipping secretly barrels whose contents they had reported as "dumped" into the common cistern of the distillery for storage. Finally, May 10, 1875, the blow fell simultaneously at St. Louis, Milwaukee and Chicago, by the seizure of all the implicated distilleries, sixteen in number, and as many rectifying houses. The records seized enabled the government to make further seizures in almost every important city in the United States, for the seizure of May 10 had been entirely unexpected and unprepared for. One telegram had gone from Washington to St. Louis. "Lightning will strike on Monday. Inform our friends in the country." But it was found that the sender and receiver of the message were both opponents of the ring; and, with this exception, no intimation of the secretary's purposes seems to have passed outside of his own little circle. As a result of this secrecy of operation, the government was able to bring into court a total amount of about \$3,500,000 of property seized, with suits on gaugers' bonds, and indictments against 238 persons, including distillers, rectifiers, wholesale liquor dealers, collectors, deputy collectors, supervisors, gaugers, storekeepers, and other persons. It was shown that the government had been defrauded of about \$1,650,000 of taxes during the ten months from July 1, 1874, to May 1, 1875.

—When the papers in the case were first laid before President Grant, he indorsed one of them with directions to "let no guilty man escape," and had supported Bristow heartily. But the first effort of the ring was to persuade the president that Bristow's zeal was inspired by a desire to obtain the presidency. The investigators had come to believe that the president's private secretary, Babcock, was one of the ring, and they directed his movements to be watched. The letter, which ordered the fraud to be exposed "from bottom to top," was stolen from the office of the government counsel: and, when it reached Babcock, the letters "W. H." had been added at the end of a line after the word "top," so as to make it appear to be the intention to investigate the White House from bottom to top. A press copy of the letter exposed the interpolation, and prevented the removal of Wilson, for which the president had hastily given orders on first reading the letter. This, however, was but one of the efforts which were made from every side to break up all confidence and co-operation between the president and the secretary: others seem to have been more successful.

—Indictments for conspiracy to defraud, and for destruction of public records, began in June, 1875, and continued throughout the year. The most important were those against John A. Joyce, revenue special agent, John McDonald, supervisor, Wm. O. Avery, chief clerk in the treasury department, and General O. E. Babcock. The trials began in the autumn at Jefferson City, Mo. Joyce was convicted, Oct. 23, McDonald Nov. 22, and Avery Dec. 3. One of the leading counsel for the government in these prosecutions was John B. Henderson, of Missouri. In the Avery trial he had occasion to introduce certain suspicious telegrams from Babcock, and he commented on them and on the president's general action in the case in terms which, to say the least, were

indiscreet. "What right," said he, "had Babcock to go to Douglas [the former internal revenue commissioner] to induce him to withdraw his agents? What right had the president to interfere with Douglas in the proper discharge of his duties, or with the secretary of the treasury? Why did Douglas bend the supple hinges of his knee, and permit any interference by the president?" Henderson claimed that this language was meant only to justify the president in *not* interfering; but it must be evident that the president could not have been fairly expected to endure this mode of attacking the whisky ring. Henderson was removed; but his place was given to Jas. O. Broadhead, a leading democratic lawyer of St. Louis, Dec. 9 the federal grand jury indicted Babcock. Babcock had already asked for a military court of inquiry, to investigate the charges against him in the Avery trial, and the president was strongly disposed to direct the attorney general to suspend all civil proceedings in the Babcock case, and turn the matter over to the military court. This was successfully resisted by Bristow; but the court was granted, and met at Chicago, Dec. 9. The attorney general directed the district attorney to send to the military court his evidence against Babcock, and the names of his witnesses; but the district attorney (Dyer) refused to obey an order which would have made him punishable for contempt of court. The military court met, suspended its proceedings, and soon afterward dissolved.

—The Babcock trial began Feb. 8, 1876. One of the most important witnesses, a gauger named Everest, who was alleged to have personal knowledge of payments to Babcock by the ring, had been induced to go to Europe. District attorney Dyer had induced him to return by a promise of exemption from prosecution, met him in Philadelphia, and obtained an outline of his testimony. As soon as this became known, the attorney general issued an order to the district attorneys at St. Louis, Chicago and Milwaukee, dated Jan. 26. 1876, ordering them to give no promises of exemption, but to punish every guilty person, who should be convicted or should confess his guilt. It is hardly necessary to say that this letter excited a general indignation, and was looked upon as an official effort to screen Babcock.

—It must be confessed, that, in spite of the fact that there was not a breath of suspicion upon the president personally, there was a very general feeling that he was to some extent on trial with his private secretary; and there was an equally general feeling of relief when the jury, Feb. 24, brought in a verdict of not guilty. Immediately afterward the president took another private secretary in Babcock's place.

—Most of the remaining defendants either plead guilty or were convicted; and a few, in whose cases there were extenuating circumstances, were non-prossed. Of the leading defendants, Avery, McKee and Maguire were pardoned in about six months.

—In March, 1876, a select committee was appointed by the house of representatives to ascertain whether any federal official had aided or given information to the defendants. It sat for six months, examined a great number of witnesses, and gave their testimony in House Misc. Doc., No. 186, 1st session, 44th congress, 1875-6. The whole makes up a startling revelation of the political methods of the time and of the disgraceful and dangerous condition of the civil service.

—Every effort had been made to blacken the private and public character of Secretary Bristow, but without the slightest success. In the spring of 1876 he opened an attack upon a whisky ring on the California coast. Here, at last, he was beaten. As soon as his investigations became dangerous, a California senator demanded the removal of several of the more active special agents of the treasury at San Francisco. The secretary refused, but was not supported by the president; and in June, 1876, he resigned. His retirement relieved the ring from further prosecution: but its active energies were broken and were never revived.

## WHITE

WHITE, Hugh Lawson, was born in Iredell county, N. C., Oct. 30, 1773, and died at Knoxville, Tenn., April 10, 1840. He removed to Tennessee with his father in 1786, was admitted to the bar in 1795, and served as judge of the state supreme court 1801-7 and 1809-15, as state senator 1807-8 and 1817-18, and as United States senator 1825-33 and 1837-40. In 1836 he received twenty-six electoral votes, from Tennessee and Georgia, for the presidency, being the representative of that "state rights" southern faction which thereafter became the southern wing of the whig party. (See WHIG PARTY, I.) See Nancy H. Scott's *Memoir of White*; 2 Benton's *Thirty Years' View*, 184.

## WILMOT PROVISIO

WILMOT PROVISIO (IN U. S. HISTORY). Although this principle has been baptized with the name of David Wilmot, a democratic congressman from Pennsylvania, who attempted to apply it in 1846 to the territory about to be acquired from Mexico, it is in reality the outcome of that principle of congressional control over the territories which has constantly been applied in practice since the nation first owned territories. The ordinance of 1787 (see that title) prohibited slavery in the northwest territory; and in the territory southwest of the Ohio the prohibition of slavery was not imposed, because congress, in accepting the cessions of it by the states, had voluntarily bound itself not to do so. In the organization of the territories, while congress has allowed the election of the lower house of the legislature by the people, it has always retained to the national government the appointment of the judges and of the governors, with a veto on the territorial legislatures, and has even retained a power to veto, in the last resort, the action of territorial governors and legislatures together. Its power to prohibit polygamy and slavery in the territories has always rested on exactly the same foundation. (See TERRITORIES.) In the case of slavery it would probably never have been denied, but for the influence occasioned by the growth of slavery. Jefferson's prohibition of slavery in both the northwest and southwest territories came within a hair's breadth of success in 1784; and the more limited prohibition of 1787 had practically no opposition. In the case of Missouri, in 1819-20, there was hardly any denial in the south, while there was a unanimous affirmation in the north, of the power of congress to prohibit anything in the territories, even slavery. The southern argument was altogether different from any such denial. It showed that the national government had acquired the territory west of the Mississippi, when slavery was permitted therein by law; that it had taken no steps whatever to prohibit slavery therein, but had allowed it to extend north through Missouri; and that, when Missouri had thereby become a slave state through the continued policy of congress, confirmed by the admission of Louisiana as a slave state in 1812, it was not just, by a sudden reversal of policy in the case of Missouri, to destroy property rights which congress, at least by *lashes*, had allowed to grow up. Leaving out of question the morality of slavery, the southern reasoning was just, and indeed, *mutatis mutandis*, was exactly the reasoning of the free-soilers of after days. In 1820 (see COMPROMISES, IV.), congress recognized its justice: it refrained from touching slavery in that part of the annexation where it had been allowed to grow up, in the states of Louisiana and Missouri, and in the territory of Arkansas; but it took absolute assurance for the future by prohibiting slavery forever in the rest of the annexation, that part lying north of latitude 36°30'. The mistake lay in allowing this to go forth as a compromise, a bargain, a division of territory between the sections, instead of a plain exercise of rightful power by congress, coupled with an act of condonation for the past. There could then have been no attempt to stamp the Wilmot proviso in 1846 as a novelty in American legislation.

—I. BEFORE ANNEXATION. Prohibitions of slavery were inserted in the organization of the new territories formed from the Louisiana purchase, Iowa in 1838, and Minnesota in 1849, by the following provision: "The laws of the United States are

hereby extended over and declared to be in force in the said territory, so far as the same, or any provision therefore, may be applicable." The prohibition of slavery therein, passed in 1820, thus attached to them as organized territories. It was very doubtful whether Oregon was really a part of the Louisiana purchase (see NORTHWEST BOUNDARY), and for greater safety an explicit prohibition of slavery was inserted in the first house bill to organize the territory. In this form the house passed the bill, Feb. 3, 1845, by a vote of 140 to 59. Pending difficulties with Great Britain made the organization of the territory at that time a matter of doubtful prudence, and it was not considered by the senate until after the treaty of June 15, 1846.

—All parties who voted for the annexation of Texas did so with a silent recognition of slavery therein, as established by local law. But the remainder of the Mexican republic was absolutely barred to slavery, at first by a decree of the dictator Guerrero in 1829, and then by the constitutions of the Mexican republic. If, then, any portion of it should be annexed to the United States, it would come in as free territory, just as all other acquisitions had been slave territory when acquired. Early in the Mexican war an arrangement seems to have been made by the administration with the banished Mexican president, Santa Anna, by which he was to be allowed to return to Mexico, reorganize his party, and conclude a peace on the basis of a payment by the United States for a cession of territory. Aug. 8, 1846, in a special message, the president asked for the appropriation of a sum of money for "the adjustment of a boundary with Mexico such as neither republic will hereafter be inclined to disturb," that is, for the purchase of Mexican territory outside of Texas. Such a bill, appropriating \$2,000,000, was at once introduced in the house, and debate was limited to two hours. Northern and southern whigs were alike opposed to any acquisition of territory, for fear of introducing with it the question of slavery: and White, of New York, and Winthrop, of Massachusetts, now expressed their party's views clearly and forcibly. Most of the northern democrats, while determined on acquisition of territory, were equally determined that it should remain free. Brinckerhoff, of Ohio, at once drafted, and Wilmot introduced, the amendment afterward famous as the "Wilmot proviso," as follows: "provided that [as an express and fundamental condition to the acquisition of any territory from the republic of Mexico by the United States, by virtue of any treaty which may be negotiated between them, and to the use by the executive of the moneys herein appropriated] neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall first be duly convicted." The words in brackets were not essential, except under temporary circumstances, and the remainder forms the Wilmot proviso proper, as it is usually cited. It followed the language of the ordinance of 1787.

—Remarkably little opposition was made to this first appearance of the proviso, and that little came from southern democrats who alleged that the territory in question was already free; that the proviso was thus needless; and that it was also mischievous, as a piece of supererogatory and offensively anti-southern legislation, which would provoke the election of extreme southern representatives and endanger the Union. This view will be found best stated by Benton, as cited below, and he himself was one of the first victims. (See MISSOURI.) The proviso was quietly accepted: the house decided it in order by a vote of 92 to 37, and adopted it (83 to 64) and the whole bill

(85 to 79) on the day of its introduction. Two days afterward, on the last day of the session, the senate voted, 19 to 10, to take up the bill for consideration. Lewis, of Alabama, moved to strike out the proviso. Davis, of Massachusetts, argued against the motion, and persisted in his argument until the time fixed for adjournment came, and he was cut off in the full flow of debate. The proviso thus fell with the bill. It was claimed at the time that it would have been passed by the votes of all the free-state senators, and those from Delaware and Maryland; but Wilson makes a very convincing showing that it would have been voted down. Nevertheless the denunciations of Davis' action in democratic newspapers and in the "Union," the official newspaper at Washington, were far more severe than in those of their opponents. Cass, in conversation, censured Davis severely. Polk, in his message of the following December, without any condemnation of the proviso, expressed his regret that the bill had not passed, and his confidence that a majority of both houses was still in favor of it. The legislatures of every northern state east of Indiana, excepting Maine, but including Delaware, formally approved the proviso, democrats and whigs uniting in the vote. Everything seemed to point to its passage, as a democratic measure, at the following session.

—Before the following session the southern members had been naturally forced into an attitude of stronger opposition to the proviso. Every southern aspirant to a seat in congress was certain to represent the sitting member's active or passive support of the proviso as an act of treason to the south; and thus all the southern democrats, who desired an acquisition of territory, were arrayed against the proviso. Southern whigs, who were against the acquisition, could safely vote against the proviso with its bill, and could carry enough northern whigs with them on that issue to preserve the national integrity of their party. How were northern democrats to keep their party intact? This pressing question was answered by the evolution of the new dogma of "popular sovereignty" (see that title) in the territories, by virtue of which the status of slavery in any territory was to be remitted to the decision of the people of the territory. Urged at first as a prudent way of settling the difficulty, it almost immediately became the touchstone of democracy, and Wilmot and democrats who supported him were driven out of the party.

—Jan. 4, 1847, in the house, Preston King, of New York, asked leave to offer a bill like that of the previous session, changing \$2,000,000 to \$3,000,000, but adding the proviso. Before it could be considered, bills of like nature, but without the proviso, had been reported in both houses. In the senate the southern whigs unsuccessfully tried to add a prohibition of any purchase of territory; and the bill, without the proviso, passed March 1. In the house the proviso was moved by Wilmot as an amendment, Feb. 8, renewed by Hamlin, Feb. 15, and adopted by a vote of 115 to 106. Douglas unsuccessfully trying to restrict it to territory north of latitude 36° 30'. March 3. in the house, the proviso was added to the senate bill in committee of the whole by a vote of 90 to 80, but rejected on the report of the committee (97 to 102); and the bill, without the proviso, was finally passed (115 to 81).

—In the meantime, a bill to organize Oregon territory, with a provision that the inhabitants should enjoy all the privileges, and be bound by all the prohibitions and restrictions, of the ordinance of 1787 (which prohibited slavery), was passed by the

house, Jan. 16, 1847. But Oregon was now to be linked in, for a time, with the territory to be annexed; and the senate, after twice committing the bill, laid it on the table, March 3.

—II. AFTER ANNEXATION AND BEFORE COMPROMISE. Before any further measures could be attempted at the next session, peace had been concluded, Feb. 2, 1848, and the great territories of California and New Mexico (see ANNEXATIONS, IV., for their extent) had been transferred to the United States. The fact of possession greatly changed political conditions. Southern democrats simply continued to oppose the proviso; northern democrats now opposed it by force of the doctrine of popular sovereignty; and southern whigs, who had opposed it together with the \$3,000,000 bill, on account of the acquisition of territory, found little difficulty in continuing the opposition after annexation. In short, the proviso had now no friends in congress, excepting a part of the northern whigs and the few remaining Wilmot democrats. Only the imminent presidential election of 1848, and the unknown possibilities of a northern free-soil uprising, prevented the organization of the territories, without the proviso, in the spring of 1848; and the lost opportunity was not easily regained.

—May 29, 1848, the president called the attention of congress to the pressing necessity of organizing Oregon territory; and the necessity was emphasized by the fact that the popular provisional government (see OREGON) had begun to make laws forbidding slavery. The necessary bill, which Douglas had reported, Jan. 10, was at once brought up; Hale offered as an amendment a section imposing the prohibitions, as well as the privileges, of the ordinance of 1787; and debate continued until July 12. A select committee of eight was then chosen, and it reported, July 18, a bill in thirty-seven sections, commonly known as the "Clayton compromise," from the chairman of the committee, organizing the territories of Oregon, California and New Mexico together. No power was given to the territorial legislatures to legislate on slavery, and questions of its legality or illegality in any particular territory were to be decided by the territorial courts, with a right to appeal to the United States supreme court. In this form the bill was passed, July 26, but the house laid it on the table by a vote of 112 to 97, and it was never revived. The majority was made up of seventy-four northern whigs, thirty northern democrats, and eight southern whigs. Aug. 2, the house passed an Oregon bill, with the section relating to the ordinance of 1787. Aug. 10, the senate passed it with an amendment declaring the Missouri compromise line to extend to the Pacific, and to be binding in all future organizations of territories: and on the following day the house non-concurred. Aug. 12, the senate receded, passed the bill as it originally came from the house, and Oregon was a free territory. The secret of the senate's action was in the Buffalo convention three days before, and the nomination of candidates pledged against extension of slavery. (See FREE-SOIL PARTY.)

—The southern leaders were doubly embarrassed at the meeting of congress in December, 1848. The discovery of gold in California, Jan. 19, 1848, was increasing the population so rapidly that a state government would soon be even more necessary than a territorial government; and the mass of northern democrats in congress were so thoroughly provoked by Taylor's election through southern electoral votes as to be ready even for the proviso. Nothing could have postponed the proviso but the shortness of the session, and the still controlling influence of the south in the senate.

Congress had hardly organized, when the house, Dec. 13, by a vote of 108 to 80, instructed the committee on territories to bring in territorial bills for California and New Mexico, "excluding slavery therefrom." The committee, one week later, reported the California bill, but it was not reached until Feb. 26, 1849. The next day it was passed by a vote of 126 to 87, almost exactly sectional. The New Mexico bill was reported Jan. 8, but was not reached. In the senate the California bill was referred, but never considered, and the committee was discharged, March 3. In place of it, an unsuccessful attempt was made to tack a senate bill to the appropriation bill. (See RIDERS, II.) At the adjournment the territories were still left unorganized.

—No one, as yet, denied the right of the people of a territory, when forming a state constitution, to prohibit slavery; and the new administration (Taylor's) at once undertook to solve the problem by procuring the formation of state governments in both California and New Mexico. In both of these the Wilmot proviso was a part of the state constitution. This forced the further proceedings into a new line, which is detailed elsewhere. (See COMPROMISES, V.) In reviewing the whole current of events, at the close of September, 1850, it will appear that the object of the proviso, the prohibition of slavery, had been successfully attained in all the territory outside of the Louisiana purchase, except the modern state of Nevada, and the territories of Utah, New Mexico and Arizona (then included in New Mexico); and that, as to the excepted portions, the Mexican laws abolishing slavery therein had never been interfered with by American laws. But the struggle over the Wilmot proviso, which was essentially only a declaration of the existing law of the territories, was a very sufficient warning that some influence was at work, which would resist any such declaration for the future. This was the doctrine of Calhoun, that the constitution's guarantee of security to property covered the territories also; and that congress was bound to enforce it in the case of slave property, as well as other property. The objection now seems insuperable that the slaves were always referred to as "persons" in the federal constitution, and as "property" only in state constitutions and laws, which could have nothing to do with the territories. But at the time Calhoun's doctrine fell in too closely with southern feeling to be resisted. It was adopted, openly by some, tacitly by others, and the comparative strength of the former class steadily increased. Calhoun's resolutions of Feb. 19, 1847, protesting against discrimination in the territories against any state, were the first, though vague, expression of the doctrine, and their effect was seen in the unanimous resolutions of the Virginia legislature, March 8, following: 1, that such a discrimination was in violation of the compromises of the constitution; 2, that it was to be "resisted at every hazard"; and 3, that, in the event of the passage of the Wilmot proviso or any law abolishing slavery or the slave trade in the District of Columbia, the governor should immediately convene the legislature "to consider of the mode and measure of redress." As the proviso discussion went on, the southern tone grew still warmer; and at the time of the final compromise most of the southern states had statutes or resolutions in existence directing the governor to call a popular convention in the event of the passage of the proviso. (See SECESSION, II.)

—III AFTER THE COMPROMISE. The general ratification of the compromise of 1850 seemed at first to have put an end to the desire for the proviso. When was it to be applied? California was a free state, and the territories had been completely

organized, those acquired under the Louisiana purchase having the proviso under the Missouri compromise, and those acquired under the Mexican purchase merely ignoring it. Not content to let well enough alone, the northern democratic leaders, in 1854, attempted to apply the "popular sovereignty" principle to the new territories of Kansas and Nebraska, formed from the Louisiana purchase (see KANSAS NEBRASKA BILL), and thus to wipe out the proviso when it was already established by law. The attempt naturally revived the proviso on a far stronger ground. It was now an evidently conservative effort to reapply to the Louisiana purchase the prohibition which had been its organic law from 1820 until 1854; and it thus secured a breadth of support greater than it could have obtained in 1849-50, and became the basis of a great northern party. (See REPUBLICAN PARTY, I.) But of course the new party could not be content to limit the assertion of the proviso to the Louisiana purchase: law for one territory was law for all, for Utah and New Mexico as well as for Kansas and Nebraska; and thus the work of 1850 was to be done over again, with no chance now for compromise. In 1857 the supreme court decided that the proviso had always been unconstitutional in the case of any territory (see DRED SCOTT CASE); but this had little effect on the supporters of the proviso. They still asserted the right of congress to impose a prohibition of slavery upon the territories, disregarding the *obiter dicta* of the supreme court, and leaving the constitutional question to be decided by the court when the case should come directly before it. Against this permanent programme a bald negative was but a poor reliance; the south was compelled to choose between admitting the validity of a prospective prohibition, or taking Calhoun's extreme ground of the duty of congress to protect slavery in the territories. It chose the latter (see DEMOCRATIC PARTY, V.), its ultimatum being expressed in Jefferson Davis' senate resolutions of May 24-25, 1860. The most important of these, in this connection, were the fourth and fifth; as follows: "4, that neither congress nor a territorial legislature, whether by direct legislation or legislation of an indirect and unfriendly character, possesses power to annual or impair the constitutional right of any citizen of the United States to take his slave property into the common territories, and there hold and enjoy the same while the territorial condition remains; 5, that, if experience should at any time prove that the judicial and executive authority do not possess means to insure adequate protection to constitutional rights in a territory, and if the territorial government should fail or refuse to provide the necessary remedies for that purpose, it will be the duty of congress to supply such deficiency." At least a part of these resolutions was explained by a territorial law of New Mexico, in 1859, establishing slavery. It was disapproved by the house of representatives, but the senate did not act on the veto bill, so that the territorial slave law remained in force. On the contrary, the eighth resolution of the republican platform in May, 1860, declared "that the normal condition of all the territory of the United States is that of freedom; that, as our republican fathers, when they had abolished slavery in all our national territory, ordained that no person should be deprived of life, liberty or property without due process of law, it becomes our duty, by legislation, whenever such legislation is necessary, to maintain this provision of the constitution against all attempts to violate it; and we deny the authority of congress, of a territorial legislature or of any individuals, to give legal existence to slavery in any territory of the United States." The issue was thus fairly made up on both sides: all or nothing. The republican programme was indorsed by Lincoln's election, and secession and war followed. (See SECESSION. III.; REBELLION.)

—IV. FINAL ESTABLISHMENT OF THE PROVISIO. The withdrawal of southern senators and representatives left the republicans in a majority in both houses of congress before the end of the session of 1860-61; but they made no attempt to enforce the eighth section of the Chicago platform. The propositions of Crittenden (see COMPROMISES, VI.), and of the peace congress (see CONFERENCE, PEACE), both of which aimed to forbid the future application of the Wilmot proviso to territory south of latitude 36° 30', were rejected; but, on the other hand, the territories of Colorado, Dakota and Nevada were organized without the Wilmot proviso, in entire silence as to slavery, and therefore with all the benefits to the south of the Dred Scott decision. Slavery in the territories remained undisturbed until 1862, immediately after its abolition in the District of Columbia, April 16. (See ABOLITION. III.) In the house, March 24, a bill was introduced "to render freedom national, and slavery sectional," and was referred to the committee on territories. It was reported, May 1, recommitted, and again reported, May 8. It was now a bill to prohibit slavery in the territories, in federal forts, dockyards, etc., in vessels on the high seas, in national highways, and in all places where the national government had exclusive jurisdiction. It was debated until May 12, when it had been modified into a simple prohibition of slavery in the territories, and was then passed by a vote of 85 to 50. In the senate, June 9. its language was slightly changed to the following: "that, from and after the passage of this act, there shall be neither slavery nor involuntary servitude in any of the territories of the United States now existing, or which may at any time hereafter be formed or acquired by the United States, otherwise than in punishment of crime, whereof the party shall have been duly convicted"; and it was then passed (28 to 10). June 17, the house concurred (72 to 38); and the bill became law, June 19. It was never brought before the supreme court, in order that its constitutionality might be examined in the light of the yet unreversed Dred Scott decision; but all doubts on that score were removed by the national abolition of slavery in 1865, through the ratification of the 13th amendment. (See CONSTITUTION, III.)

—See 3 von Holst's *United States*, 286; 1 Greeley's *American Conflict*, 189; 2 Wilson's *Rise and Fall of the Slave Power*, 18; Harris' *Political Conflict in America*, 114; 2 A. H. Stephens' *War Between the States*, 165; *Buchanan's Administration*, 18; 1 Dix's *Speeches*, 179 (Three Million Bill). Gardiner's *The Great Issue*, 94; 16 Benton's *Debates of Congress*, 223-254 (Oregon), 399 (summary of Mexican laws abolishing slavery); Cleveland's *A. II. Stephens*, 343 (and law authorities there cited in favor of the continuance of Mexican laws after conquest); 3 *Statesman's Manual*, 1613 (Message of Aug. 8, 1846), 1710 (Message of May 29, 1848); 15 Benton's *Debates of Congress*, 645 (introduction of the proviso); 16 *ibid.*, index under *Slavery*; 4 Calhoun's *Works*, 339 (resolutions of Feb. 19, 1847); 1 A. H. Stephens' *War Between the States*, 409 (Senate resolutions of May 24-25, 1860); 12 *Stat. at Large*, 432 (act of June 19, 1862); Wilson's *Anti-Slavery Measures in Congress*, 92. The different shades of opinion as to the proviso may best be studied as follows: moderate democratic (south), 2 Benton's *Thirty Years' View*, 695 (north), 1 Dix's *Speeches*, 281; extreme southern democratic, 4 Calhoun's *Works*, 535 (Speech of Feb. 24, 1849); southern whig, Cleveland's *A. II. Stephens*, 332 (Speech of Feb. 12, 1847); northern whig, 5 Webster's *Works*, 253 (Speech of March 1, 1847); free-soil, Horace Mann's *Letters and Speeches*, 10 (Speech of June 30, 1848); abolitionist, Jay's *Review of the*

*Mexican War*, 183, and *Warden's Life of Chase*, 314; administration, 1849-50, 3  
*Statesman's Manual*, 1847 (Message of Jan. 21, 1850). The *Democratic Review*  
carefully avoids the subject until September, 1847 (p. 103), and the *Whig Review* until  
August, 1848 (p. 193), and then both pronounce against the proviso, the former as an  
abolition measure, the latter as a democratic measure.

## WILSON

WILSON, Henry, vice-president of the United States 1873-5, was born at Farmington, N. H., Feb. 16, 1812, and died in office at Washington city, Nov. 22, 1875. His name, Jeremiah Jones Colbath, was changed to Henry Wilson by an act of the legislature in 1830. He was self-educated during the time which he could save from his labors as a farm hand and shoemaker. From 1841 until 1852 he served frequently in the state legislature, as a whig with strong anti-slavery opinions. In 1848 he withdrew from the whig national convention, entered the free-soil party, and was its candidate for governor in 1858. He then went into the "know-nothing" organization (see AMERICAN PARTY), but withdrew from it in 1855. Before his withdrawal he had been elected United States senator by a coalition of know-nothings, free-soilers and opposition democrats; and he retained the position as a republican until his election as vice-president. During the rebellion he served as chairman of the senate military committee, and took a leading part in the conduct of the war by congress. His leading work is the *History of the Rise and Fall of the Slave Power in America*; his minor works are the *History of the Anti-Slavery Measures in Congress, 1860-64*; *Military Measures of the United States Congress*; *History of the Re-construction Measures in Congress, 1865-8*; *History of the Part of Congress in the War to suppress the Rebellion*. See Stowe's *Men of Our Times*; Mann's *Life of Wilson*; Nason's *Life of Wilson*.

## WIRT

WIRT, William, was born at Bladensburgh. Md., Nov. 8, 1772, and died at Washington city, Feb. 18, 1834. He was admitted to the bar in 1794, and practiced in eastern Virginia until 1817, when he became attorney general of the United States, serving until 1829. In 1830 he removed to Baltimore. In 1832 he was the anti-masonic candidate for the presidency (see ANTI-MASONRY, I), and received the seven electoral votes of Vermont. See Kennedy's *Memoir of Wirt* (1852); 70 North American Review, 255; 92 *ib.*, 277.

## WISCONSIN

WISCONSIN, a state of the American Union, formed from the northwest territory. (See TERRITORIES, ORDINANCE OF 1787.) Its area was included successively in the territories of Indiana, Illinois and Michigan, and was finally organized into the territory of Wisconsin, April 20, 1836. An enabling act was passed Aug. 6, 1843, and under its provisions a convention at Madison, Oct. 5-Dec. 16, 1846, framed a state constitution. An act was then passed, March 3, 1847, to admit the new state under this constitution, if it should be ratified by popular vote. It was rejected by the people, owing to its attempt to prohibit banks and banking, and Wisconsin remained a territory. May 29, 1848, the state was finally admitted under its first constitution.

—BOUNDARIES. As this was the fifth state erected from the northwest territory, which, by the ordinance of 1787, was to be divided into not more than five states, it would seem fitting that Wisconsin should have comprised all the remnant of the original territory. This, however, was not done: five and a half states were really formed, that portion west and north of the western end of Lake Superior being taken from Wisconsin and given to the trans-Mississippi territory of Minnesota. The boundaries of the state, as fixed by the enabling act and accepted by the first constitution, are as follows: Beginning in the middle of Lake Michigan, in latitude 42° 30' north (the northern boundary of Illinois); thence, with the Michigan boundary, through Lake Michigan, Green Bay, and the Menomonee, Brulé and Montreal rivers to Lake Superior; thence through the middle of Lake Superior to the St. Louis river at the head of the lake, up the St. Louis to its first rapids, due south to the St. Croix river, down the St. Croix to the Mississippi, down the Mississippi to the northwest corner of Illinois, and thence east to the beginning.

—CONSTITUTION. The constitution under which the state was admitted, still in force, was framed by a convention at Madison, Dec. 15, 1847-Feb. 1, 1848, and ratified by popular vote March 13. It forbade slavery; gave the right of suffrage to white males over twenty-one, on one year's residence, but with power to the legislature to extend the limits of the elective franchise on ratification by popular vote; fixed the numbers of the assembly at not less than fifty-four nor more than 100, to serve one year, and of the senate at not less than one-fourth nor more than one-third of the assembly, to serve two years; gave the governor, elected by popular vote, a term of two years; made the judiciary elective for a term of years, and removable by address of two-thirds of the members elected to each house; forbade the loaning of the state's credit, or the contracting of a state debt of more than \$100,000 except in case of war or insurrection; and made Madison the capital of the state. Slight amendments were made in 1867, 1869 and 1870; in 1871 the legislature was forbidden to pass special laws in a number of specified cases; in 1874 county and municipal governments were forbidden to contract debts to an amount greater than 5 per cent. of their taxable property; and in 1882 the sessions of the legislature were made biennial.

—GOVERNORS. Nelson Dewey, 1848-51; Leonard J. Farwell, 1851-3; Wm. A. Barstow, 1853-5; Coles Bashford, 1855-7; Alex. W. Randall, 1857-61; Louis P.

Harvey, 1861-2; Edward Salomon, 1862-3; James T. Lewis, 1863-6; Lucius Fairchild, 1866-72; C. C. Washburn, 1872-4; Wm. H. Taylor, 1874-6; Harrison Ludington, 1876-8; Wm. E. Smith, 1878-82; Jeremiah M. Rusk, 1882-4.

—POLITICAL HISTORY. In national politics the state was democratic until 1856, casting her electoral votes for Cass and Pierce in 1848 and 1852. In 1856, and at every presidential election since that year, the state has been republican, about 55 per cent. of the total popular vote being cast for the republican electors, except in 1876, when it fell to 51 per cent. In more local elections, the results have been closely similar. Until 1855 the state governments and congressmen were democratic, with the following exceptions: in 1851 Gov. Farwell was elected by a temporary coalition of whigs and free-soilers; and until 1852 the southeastern or Milwaukee district elected a free-soil congressman, the southwestern district a whig, and the northeastern district a democrat. The coalition of 1851 dissolved almost immediately, and for the next two years democratic supremacy was hardly disputed. Early in 1854 the organization of the republican party (see that title) was begun, and before July it had been completed, the whig and free-soil committees disbanding, and new committees of whigs, free-soilers and democrats, being appointed in their stead. In the fall elections the new party carried two of the congressional districts and the lower house of the legislature, and elected twelve of the twenty-five senators: the Milwaukee district was now democratic. In the following year, though the democrats carried the lower house and elected all the state officers except the governor, the republicans secured the senate, and, after a struggle, the governorship also. For this office the first official count gave Barstow (dem.) 36,170 votes, and Bashford (rep.) 36,012. Bashford claimed a miscount, took the oath as governor in January, 1856, and brought a *quo warranto* suit in the state supreme court against Barstow, who had also taken the oath. The assembly voted to recognize Barstow as governor, and the senate voted to recognize him as governor *de facto* until the decision of the supreme court. Barstow denied the court's jurisdiction, which the court after argument affirmed, Feb. 19. Barstow then withdrew from the case under protest, and left the office to Bashford. Since that time all the governors, with the exception of Gov. Taylor, have been republican, as well as the legislatures, the United States senators and the congressmen, with some exceptions, most of which are noted below.

—In 1856 the republicans again elected the governor, a majority of both houses of the legislature, and as a consequence the United States senator (Doolittle): the democrats again elected the other state officers. This was the last election for many years in which the result was close or doubtful. Since 1863 the Fond du Lac district has always chosen a democratic congressman; and to this must be added the northeastern or Green Lake district in 1859-65, the Milwaukee district in 1863-5 and 1871-85, the Winnebago district in 1875-85, and the general democratic success in 1882. In all other congressional elections the republicans have been successful, having usually five of the six congressmen from 1861 until 1871, and five of the eight congressmen from 1871 until 1881. In the election of 1882, under a new apportionment, the state was entitled to nine congressmen, and the democrats were successful in six of the districts.

—In state politics the most interesting issues have been the Graham law in 1872, and the Potte law in 1874. The former was an act requiring a license for the sale of liquor, together with a bond for the payment of any damages recovered against the seller by a town for the support of an intoxicated person, or by any person injured in the means of support by the sale of liquor to husband, wife, parent or child. It was decided constitutional by the state supreme court in 1873, and, with other moving causes, led to a slight republican reverse in that year; the liberal republicans and democrats elected Taylor governor. March 11, 1874, the Potter law was passed. It was a general railroad law, fixing railroad rates for passengers and freight, and creating a board of commissioners to enforce the law. The railroads took the case to court, and in the interim refused to obey the law; but the case was decided against them by the state court and the federal circuit court, and steps were at once taken to revoke the charters of the railroads for their violation of the law. For the time the railroads yielded, but the good understanding between the "grangers" (see that title) and the democrats gave the latter most of the state officers, and their candidate for governor, Taylor, was only defeated by the close vote of 85,155 to 84,314. But throughout these slight vicissitudes the republicans retained control of the legislature, except that in 1875 their regular candidate for United States senator, Carpenter, was defeated by Cameron, also a republican, through the votes of democrats and "bolting" republicans. The legislature in 1882-3 stands as follows: senate, twenty-four republicans, nine democrats; house, seventy-eight republicans, twenty-two democrats.

—Among the political leaders of the state have been the following: Angus Cameron, republican United States senator 1875-85; Matthew H. Carpenter, republican United States senator 1869-75 and 1879-81; Lucien B. Caswell, republican congressman 1875-83; Orsamus Cole, whig congressman 1849-51, state chief justice at present (1884); P. V. Deuster, democratic congressman 1879-85; Henry Dodge, governor of Wisconsin territory 1836-41, delegate to congress 1841-5, democratic United States senator 1848-57; James R. Doolittle, state circuit judge 1853-6, republican United States senator 1837-69, democratic candidate for governor 1871; Charles Durkee, free-soil congressman 1849-53, republican United States senator 1855-61, governor of Utah territory 1865-70; Charles A. Eldredge, democratic congressman 1863-75; Richard Guenther, republican congressman 1881-5; George C. Hazelton, republican congressman, 1877-83; Timothy O. Howe, state circuit and supreme court judge 1850-55, republican United States senator 1861-79, postmaster general under President Arthur; Wm. Pitt Lynde, democratic congressman 1848-9 and 1875-9; Halbert E. Paine, republican congressman 1865-71; E.g. Ryan, chief justice of the state supreme court; Philetus Sawyer, republican congressman 1865-75, and United States senator 1881-7; Cadwallader C. Washburn, republican congressman 1855-61 and 1867-71, and governor 1872-4; and Charles G. Williams, republican congressman 1873-83.

—The state was named from its principal river, the Wisconsin, "Ouisconsin," a mixed French and Indian word, said to mean "westward flowing."

## WRIGHT

WRIGHT, Silas, was born at Amherst, Mass., May 24, 1795, and died at Canton, N. Y., Aug. 27, 1847. He was graduated at Middlebury college in 1815, was admitted to the bar in 1819, and almost immediately entered politics as a democrat. He served as surrogate of Rockland county 1821-4, as state senator 1824-7, as congressman 1827-9, as state comptroller 1829-33, as United States senator 1833-44, and governor 1844-6. About 1824 his ability had made him a leading member of the "Albany regency" (see that title), which controlled the state democratic party; and he held his place in it until his death. Van Buren's failure to receive the democratic nomination for the presidency in 1844 placed the regency in an attitude of armed neutrality toward the incoming administration of Polk; and, when this state of things had developed into open war in 1846. Wright was defeated for re-election as governor by the refusal of administration democrats to vote. His death soon afterward added to the bitterness of feeling between his followers and their opponents, and the state party in 1848 made the conflict national. (See BARNBURNERS; HUNKERS; FREE-SOIL PARTY; NEW YORK; DEMOCRATIC PARTY, IV.)

## WYOMING

WYOMING, a district in the northeastern part of Pennsylvania, the seat of a long conflict of jurisdiction between Pennsylvania and Connecticut. Attention is elsewhere called (see TERRITORIES) to some of the difficulties which were occasioned by the undefined western boundaries of Massachusetts, Connecticut, Virginia, and the three colonies south of Virginia. In the case of Connecticut the difficulty was increased by the fact that a western prolongation of its territory, passing over the Dutch settlements on the Hudson river, specially excepted under the head of possessions of "any other Christian prince or state." would have taken a strip of land about 120 miles wide from the northern part of Pennsylvania. Connecticut's assertion of her rights took the form of a private association, the "Susquehanna company," organized in 1753, and backed by the colonial government. In 1754 the company sent commissioners to meet the council of the Six Nations at Albany (see ALBANY PLAN OF UNION), in order to purchase the Indian title. Franklin and the other Pennsylvania commissioners, aided by Sir William Johnson, of New York, endeavored to prevent the purchase, but it was effected for £2,000. The eastern boundary was to be an irregular northerly line at a distance of ten miles east of the Susquehanna from latitude 41° north to latitude 42° north; thence two degrees of longitude west; thence 120 miles south; and east to the place of beginning. In 1762 the company sent its first party of settlers, 200 in number; but the Indians attacked and dispersed them, sent a deputation to Hartford in 1763 to repudiate the sale to the company, and in 1768 resold the same territory to Pennsylvania. In 1769 the company, disregarding the Indian transactions, again began to throw immigrants into Wyoming, and a desultory civil war began between the Connecticut settlers and the Pennsylvania men to whom the district had been leased. The former were several times driven altogether out of the valley, and compelled to return to Connecticut, but their persistence was successful within two years in obtaining a permanent lodgment. This result was due in great measure to the faulty land policy of Pennsylvania, whose proprietors, the Penn family, made it their regular policy, whenever it was possible, to grant leases only. Franklin says of Penn's initiation of this policy: "The scene of action being shifted from the mother country to the colony, the department of the legislator was shifted too. Less of the man of God now appeared, and more of the man of the world. One point he had already carried against the inclination of his followers, namely, the reservation of quit rents, which they had remonstrated against as a burden in itself, and, added to the purchase money, without precedent in any other colony; but, he artfully insinuating that government must be supported with splendor and dignity, and that by this expedient they would be exempt from other taxes, the bait took, and the point was carried." It was unnatural to expect that mere lessees would exhibit the same spirit in conflict as men who were maintaining a claim for absolute ownership. In other words, the struggle was between two opposite land systems, that of freeholders and that of leaseholders. While this was the case, the result was not doubtful, and the success of the Connecticut settlers was not displeasing to most of the Pennsylvania people, who disliked the proprietary government and the proprietary land system.

—In 1773 the Wyoming settlement had gained so much strength that it began to have ambitious views of independent existence as a separate colony, and the company, meeting at Hartford, June 2, 1773, adopted a form of government for it. But the legislature of Connecticut, having been fortified by the favorable opinion of a number of the best lawyers in Great Britain, Dunning, Jackson, Widderburn and Thurlow, asserted the colony's jurisdiction over the Susquehanna company's territory. In 1774 it was made a town under the name of Westmoreland, and was to be considered a part of Litchfield county, Connecticut. The town for several years sent delegates to the Connecticut legislature. The breaking out of the difficulties with the mother country suspended all minor disputes, and the contest was suspended throughout the revolutionary war, except that the attack on Wyoming and massacre of its defenders, in July, 1778, seem to have been influenced in a slight degree by the feeling that the settlers were interlopers.

—In 1779 an act of the Pennsylvania legislature transferred all the proprietary quit rents to the state, reserving the proprietors' private property to them, and granting them \$524,000 compensation for quit rents, payable in installments after the peace. The new lord of the soil, the state, at once abandoned the leasehold system in future sales, and thus renewed the contest with the Connecticut settlers on equal terms. Under the provision of the articles of confederation which made congress a court of last resort for the trial of title to territory disputed between the states, Pennsylvania brought suit against Connecticut to decide the jurisdiction of Wyoming. The case was heard by five judges at Trenton, and in November, 1782, their unanimous decision, afterward confirmed by congress, was given in favor of Pennsylvania. By this time a number of Pennsylvanians had settled in the territory, and when these proceeded to elect justices of the peace the Pennsylvania legislature, in September, 1783, directed the governor to commission the officers so elected. This began the "war of the Pennamites and the Yankees." The Connecticut settlers had submitted to the decision of congress, and given up their town organization; but they expected that their Connecticut titles to land would be respected or quieted. The conditions offered by Pennsylvania were intolerable: the Connecticut settlers were to surrender half their lands at once, to retain possession of the other half for one year, and were then to surrender the whole to claimants under Pennsylvania titles. The settlers resisted, led by John Franklin and others, and prevented state agents from laying out townships or counties; and their resistance had so much sympathy from the people of Pennsylvania that the legislature, Sept. 15, 1784, suspended proceedings. For the next two years the district was in a very anomalous condition, until in September, 1786, Pickering (see his name) procured the adoption of two complementary measures which bade fair to settle the whole difficulty. Luzerne county was established, and the district was thus brought within the jurisdiction of Pennsylvania, and the petitions of the Connecticut settlers for a confirmation of their titles were granted by a confirmatory act. By Pickering's active exertions the settlers were brought to agree to the settlement in May, 1787; but in the following year the legislature, having secured the organization of the county, repealed the confirmatory act, and this shocking piece of bad faith ("unjust and cruel," Pickering calls it) reopened the difficulty. Suits were brought by Pennsylvania claimants against the settlers; but it required more than eight years to decide the first suit, and the unfavorable issue of this one had no effect on the persistence of the other settlers. Finally, April 4, 1799, the legislature passed a

compromise act, which secured possession to those who held Connecticut titles, acquired before the Trenton decision of 1782, on the payment of small sums ranging from 8½ cents to \$2 an acre. The war of the Pennamites and Yankees was thus ended.

## WYOMING TERRITORY

WYOMING TERRITORY, a territory of the United States, north of Colorado and Utah. Its area (97,883 square miles) was a part of the Louisiana cession (see ANNEXATIONS, I.), except the southwestern strip, about one degree in width, about two-thirds of the length of the territory, and containing 14,320 square miles, which was a part of the Mexican cession. (See ANNEXATIONS, IV.) The territory was organized by act of July 25, 1868, and by the census of 1880 its population is 20,789. Its capital is Cheyenne. The act of July 25, 1868, is in 15 *Stat. at Large*, 178.

## X Y Z MISSION

X Y Z MISSION (IN U. S. HISTORY). The relations between the French republic and the United States had been steadily becoming more tightly strained for years before the inauguration of President John Adams in 1797, more especially by reason of the manner in which France had seized American provision ships (see EMBARGO, I.), and permitted illegal captures of American vessels by her privateers. The position of France was more advantageous from the fact that she respected, and pretended to respect, no international law whatever. Her assumed place was not that of a coequal unit in the family of nations, but that of an apostle of liberty, limited in her action only by her own conceptions of expediency. Appeals to treaties violated by France met an easy answer in declamatory references to liberty; and any nation refusing to strengthen the hands of France was a self-confessed enemy to liberty and to France. In dealing with both France and Great Britain, Washington's policy was an armed neutrality, but no party supported him cordially in all its features. The republicans (democrats) tended from the beginning to an unarmed dependence upon France; and the federalists, as they grew to be more openly a commercial party, tended to an armed dependence upon Great Britain. Washington's policy was successful in checkmating Genet (see his name), and in keeping succeeding French envoys within limits for some years. But even Washington had to yield to the growing change in the federal party which dates from Jay's treaty (see both these titles) with Great Britain; and Adams, at his inauguration, found his party as much disposed to pick a quarrel with France as France was certain to furnish the opportunity, and far less disposed to submit to a counterbalancing influence from him than from his predecessor.

—In return for the recall of Genet, the French republic had asked and obtained the recall of Gouverneur Morris, the American minister, who had not even affected any sympathy with the course of the French revolution. In his place was sent James Monroe, who proved much more acceptable to France. The French republic (see EMBARGO, I.) had already begun those interferences with American commerce which provoked English retaliatory interferences; and these consequences, in their turn, made the French aggressions increasingly annoying. Most of the English annoyances were removed by Jay's treaty; as to France the United States still depended upon the old treaty of alliance of 1778. But France, in addition to her long-standing grievance arising from Washington's policy of neutrality, of which she could hardly complain openly, had now a plausible ground of complaint in what she chose to consider the American alliance with Great Britain. In February, 1796, one of the directory informed Monroe that the treaty of 1778 was at an end from the moment of the ratification of Jay's treaty; to which Monroe very properly replied that the treaty had already been brought to nothing by the constant French captures of American vessels.

—In other points of his diplomatic intercourse Monroe had not so well satisfied either Washington or the cabinet. He had been given in advance a complete vindication of Jay's treaty for the information of the French government, but had not presented, it, believing that it was intended to be held in readiness to answer formal complaints. And in general his diplomatic language was altogether ill advised and unfitting an ambassador. As a single instance, his letter of Sept. 3, 1794, to the committee of public safety, declared that, if they should be of opinion that the French infractions of the treaty were productive of "any solid benefit to the republic, the American government and my countrymen in general will not only bear the departure with patience, but with pleasure." Their tone of pitiful subservience makes it difficult to read Monroe's official communications, as collected and published by himself, with either pleasure or patience; and, after a sharp rebuke from Pickering, in June, 1796, he was recalled, and Charles Cotesworth Pinckney was sent in his place.

—By this time the control of the French revolution had passed from the madness of the many to the selfishness of the few. The executive directory now enjoyed a power of which the military ability of Napoleon had been the first foundation and was still the principal buttress; and under its leadership the French republic was employing for pure self-aggrandizement the exemption from international law which it had at first asserted in the name of liberty. And Napoleon, from the beginning, saw the limit which the British channel would put to the conquest of Europe, and the manner in which alone he could pass it, by giving the English fleets employment elsewhere. In 1797, after the peace of Campo Formis, he wrote: "We must set all our strength upon the sea; we must destroy England; and the continent is at our feet." But the same year had already seen the destruction of the Spanish fleet off St. Vincent, and of the Dutch fleet at Camperdown; and from this time until 1812 Napoleon never ceased the effort, by bluster, by kindness, or by fraud, to make the long and stormy coast of North America his most efficient ally against Great Britain.

—A few days before Pinckney's arrival the French minister of foreign relations informed Monroe what formalities were to be observed in taking leave. Dec. 9, 1796, Monroe presented his letter of recall, and Pinckney his letter of credence. Two days after, Monroe received written notice that no American minister would be received until the French grievances should be redressed, and that the French minister to the United States would be recalled; and yet, at the end of the month, he accepted a public reception from the directory, at which the president, Barras, without remonstrance from him, publicly announced that France "would not stoop to calculate the consequences of the condescension of the American government to the wishes of its ancient tyrants." Pinckney was left in Paris, refused recognition by the directory, and even threatened with police surveillance, until the latter part of January, 1797, when he received written notice to quit France, and retired to Holland to await instructions from home.

—Adams was intent upon following up the policy of neutrality, but this news left him little option. He called a special session of congress for May 16, 1797, and stated his intention of sending a new mission to France, to conciliate that country, if possible, but at the same time recommended the prompt formation of a navy and a general permission to private vessels to arm in self-defense. For the mission he named

Pinckney, John Marshall, and Francis Dana, chief justice of Massachusetts, and these were confirmed by the senate. Dana declining, Elbridge Gerry was substituted, being specially acceptable to his close personal friend, the president, and, as a democrat, to France also. In October, 1797, the three met at Paris, and undertook to open negotiations with the directory. One leading complaint on the part of France evidently awaited them. The treaty of 1778 had established the principle (between France and the United States) that "free ships made free goods," that enemy's property, excepting contraband of war, was not to be captured in a friendly ship. Jay's treaty, on the contrary, allowed the capture of enemy's property in friendly ships; so that France complained that her ships could not lawfully take English property from American vessels, while British ships were not so restrained as to French property. On this head, the commissioners were empowered to grant to France the same privilege which Jay's treaty granted to Great Britain. They were also directed to demand but not as a *sine qua non*, compensation for past injuries to American commerce; and they were forbidden to consent to any loan, under any guise.

—While the commissioners were engaged in Paris during the winter, and while little was known of their proceedings, owing to difficulty of winter communication, politics in the United States came to a complete stand-still. The federalists were thoroughly alarmed by the state of affairs in Europe, and the dubious prospects of a single-handed war with France. The French armies had the continent at their feet, and even Great Britain had become anxious for peace. A conflict with France, that is, with continental Europe, was certainly not at any time to be sought wantonly by a backwoods nation of 3,000,000 souls, inhabiting an enormous territory and politically divided among themselves; but the case was infinitely worse if the British navy was to leave the ocean open to the unopposed transport of French troops. Both political parties were afraid to take a step forward, and their uneasiness was increased by the fact, that, though the federalists controlled the senate, there was no party majority in the house of representatives. That body was controlled by a number of members of doubtful political sympathies, without whose support neither party could do anything. Thus, in spite of the president's recommendations to equip a navy, arm private vessels, and fortify the coast, nothing was done throughout the winter. March 5, 1798, the president notified congress that cipher dispatches, dated from November until January, had arrived from the commissioners; and March 19, having deciphered them, he sent another message, in which, without detailing the contents of the dispatches, he summed them up in the information that the commissioners could gain no terms that were "compatible with the safety, the honor or the essential interests of the nation." This first thunder-clap was so effective that the house promptly passed bills to equip three frigates, and to prohibit the exportation of arms; and the senate passed bills to authorize the lease of cannon foundries and the purchase of sixteen additional vessels of war. In spite of the long series of aggressions upon American commerce by both Great Britain and France, these were the first belligerent preparations made by the United States under the constitution. To check them, it was at first hoped by the democrats that an adjournment of congress might be secured; but this was impossible without the consent of the senate. As a second choice, resolutions were offered, March 27, that it was not expedient, under existing circumstances, "to resort to war" against France, or to arm merchant vessels. One of the leaders, Giles, during the debate, attacked the president for not communicating the dispatches; whereupon the

federalists offered a resolution calling on the president for copies of such dispatches as were proper to be communicated. To prevent an invidious selection from the dispatches, the democrats insisted on making the call for *all* the dispatches; and in this form the resolution was passed, April 2. The copies were sent the next day, the president being willing to gratify democratic curiosity to the fullest extent. One may imagine the absolute stupefaction of the democratic leaders as the *coup de théâtre*, which they themselves had assisted in preparing, fell upon them as the dispatches were read.

—In brief, the commissioners had been kept waiting in Paris for six months without official recognition, had been approached by unofficial go-betweens with proposals for bribes to the directory and the French treasury as indispensable prerequisites to peace, and, on their refusal, had been ordered out of France. On reaching Paris, they had found that Talleyrand, lately a royalist exile, was now the minister of foreign affairs. They had applied to him at once for an interview, but had been informed that he could not grant it until he had finished a report to the directory on American affairs. This answer had hardly been given when Talleyrand's unofficial agents appeared on the scene, and opened communications with the commissioners. In the dispatches, as sent to congress, the names of the agents were honorably kept secret, letters of the alphabet being substituted for them. The principal agents were M. Hottinguer (designated as X), M. Bellamy, a Hamburgh merchant (Y), and M. Hauteval, formerly resident in Boston (Z); and from these the whole transaction took its popular name of the "X Y Z mission." Their appearance had been heralded by information, through Talleyrand's secretary, that the directory were greatly exasperated by some passages in the president's message, that persons would be appointed to conduct the negotiations, and that they would report to him (the secretary). Oct. 18, X called on Pinckney with a message from Talleyrand: it would be necessary, in order to calm the exasperation of the directory, that a bribe of 1,200,000 livres (£50,000) should first be given them. Pinckney refused to discuss the matter without his colleagues, and X the next day laid written propositions before the envoys. The bribe to the directory was now supplemented by the demand of a "loan" to the French republic: if both were agreed to, the directory would restore the treaty of 1778, and submit American claims for damages to arbitration, provided also that the American government would "advance" money to pay any damages awarded against France. Within the next few days, Y and Z appeared, and the proposed form of the loan was explained. France had extorted from her "sister republic" of Holland, and still held, shares of stock amounting to 32,000,000 florins (£2,560,000), worth about half their par value. The United States envoys were to offer to buy these at par; and, as Holland was certain to pay them at par after the war, the whole transaction would really be only a loan. But Y put the whole negotiation into a nutshell thus: "I will not disguise from you that, this satisfaction being made, the essential part of the treaty remains to be adjusted: *il faut de l'argent, il faut beaucoup d'argent*—you must pay money, you must pay a great deal of money." They informed the envoys that nothing could be done in Paris without money; that one of the directory was in the pay of the privateers-men who had been plundering American commerce; that Hamburg and other European states had been compelled to buy a peace; and that the United States must do the same. The envoys nursed the negotiation very skillfully, proposing to send one of their number home for instructions, to suspend French captures in the

meantime, and to do various inadmissible things, until they had accumulated a most unsavory mass of "diplomatic" matter. Oct. 27, X became impatient. "Said he: Gentlemen, you do not speak to the point; it is money it is expected that you will offer money. We said that we had spoken to that point very explicitly: we had given an answer. No, said he: you have not; what is your answer? We replied. It is no; no; no; not a sixpence." This plain, manly and simple answer is probably the one which was distorted into the more bombastic form, much more popular in America: "Millions for defense, but not a cent for tribute."

—The next day Talleyrand himself had an interview with Gerry, Z acting as interpreter. He informed Gerry that unless the envoys "assumed powers, and made a loan" within a week, the directory would issue a decree demanding an explanation of objectionable passages in Adams' message. On Gerry's report, the envoys unitedly sent word to Talleyrand that they would assume no such powers, and that he need not delay the decree on their account. On the following day X became still more urgent. He offered to allow the envoys to remain in Paris and communicate with their government as to the "loan," provided the bribe to the directory was paid; but, in default of this condition, threatened the expulsion of the envoys from France, and a declaration of war against the United States. This the envoys answered by flatly declining any further negotiations with unofficial agents, and here their mission really ended. The remainder of their six months in Paris was spent in preparing memorials to Talleyrand, writing dispatches to their own government, and repulsing the continued efforts of X, Y and Z to renew their negotiations. It was not until April 3, 1798, that Talleyrand dismissed Pinckney and Marshall, and then only by a letter to Gerry stating that he supposed they had "thought it useful and proper," by this time, to quit the territories of the republic. Marshall sailed for home April 16, but Pinckney was detained for several months by the illness of a daughter.

—The powers given to the envoys had been joint and several, and Talleyrand, ever since the preceding December, had tried to persuade Gerry to use his own power and make a treaty. Now, on dismissing Pinckney and Marshall, he expressed his desire that Gerry should remain so emphatically that Gerry obeyed, fearing a declaration of war if he should depart unauthorized. At the same time he informed Talleyrand that he would only confer informally and unaccredited. He remained in Paris until early in August, when he at last received a passport, and obeyed the imperative directions of his government to return at once. Before his departure news arrived of the explosion which the dispatches of the envoys had caused in America, whereupon Talleyrand indignantly denied all knowledge of the X Y Z negotiations, and called upon Gerry to give him the names of the "wretched intriguers" who had taken advantage of the envoys. This indignation blinded no one; and Y, who had taken refuge in Hamburg, made a counter-declaration that he had never taken a step in the negotiations without Talleyrand's knowledge and direction.

—The effect of the dispatches upon the democrats in congress was increased by the persistence with which both Talleyrand and his agents had returned to the assertion that their friends in America would believe and trust them rather than the federalist commissioners. They had so far mistaken the party, said Jefferson, "as to suppose their first passion to be attachment to France and hatred of the federal party, and not

love of their country." At any rate, the allegation made the democrats (or republicans) for the time a highly unpopular party. A flame of warlike feeling burst out from the country at large, and war meetings, processions and addresses to the president, volunteering, and private subscriptions of money and war vessels for government use, became the order of the day. The black cockade, the revolutionary badge, was generally worn; two new patriotic songs, "Hail Columbia" and "Adams and Liberty," became highly popular; and the president, careering at the head of the storm, felt for once that he liked the people and that the people liked him. In the only doubtful portion of congress, the house of representatives, all the doubtful members, and many of the democrats, fell instantly into line with the federalists. The senate bills for increasing the navy and purchasing foundries were passed at once, and the necessary appropriations were made. The navy, hitherto under control of the secretary of war, was made a separate department (April 30). The president was authorized to enlist 10,000 regular troops, and 10,000 volunteers, if any foreign power should invade or declare war against the United States within three years (May 28). American vessels of war were authorized to capture any "armed vessels, sailing under authority or pretense of authority from the republic of France," which should commit depredations on American commerce (May 28). American merchant vessels were authorized to resist capture by French vessels (June 25); and American war vessels and privateers were finally authorized (July 9) to capture armed French vessels of every description. Commercial intercourse between the United States and France and her dependencies was suspended (June 13); and a brief act of July 9 declared the treaties with France no longer binding upon the United States, since France had repeatedly violated them, refused reparation, and "repelled with indignity" all attempts to negotiate. Acts were also passed for the imposition of a direct tax, for a loan upon the credit of the direct tax, and for a general loan of \$5,000,000.

—In strong contrast to the vulgar notion of the belligerency of democracies, the American republic has always aimed at peace. Nevertheless, its people have always been proud of its potential weight in war, and have been fond of looking forward to the day when its irresistible growth in power should reduce to an evident littleness the high-sounding international wars of the continent of their forefathers. In any such point of view the little history of the nation's first defiance to an equal member of the family of nations, of the *quasi* war of 1798 against France, and of the scattered sea battles in which the little navy acquitted itself so brilliantly, must always be an interesting point of departure. Had the dominant party stopped with the preparations above detailed, even its opponents must have acknowledged the vigor and success of its administration. But the time was one of political passion more intense than can well be conceived now. Each party had inherited many of the practices, and still more of the apprehensions, arising from previous party conflict in the mother country, where parties had not hesitated to assail one another, if not by force, at least by a forcible wrenching of the laws from their proper purposes. To the democrats, the provisional army, officered almost exclusively by federalists, seemed to be not only a means to provide salaries for their opponents, but a possible weapon of offense in party warfare. The step was defended by the federalists on the ground of the danger of an invasion of the southern states by a force of negro soldiers from the French West India islands, who would excite a slave insurrection. For the more flagrant measures, the alien and sedition laws (see that title), little defense could be offered. They were

distinctly partisan. Under the operation of the sedition law, Hamilton published with impunity a pamphlet attack on the president, holding up to view his "disgusting egotism, distempered jealousy, and ungovernable indiscretion," and styling him an "arrogant pretender to superior and exclusive merit" while democratic politicians were arrested and tried for even circulating petitions against the sedition law, or for expressing a wish that the wadding of a cannon might strike the president in the broadest part of his person. Supposing the next congress should prevent the embarrassing feature of a democratic majority in the house of representatives, was the majority to be removed by a series of arrests under the sedition law, supported by the provisional army? The counter-movement of the democratic leader is elsewhere given. (See KENTUCKY RESOLUTIONS, NULLIFICATION.) Whatever its objects may have been, it need only be said here that the apprehensions which led to it were unfounded, and that the federalists attempted no such use of the sedition law.

—Even before Gerry's departure, Talleyrand had received news of the stir which the dispatches of the envoys had excited in the United States, and the effect was instant. The directory protested their desire for peace, and in August issued several decrees, releasing American prisoners, raising the embargo on American ships, and cautioning French vessels to do no injury to legitimate American vessels. They even drew a veil over the language of President Adams' messages, for which they had formerly demanded satisfaction, but which had now grown into an indictment of the directory's principles, practices and manners, of a warmth unheard of elsewhere at the time; and they semi-officially offered to receive a new American minister. But Adams, in his message of June 21, 1798, announcing Marshall's arrival, had declared that he "would never send another minister to France without assurances that he would be received, respected and honored as the representative of a great, free, powerful and independent nation." And in his annual message of Dec. 8, 1798, his language rose to concert pitch: he declined to send another minister to France without more determinate assurances, left it to France to take the requisite steps to accommodation, and gave that country "deliberate and solemn" warning that, "whether we negotiate with her or not, vigorous preparations for war will be alike indispensable." Meanwhile Talleyrand had been casting about for a channel through which to convey the assurances necessary; and had found it in William Vans Murray, the American minister to Holland. Nor was Adams unwilling to receive the assurances, for he had already found that war with France involved the elevation of Hamilton, whom he cordially detested. Washington had accepted the position of lieutenant general, conferred upon him at the previous session, on condition that he should be allowed to name his subordinates. As the three next in rank to himself he had named Hamilton, C. C. Pinckney and Knox, who were confirmed; but the president insisted on making Knox the senior, on the ground of his superior revolutionary rank, and only yielded before Washington's threat of a resignation of his own commission. Hamilton was thus to be practically commander-in-chief of the provisional army. He had already become commander-in-chief of the president's cabinet, which had been inherited from Washington; its members maintained a close and confidential intercourse with him, in striking contrast to the increasing contempt which their correspondence expressed for their nominal chief. To refuse Talleyrand's overtures in order to put Hamilton at the head of an army for the invasion of Florida and Louisiana, perhaps to make him a conquering hero and a popular candidate for the presidency, was more than could be

expected from Adams. He could not trust his cabinet; and, without giving its members any hint of his intention, he nominated Murray as minister to France, Feb. 18, 1799, and a week afterward added Chief Justice Ellsworth and Patrick Henry to the commission. Henry declined, and Gov. William R. Davis, of North Carolina, was named in his place. The blow confounded the president's party. Every influence was unsuccessfully brought to bear on the president and on the senate to balk the nominations. The cabinet officers lost their heads: instead of either resigning or keeping silence, they protested against the step, and thus finally lost the president's confidence. The federal party, which had begun the year in high and united confidence, was now convulsed by sudden feud, the president stigmatizing his federalist opponents as a British faction; and the latter equally dreading, distrusting and disliking the president. The new mission to France had not only dissolved the provisional army; it had thrown the whole federal policy into the air. It is in itself a condemnation of the party that its policy should have been reduced by this time to a single card—the continuance of the hostile attitude toward France; when this was gone, the fire of the party was out.

—At first everything seemed to promise quick success to the new mission. Murray had been informed of his appointment, with the reservation that the other two members would not set sail until full assurances had been received as to their reception. Talleyrand hastened to give such assurances in the amplest terms. Before the instructions for the envoys had been completed, the face of affairs in Europe had been so changed as to give the federalists some fresh courage. Disasters to the French arms had been steadily growing more serious; Napoleon, the directory's genius, was blocked up in Egypt or Syria; and in June, 1799, a new revolution displaced all but one of the directory. The government which had given the assurances of a kindly reception of the envoys was no longer in power, and the federalists urged the president to stop their embarkation until new assurances should be given. It may be that the revived federalist spirit was also due to the ascertained fact that the new house of representatives (1799-1801) would be federalist as well as the senate, a southern reenforcement having established a party majority there. Oct. 16, the president again chilled his party by directing, without consulting his cabinet, the immediate embarkation of Ellsworth and Davis. This step was attributed at the time to the president's frantic jealousy of Hamilton, who had inopportunistically made his appearance in Trenton (then the temporary seat of government) at the same time with the cabinet and envoys, as if for consultation with them. It is now well settled that Adams' motive was mainly the pacific policy which has been the almost invariable rule with American presidents (see EXECUTIVE, III.): and that his action in this case differed from Washington's action on Jay's treaty only in the difference of mode due to the different characters of the two men. Nevertheless, this new reason for distrusting the president, together with the impossibility of ignoring in the approaching election the representative of New England, the section from which most of the federalist electoral votes were to come, left the party leaders in a quandary. Their only apparent road of escape was in the effort to make C. C. Pinckney president and Adams vice-president, and this road led straight to the overthrow of the party in 1800-1. (See CAUCUS, CONGRESSIONAL, I.; FEDERAL PARTY, I.)

—The envoys found, that, by the new revolution of Nov. 9, 1799, Napoleon, who had suddenly returned from Egypt the preceding month, had become first consul. Three commissioners were appointed to treat with them, and a convention was signed Sept. 30, 1800. It secured safety for American commerce for the future, until England and France in turn began to violate international decency in their attacks on neutral commerce (see EMBARGO); but Napoleon was ingenious enough to obtain a mutual abandonment of claims for damages, by reason of the declaration of congress in 1798, that the treaties with France were no longer in force. In this form it was finally ratified by both parties, and declared in force Dec. 21, 1801.

### YAZOO FRAUDS

YAZOO FRAUDS (IN U. S. HISTORY), the name commonly given to a land act passed by the Georgia legislature in 1795, and to certain claims arising under it, which were not settled until 1814.

—Georgia began her existence as a state with doubtful claims to the territory west of her present area. (See TERRITORIES.) The Indian title had been extinguished in but a part of the state, bounded east by the Savannah river up to a considerable distance above Augusta, and west by the Altamaha and Oconee. The rest of the state belonged to the Indians, principally Cherokees and Creeks, but over all of it the state claimed sovereignty and jurisdiction, and the exclusive right to pre-empt lands from the Indians. (See CHEROKEE CASE.) When, therefore, the state sold lands, the sale was really of the right of pre-emption. In this manner a bargain was made in 1789 to transfer about 15,000,000 acres to three land companies for about \$200,000; but the companies insisted on paying for the lands in depreciated Georgia paper, whereupon the legislature declared the bargain at an end.

—This abortive sale furnished a precedent for the increasing land speculations which grew to be a mania during the twenty years, 1780-1800. During the first fifteen years of this mania it had almost exhausted the sale of whatever lands the states had not covered by military land warrants. Georgia's vague and doubtful territorial claims seem to have at last attracted attention as a promising field for speculation. Four land companies were formed, the Georgia company, the Georgia Mississippi company, the Upper Mississippi company and the Tennessee company, commonly called, in general, the Yazoo companies, from the general field of their operations, in the Yazoo district. These joined forces in an attack upon the Georgia legislature, and obtained from it the passage of the act of Jan. 7, 1795, the most extraordinary piece of state legislation in our history. It purported to transfer to the companies named, for a consideration of \$500,000, a tract of land then estimated at 20,000,000, but afterward found to contain 35,000,000, acres. The price, about one and two-thirds cents per acre, for the richest farm land in the country, was certainly suspicious, but the act itself kindly furnished to the companies the means of corrupting the legislature: one clause contained a provision allowing the companies to take up, on the same terms, 2,000,000 acres additional, for the benefit of whatever "citizens of Georgia" they should admit as their partners. And so little care was taken by the participants to cover their tracks that the United States commissioners in 1802-3 had only to compare the schedule of partners acknowledged by the companies with the legislature's yea and nay votes to show that every member of both senate and house who voted for the act of 1795 had been bribed by a share of the 2,000,000 acres, with a single exception, Robert Watkins, whose name deserves to be recorded. The bribery was effected in the manner now familiar, by assigning a number of acres to the legislator, excusing him

from payment until the market price had risen to forty or fifty times the stipulated price, and then paying him the difference.

—The publication of the act aroused an instant storm of indignation throughout the state. In every county but two the grand juries presented the act as unconstitutional and void; and when the state convention met in May, 1795, it was deluged with petitions, memorials and remonstrances against the land act. These it transferred to the attention of the next winter's legislature, so that the election of that body turned on the Yazoo question. When it met, the members who had voted for the act had disappeared from state politics; Jackson, the United States senator, had resigned his seat and entered the state legislature to lead the anti-Yazoo majority; and an act was passed, Feb. 13, 1796, revoking the sale as a violation of the state constitution, illegal and void, and directing the repayment of purchase money to all purchasers who should apply for it within eight months. The act of 1795 was then publicly burned in front of the state house, the two houses attending in a body: the committee handed the act to the president of the senate, he to the speaker of the house, he to the clerk, and he to the doorkeeper, who threw it into the fire. All evidence of its passage was expunged from the records; and the constitution of 1798, while forever prohibiting sales of lands to individuals or companies before counties were fixed, ordered the land companies' purchase money to be kept in the state treasury at the companies' risk, and subject to their order of withdrawal.

—One would imagine that all these proceedings were a sufficient evidence of a cloud upon the companies' title to make intending purchasers exceedingly cautious. They seem to have had no great difficulty, however, in disposing of their lands at a sufficient advance to give them a handsome profit; and, as the third parties continued to sell, an army of claimants was gradually formed, particularly in New England and the middle states. When Georgia, in 1802, ceded her western claims to the United States, clauses in the compact confirmed Georgia's previous grants, and provided that not more than 5,000,000 acres should be appropriated for the satisfaction of "other claims," if congress should act upon them within a year. The commissioners, Madison, Gallatin and Lincoln, who had negotiated the compact with Georgia, reported, Feb. 16, 1803, that the present Yazoo claimants were innocent third parties, holders without notice, and their claims ought to be compromised; that they offered to accept twenty-five cents an acre, or a lump sum of \$8,000,000; but that a sum of \$2,500,000 with interest, or \$5,000,000 without interest, payable out of the proceeds of Mississippi land sales, would be a fair compromise. The Yazoo claims now met the fiercest and most uncompromising opponent in the person of John Randolph. (See his name.) He had been in Georgia on a visit in 1795-6, and now took up the battle against the claimants with a rancorous sense of personal hostility which added to his naturally angry support of Georgia's action as a sovereign state. Nevertheless an act was passed, March 3, 1803, one of whose clauses, after setting aside a part of the 5,000,000 acres for British claimants and squatters without title, appropriated the remainder to the satisfaction of such other claims, arising under "any act or pretended act of the state of Georgia," as should be filed in the office of the secretary of state before Jan. 1, 1804, and subsequently approved by congress.

—Among the claimants was the New England Mississippi company, successor by purchase to the Georgia company. Randolph's opposition has usually been attributed to a general hatred of New England, but its real basis seems to have lain in an honest belief that the New England company was an organized attempt to obtain \$8,000,000 from congress by the same process of corruption and bribery which had originally been successful with the Georgia company. The company's principal agents were Granger, then postmaster general, and Perez Morton, a leading democratic politician of Massachusetts. Their chances in congress seemed to be fair, when Randolph anticipated them by offering a series of resolutions, Feb. 20, 1804, upholding the Georgia revoking act of 1796, and directing that no part of the 5,000,000 acres be appropriated to any claimants under the act of 1795. The second resolution contains the gist of Georgia's defense of her action, as follows: "That, when the governors of any people shall have betrayed the confidence reposed in them, and shall have exercised that authority, with which they have been clothed for the general welfare, to promote their own private ends under the basest motives and to the public detriment, it is the inalienable right of a people so circumstanced to revoke the authority thus abused, to resume the rights thus attempted to be bartered, and to abrogate the act thus endeavoring to betray them." His resolutions were postponed in March by a general majority of about 53 to 50; but his object had been obtained, for the claims were practically postponed with the resolutions. But Randolph always believed that his own fall from the leadership of his party in congress was directly attributable to the disappointment of members of congress interested in the claims, and backed by a strong and unscrupulous lobby. He was not alone in the belief: the evident conviction that bribery had been at work in congress makes the debates of the time quite unpleasant reading.

—In January, 1805, the claims again came up for consideration, and Randolph, freed from any partial checks by his evident banishment from his party, gave loose reins to the powers of vituperation, in which he was unsurpassable. Every one who favored the claims in any way came in for a share, but most particularly the principal agent, Granger. Randolph, in a speech of Jan. 31, 1805, even accused him, without offering any direct evidence, of having prostituted his official power of making postoffice contracts to the purchase of members' votes for his constituents, the New England company. One sentence will give some idea of Randolph's peculiar style: "You must know, sir, that the person so often alluded to maintains a jackal, fed not upon the offals of contract, but with the fairest pieces in the shambles; and at night, when honest men are in bed, does this obscene animal prowl through the streets of this vast and desolate city, seeking whom he may tamper with." Granger, the next day, wrote a naturally indignant letter to the speaker, demanding an investigation, which was not accorded to him, Randolph's object had been sufficiently attained, and he followed the same tactics for the future, making it so unpleasant for any one who introduced a bill to satisfy the claimants that no act was passed. Even in 1808, when the short-lived democratic legislature of Massachusetts unanimously asked congress to act upon the claims, no attention was paid to the request.

—Failing before congress, the claimants arranged a conflict of title between holders of Yazoo lands under their grant and under the United States, and thus got the matter before the supreme court in the case of *Fletcher vs. Peck*. The decision was given in

1810, and fully sustained the claimants. It held that the law of 1795 was a contract between the state and the claimants; that the states were forbidden by the constitution of the United States (art. I., section 10) to pass any law impairing the obligation of contracts; and that the revoking act of 1796 was therefore unconstitutional and void. Still the matter languished until March 31, 1814, when an act was passed appropriating \$8,000,000 in scrip, payable out of the proceeds of Mississippi lands, to satisfy the Yazoo claimants. Comparatively little of this, however, went to the claimants. Most of them had become discouraged by the long delay, and had sold their claims to speculators at a heavy discount. Some few subsequent acts were found necessary to complete minor details, but the end of the case was fairly reached in 1814.

—It is certainly true that the states were forbidden by the constitution to pass any law impairing the obligation of contracts; but it is equally true and clear that the contracts then intended were mere private contracts between individuals, and not those which are public in their nature and trench on the prerogatives of the state government. It is usually considered that the change of course was first made by the supreme court in the case of *Dartmouth College vs. Woodward* in 1819, though that case was only that of a private eleemosynary corporation, and the rule in its case has since been transferred to the maintenance, as irrevocable contracts, of the charters of corporations essentially public in their nature. A more apt illustration of this subsequent line of decision may be found in this Yazoo case in 1810. The contract was one which deprived the state of its public lands, which was obtained by a wholesale corruption of legislative agents never effectually denied, and which was protested against by one of the principals, the people of the state, the instant their voice could be heard, as not their act and deed, Surely it would seem that here there was no contract at all; or that, if there was a contract, it came with the implied condition of the state's power to revoke or alter it. Whether we take the standpoint of state sovereignty (see that title) or national sovereignty, it is clear in either case that the state legislatures in 1775 were left, either by the will of the people of the state or of the people of the nation, the same supreme power of revocation or alteration of their public charters or public contracts which has always been possessed by the British parliament. He who asserts that they have since lost that power may fairly be asked to put his finger on the place where the decree of the state or of the nation has taken it from them. It is hard to side with John Randolph against John Marshall, but it is infinitely harder to see any such sweeping decree in the contract provision of the constitution. We can only see a series of stepping stones, beginning with the Yazoo decision, and ending with a general judicial decree that the state legislatures have no power to revoke or alter charters. So that, as the law stands, any corporation has only to be unscrupulous enough to purchase our legislature, and to obtain from that body an irrevocable charter granting it any privileges, however enormous or however opposed to the self-government of the people of the state, and it obtains at once a vested right which must be sustained by the judicial power and physical force of the United States. In this aspect, the case has a far more dangerous appearance now than in 1810 or 1819, owing to the rise of a class of corporations whose powers, ambitious and perilous rivalries could hardly have then been imagined. It may be dangerous in some degree to expose our corporations to the meddlesomeness of state legislatures; but it can hardly be denied that it is still more dangerous to hang the safety of popular

government by states upon the small chance of the unanimous and perpetual scrupulousness of an infinite number and variety of corporations. When the danger shall appear in practice for the first time it will be too late to avoid it, for the court in the Yazoo case very naturally decided, as it must always decide, that it could not examine or even recognize any allegation of corruption in the supreme legislative authority of a state: it must take the legislature's action as the voice of the state. Judge Jameson, in the pamphlet cited below, speaks as follows: "It may be heresy, but, if so, the heretics are a large and increasing company who maintain that the decision in Dartmouth college vs. Woodward has been carried much too far, and been made to sustain grants which neither law nor justice nor sound political principle can sanction. \* \* But in some of the very cases in which our courts have sustained that species of contracts, upon the supposed controlling authority of the Dartmouth college case, may be found the law which is ultimately to rescue us from the bondage that case has brought upon us. In many of these cases there are dissenting opinions, giving, in the judgment of many, the better law in regard to the proper application of the principles of the Dartmouth college case. By going back, therefore, to the path which was abandoned when the rule in that case, that of a private eleemosynary corporation, was perverted to the maintenance of corporate institutions invested with great public functions, not only congress but the states will be left free to bring the needful legislation to bear against those monster establishments deeming themselves impregnable behind the barrier of the constitution."

### ZEITGEIST.

ZEITGEIST. *Its Nature and Power.* The *Zeitgeist* is a German word, meaning the spirit of the times, or the spirit of the age. In the following article it will be frequently rendered literally by the English compound *Times-Spirit*.

—Every one feels the power of the times-spirit, but no one explains to us on what that power depends. All speak of the times-spirit, or of the spirit of the age; most men pay homage to it; yet nobody tells us what the times-spirit which they worship and which they sometimes unwillingly obey, is. The idea of the times-spirit did not originate in our day. It was given expression to, even by the brahmans of ancient India. The old Romans were acquainted with the "spirit of the century" (the *sæculum*). (Tac. *Germ.*, 19.) But our age has grown more attentive than any former one to the drift of the spirit of the times. Hence the question, What is the times-spirit? imperatively demands an answer.

—I. Let us first see by what external signs men think they can recognize the times-spirit, and what qualities they ascribe to it.

—1. The times-spirit manifests itself chiefly in the definite character and the special intellectual direction by which the different ages and the different phases of the times are distinguished from one another. The contrast noticeable between the great periods of the world's history, marks also the changes or transformations of the times-spirit, in a general way. Even the spirit of the middle ages was once present in the world as the spirit of the times, as the times-spirit; and in its time it crushed out the spirit of the ancient world, just as it had itself to yield subsequently to the spirit of modern times. Again, in these great periods of the world's history the spirits of the centuries, and even of the half-centuries composing them, are surprisingly different. Only, the century must not be reckoned according to our Christian system of chronology, for the experience of history everywhere shows, that the spirit of the new century becomes observable in all its youthful impetuosity even in the last decade (according to Christian chronology) of the previous century. Christ was not born at the beginning of a century, and hence our Christian chronology does not correspond with the chronology of the periods of the world's history (*weltperioden*, world-periods).

—With the ages, new ideas, like stars, rise above, and again sink below, the horizon of humanity. In one century, an idea has a powerful attraction for men; in another, that same idea exercises no influence whatever. In one age, men wax enthusiastic over it, in the next they pass it by coldly and indifferently. In the twelfth century (including the last decade of the eleventh) all Christian Europe was stirred to its very center by the desire to rescue the sacred sepulchre of Jesus from the infidel. To effect that end, millions of men with fiery ardor rush into the arms of unknown danger, privation and death. But this fanatical impulse loses its power over minds in the thirteenth century, and, later, dies out entirely. The second half of the fifteenth and the first of the

sixteenth century, favor the renaissance of ancient ideas, and the reformation of the church, which had previously been attempted, without success, by individuals; while, from 1540 onward, the spirit of reaction and torpidity rose up and was just as victorious. In the seventeenth century, princely absolutism everywhere celebrated its triumph over the estates system; and in the eighteenth, beginning with 1740, the craving for enlightenment and the freedom of the middle class of citizens raged with the violence of revolution. The nineteenth century corresponds with the growth of representative constitutional government and the national (see NATIONALITIES, PRINCIPLE OF) current in politics. In one age, the fundamental feature of the times-spirit is liberal; in another, conservative; while in a third it is either radical or absolutist.

—The same changes or transformations of the times-spirit are, besides, visible in miniature, in any one age. Here, too, there is an upward and a downward movement to be distinguished. The spokes of the great wheel of the world's history consist of smaller wheels which have a rotation of their own. The very same men grow enthusiastic, in one phase of the times, over popular freedom, and in another call for a dictatorial power; but, in both instances, they appeal to the spirit of the age with which the direction they follow is in harmony. When Napoleon I. undertook to re-establish Cæsarian authority, he tried to discover, by means of pamphlets which he caused to be scattered widespread, whether the time for it had come, just as Noah, according to the Jewish record, once tried to find out whether the waters of the deluge had subsided; and Napoleon repeatedly postponed carrying his design into execution, because the time had not yet come for it. At last the signs of the times seemed favorable to him; he then cast aside the veil of the consulate, and founded the new empire. Such an undertaking would have been as impossible later, at the time of the restoration after 1815, as it would have been earlier, in the turbulent time of the revolution.

—This changing of the times-spirit seems to protect mankind from the lasting, all-crushing despotism of a single, one-sided tendency or direction, and of one sole power. Time causes one force to set again, which it had previously called on to rise, and summons other sleeping forces into life and operation. With time the wheel of destiny turns round, and now new hopes and cares awaken, and now again old sorrows and old joys approach their end. In the change of human things the change of the times-spirit has a great share. Not our globe alone is round and must turn on its axis; the times-spirit too revolves, and, by its revolution, exercises a changing influence on the opinions and doings of men.

—2. A second noteworthy observation is the propagation of the times-spirit. Were it limited to a single country, or to a definite nation, we would suppose we discovered it in the peculiar spirit of that country or that nation. But it is evidently not confined within the boundaries of a country; it moves, in the same current and direction, over different nations. Like the currents of the wind, in the atmosphere, it now moves from the east to the west, and now from the north to the south, and *vice versa*. The religious, believing, and, in a political sense, feudal, fundamental feature of the mediæval times-spirit, spread not only over Christian Europe, but, simultaneously, over the Mohammedan east.

—It is often thought that the changes in the spirit of the times can be explained by certain definite experiences of a people, or by certain measures taken by its government. The explanation is a wrong one; for the spirit of the times changes among other peoples also, with different experiences and different governments. We must not think that the change in the spirit of the times was caused for the reason that this thing or that thing happened, or for the reason that this thing or that was left undone. It may be that such happening or leaving undone of a thing may, as a secondary cause, have helped the efficiency of the change of the times-spirit, or put obstacles in its way. The change itself, however, is not dependent on such happening or leaving undone, and has another and chief cause. The best liberal government can not prevent the return of the time of a conservative tendency. And when, even an absolutistic government makes no gross mistakes, the times-spirit does not always persist in the same direction, but from time to time ventures a leap in the way of radicalism.

—But the spirit of the times does not propagate itself in entirely the same measure among different peoples. It changes, too, the principal representatives of its character for the time being. At one time one nation, and at another time another, appears as the especial organ of the times-spirit, according as the peculiar nature of such a nation harmonizes with the most prominent quality of the spirit of the times. The spirit of the times in this way lifts up the nations, and lets them fall again.

—The principal seat of the times-spirit in Europe, in antiquity, was first Greece, and, later, Rome. During the middle ages the Germans, although unconscious of the fact, were the representatives of the spirit of the times. In the age of the reformation of the church the German nation was the chief organ of the times-spirit, just as the French nation was in the age of the revolution. In the former instance, the times-spirit swept from Germany over northern and western Europe; in the latter, like a storm, from Paris over the European world. The full power of the moving times-spirit, like the crest of a wave, becomes perceptible only in the land or among the nation which is its principal seat or principal representative; and its force in other lands and among other peoples decreases in intensity, until the wave reaches its trough.

—3. The great power of the times-spirit shows itself mainly in the multitude. It comes over the masses, they know not how themselves, and gives them the direction which they follow. The greater number of them surrender themselves up to its impressions, and allow themselves to be filled by it. As plants, at certain seasons of the year, shoot forth and blossom, then stand still and fade, nations are now stirred to action by the current of the times-spirit, and again are relegated by it to rest. The times-spirit wakes up and slumbers according as these qualities or those appear in it. Its course is mysterious. It forces itself in like the wind; it communicates itself from one man to another just as heat does from one body to another. At times, it spreads like an epidemic, and, in a moment almost, transforms the hopes and moods of men.

—But there is a great difference between the times-spirit and the cosmic influences of the seasons and the changes of the wind. There was a time when men sought to explain the strangest effects of the times-spirit by cosmic causes. Astrologers calculated the destiny of men from the constellations of the heavens. They thought

that by the position or movement of the planets especially they might discover men's plans and acts, and measure the change of the times-spirit. Fruitless and foolish endeavor! Were the cause of the change of the times-spirit to be found in the external nature of our globe, that same cause, like the seasons of the year, like the changes of heat and cold, like the currents of the wind, would necessarily exercise an influence on men and on all other creatures, at the same time on plants and on animals. But of this there is no trace. No matter how the times-spirit changes, the growth of plants and the life of animals do not follow the change. They do not feel it.

—The power of the times-spirit manifests itself only in the life of man; it is connected with human nature, and is scarcely explainable except by the facts of human nature.

—As the times-spirit is confined to the world of men, its power is enhanced by the intercourse of men with one another, and in many ways weakened and checked by the isolation of men from one another. Nowhere is the times-spirit stronger than in great cities, in which men live closely packed together in constant and active intercourse with one another. It rules much less in the country, with its small villages and scattered farm-houses. The seclusion of a monastery can not withdraw itself entirely from it, but it only slightly feels the transforming power of the times-spirit.

—4. Its power over men is not an absolute one. Some, especially individuals of energetic character and determined mind, resist its influences, and sometimes endeavor, with success, to swim against its stream. Many combat the times-spirit which they hate. Many more, vexed and defiant, repel its rule. The world's history is determined only in part by the times-spirit. The individual freedom of men, as well as the times-spirit, leaves its impress on the history of the world, and in it another spirit besides that of the times reveals itself to us. The latter we recognize only where the spirit of the masses moves. Hence the times-spirit does not fill the whole of human nature, and is not identical with the mind or spirit of man in general.

—5. But neither can the changes of the times-spirit be explained by the play of caprice. That change is not like the varying pictures of a revolving kaleidoscope. Rather is there an intrinsic connection between the character of a preceding and of a succeeding section of time; we may perceive an organic succession of ages, and again an organic succession of phases of the times within the same age, which strongly reminds us of the succession of the age-stages in the life of man. The transformation of the times-spirit, too, begins with childhood, and rises to the height of youthful consciousness, to subsequently, after wise work and careful preservation, sink again into aging routine and prudent calculation, and to prepare for a new revolution. In all this there is regularity and law, not chance and caprice.

—A great many modern philosophers have endeavored to discover this law. Hegel's endeavor to find it in the dialectic movement of the faculty of thought necessarily failed, because human faculties are manifold, and because the self-conscious mind of thinkers does not at all always determine the direction of the masses. The presentiments of Fourier and the speculation of Krause which pointed to the succession of the age-stages of human life, and sought by them to explain the changes of the times-spirit, were happier. But Frederick Rohmer investigated the law of the

times-spirit more deeply and more comprehensively than any other writer, and explained it by psychology. His own nature, which was very sensitive to, and had a fine feeling for, all the changes of the times-spirit, constantly spurred him on to observe its course, and follow it, like the minute-hand of a clock, with strained attention. In this way he at last found an accurate measure for the movement of the times-spirit.

—This prevalence of law in its movement distinguishes the spirit of the times from the changeable fashion. The times-spirit, indeed, exercises its power on the fashion too. It manifests itself by way of preference in the art style of different ages, from which even the fashion can not free itself, and most clearly in the architectonic style, but in music and in literature also. Thus the fashion only followed the times-spirit when, in the seventeenth, and to some extent in the eighteenth century, it gave its preference to rococo forms, and delighted in queues and hair-bags. Again, it was led by the spirit of the times when the French revolution revived antique fashions, corresponding to the republican models of Grecian and Roman antiquity, which then had great influence on the renovation of public life; and when it afterward, in the Napoleonic period, turned to the aristocratic and severer forms of Cæsarian Rome. To the extent that the fashion follows the times-spirit, it, too, is determined by law. But side by side with this law, the individual inclinations, whims and moods of persons and social centres, operate very powerfully on the fashion—persons and centres which are looked upon by the rest of society as authorities, and in whose footsteps the rest of society is accustomed to follow. The lions and lionesses of fashion in Paris and London are not always led to their resolutions and choices by the general movement of the times-spirit, but are determined in great part by their own freedom. We know, for instance, what kind of a personal cause it was that brought crinoline into fashion; and, in men's adhesion to the dress coat and silk hat, we perceive not so much the changeableness of the times-spirit as the supremacy of French style.

—II. What, then, is the times-spirit, the qualities of which we have been considering? Is it really, as many suppose, the sum of individual human minds existing at a given time? When Goethe once wished to ridicule the false times-spirit, he wrote the well known lines:

"Was ihr den Geist der Zeiten nennt,  
Das ist der Herren eigner Geist."

[What the gentlemen call the spirit of the times, is their own spirit.]—And, indeed, men frequently palm off their own spirit for the times-spirit; sometimes they deceive themselves about it, and sometimes they wish to deceive others about it. But the true times-spirit is something different from the sum of separate spirits. If it were only the sum of separate spirits, the fact that the same individuals follow this current of the times-spirit to-day, and to-morrow perhaps an entirely opposite current, would remain entirely unexplained. Their individual inclinations and opinions remain sometimes the same, notwithstanding they allow themselves to be carried away by the new current. Under the cover of their own roof, they do not hesitate to give expression to their opposition to, and heartfelt dislike of, the course which they publicly pay homage to

and obey. With these, therefore, their change of attitude is not arbitrary. It is not these gentlemen's own spirit that calls forth the spirit of the times.

—Moreover, if the times-spirit were only the sum of individual spirits, it would not be possible to explain why the spirit of the times is so widely propagated, and yet seems specially powerful now in one country, and now in another.

—So, too, would remain unexplained the intrinsic connection of the movements of the times-spirit with one another, and the succession of its changes in great periods of time from age to age, a connection and succession which extend far beyond the brief lives of individual men, and which, therefore, can not be measured by the standard of individual men, nor be dependent on individual men.

—Lastly, if the times-spirit were nothing but the sum of individual minds or spirits, the many-sided struggle of the individual with the spirit of the times would be inconceivable; and yet that struggle is fought out frequently by individual men with themselves and within themselves, and not merely with other men.

—But if the times-spirit be not the sum of individual minds or spirits; if, rather, there be unity in its nature and development, its cause must be looked for only in humanity as a whole. Only on the supposition that humanity as a unit has a psychic aggregate bent or aggregate disposition of its own, an aggregate destiny of its own, and therefore an aggregate development of its own, can the times-spirit be explained; and then it is explainable as the orderly development of the soul-life of humanity.

—And so it is indeed. The world's history is the documentary proof that there is such a thing as a development of humanity, a development which progresses through great life-periods in organic sequences. The world's history and the times-spirit are nearly related and closely connected phenomena. The times-spirit accompanies the world's history in the paths of its development, and exercises its unceasing influence on the shaping of that history. The general character and spirit which, in the different periods and ages of the world's history, assumed a definite form, were once, when events were still, so to speak, in their fluid state, to a great extent, the spirit of the times. The world's history is development behind us, development in the past, succession that is past. The times-spirit is the development of the human mind in the present. But the times-spirit is certainly not the only thing that determines the world's history. If it alone ruled as a power superordinated over individual men and binding individual men, the world's history would be like the growth of a plant; individual freedom would be oppressed by its weight; there would be no deeds, no works of men peculiar, but only joint works of the general human mind. But the times-spirit is only one of the moving forces; in the struggle with that force, the spirit of tradition and of traditional authority asserts itself; side by side with it works the special spirit of the nationality of a definite people, of dynasties and families, but above all, of remarkable individual men. From the reciprocal struggle and strife, action and interaction, of all human forces, proceed all world-historical results.

—But the times-spirit is one of the most important and efficient of the forces which determine the world's history. By the psychologic law of ordered change, which is

innate, as a common faculty, in the human race, the human race is spurred on to gradual development and perfection, and guided to its destiny. By the times-spirit, to which God has borne testimony, before the mind of man, God, with far-stretching rein, guides the course of the world's history, and carries humanity unceasingly forward. Once the great significance of the times-spirit is recognized, men will revere it as something sublime, as something divinely human, and look upon those who, ever turned toward the eternal and unchangeable, put a low estimate on the changes of the times-spirit, as short-sighted and unwise. The manifoldness of human life in common and the freedom of human development, are instigated and led by the changes of the times-spirit.

—III. What, we may now ask, should be the attitude of the statesman toward this great intellectual power? 1. First, he is obliged carefully to notice the signs of the times, and to study the spirit of the times in which he is called to work. The question, What time is it? is always eminently important; for not at every hour you wish, can what you wish be done. Everything has its time, and the man who at the wrong time, whether too early or too late, undertakes great things, will generally succumb under difficulties, and his endeavors will remain without result.

—Then, again, the present world must first answer the question, In what world-period do we live? What is the fundamental character of our age? The world of our day is not clear on this point. But this much, I think, can be confidently asserted: The so-called modern world-period, in which a new revolution of the great wheel of the world's history is going on, has still an aspiring youthful character. Humanity has not yet reached the height of its aggregate life. The immeasurable results of the modern sciences and the whole political movement of the time bear testimony to the masculine spirit of modern humanity, with its will to become conscious of itself, and to shape itself in freedom. Ours is a great creative age, more conscious and more free than any former world-period. Hence, in the spirit of this our world-period, a liberal fundamental trait appears, one which recalls the still younger genius of the great period in the history of the world which brought forth the blossoms and splendor of Hellenic and Roman antiquity, and one which presents a surprising contrast to the stormy and oppressive, the intellectually less gladsome and less clear, nature of the middle ages. Even in the new and most glorious world-period on which humanity entered in the year 1740, the first beginnings and first essays of the new spirit were still childishly naïve or boyishly boisterous. In the first age of the *aufklärung* (enlightenment), from 1740 to 1789, a cosmopolitan, philanthropic philosophy prevailed. The educated world, the first moved by the times-spirit, now not only turned away with contempt from the middle ages, but also from the great traditions of the past, and raised its eyes with enthusiasm to the new ideals which philosophy held up to it, and from which it expected a new order of things. Then it undertook in the following and second age of the new world-period, in the age of the revolution, to realize the pictures of its phantasy, and to transform the world in reality. But it was more successful in tearing down and destroying the old order of the world than in establishing the new one. The speculative school in which it was educated could not make up for its lack of experience and of practical understanding. The world indeed moved forward, but not without occasionally falling back again. At last it gave up its naïve confidence in the abstract ideas of equality and liberty; in consequence of the

experiments it had made, it learned how to understand history better, and to appreciate the power of tradition. The principle which, in this our third age, since 1840, chiefly moves minds, especially in Europe, the principle of nationalities (see NATIONALITIES, PRINCIPLE OF) is, indeed, narrower than the ideas of the earlier revolutionary age of the universal rights of man, but it has more historical intrinsic value, and more formative power in it. We have not yet reached the height of genuinely liberal development. Even our grandchildren will not attain it. Our entire movement is not yet free from violent radical currents and precipitation; it occasionally turns about in the direction of the contrary extreme of absolutist reaction. But we may assert with joyful certainty that mankind has for a century past been making extraordinary progress, and is still making steady, manly progress toward the great goal: fully developed humanity.

—2. The statesman should never put a low estimate upon or undervalue the times-spirit, not even when the current of the times is unfavorable to him and to his plans, and not even when it brings to the surface, not the highest forces of human nature, but human nature's lower impulses; for the power of the times-spirit is always great, and its movements are necessary to the development of humanity. Remarkable men, indeed, go their own way, and do not, like the multitude, follow every change of the wind. But the statesman who despises the spirit of the times would be like the fool who despises the winter because it calls forth no blossoms, and ridicules the might because it invites to repose. The monk or the hermit may shut himself up from the spirit of the times, by withdrawing himself from life in common with other men; but the statesman who cares to work and live among men, can not. As the cautious gardener carefully watches the heat and cold, dryness and moisture, and endeavors to guard his plants from the injurious effects of the extreme forces of nature; and as the sailor takes the winds and the waves into consideration, the statesman must notice the movements and qualities of the times-spirit, and work against its disfavor. But if he will resist the current of the times, he must neither rest from labor nor sleep. Every place he lays open to assault will be overflowed by the hostile current of the times-spirit; every gap that he leaves open will be filled by it. Before he is aware of it, he is closed in, betrayed, overthrown.

—3. If the times-spirit is favorable, the statesman whose direction is greatly promoted by the blowing of the times-spirit, may risk much, for he will succeed in much. The time goes forward in the same direction, and the boat; with a favorable wind, moves quickly and happily. If he meets with obstacles which he can not for the moment overcome, he can wait. Time comes to his assistance, removes the obstacles in his course, or wears them out and opens the way for him. Napoleon III., even when he was a prince, understood the great political truth, that the man who moves with the current of his time meets with success, while the statesman who swims against it, perishes.

—4. The ideas of the times and the forms of the times correspond to the spirit of the times. Ideas are never first conceived and expressed by races, but always by single individuals; yet ideas become ideas of the times only when they are taken up and propagated by the receptive masses. Sages and philosophers announce the ideas of the future, in advance. From their intellectual height they discover many ideas which

operate only on future generations, earlier than do the multitude who live in the valleys below them. But the practical statesman can try to realize only the ideas which suit the times in which he lives. It is only for these ideas of the times that he will find understanding and support among men. He must guard against defending obsolete ideas of the times after the manner of the romantic school. For even if the spirit of tradition lends him some assistance, he will at most meet with only momentary success. The hostile age marches over him, and tramples his work under foot. His policy becomes ridiculous quixotism. But it is almost more dangerous, if more laudable, for the statesman to undertake to carry out the ideas of the future before the time to carry them out is ripe. He will then make shipwreck on the rocks of stern reality, and be scoffed at as an idealistic visionary. The true task of the statesman is the realization of the actual ideas of the times. On this depends, in large measure, the popularity of statesmen. When they go with the ideas of the time, they are, for the most part, popular; when they go against the time, they become unpopular. The reason of the frightful unpopularity of the order of Jesuits for a century past, is to be found not solely in the dangerous intrigues of the order, but principally in the fact, that the whole tendency of the order is in deadly enmity with the modern spirit of the times and with the intellectual consciousness and cravings of the humanity of to-day. The great success of Napoleonic, English, Italian and Prussian politics, was certainly determined to a great extent by this: that their main tendency was in harmony with the liberal and national tone of the spirit of the times in the present age.

—5. But every age has also a love for definite forms of its life. It is not sufficient for the statesman to recognize the ideas of the time, and to enter the lists for them; he will do well also to use the forms of the time. A century ago, enlightened absolutism was acceptable to the age. Great things could then be accomplished without great struggles, under that form. In our age, which demands, as its right, the representative form, and especially the assent and co-operation, of popular representation, enlightened absolutism meets with powerful, opposition even when it advocates the real ideas of the time. Count Cavour for this very reason received earlier and more easily the recognition and cheerful support of his nation than did Prince Bismarck, because Cavour used the forms of the time for the ideas of the time, while Bismarck seemed at first to despise the forms of the time, and undertook to realize new ideas by the means of an earlier time. Hence the labor of Prince Bismarck was harder and slower; but in proportion as he showed himself more favorable to the forms of modern political life, he won for himself the furthering support of the many.

—6. Yet the greatest statesman can not singly, not even with the forms of the time, realize the ideas of the time. The new ideas, indeed, exercise their influence; but so do the old historical powers of authority and custom. The savant may carry out the thought of the time, in theory, with logical acumen, and a consistency regardless of consequences. Real life does not square with the straight lines and sharp angles of doctrines; it bends them and changes them in the application of them. Practical politics is an art which has a great many complicated problems to solve, an art which has to deal with many joint and personal forces. The result of political struggles necessitates treaties of peace, attempts at settlement or adjustment and compromises. The man who, out of blind zeal for the spirit of the times, scorns all compromise,

may, indeed, be an honorable doctrinarian, but he must not expect the success or laurels of the statesman.

J. C. BLUNTSCHLI.

## ZOLLVEREIN.

ZOLLVEREIN. The German *zollverein*, or customs-association, was the union effected among a number of the German states, and begun by the junction of some of them with Prussia, for tariff purposes, a union by virtue of which (the Prussian tariff system being taken as a basis within the limits of the territory of the association) all tariff barriers between such states were swept away, while duties were collected at the boundary lines of the association, on their joint account, and divided among the several states, parties to the union, in proportion to their population.

—This union came into existence after the dissolution of more than one tariff alliance against Prussia, Jan. 1, 1834, and was at first intended to continue for eight years. At that date the union embraced eighteen German states. In 1835, Hessen-Homburg, Baden and Nassau entered it; in 1836, Frankfurt; in 1838, Waldeck; in 1842, Braunschweig, Lippe and Luxemburg; in 1851 and 1852, Hanover and Oldenburg. From 1854 to 1865, all the German states, with the exception of Austria, the two Mecklenburgs and the Hanseatic cities, belonged to the Zollverein. The last Zollverein treaty is dated May 16, 1865, and was to run from Jan. 1, 1866, to the end of 1877, but was set aside by the events of 1866. The *zollverein*, or customs-association treaty, of July 8 1867, between the North German confederation considered as a single tariff territory, on the one hand, and Bavaria, Wurtemberg, Baden and Hesse on the other, which was to continue in force for twelve years, rested on a different basis entirely.

—The Zollverein itself was brought to an end by the establishment of the German empire, inasmuch as the constitution of the empire, of April 16, 1871, art. 33, provides that Germany shall constitute one single country for tariff and commercial purposes, with Bremen and Hamburg as free ports. At present the Zollverein, therefore, has mainly an historical interest.

—The economic consequences to Germany of the Zollverein were the consequences which may be expected from every customs-union. 1. It reduced the cost of the collection and administration of the customs duties as a consequence of the removal of the tariff barriers between the associated states; 2, it rapidly developed the industry of those states by the application of the principle of free trade in their commercial intercourse; 3, it increased the customs receipts by increasing consumption, the tariff being a moderate one; 4, it rendered it possible for these states, through the union, to conclude advantageous treaties with foreign countries, which are more disposed to make concessions to a state which offers them a large market than to small, unimportant countries; 5, it increased the commerce of the customs-union with foreign countries; 6, it increased the political importance of Germany, since its political union was destined, sooner or later, as it actually did, to spring from its customs-union.[159](#)

## LISTS OF WRITERS

Among The Writers Of The Articles In The First And Second Volumes Are The Following:

EDWARD ATKINSON, the distinguished Publicist, Boston, Mass.

BARTHÉLMY SAINT-HILAIRE, Member of the Institute of France.

FRÉDÉRIC BASTIAT, the famous French Economist.

HENRY BAUDRILLART, Member of the Institute of France, contributor to the *Dictionnaire Général de la Politique*.

MAURICE BLOCK, Statistician, Political Economist and Publicist; Editor of the *Dictionnaire Général de la Politique*, Paris.

J. C. BLUNTSCHLI, Professor at the University of Heidelberg, the celebrated writer on International Law; one of the Editors of Bluntschli and Brater's *Staatswörterbuch*.

GEROLAMO BOCCARDO, Editor of the *Dizionario Universale di Economia Politicae Commercio*, Italy.

JACQUES DE BOISJOSLIN, Paris, France.

ALBERT S. BOLLES, Author of the "History of American Finance."

GASTON DE BOURGE, Advocate, Paris.

HORATIO BURCHARD, Director of the Mint, Washington, D. C.

EDWARD CARY, Editor of the "New York Times."

E. CAUCRY, Member of the Institute of France.

EMILE CHÉDIEU. Advocate.

A. E. CHERBULIEZ, Swiss Political Economist, contributor to the *Dictionnaire de l'Economie Politique*.

JOHN W. CLAMPITT, Attorney at Law, Illinois.

AMBROISE CLÉMENT, the distinguished French Economist.

ROYER-COLLARD, Professor, of the *Faculté de Droit*, Paris.

Hon. THOMAS M. COOLEY, Author of "Constitutional Limitations," etc., etc.; Judge of the Supreme Court of Michigan.

CHARLES COQUELIN, one of the Editors of the *Dictionnaire de l'Economie Politique*.

COURCELLE-SENEUIL, Paris, France.

BANCHOFT DAVIS, Assistant Secretary of State, Washington, D. C.

DELABARRE-DUPARCQ, Director at the Military School of Saint-Cyr.

JULES DUVAL, Publicist.

CL. DUVERNOIS, French Ex-Minister.

Hon. DORMAN B. EATON, Chairman of the Civil Service Commission, New York.

Hon. MAX. EBERILARDT, Attorney, Chicago.

LÉON FAUCHER, Member of the Institute of France.

HENRY FAWCETT, M. P., Professor of Political Economy at the University of Cambridge; at present Postmaster General of Great Britain.

GASPAR FINALI, Ex-Minister, Italy.

JOHN FISKE, the well-known Essayist and Philosopher, Cambridge, Mass.

WORTHINGTON C. FORD, Esq., Brooklyn, N. Y.

L. FOUBERT, *Chef de division*, France.

JOSEPH GARNIER, Professor of Political Economy, Member of the Institute of France.

HENRY GEORGE, Author of "Progress and Poverty," New York.

LOUIS GOTTARD, Publicist.

GEORGE WALTON GREENE, Attorney and Counselor, New York.

JULES GRENIER, Publicist.

W. E. GRIFFIS, Author of the "Mikado's Empire," Schenectady, N. Y.

FAUSTIN HÉLIE, Member of the Institute of France.

XAVIER HEUSCHLING, Ministry of the Interior, Brussels.

J. E. HORN, Writer on Finance, Member of the Hungarian Parliament.

M. HUMANN, Advocate, France.

EDWARD S. ISHAM, Attorney and Counselor at Law, Chicago.

Prof. E. J. JAMES, Normal University, Normal, Illinois.

Judge JOHN A. JAMESON, Author of "The Constitutional Convention," Chicago.

ALEXANDER JOHNSTON, Author of "History of American Politics," Norwalk, Conn.

Hon. JOHN JAY KNOX, Comptroller of the Currency, Washington, D. C.

CHAS. LAVOLLÉE, Ex Prefect, France.

T. E. CLIFFE LESLIE, the eminent English Political Economist, lately deceased. His last literary effort was the article, "History, Economic and Legal," written for this Cyclopædia a few weeks before his death.

HENRY D. LLOYD, Financial Editor of the "Chicago Tribune."

Judge JOHN LOWELL, Chestnut Hill, Mass.

J. R. M'CULLOCH, the English Economist.

M. DE MOLINARI, Editor of *Journal des Débats*, Corresponding Member of the Institute of France. Cities and Towns; Civilization; Fashions; The International Association of Workingmen; Nations; Nobility; Protection

MICHEL NICOLAS, Professor, Montauban, France.

M. ORTOLAN, Lawyer, France.

ESQUIROU DE PARIEU, Member of the Institute of France.

JULES PAUTET, French Vice-Prefect

M. POEZL, Professor at the University of Munich.

R. P. PORTER, Special Agent (Tenth Census of the United States) for Statistics of Wealth, Debt, Taxation and Railroads, Washington, D. C.

M. RABUTAUX, Publicist.

R. W. RAYMOND, Esq., New York.

ERNEST RENAN, Member of the Institute of France.

LOUIS REYBAUD, Member of the Institute of France.

WILLIAM ROSCHER, the celebrated German Economist, founder of the Historical School of Political Economy, Leipzig.

M. ROTHE, Professor at Sorö, Denmark.

LÉON SAY, Economist.

JULES SIMON, Member of the French Academy.

E. MUNROE SMITH, Professor in Columbia College, New York.

A. R. SPOFFORD, Librarian of Congress, Washington, D. C.

SIMON STERNE, Lawyer, New York.

A. M. SULLIVAN, M. P., London, England.

HENRI THIERS. France.

JOHN P. TOWNSEND, one of the Vice-Presidents of the Bowery Savings Bank, New York.

J. D. WEEKS, Editor of the "Iron Age," Expert and Special Agent (Tenth Census United States) Wages in Manufacturing Industry. Washington, D. C.

Hon. D. A. WELLS, the eminent American Economist, Norwich, Conn.

HORACE WHITE, the well-known writer on Economic subjects, New York.

FREDERICK W. WHITRIDGE, Attorney, New York.

TALCOTT WILLIAMS, Editor "The Press," Philadelphia, Pa.

Hon. H. B. WITTON, Inspector of Canals, Hamilton, Ontario.

Prof. THEO. S. WOOLSEY, Yale College.

**Among The Writers Of The Articles In The Three Volumes, Are The Following:**

EDWARD ATKINSON, Boston, Mass.

BARTHELEMY SAINT-HILAIRE, Member of the Institute of France.

FREDERICK BASTIAT, the famous French Economist. Spoliation by Law; Plenty and Dearth.

HENRI BAUDRILLART, Member of the Institute of France.

MAURICE BLOCK, Statistician, Political Economist and Publicist, Editor of the *Dictionnaire Général de la Politique*, Paris.

J. C. BLUNTSCHLI, one of the editors of Bluntschli & Brater's *Staatswörterbuch*.

GEROLAMO BOCCARDO, Editor of the *Dizionario Universale di Economic Politica e di Commercio*, Italy.

JACQUES DÉ BOISJOSLIN, Paris, France.

ALBERT S. BOLLES, Author of "History of American Finance," Philadelphia, Pa.

GASTON DE BOURGE, Advocate, Paris, France.

R. R. BOWKER, New York.

T. T. BRYCE, New Haven, Conn.

HORATIO BURCHARD, Director of the Mint, Washington, D. C.

EDWARD CARY, New York.

E. CAUCHY, Member of the Institute of France.

EMILE CHEDIEU, Advocate, France.

A. E. CHERBULIEZ, Political Economist, contributor to the *Dictionnaire de l'Economie Politique*.

JOHN W. CLAMPITT, Counselor-at-Law, Chicago.

AMBROISE CLEMENT, the distinguished French Economist.

JAMES F. COLBY, Counselor-at-Law, New Haven, Conn.

ROYER-COLLARD, Professor of the *Faculté de Droit*, Paris.

EUSTACE CONWAY, Counselor-at-Law, New York.

THOS. M. COOLEY, Author of "Constitutional Limitations," etc., etc., Judge of the Supreme Court of Michigan.

CHAS. COQUELIN, one of the Editors of the *Dictionnaire de l'Economie Politique*, France.

C. COWLEY.

COURCELLE-SENEUIL, Paris, France.

E. H. CROSBY, Counselor-at-Law, New York.

J. C. BANCROFT DAVIS, Assistant Secretary of State, Washington, D. C.

DELABARRE-DUPARCQ, Director at the Military School of St. Cyr, France.

CHARLES DUNOYER, France.

JULES DUVAL, Publicist, France.

CL. DUVERNOIS, French Ex-Minister.

DORMAN B. EATON, Chairman of the Civil Service Commission, New York.

MAX. EBERHARDT, Counselor-at-Law, Chicago.

LEON, FAUCHER, Member of the Institute of France.

HENRY FAWCETT, M. P., Professor of Political Economy at the University of  
Cambridge; at present, Postmaster General of Great Britain.

GASPAR FINALI, Ex-Minister, Italy.

JOHN FISKE, Cambridge, Mass.

WORTHINGTON C. FORD, Brooklyn, N. Y.

L. FOUBERT, *Chef de division*, France.

JOSEPH GARNIER. Professor of Political Economy, Member of the Institute of  
France.

HENRY GEORGE, Author of "Progress and Poverty," New York.

D. C. GILMAN, President of Johns Hopkins University, Baltimore.

E. L. GODKIN, Editor New York *Nation*.

G. BROWN GOODE, Smithsonian Institute, Washington, D. C.

LOUIS GOTTARD, Publicist, France.

GEORGE WALTON GREEN, Counselor-at-Law, New York.

JULES GREENTER, Publicist, France.

W. E. GRIFFIS, Author of "The Mikado's Empire," Schenectady, N. Y.

F. P. G. GUIZOT, France.

ARTHUR T. HADLEY, Instructor in Political Science, Yale College, New Haven,  
Conn.

J. B. HAMILTON, Surgeon General U. S. Marine Hospital, Washington, D. C.

FAUSTIN HÉLIE, Member of the Institute of France.

XAVIER HEUSCHLING, Minister of the Interior, Brussels, Belgium.

J. E. HORN, Writer on Finance, Member of the Hungarian Parliament.

FRANKLIN B. HOUGH, Washington, D. C.

EDWARD S. ISHAM, Counselor-at-Law, Chicago, Ill.

E. J. JAMES, University of Pennsylvania, Philadelphia, Pa.

JOHN A. JAMESON, Author of "The Constitutional Convention," Chicago, Ill.

PAUL JANET, Member of the Institute of France.

ALEXANDER JOHNSTON, Professor of Jurisprudence, Princeton College, N. J.

JOHN JOHNSTON, Banker, Milwaukee, Wis.

JOHN J. KNOX, Comptroller of the Currency, Washington, D. C.

GUSTAVE KOERNER, Ex-Governor of Illinois.

CHAS. LAVOLLÉE, Ex-Prefect, France.

LOUIS LECLERC, France.

A. LEGOYT, France.

T. E. CLIFFE LESLIE, the eminent English Political Economist.

HENRY D. LLOYD, Financial Editor of the *Chicago Tribune*.

E. L'ONG, Professor University Dorpat, Russia.

JOHN LOWELL, Chestnut Hill, Mass.

ALFRED BISHOP MASON, Counselor-at-Law, Chicago, Ill.

D. H. MASON, Chicago, Ill.

CHARLES DE MAZADE, France.

J. R. M'CULLOCH, the English Economist.

G. DE MOLINARI, Editor of the *Journal des Débats*, Corresponding Member of the Institute of France.

M. MONJEAN, France.

E. MONTEGUT, France.

MICHEL NICOLAS, Professor, Montauban, France.

S. N. D. NORTH, Utica, N. Y.

M. ORTOLAN, Lawyer, France.

A. OTT, France.

E. PAIGNON, France.

ESQUIROU DE PARIEU, Member of the Institute of France.

H. PASSY, France.

## The Following Is A List Of The Subjects Treated By American Writers:

ATKINSON, EDWARD—Banks, Functions of.

BOLLES, ALBERT S.—Finance, American.

BOWKER, R. R.—Scratching.

BRYCE, T. T.—Products on Paper.

BURCHARD, H. C.—Coinage; Gold; Silver.

CARY, EDWARD—Education and the State; Gambettism.

CLAMPITT, JOHN W.—Bill; Court Martial; Military Commissions; Law, Common; Law, Criminal; Magna Charta; Police Power of the State.

COLBY, JAMES F.—Privateering; Prizes, Maritime; Suffrage; Territorial Waters.

CONWAY, EUSTACE—Treaties; United States Pension Laws.

COOLEY, THOS. M.—Bar; Corporations, Law of.

COWLEY, C.—Knights of the Order of St. Crispin; National Cemeteries; Ten-Hour Law; "Waitham System."

CROSBY, EDWARD H.—Petition, Right of; Priority of Debts Due to the United States and to the States; Public Policy.

DAVIS, J. C. BANCROFT—Geneve. Arbitration; Treaties of the United States.

EATON, DORMAN B.—Civil Administration; Civil Service Reform; Confirmation by the Senate; Judiciary, Elective; Patronage; Primary Elections; Promotion; Removals from Office; Spoils System; Term and Tenure of Office.

EBERHARDT, MAX.—Aliens; Bundesrath; German Empire.

FISKE, JOHN—Great Britain; House of Commons; House of Lords.

FORD, WORTHINGTON C.—Extradition; Income Tax; Internal Revenue of the United States; License Tax; Navy; Participation in Profits; Poll Tax; Prices; Public Lands of the United States; Refunding of the Public Debt of the United States; Sinking Fund; Tariffs of the United States.

GEORGE, HENRY—Chinese Immigration.

GILMAN, D. C.—Universities.

GODKIN, E. L.—Office-Holders, Danger of an Aristocracy of.

GOODE, G. BROWN—Fisheries; Treaties, Fishery.

GREEN, GEORGE WALTON—Municipal Bonds; Naturalization; Repudiation.

GRIFFIS, WM. E.—China; Corea; Formosa; Japan; Mongols; Mutsuhito; Riu Kin; Shimonoseki Indemnity; Shinto; Siam; Tartar, Tartary; Ta-Tsing; Tauism; Tonquin.

HADLEY, ARTHUR T.—Over-Production; Postoffice; Profits; Reciprocity; Speculation; Subsidies; Transportation, Means of; Weights and Measures.

HAMILTON, JOHN B.—Quarantise.

HOUGH, FRANKLIN B.—Forestry.

ISHAM, EDWARD S.—Corporations, Economic and Social Relations of.

JAMESON, JOHN A.—Convention, The Constitutional.

JAMES, E. J.—Banks of Issue; Customs Duties; Education, Compulsory; Emigration and Immigration; Excise; Factory Laws; Finance, Science of; Insurance; Labor; Political Economy, History of.

JOHNSTON, ALEXANDER—The Articles on the Political History of the United States in the Cyclopædia.

JOHNSTON, JOHN—Scotland.

KNOX, JOHN JAY—Banking; United States Notes; United States Notes—Legal Tender Cases—Decisions of the Supreme Court of the United States; United States Surplus Money. Distribution of, among the States.

KOERNER, GUSTAVE—Monroe Doctrine; Outlawry.

LLOYD, H. D.—Clearing, and Clearing Houses.

LOWELL, JOHN—Bankruptcy.

MASON, ALFRED B.—Proportional Representation.

MASON, DAVID H.—Protection in the United States.

NORTH, S. N. D.—Press, The Newspaper and Periodical.

PORTER, ROBERT P.—Debts, National, State and Local.

PUTNAM, GEO. HAVEN—Property, Literary.

RAYMOND, R. W.—Mines.

SANBORN, F. B.—Pauperism.

SMITH, EDMUND MUNROE—Nationality, Law of.

SMITH, HAYDN—Exchange, An; Fund, Funding, Refunding.

SPOFFORD, A. R.—Academies; Ballot; Budget; Congress of the United States; Education, Bureau of; Homestead and Exemption Laws; Interior, Department of the; Justice, Department of; Library of Congress; Lobby; Navy, Department of the; Parliament, The British; Parliamentary Law; Patent Office; Postoffice Department; Public Lands, Office of; States, Legal and Constitutional Diversities of; Treasury Department; War Department.

STERNE, SIMON—Cities, Administration of American; Legislation; Monopolies; Railways; Representation.

TOWNSEND, JOHN P.—Banks, History and Management of Savings.

WALKER, FRANCIS A.—Public Revenue; Wage Fund; Wages.

WEEKS, JOS. D.—Conseils Des Prud'hommes; Industrial Arbitration; Strikes and Lockouts.

WELLS, DAVID A.—American Merchant Marine; Distilled Spirits; Extradition; Fair Trade; Free Trade; Navigation Laws of the United States; Taxation; United States Pension Laws and Pension Laws of other Countries.

WHITE, HORACE—Commercial Crises; Money and its Substitutes; Paris Monetary Conference.

WHITRIDGE, FREDERICK W.—Assessments, Political; Canens System; Instructions; Jury, Trial by; Patents, and the Patent System.

WILLIAMS, TALGOTT—Apportionment; Party Government in the United States; Tammany Hall; Turkey.

WINES, FRED. H.—Prison and Prison Discipline.

WITTON, H. B.—Dominion of Canada.

WOOLSEY, THEODORE S.—Blockade.

[1.] In the United States a witness may be sworn in any manner considered binding on his conscience. Quakers and others having conscientious scruples against the taking of an oath under any circumstance, may affirm instead. In some of the states the witness,

whoever he be, may elect between the taking of an oath and judicial affirmation. The penalty for the affirmation of what is false by a witness in a civil or criminal case, is the same as for perjury.

—Besides the judicial and professional oath, there is what the French call the "political oath," which in part corresponds to the oath taken, in countries like the United States, to support the constitution. Of this latter oath, C. Lavollée says: "In feudal times, when political society was made up of suzerains, vassals and serfs, the oath of fealty was but the necessary or at least logical consecration of the bonds of submission which united the inferior to his superior. Subsequently, when absolute monarchy, basing itself on divine right, had survived feudalism, the oath of fealty was retained; and it could not but be retained, since the sovereign represented both God, whose delegate he was, and the nation all of whose rights he absorbed into his own person. The political oath was then as logical as it was under the feudal system.

—The external ceremonies and formulas of the oath were in keeping with the principle of submission, or rather of subjection, which bent the subject at the feet of his master. The master had all the rights; the subject had only duties. By the oath the subject solemnly pledged himself to maintain a condition of things which he had not brought about, and which he could not do away with. He fulfilled his chief duty by promising fidelity to the person whom he recognized as his superior and master. Nothing simpler or more rational.

—The modern law regulating the forms of government of a people, in the greater number of civilized states, rests on a totally different principle. Divine right has joined feudalism in the ruins of history, and has been replaced by the right of the people. Dynasties no longer force themselves on a people: they have to be accepted; the prince is the delegate, the mandatory of national sovereignty; in such a manner, that by the overthrow of the old order of things, logically speaking, the prince owes the oath of fealty to the people, and not the people to the prince. It is so in certain republics, in which the principle of popular sovereignty has been established from the beginning, and is not perverted by traditional formalities which had their origin in the old right of kings. In several constitutional states the king takes the oath of fealty to the constitution.

—Hence in countries which profess the dogma of popular sovereignty, the *political oath* can not be what it was under the old regime. We might even say that not only has it no *raison d'être*, no reason why it should exist, but that there are reasons why it should not exist. An oath, with the forms of solemnity which surround it, represents in the eyes of men the idea of an indissoluble and perpetual engagement. But should the citizen swear to be always faithful to a sovereign whose rights, created by the national will, may be destroyed by that same will? Should he swear always to obey and support a constitution which the nation may modify or abrogate at any moment? We can understand an oath made to a superior and immutable being, to God, or to a sovereign consecrated by divine right; we can understand an oath to the great principles of truth, probity, honor, duty, principles universally accepted and respected, implanted by God in the human conscience, whence they dominate time, circumstances and laws. But it is very difficult to define the character and value of an

oath given to a removable sovereign, to precarious institutions, made by the very persons in whom resides the right to change the sovereign and modify the institutions. In such an act we can see only a conditional oath, limited by restrictions and hedged in by reservations; but such an act is not an oath. \* \* \* Not only is the political oath useless, since it never strengthened or saved a constitution or a sovereign, but, moreover, it is sometimes only an instrument of tyranny or violence. \* \* \* The political oath has not, in the eyes of the people of our day, the authority which belongs to so solemn an act. It has not the character of inviolability; it is commented on and discussed. It is not of rare occurrence, that the person who takes it harbors, in his innermost soul, a faith different from that to which he has just sworn; public opinion no longer grows indignant at this, nor is it even surprised at it: sometimes it is an accomplice to the wrong, requiring the official or other person who takes the oath to remember, at the moment he takes it, an oath he had previously taken. This is a deplorable confusion of ideas; for just as there is but one conscience and one morality, there can be but one oath: it matters not what we call it, judicial, professional or political: all oaths impose the same duties and should be kept with the same fidelity \* \* \*. But we must not lose sight of the fact that, according to modern law, the constitution of a country may be indefinitely modified by the national will, so that an oath can be no obstacle in the way of the desires or of the proposals of reform which it is the right of every citizen to express in a legal way. The oath itself would be opposed to the constitution if it held the person taking it within bounds which would prevent him from exercising that right. With the oath as governments have always wished to interpret it, it would be possible to confiscate the national will for all time. Revolution has too frequently undertaken the task of answering that pretense. \* \* Says M. Odilon Barrot, 'Oaths are taken or refused, but not discussed. The sanction of the oath being entirely in the conscience, the strength of the oath is entirely in the morality of the person who takes it.' In political matters, more than in any other, it is the character of the man which gives authority to the oath. \* \* Let the politician, functionary or civil magistrate take an oath to the law, the soldier to his flag, and every citizen to what to him is duty: such, in our opinion, is the simple and easy solution of this much debated question. In politics everything is variable, uncertain and precarious. In the midst of the crumbling of thrones and constitutions which our generation has witnessed, we should like to have pointed out to us a form of government or a dynasty certain to grow old with its oaths. But *duty* is, and will always subsist. Let men take an oath of fealty to *it*." The "political oath" here spoken of is very intimately related on one side to the oath of allegiance.—ED

#### Footnotes for OATH OF ALLEGIANCE

[2.] There is, I conceive, nothing in law to prevent the crown, by and with the consent of the estates of the realm, in the ordinary form of an act of parliament, and with the advice of responsible ministers, from repealing or amending the act of settlement. In the event of its appearing likely that there should be a failure of the persons thereby defined as capable of succession, amendment would become necessary; for example, if they should not be or should cease to be Protestants.

[3.] It is remarkable that in the assize of Northampton (1176) the justices are directed to take the oath of fealty even from "rustics": "*Item justitiæ capiant domini regis*

*fidelitates \* \* ab omnibus, scilicet comitibus, baronibus, militibus et libere tenentibus, et etiam rusticis, qui in regno manere voluerint.*" Does this include men who were not free? In the earliest forms of the oath of fealty to the king, both in England and elsewhere, the promise was to be "*fidelis sicut homo debet esse domino suo.*" Allen ("Royal Prerogative," pp 68-71) thinks this was a limitation of the subject's obedience, or reservation of his right to throw off allegiance if the king failed in his duties, and this is probable. But the words would likewise operate in the king's interest by adding the stricter personal bond of homage to the more general obligation of fealty.

[4.] Bishops *after* consecration swore fealty only; but on their election, and before consecration, they did homage. Glanvill, lib. 9, cap. 1, *ad fin.*

[5.] Strictly there is not any oath of homage distinct from the oath of fealty. The oath was always an oath of fealty, and the duty of homage, where it was present, carried with it the duty of swearing fealty to the lord. On the other hand, there might be, and often was, fealty without homage. (Allen, p. 62. Cp. Hargrave's and Butler's Notes on Co. Litt., 68*a.*) Homage was the privilege of the freeholder, being "the most honourable service, and most humble service of reverence, that a franktenant may do to his lord." (Litt., s. 85.) As to the common-law duty, cp. Selden. "Table Talk," s. v. "Fathers and Sons," "Every one at twelve years of age is to take the oath of allegiance in court-leets [*sic*] whereby he swears obedience to the king."

[6.] 1 Eliz., c 1. In the argument in *Miller vs. Salomons*, in the Exchequer (7 Ex., at p. 478), it was erroneously stated to be the first statute on the subject.

[7.] The "etc." means, I suppose, "and the contents of this Book."

[8.] 1 Anne, c. 16, 4 & 5 Anne, c. 20; and as to Scotland, 6 Anne, c. 66 (Statutes of the Realm, c. 14, in other editions).

[9.] One of the minor points taken by Mr. Salomons' counsel was that, as the act of George III. did not authorize the insertion from time to time of the reigning sovereigns' names, it expired at the end of the reign, or at all events when there ceased to be a king named George.

[10.] Sir Samuel Martin's, then a baron of the exchequer, and now the only survivor, as it happens, of the judges before whom the case was argued.

[11.] The oaths of allegiance, etc., were enforced on the clergy by Charles II.'s act of uniformity and various other statutes. The taking of them was part of the ordination service until separated from it by this act.

[12.] It may be worth while to explain to lay readers that this does not mean limiting the powers of the crown, but defining the course of the succession.

Footnotes for OCEANICA

[13.] GOVERNMENT OF THE COLONIES.—*New South Wales*. The constitution of New South Wales, the oldest of the Australasian colonies, is embodied in the act 18

and 19 Vict., cap. 54, proclaimed in 1855, which established a "responsible government." The constitution vests the legislative power in a parliament of two houses, the first called the legislative council, and the second the legislative assembly. The legislative council consists of not less than twenty-one members, nominated by the crown, and the assembly of 108 members, elected by seventy-two constituencies. To be eligible, a man must be of age, a natural-born subject of the queen, or, if an alien, he must have been naturalized for five years, and resident for two years before election. There is no property qualification for electors, and the votes are taken by secret ballot. The executive power is in the bands of a governor nominated by the crown. The governor, by the terms of his commission, is commander-in-chief of all troops in the colony. In the exercise of his authority he is assisted by a cabinet of eight ministers. The cabinet is responsible for its acts to the legislative assembly.

—*New Zealand.* The present form of government for New Zealand was established by statute 15 and 16 Vict., cap. 72, passed in 1852. By this act the colony was divided into six provinces, afterward increased to nine, namely: Auckland, Taranaki, Wellington, Nelson, Canterbury, Otago, Hawke's Bay, Westland and Marlborough, each governed by a superintendent and provincial council, elected by the inhabitants according to a franchise which practically amounts to household suffrage. By a subsequent act of the colonial legislature, 39 Vict., No. xxi., which was passed in 1875, the provincial system of government was abolished. By the terms of this act and of other amending statutes the legislative power is vested in the governor and a "general assembly," consisting of two chambers, the first called the legislative council, and the second the house of representatives. The legislative council consists of forty-five members, nominated by the crown for life, and the house of representatives of ninety-five members, elected by the people for three years. The members of the house of representatives include four aborigines, or Maories, elected by the natives. Every owner of a freehold worth £50, or tenant householder, in the country at £5, in the towns at £10 a year rent, is qualified both to vote for, and to be a member of, the house of representatives. The executive authority is vested in a governor appointed by the crown. The governor is, by virtue of his office, commander-in-chief of the troops. The general administration rests with a responsible ministry, consisting of about seven members. Besides the ministers, there is one native member of the executive council, but not in charge of any department. The control of native affairs, and the entire responsibility of dealing with questions of native government, were transferred in 1863 from the imperial to the colonial government. In 1864 the seat of the general government was removed from Auckland to Wellington, on account of the central position of the latter city.

—*Queensland.* The form of government of the colony of Queensland was established Dec. 10, 1859, on its separation from New South Wales. The power of making laws and imposing taxes is vested in a parliament of two houses, the legislative council and the legislative assembly. The former consists of thirty members, nominated by the crown for life. The legislative assembly comprises fifty-five deputies, returned from as many electoral districts, for five years, by the ballot vote of all tax payers. Persons having property, either leasehold or freehold, or a license to depasture lands from the government in any electoral district in which they do not reside, have the right of a vote in any district in which such property may be situated, as well as in the district in

which they reside. The executive power is vested in a governor appointed by the crown. The governor is commander-in-chief of the troops, and also bears the title of vice-admiral. In the exercise of the executive authority he is assisted by an executive council of six ministers. The ministers are jointly and individually responsible for their acts.

—*South Australia*. The constitution of South Australia bears date Oct. 27, 1856. It vests the legislative power in a parliament elected by the people. The parliament consists of a legislative council and a house of assembly. The former (according to a law which came into force in 1881) is composed of twenty-four members. Every three years the eight members whose names are first on the roll retire, and their places are supplied by two new members elected from each of the four districts into which the colony is divided for this purpose. The executive has no power to dissolve this body. It is elected by the whole colony voting as one district. The qualifications of an elector to the legislative council are, that he must be twenty-one years of age, a natural-born or naturalized subject of the queen, and have been on the electoral roll six months, besides having a freehold of £30 value, or a leasehold of £20 annual value, or occupying a dwelling house of £25 annual value. The qualification for a member of council is merely that he must be thirty years of age, a natural-born or naturalized subject, and a resident in the province for three years. The president of the council is elected by the members. The house of assembly consists of forty-six members, elected for three years. The qualifications for an elector are that of having been on the electoral roll for six months, and of having arrived at twenty-one years of age; and the qualifications for members are the same. There were 57,627 registered electors in 1882. Judges and ministers of religion are ineligible for election as members. The elections of members of both houses take place by ballot. The executive power is vested in a governor appointed by the crown and an executive council, consisting of the responsible ministers, and specially appointed members. The governor is at the same time commander-in-chief of the troops. The ministry, of which he is the president, is divided into six departments. The ministers are jointly and individually responsible to the legislature for all their official acts.

—*Tasmania*. The constitution of Tasmania was established by act 18 Vict., No. 17, supplemented by act 34 Vict., No. 42, passed in 1871. By these acts a legislative council and a house of assembly are constituted, called the parliament of Tasmania. The legislative council is composed of sixteen members, elected by all natural-born or naturalized subjects of the crown who possess either a freehold worth £30 a year, or a leasehold of £200, or have a commission in the army or navy, or a degree of some university, or are in holy orders. The house of assembly consists of thirty-two members, elected by householders of £7 per annum, or freeholders of property £50 in value, and all subjects holding a commission, or possessing a degree. The legislative authority rests in both houses, while the executive is vested in a governor appointed by the crown. The governor is, by virtue of his office, commander-in-chief of the troops in the colony. He is aided in the exercise of the executive authority by a cabinet of responsible ministers, consisting of five members. The ministers must have a seat in one of the two houses.

—*Victoria*. The constitution of Victoria was established by an act, passed by the

legislature of the colony in 1854, to which the assent of the crown was given, in pursuance of the power granted by the act of the imperial parliament of 18 8 19 Vict., cap. 55. The legislative authority is vested in a parliament of two chambers; the legislative council, composed of forty-two members, and the legislative assembly, composed of eighty-six members. A property qualification is required both for members and electors of the legislative council. According to a bill passed in 1881 members must be in the possession of an estate of the annual value of £500, and electors must be in the possession or occupancy of property of the ratable value of £10 per annum if derived from freehold, or of £25 if derived from leasehold or the occupation of rented property. No electoral property qualification is required for graduates of British universities, matriculated students of the Melbourne university, ministers of religion of all denominations, certificated schoolmasters, lawyers, medical practitioners, and officers of the army and navy. One-third of the legislative council must retire every three years, so that a total change is effected in nine years. The first election of new members took place November, 1882. The members of the legislative assembly are elected by universal suffrage, for the term of three years. Clergymen of any religious denomination, and persons convicted of felony, are excluded from both the legislative council and the assembly. The number of electors on the roll of the legislative council was increased by the action of the bill of 1881 from 33,105 to about 110,000; the number of electors for the legislative assembly was 176,022, according to the latest returns. The executive authority is vested in a governor appointed by the crown. The governor is commander-in-chief of all the colonial troops. In the exercise of his duties as the executive he is assisted by a cabinet of nine ministers. At least four out of the nine ministers must be members of either the legislative council or the assembly.

—*Western Australia.* The administration of Western Australia is vested in a governor, who exercises the executive functions. There is besides a legislative council, composed of seven appointed and fourteen elected members, the latter returned by the votes of all male inhabitants, of full age, assessed in a rental of at least £10. The qualification for elected members is the possession of landed property of £1,000. The governor is assisted in his functions by an executive council.

—POPULATION, RESOURCES, ETC., OF THE COLONIES.—*New South Wales.* The excess of immigration over emigration averaged 10,000 annually in the seven years 1874-80. There is a high birth rate in the colony. The excess of births over deaths amounted to 116,931 in the year 1880. The population of Sydney, the capital of New South Wales, numbered 220,427 at the census of April 3, 1881, the total comprising 99,670 inhabitants within the city, and 120,737 in the suburbs. The increase of population in the decennial period 1871-81 was 89,272, or 66 1/2 per cent. The trade of New South Wales more than quadrupled in the fifteen years 1850-64. The total value of the imports in 1850 amounted to £2,078,338, and in 1864 had risen to £10,135,708. The exports in 1850 were valued at £2,399,580, and in 1864 at £9,037,832. From 1864 to 1870 there was a decline in both imports and exports, but a new rise took place in 1871, continuing with interruptions till 1881. The value of the total imports in 1881 was £17,409,326: the value of the total exports, including bullion, was £16,049,503. Rather more than one-third of the total imports of New South Wales come from Great Britain, and about one-third of the exports are shipped

to it. The staple article of export from New South Wales to the United Kingdom is wool. Of this article there were exported in the year 1881, 87,739,914 lbs., of a value of £5,304,576. Next to wool, the most important articles of export are tin, copper, tallow and preserved meat. In March, 1882, New South Wales had 83,062,854 sheep; 2,180,896 horned cattle; 346,931 horses; and 213,916 pigs. The total area of land under cultivation embraced 645,068 acres, of which about one-half was under wheat and maize. New South Wales is believed to be richer in coal than the other territories of Australasia. In 1881 there were mined 1,775,224 tons of coal, valued at £603,248. The gold mines of New South Wales cover a vast area, extending over three districts, called the Western Fields, the Southern Fields, and the Northern Fields. The gold produce of the colony was estimated as follows, in each of the seven years 1875-81:

YEARS.	Quantity.	Value.
	Oz.	£
1875.....	552,592	2,097,740
1876.....	410,330	1,589,854
1877.....	124,113	496,452
1878.....	182,120	768,480
1879.....	109,650	399,187
1880.....	118,600	441,543
1881.....	145,532	550,111

New South Wales likewise possesses valuable copper and tin mines, the former producing 27,587 tons of copper in 1881. New South Wales has three lines of railway, the Southern, the Northern and the Western. In 1881 there were 994¼ miles of railway open for traffic and 11½ miles of tramways, and 487 miles under construction. The whole of the lines were built by the government. Of electric telegraphs there were in the colony 14,278 miles of line in 1881, constructed at a cost of £492,211. The paid messages transmitted in 1881 numbered 1,597,741. There were 318 telegraph stations at the end of 1881. The postoffice of the colony transmitted 26,355,600 letters, 16,527,900 newspapers, and 851,300 packets, in the year 1881.

—*New Zealand.* The census of April 3, 1881, gave the total population of 534,032, including 44,099 Maories (24,370 males and 19,729 females); of the rest, 269,605 were males and 220,328 females. This includes 5,004 Chinese, of whom only nine were females. In 1880 there were 19,341 births, 5,437 deaths and 3,181 marriages in the colony. At the census of 1881 there were four towns with upward of 10,000 inhabitants in New Zealand. The total number of immigrants and of emigrants, and the surplus of immigrants over emigrants, was as follows:

YEAR.	Immigrants.	Emigrants.	Surplus of Immigrants.
1871	10,083	5,297	4,786
1872	10,725	5,752	4,973
1873	13,572	4,761	8,811
1874	48,965	5,859	38,106
1875	31,737	6,467	25,270
1876	18,414	6,459	11,955
1877	12,987	6,611	6,376
1878	16,263	5,766	10,497
1879	23,597	5,234	18,723
1880	15,154	7,923	7,231
1881	9,688	8,033	1,655

The commerce of New Zealand increased nearly twenty-fold in the twenty years from 1859 to 1878; but while the imports, which at one time amounted to more than eight millions, fell again, the exports increased slightly in recent years. The value of the total imports of New Zealand in 1881 was £7,457,045; of the exports, £6,060,866. The value of the imports from Great Britain in 1881 was £3,718,308; that of the exports to Great Britain, £5,125,859. The staple article of export from New Zealand to the United Kingdom is wool. In 1881 there were exported to Great Britain 59,368,832 lbs. of wool, of an aggregate value of £3,477,993. Next to wool the most important articles of export were corn, flour, gum and preserved meat. The live stock of the colony consisted, in April, 1881, of 161,736 horses, 698,637 cattle, 12,985,085 sheep, 200,083 pigs, and 1,563,216 head of poultry. The greatest increase of live stock in recent years was in sheep. Their number increased from 1,523,324 in 1858, to 7,761,383 in 1861, to 4,937,273 in 1864, to 8,418,579 in 1867, to 9,700,629 in 1871, and to 11,704,853 in 1874. Large gold fields were discovered in the spring of 1857. The gold exports amounted to 355,322 ounces, valued at £1,407,770 in 1857; in 1881 only 250,683 ounces, valued at £996,867. In 1882 there were 1,383 miles of railway open for traffic. The total expenditures on construction of all the lines to March 31, 1881, had amounted to £9,599,355, and in 1882 to £9,869,669. On March 31, 1882, the colony had 3,824 miles of telegraph lines, and 9,653 miles of wire. The number of telegrams dispatched was 1,438,772, of which total over a million were private messages. The total receipts from telegrams amounted to £78,116. The total number of telegraph offices in the colony was 234. The postoffice in the year 1881 received 25,557,931 letters, of which number two-thirds came from places within and one-third from places without the colony. The total number of newspapers received in 1881 was 12,248,043, of which number over two-thirds came from places within and less than one-third from places without the colony. The total revenue of the postoffice amounted to £154,142 in 1881.

—*Queensland.* Queensland is divided into twenty municipalities, the largest of which, as regards population, is Brisbane. It contains the city of Brisbane, the capital of the colony, and the seat of government, with a population of 31,109 on April 3, 1881. The number of immigrants in 1881 was 16,223; that of the emigrants, 9,209. The total value of imports in 1881 was £3,601,906, and of exports, £3,289,253. Wool,

preserved meat and tallow are the chief articles of export. In December, 1882, there were 28,026 acres under sugar cane, out of a total of 128,875 acres under cultivation. The live stock at the end of 1881 numbered 194,217 horses, 3,618,513 cattle, 8,292,883 sheep and 56,438 pigs. There are several coal mines in the colony, the produce of which amounted to 65,612 tons in 1881. Gold fields were discovered in 1867, the produce of which amounted to 373,266 ounces, valued at £1,306,431 in the year 1877; in 1881 it was only 259,782 ounces, valued at £923,012. At the end of 1881 there were 800 miles of railway open for traffic in the colony, and 200 miles more in course of construction; while in 1882 a trans-Australian line from Brisbane to Port Darwin had been began. The postoffice of the colony in the year 1881 carried 5,178,547 letters, 4,530,263 newspapers, and 409,575 packets. At the end of 1881 there were in the colony 6,279 miles of telegraph lines, and 8,585 miles of wire, with 170 stations. The number of messages sent was 597,333 in the year 1881.

—*South Australia*. On April 3, 1881, the population of South Australia numbered 279,865 (149,530 males and 130,335 females). Of these 75,812 were members of the church of England, 42,628 Roman Catholics, and 42,103 Wesleyan Methodists. During 1881 there were registered 10,708 births, 4,012 deaths and 2,308 marriages. The population of Adelaide, the capital of the colony, was, in 1881, 38,479, exclusive of the suburbs. The number of acres under cultivation doubled in the ten years 1866-76. There were 2,613,908 acres under cultivation in 1882. 1,768,781 thereof under wheat. The live stock of the colony comprised 159,678 horses. 314,918 horned cattle and 6,810,856 sheep. The total value of South Australian imports in 1882 was £5,890,000, and of exports, £5,280,000. The three staple articles of export are wool, wheat and flour, and copper ore. The total exports of wool in 1881 amounted to £1,911,927; the exports of wheat and flour, to £1,336,761; and the exports of copper, to £263,370. Mining operations are pursued on a very extensive scale in the colony. The mineral wealth as yet discovered consists chiefly in copper, besides which there exist iron ores of great richness. The colony had 945 miles of railway open for traffic in July, 1882, and 174 miles of lines in course of construction. There are two principal lines of railway, namely, the Port line, extending from Adelaide to Port Adelaide, and the North line, connecting Adelaide with the chief copper mines. The colony had 4,946 miles of telegraph in operation at the end of 1881, with 7,227 miles of wire. Included in the total is an overland line, opened in 1872, constructed at the expense of the South Australian government, running from Adelaide to Port Darwin, a distance of 2,000 miles. In 1882 there were 488 postoffices in the colony; and during 1880 there passed through them 10,340,772 letters and packets, and 5,790,768 newspapers.

—*Tasmania*. The area of this colony is estimated at 26,215 square miles, or 16,778,000 acres, of which 15,571,500 acres form the area of Tasmania proper, the rest constituting that of a number of small islands. The total number of acres granted, or sold, up to the end of the year 1882, was 4,265,944; of these, 1,888,053 acres are held on depasturing leases, 374,374 acres being under cultivation, 53.41 per cent. of the population belong to the church of England; 22.24 per cent. to the church of Rome. At the census of 1881 the number of persons returned as being unable to read and write, was 31,080; as being able to read, only 9,589. The number of immigrants in 1881 was 12,579; that of emigrants, 11,163. The total value of the imports in 1881 was £1,438,524; that of the exports, £1,555,576. The commerce of Tasmania is almost

entirely with the United Kingdom and the neighboring colonies of Victoria and New South Wales. Wool is the staple article of export. There were in the colony 27,805 horses, 130,526 head of cattle, 1,847,479 sheep and lambs, and 49,660 pigs. on March 31, 1882. The soil of the colony is rich in iron ore and tin, and there are large beds of coal. Gold has also been found. The exports of tin amounted in value to £375,775, and yield of gold to £216,901 in 1881. At the end of 1881 there were 178 miles of railway open for traffic. At the commencement of 1882 the number of miles of telegraph line in operation was 928, and the number of stations, 85. In 1881, 147,660 telegraphic messages were sent. The submarine cable, established in 1869, and connecting the colony with the continent of Australia, carried 14,871 messages in 1880. The postoffice carried, in the year 1881, 1,994,148 letters, 187,555 packets, and 2,049,949 newspapers.

—*Victoria*. The population of this colony, which in 1836 was but 224, had increased in 1881 to 862,346. During the last decade there has been a large decrease both in Chinese and aborigines. About one-half of the total population of Victoria live in towns. The number of immigrants in 1881 was 59,066, and that of emigrants, 51,744. The birth rate in Victoria was 30.75 per 1.000 in 1880. The two staple articles of export from the colony are wool and gold. The total exports of wool amounted to £8,467,369 lbs., valued at £5,450,029, in 1881. In the ten years from 1852 to 1861 the exports of gold amounted to upward of two millions of ounces in weight per annum, but subsequently there was a gradual decline, till the year 1867, when the exports fell to under a million and a half ounces. In 1881 the produce of gold amounted to 858,850 ounces, valued at £3,674,104. There were 1,997,943 acres of land under cultivation in the colony at the end of March, 1882. In recent years there was a slowly increasing cultivation of the vine, the number of acres planted amounting to 4,919. In the year ended March 31, 1881, there were in the colony 275,516 horses, 1,286,267 head of cattle, 10,360,285 sheep, and 241,936 pigs. There were 1,214 miles of railway completed at the end of 1881, and 450 miles in progress. There were 3,349 miles of telegraph lines, comprising 6,626 miles of wire, open at the end of 1881. The number of telegraphic dispatches in the year 1881 was 1,281,749. At the end of 1881 there were 298 telegraph stations. The postoffice of the colony forwarded 26,308,347 letters, 4,213,625 packets, and 11,440,732 newspapers, in the year 1881. There were 1,158 postoffices on Dec. 31, 1881.

—*Western Australia*. The agricultural prosperity of the colony has been greatly on the rise in recent years: still, there were only 60,821 acres of land under cultivation at the end of 1881, out of a total of 626,000,000 acres. The live stock consisted, in 1881, of 31,755 horses, 60,009 cattle, and 1,267,912 sheep. The total value of imports in 1881 was £404,831, and of exports, £502,769. Wool and lead are the principal articles of export. Copper and coal are also found. There were eighty-eight miles of railway open for traffic at the end of 1882. In 1881 there were 1,585 miles of telegraph line within the colony, with twenty-seven stations. In 1881 there passed through the postoffice 929,624 letters, 693,283 newspapers, and 79,818 packets.—F. M.

Footnotes for OFFICE-HOLDERS

#### Footnotes for ORIENTAL QUESTION

[15.] Who would write history after civilized Europe had perished? We are not so sure that the conquest of Turkey by Russia would add to the power of the latter.—MAURICE BLOCK.

[16.] Russia's ambitious designs found expression again in the last Russo-Turkish war. The insurrections which took place in Herzegovina, Servia and Montenegro, in 1876 and 1877, not without being produced by Russian influence, caused new controversies between Russia and Turkey, after the latter had refused the guarantees desired by the great powers for the security of the Christians, in the conference which met at Constantinople in November, 1876, and which continued in session till January, 1877. These controversies led to a declaration of war by the czar against the porte, April 24, 1877. This was the fifth Russo-Turkish war. On March 3, 1878, a treaty of peace, called the peace of San Stefano, was signed, by which the war was ended. But the congress of Berlin materially changed its provisions in favor of Turkey. This congress met at Berlin, June 13, 1878, under the presidency of the German chancellor, Prince Bismarck. It was called to examine the result of the Russo-Turkish war (1877-8) created by the peace of San Stefano, and to make it harmonize with the interests of the other powers, especially of England and Austria. The result of the transactions and celebrations of this congress was the peace of Berlin, which provided for the independence of Rumania, Servia and Montenegro, and established two new independent states, Bulgaria and Eastern Rumelis. The immediate gain to Russia by this war was not great considering the sacrifice it had made in it. It cost 500,000,000 roubles, and 172,000 men on the European theatre of the war. On the other hand, the war greatly increased the influence of Russia, as a great Slavic power on the Balkan peninsula, and afforded it an opportunity to interfere in the affairs of that peninsula at any time.

#### Footnotes for PARAGUAY (Republic of).

[17.] The ministry consists of five secretaries, presiding over the departments of the interior, of finance, of worship and justice, of war, and of foreign affairs. For administrative purposes the country is divided into seventy departments (*departementos*), governed by commanders.

—The public revenue of Paraguay is derived mainly from customs duties. In 1881 they yielded £82,548. In 1882 the expenditure was estimated to amount to £62,685, inclusive of interest on the debt, army expenses and other items.

—The republic had no debt until the war of 1865-70, which led to the raising of large internal loans. In 1871 and 1872, the government contracted two foreign loans, the first of the nominal amount of £1,000,000, and the second of £2,000,000, each bearing 8 per cent. interest. The loans, issued at the price of 80, were hypothecated on

the public lands of Paraguay, valued at £19,380,000. Payment of both interest and sinking funds on the two loans ceased in 1874. No part of the previous payments, according to the report of the select parliamentary committee on foreign loans, 1875, "was provided for by the government of Paraguay, but the whole was derived from the proceeds of the loans themselves. Since these funds so set apart have been exhausted, no payment on account of interest or sinking fund has been made by the government of Paraguay." According to treaty stipulations arising out of the war of 1865-70, Paraguay is indebted to Brazil to the amount of 200,000,000 pesos, or £40,000,000; to the Argentine Confederation to the amount of 35,000,000 pesos, or £7,000,000, and to Uruguay to the amount of 1,000,000 pesos, or £200,000, being a total war debt of 236,000,000 pesos, or £47,200,000.

—The military force in the war against the united armies of Brazil Uruguay and the Argentine Republic, carried on during the years 1865-70, comprised 60,000 men, including 10,000 cavalry and 5,000 artillery. These troops were afterward altogether disbanded, and the entire force in 1877 consisted of 185 foot soldiers, forming the garrison of the capital. The permanent army is only 500 men.

—The frontiers of the republic, not well defined previous to the war of 1865-70—large territories considered part of it being claimed by Brazil, Bolivia and the Argentine Confederation—were fixed by a treaty of alliance between Brazil, the Argentine Confederation and Uruguay, signed May 1, 1865, to be between 22° and 27° south latitude, and 57° and 60° west longitude, of the meridian of Paris. By the final adjustment of the boundaries between Paraguay and neighboring states the area of the former is now estimated at 91,970 square miles.

—An enumeration made by the government in 1857 showed the population to number 1,337,439 souls.

—At the beginning of 1873 the number of inhabitants, according to an official return, was reduced to 221,079 souls, comprising 28,746 men and 106,254 women over fifteen years of age, with 86,079 children, the enormous disproportion between the sexes, as we has the vast decrease of the population, telling the results of the war. Since that date, another enumeration was taken, in 1876, the returns of which state the population at 293,844, being an increase of 72,765 in three years. About one-third of the inhabitants are living in the central province, containing the capital, the rest being spread thinly as settlers over the remaining portion of cultivated country. Nearly three-fourths of the entire territory is national property.

—The chief article of foreign commerce of Paraguay is the *yerba mate*, or Paraguayan tea, made of the leaves of the *Ilex Paraguayensis* tree, dried and reduced to powder, which are extensively consumed in all the states of South America. About 7,600,000 pounds of tobacco were exported in 1881. However, the total commerce of the republic is very small, the aggregate of imports and exports not amounting, on the average, to more than half a million sterling per annum. In 1881 the imports amounted to £255,600, and the exports to £362,400. The imports are derived to the extent of three-fourths from Great Britain, and one-fourth from France and Germany. The British imports are passing entirely through the territories of Brazil and the Argentine

Confederation, and since the year 1862, when a few articles of machinery and furniture, valued at £1,764, arrived from England, there has been no direct intercourse between Paraguay and the United Kingdom.

—The only railway in Paraguay is a short line of forty-five English miles, from Asuncion, the capital, to Paraguay. There are no lines of telegraph but one at the side of this railway.—F. M.

Footnotes for PARDON.

[18.]No attempt has been made in the above to give the actual law, constitutional and other, relative to the pardoning power; this Cyclopædia being one of politics and political economy, mainly, and not of law.

—In the United States the power to pardon offenders is vested by the several state constitutions in the governor. It is not, however, a power which necessarily inheres in the executive. (*State vs. Dunning*, 9 Ind., 22.) And several of the state constitutions have provided that it shall be exercised under such regulations as shall be prescribed by law. There are provisions more or less broad to this purport in those of Kansas, Florida, Alabama, Arkansas, Texas, Mississippi. Oregon, Indiana, Iowa and Virginia. In *State vs. Dunning*, 9 Ind., 20, an act of the legislature requiring the applicant for the remission of a fine or forfeiture to forward to the governor, with his application, the opinion of certain county officers as to the propriety of the remission, was sustained as an act within the power conferred by the constitution upon the legislature to prescribe regulations in these cases. And see *Branham vs. Lange*, 16 Ind., 500. The power to reprieve is not included in the power to pardon. (*Cooley*.)

Footnotes for PARLEY.

[19.]The institution of parley is useful to the strong as well as to the weak; not to respect it is not only a crime, but also, for each, a very grave fault against his own interest. It sometimes happens in war that a *parlementaire* is killed; we believe this is always by mistake. The flag has not, perhaps, been seen, or, if the envoy presents himself during a battle, which is generally a very inopportune moment, he may be accidentally wounded.—M. B.

Footnotes for PARLIAMENTARY LAW

[20.]References given in italics, are to subjects treated in this article; those given in small capitals, are to articles in the Cyclopædia at large.

Footnotes for PEACE

[21.]The preceding only applies to wars of aggression, and in such cases most constitutions require the consent of the national representatives. Even when the constitution attributes to the king the right to declare war, this does not mean that the war is the result of the royal will, but only that it is one of the king's functions (and

not, for instance, one of the functions of a minister or prefect) to sign the act. The right of defense, in case of an attack, is too evident, and is therefore not mentioned.

[22.] Arbitration can be employed only in cases involving material interests, and in that case all European nations will submit to it in the future. Is there any material interest which is worth the milliards which war actually costs? Thus, there will be no more fighting but for honor or for a sentiment, a passion; but what can arbitrators do in such a case?

Footnotes for PERSIA.

[23.] By the treaty of Dec. 9 (21), 1881, ratified Feb. 28 (March 12), 1882, the boundary between the Persian province of Chorasán and the territory of the Turkomans, which had lately been occupied by the Russians, was finally established. By the stipulations of that treaty the boundary line is formed by the lower parts of the Atrek river upward to Fort Tschat, by the ridge of the Songu Dagh and by the Sjägirim mountains; it next crosses the upper Tshandyr, runs in a northeasterly direction to the Sumbar, following its course to its month; it then runs along the ridge of the Kopet Dagh in a southeasterly direction, following, as a whole, irrespective of some sinuosities and indentations, the northern water-shed of the Atrek river, up to Baba-Durmas, which remains in the possession of Persia. This conquest by Russia has at least the advantage for Persia, that a considerable portion of the latter country will henceforth be secure from the destructive invasions of the Turkomans; the Russians also gave their freedom to a great number of captive Persians in the settlements of the Tekke (Turkomans). The sixth volume of Behm & Wagner's *Die Bevölkerung der Erde* contains the latest estimates of the population of Persia, by Gen. Houtum-Schindler, who possesses a most thorough knowledge of the country; these estimates are based, partly on the general's own observations, and partly on the statements of the Persian minister of finance, and are as follows:

	<b>Inhabitants.</b>
<b>99 towns, with 363,630 families</b> .....	<b>1,963,600</b>
<b>Villages and about 30 districts containing no towns.</b>	<b>3,780,000</b>
<b>Nomads, as follows:</b>	
<b>Arabians, with</b> .....	<b>57,800 families</b>
<b>Turks, with</b> .....	<b>160,000</b> “
<b>Kurds, Lak, with</b> .....	<b>150,000</b> “
<b>Belooches, Gipsies, with</b>	<b>4,600</b> “
<b>Bachtjares, Lurcs, with</b>	<b>52,000</b> “
	<b>424,400</b>
	<b>families</b> } <b>1,909,800</b>
<b>Total</b> .....	<b>7,653,600</b>

According to religion these 7,653,600 inhabitants are divided into 6,860,600 Shiites, 700,000 Sunnites and Mohammedan sectarians, 8,000 Parsees, 19,000 Jews, 43,000 Armenians, and 23,000 Nestorians. Of 1,000 Armenians, 528 are males, 472 females; of 1,000 Mohammedans, 495 are males, and 505 females.

—The cultivation and the export of opium, which are not only encouraged by the government, but even ordered by it, have lately considerably increased, while in other respects little or no progress has been made in the country. The Persian opium trade

dates only from the Anglo-Chinese war. In consequence of the safety afforded by the occupation of Hong Kong by the English, Persian opium gradually made its way to China. The prohibitory duties exacted in the ports of India had been a great obstacle in the way of trade, and for a long time more opium was sent to Constantinople than to Hong Kong. Finally, some merchants of lead discovered the route via Ceylon, and now that drug is shipped via Bender-Abbas directly to China, by steamers of the Peiho line of steamships. In 1880 the export was 6,000 *piculs* (or boxes of 125 English lbs.), and in 1881, 8,000; while ten years previous, the export amounted to but 4,000 *piculs*, or one-half of the amount exported in 1881. 8,000 *piculs* are equivalent to 480 English tons, and are but one-tenth of the quantity of opium exported from India. With better roads. Persia might well night make its competition felt by India. Probably in consequence of the primitive method of manufacturing it, Persian opium is a little cheaper than that produced in India; crude Persian opium costs ten rupees per *see* (two lbs.); refined, thirteen and one-third rupees, against sixteen rupees for refined Indian opium.

—The Persian priesthood consists of many orders, the chief of them at the present time being that of Mooshtched, of whom there are but five in number in the whole country. Vacancies in this post are filled nominally by the members of the order, but in reality by the public voice, and the shah himself is excluded from all power of appointment. Next in rank to the mooshtched is the sheik-nl-islam, or ruler of the faith, of whom there is one in every large town, nominated by, and receiving his salary from, the government. Under these dignitaries there are three classes of ministers of religion, the mooturelle, one for each mosque or place of pilgrimage; the muezzin, or sayer of prayers, and the mollah, or conductor of rites. The Armenians are under two bishops, one of them Roman Catholic, and both residing at Ispahan. There is wide tolerance exercised toward Armenians and Nestorians, but the Jews and Guebres suffer under great oppression. Education is in a comparatively advanced state, at least as far as the upper classes are concerned. There are a great number of colleges, supported by public funds, in which students are instructed in religion and Persian and Arabian literature, as well as in a certain amount of scientific knowledge, while private tutors are very common, being employed by all families who have the means. A larger portion of the population of Persia are possessed of the rudiments of education than of any other country in Asia, except China. The revenue and expenditure of the government are known only from estimates, as no budgets or other official accounts have ever been published. The receipts of the year 1875 amounted to 4,361,660 tomans, or £2,026,354, in money, besides payments in kind, consisting of barley, wheat, rice and silk, valued at 550,840 tomans, or £255,911, making the total revenue equal to 4,912,500 tomans, or £2,282,265. The bulk of the public expenditure is for the maintenance of troops, and salaries, with pensions, to the Persian priesthood, while each annual surplus is paid into the shah's treasury. Almost the entire burthen of taxation lies, as remarked above, upon the laboring classes, and, among these, upon the Mohammedan subjects of the shah. The amount of revenue collected from the Christian population, the Jews, and the Guebres, is reported to be very small. The government has no public debt.

—By a decree of the shah, issued in July, 1875, it was ordered that the army should for the future be raised by conscription, instead of by irregular levies, and that a term

of service of twelve years should be substituted for the old system, under which the mass of the soldiers were retained for life. The organization of the army is by provinces, tribes and districts. A province furnishes several regiments; a tribe gives one, and sometimes two, and a district contributes one battalion to the army. The commanding officers are almost invariably selected from the chiefs of the tribe or district from which the regiment is raised. The Christians, Jews and Guebres in Persia are exempt from all military service. The whole external trade of Persia may be roughly valued at £4,000,000 annually, of which £2,500,000 may be taken as the value of the imports, and £1,500,000 as that of the exports. The greater part of the commerce of Persia centres at Tabreez, which is the chief emporium for the productions of northern India, Samarkand, Bokhars. Cabul and Beloochistan. There are no official returns of the value of the total imports and exports, the former of which are estimated to have averaged £1,000,000, and the latter £500,000, per annum, in the year 1876-80. The principal article of import into Tabreez during the five years consisted of cotton goods of British manufacture, of the average annual value of £800,000; while the chief article of export was silk, shipped for France and Great Britain, of the average annual value of £110,000. All the European merchandise that reaches Tabreez passes by Constantinople to Trebizond, whence it is forwarded by caravans. Upward of £100,000 worth of carpets are now annually exported to Europe.

—Persia has a system of telegraphs, established by Europeans. At the end of 1879 there were 3,367 miles of telegraph lines and 5,660 miles of telegraph wire in operation. The number of telegraph offices was seventy-one at the same date. The number of dispatches forwarded in the year 1878 was 500,000, the revenue of the year from telegraphs amounting to £15,000. The first regular postal service, also established by Europeans, was opened in January, 1877. Under it mails are conveyed from Julfa, on the Russian frontier, to Tabreez and Teheran, and from thence to the port of Resht, on the Caspian sea. In November, 1882, the Persian government arranged with a syndicate of French capitalists for the construction of a railway from Resht to Teheran, 250 miles. (See Statesman's Manual, 1883.)

Footnotes for PERU.

[24.]The so-called "saltpetre war" carried on by the republic of Chili, against the allied republics of Peru and Bolivia, was begun in the year 1879. For decades there had existed a controversy concerning the boundaries between Chili and Bolivia. The question in dispute was, whether the province of Atacamba, between Peru and Chili, belonged entirely to Bolivia, or whether Chili had a right to claim its extremest southern part. This question increased in significance, when it was discovered, that there were in this very southern part vast deposits of guano, extensive beds of saltpetre and rich veins of silver. By the treaty of Aug. 10, 1866, the governments of Chili and Bolivia agreed that the territory in dispute should belong to both states in common, so far as the division of receipts from taxes and revenue duties was concerned, and Bolivia pledged itself in no way to disturb Chilean citizens in the exploitation of the saltpetre mines. Incensed by Peru, with which Bolivia had concluded a secret offensive and defensive alliance in 1873, the government of Bolivia did not observe the treaty of 1866; it arbitrarily taxed a Chilean company of merchants in the seaport of Antofagasta, and here meeting with resistance, made

several arrests and confiscated the property of the company. Peru, which exported large quantities of guano and saltpetre, and feared the competition of energetic Chili, did not dislike this repression. Chili complained of the action of Bolivia in violation of the treaty, and when the latter did not pay any attention to its complaints, Chili equipped a squadron, caused Antofagasta to be blockaded by the same on Feb. 14, 1879, and the entire saltpetre region to be seized. Upon this followed, on the first of March, the declaration of war by Bolivia, which, on the second day of April, concluded an armed alliance with Peru. The Chilian squadron next blockaded the south Peruvian port of Iquique and other ports in the neighborhood, whence saltpetre and guano were exported. Pressed hard by the Peruvian fleet, which had more iron-clads, the Chilians were, however, compelled to raise the blockade and to retire to Antofagasta. But soon afterward they succeeded in capturing the strongest iron-clad of the enemy, in taking the port of Pisagua and in defeating the land forces of the Bolivians and Peruvians near Dolores; they also occupied the port of Iquique and took away the entire south Peruvian province of Tarapacs, with its rich beds of guano and saltpetre. Chili was completely master at sea, and Arica and other ports of Peru were blockaded by the Chilian fleet. Intense excitement prevailed in the two allied states, and their two respective governments were overthrown; in Bolivia there existed a state of anarchy, its army and finances being prostrate; in Peru, Gen. Pierola, who had been elected president, ruled like a dictator. The campaign of 1880 was still more favorable for the Chilians. Their troops, under Gen. Baquedano, marched on the 20th of March into the town of Moquegua, which had been abandoned by the Peruvians; the Chilian troops threw the enemy back on Tacna, where the allied troops suffered another defeat, upon which the former occupied the town and took Arica by storm. The Bolivian troops retired home after the defeat near Tacna. Through the mediation of the United States negotiations for peace were begun. The plenipotentiaries of the belligerent republics and of the United States convened on neutral ground, on board a United States man-of-war, on the 22d of October. The conference, however, did not agree as to the conditions of peace. The proposition that the three states should submit to the arbitration of the United States government was refused by the victorious Chilians. Thus the conference came to an end, without any result, on the 27th of October. With a force of about 24,000 men the Chilians resumed the war. They landed two army corps on the coast of Peru, they routed the enemy, intrenched near Lurin, and advanced toward Lima, the capital of Peru. After having suffered two further defeats, one near Chorillos, on Jan. 12, 1881, and the other near Miraflores, on the 15th of the same month, the enemy fled in confusion to Lima. The Peruvian army was now utterly demoralized, and unable to resist any further. Lima was occupied by the Chilian troops on the 17th of January. In place of the fugitive Pierola, Calderon was appointed provisional president of Peru by a convention of notables; after the session of congress, which had been convened with great difficulty, had been opened, Calderon's nomination was made definitive. Gen. Lynch, who, in place of Gen. Baquedano, was intrusted with the chief command of the Chilian troops, came in conflict with Calderon and with Galvez, the minister of foreign affairs; he ordered their removal; and when, his orders notwithstanding, both of them continued to exercise their functions, they were arrested and sent to Santiago. The United States government, believing it had a right to intervene in all American states, and knowing its own interest to be better guarded by the existence of small than of large states, had already recognized the Calderon government; it had also declared to the Chilian

government, that the latter would not be allowed to insist upon a cession of territory as a condition preliminary to negotiations for peace, and that the United States would not suffer any intervention from Europe. Chili stipulated the following conditions: Peru was to cede the district of Tarapaca, and to pay a war indemnity of twenty millions of dollars within sixteen years; until the completion of the payment of that sum, Chili was to keep the town of Arica as a pledge; and in case the indemnity should not be paid, Chili would keep Arica and take possession also of the guano island, Lobos. Chili declared to the American minister that it would decline all further mediation in case of Peru's refusing to accept these conditions. In a circular of Dec 21, 1881, to the diplomatic representatives of Chili, Balmaceda, the Chilian minister of foreign affairs, gave an accurate account of the causes of the war, of the events of the war and of the intervention by the United States, and insisted upon the demand of a cession of territory, which he signified as an indispensable means of indemnification, and a condition of security based upon international law. At the same time he did not fail to recall the fact that the United States government in its international conflicts (especially in the wars with Mexico) did not hesitate to impose on the vanquished adversary cessions of large tracts of territory as a preliminary condition. Under such circumstances the negotiations, it is true, were continued, but the conclusion of peace was removed to an incalculable distance; meanwhile Chili remained in possession of what it had occupied.

—During the year 1882 no essential change occurred in the condition of Peru. The Chilians insisted upon their conditions of peace, and in Peru they could find no government that would agree to these conditions. Bolivia kept aloof from the war, and neither could Peru expect any assistance from any other power, the more so because the United States in 1882 abstained from any intervention. In that part of the country which had not been occupied by Chilian troops, lawless gangs of soldiers, under rapacious and violent leaders, raged in a most cruel manner. In Chincha sixty European inhabitants were shot, and in pillaging the town the marauders destroyed property valued at eight millions of dollars. In the seaport of Pisco the gang of Col. Mas, on the 24th of January, in a state of beastly intoxication, murdered several hundreds of inhabitants. Several generals now claimed the highest authority, and fought one against the other; thus: Admiral Mantero, in Huaraz; farther north, the Indian Puga; in Cajamarca, Pierola's former minister of war, Gen Iglesias; in Arequipa, Carrillo; in Ayacucho, Gen. Caceres, a brave and determined officer. The latter had some of the leaders of the marauding troops shot, among them Col. Mas. The Chilians refused to recognize the troops of these leaders as belligerent soldiers, but treated all men who were captured with arms in hand as highway robbers. The Peruvians treated the Chilians in a like manner. Thus, on the 9th of July they surprised and killed a troop of Chilian soldiers in Concepcion, upon which the Chilian general, del Canto, caused all the inhabitants of that town to be massacred. The Chilians, growing impatient because peace was not concluded, sought to indemnify themselves by increasing the revenue duties, and by imposing contributions on the towns which they held and occupied. In this manner they tried to compel the Peruvians to make peace. The negotiations with President Garcia Calderon, confined in the interior of Chili, remained without result, because he refused to agree to the cession of Arica and Tacna. The Chilians therefore entered into negotiations with Iglesias, an honest but narrow-minded man, in Cajamarca; Iglesias proved to be more ready to yield.

Montero, however, who, by virtue of his former capacity as vice-president, had declared himself the constitutional successor of Calderon, who had gone to Arequipa and had even formed a ministry there, refused to ratify the concessions made by Iglesias.

—On May 15, 1883, a treaty of peace, accepted by Iglesias, was concluded between Chili and Peru. The stipulations of the treaty were as follows: 1. The unconditional surrender in perpetuity to Chili of the department of Tarapaca as far north as the Quebrada de Camarones, the whole of which territory is consequently to be governed by Chili. 2. The territories of Tacna and Arica, now held by Chili, are to be subject to the legislation and government of that republic during ten years from the date of the treaty's taking effect. At the expiration of that time, a plebiscitum is to be had which shall decide whether that territory shall be subject to Chili or return to Peru. The country which remains in possession of the territory is to pay the other country 10,000,000 silver Chilean dollars, or the equivalent in Peruvian *soles*. A special protocol is to determine the form under which the plebiscitum shall be held, and the time of payment of the \$10,000,000 alluded to. 3. The government of Chili binds itself strictly to comply with the contract signed and decrees issued respecting guano Feb. 9, 1882, and respecting nitrate March 22 of the same year, and it adds thereto the following declaration: "The said decree of Feb. 9, 1882, orders the sale of 1,000,000 tons of guano, and article thirteen establishes that the net price of the guano, after deducting the cost of extraction, analysis, weighing, loading, salaries of employés to overlook these different operations, and all expenses incurred up to the moment of placing it, sacked, on board the vessel, shall be divided in equal parts between the government of Chili and the creditors of Peru, whose credits are guaranteed by this article." The government of Chili also declares that, when the sale of 1,000,000 tons shall have been completed, it will deliver to the creditors of Peru 50 per cent. of the net proceeds, as provided by article thirteen, until the debt shall have been extinguished or the deposits exhausted. But it is understood that only the deposits which are actually worked are alluded to hereby, and that all those which may hereafter be discovered or worked in the annexed territories will belong exclusively to Chili, which will retain all the proceeds and dispose of them as she may determine. It is also understood that the creditors of Peru who are benefited under this concession must comply with the regulations contained in the decree of Feb. 9, 1882, and that, beyond the declarations contained in this article, Chili does not recognize, on account of war or any other motive, any indebtedness of Peru, of any nature whatsoever. 4. The North Lobos islands will continue to be managed by Chili until the 1,000,000 tons of guano which have been sold shall have been delivered. Then they will be returned to Peru. The 50 per cent of the net proceeds of the guano from the Lobos islands to which Chili is entitled under the decree of Feb. 9, is ceded by her to Peru, and payment thereof will be commenced directly the present treaty shall have been ratified.

—The questions referring to the future commercial relations between the two countries, and the indemnities due the Chilians for losses through the war, are matters for subsequent discussion and arrangement. The treaty, however, could not be carried into effect, because the Peruvians refused to recognize Gen. Iglesias as their lawful president, and to ratify the treaty he had signed. Victorious Chili was from the

beginning willing to recognize Iglesias as president, because his presidency offered the best guarantees for the ratification, and for the strict observance, of the treaty. Meanwhile, the lawless condition of Peru continued. Bands of so-called "patriots," who opposed Iglesias and the ratification of the treaty of peace, committed numberless outrages. This reign of terror, and the consideration of the fact that the conclusion of a treaty would be an indispensable condition to the recovery of Peru, caused the better part of the population of that country to rally around Iglesias, and to support his claims to the presidency.

[25.] Peru had a deficit, in 1876, of about \$1,538,490. It has (1883) a large public debt, divided into internal and external. The internal liabilities are estimated at about \$20,000,000. It has, besides, a floating debt of an unknown amount, greatly increased by large issues of paper money, made in 1879 and 1880, to carry on the war against Chili. The total of these issues was estimated, at the end of October, 1880, at 35,000,000 *soles*.

—The army of Peru was composed, at the end of 1878, of eight battalions of infantry, numbering 5,600 men; of three regiments of cavalry, numbering 1,200 men; of two brigades of artillery, numbering 1,000 men; and of a gendarmerie, numbering 5,400 men. The number of men under arms was raised nominally to 40,000 in May, 1879, after the outbreak of hostilities against Chili, and further increased to 70,000 in the summer of 1880, after the successful invasion of the territory by the Chilians. At the beginning of November, 1879, the Peruvian navy consisted of four ironclads and six other steamers. In 1883, in consequence of the war with Chili, it may be said that both the army and navy of Peru have been completely destroyed.

—The foreign commerce of Peru is chiefly with Great Britain and the United States.

—In 1878 there were open for traffic, or in course of construction, eleven railway lines belonging to the state, 1,281 miles in length, and costing 128,354,600 *soles*. There were, besides, eight lines belonging to private persons, 496 miles in length, and two lines belonging in part to the state and in part to individuals.

Footnotes for PETITION, Right of

[26.] See, for example, "Address to the People of Maryland," 3 American Museum, 419, giving an account of the Maryland convention, very few members of which, it is true, seemed to wish to have the right of petition mentioned in the constitution; p. 424.

[27.] See *ib.*, 273-278, 280-290, 557-562, for the attempt to censure John Quincy Adams for a breach of this resolution; and notice, at p. 278, Mr. Cushing's able argument, showing that the right of petition existed independent of the constitution.

[28.] (See also 1 Blackstone's Commentaries, 143; Story on the Constitution, § 1894; Cooley's Constitutional Limitations, 349; 1 May's Constitutional History, chap 7, pp. 410-417; Whipple's Report to the Legislature of Rhode Island, and Otis' Letter, published in pamphlet form, by Cassady 8 March, Boston, 1889; Broom's Constitutional Law, 408 et seq., 493 et seq., 508 et seq.)

#### Footnotes for PHYSIOCRATES.

[29.] The date of this publication is important in the history of the science. We have remarked, in an essay relating to the origin and filiation of the term political economy (*Journal des Economistes*, vol. xxili., pp. 11, 217): "Engene Daire, after stating (xiv. of his Introduction to the 'Works of Turgot,' in the *Collection des principaux Economistes*) that this work was printed about 1766, inclines us to believe in the notice of Mercier de la Rivière (same vol., p. 430), that this date is not exact, and that Turgot's treatise appeared later. Engene Daire was mistaken a second time; we have before us a copy of the edition of 1766 in 12mo." If Eugene Daire was mistaken, it was only in part, and we ourselves are also mistaken. The volume of which we speak, bore the last date which we mention; but this date points to the time when Turgot was writing, during his intendancy. The first edition seems to have been the separate one formed of the article in the *Ephémérides*, part of which appeared in the 11th vol., at the end of 1769, and a part in the 12th vol., at the commencement of 1770.

#### Footnotes for PIRACY

[30.] Kent. in his Commentaries (vol. i., p. 183), gives the following definition of piracy: "Piracy is robbery, or a forcible depredation on the high seas, without lawful authority, and done *animo furandi*, and in the spirit and intention of universal hostility. It is the same offense at sea with robbery on land; and all the writers on the law of nations, and on the maritime law of Europe, agree in this definition of piracy." Further on he continues: "They (pirates) acquire no rights by conquest; and the law of nations, and the municipal law of every country, authorize the true owner to reclaim his property taken by pirates, wherever it can be found; and they do not recognize any title to be derived from an act of piracy. The principle, that *a piratis et latronibus capta dominium non mutant*, is the received opinion of ancient civilians and modern writers on general jurisprudence; and the same doctrine was maintained in the English courts of common law, prior to the great modern improvements made in the science of the law of nations."

—By the constitution of the United States, congress is authorized to define and punish piracies and felonies committed on the high seas, and offenses against the law of nations. In pursuance of this authority it was declared, by the act of congress of April 30, 1790, c. 9. sec. 8, that murder or robbery, committed on the high seas, or in any river, haven or bay, out of the jurisdiction of any particular state, or any other offense which, if committed within the body of a county, would, by the laws of the United States, be punishable with death, should be adjudged to be piracy and felony, and punishable with death. It was further declared, that if any captain or mariner should piratically and feloniously run away with any vessel, or any goods or merchandise to the value of fifty dollars, or should yield up any such vessel voluntarily to pirates; or if any seaman should forcibly endeavor to hinder his commander from defending the ship or goods committed to his trust, or should make a revolt in the ship—every such offender should be adjudged a pirate and felon, and be punishable with death. [By the act of congress of March 3, 1835, c. 313, the offense of making a revolt in a ship is no longer punishable as a capital offense, but only by fine, and imprisonment at hard

labor.] Accessories to such piracies before the fact are punishable in like manner; but accessories after the fact are only punishable by fine and imprisonment. And by the act of March 3, 1819, c. 76, sec. 5, congress declared, that if any person on the high seas should commit the crime of *piracy, as defined by the law of nations*, he should, on conviction, suffer death. This act was but temporary in its limitation, and has expired; but it was again declared, and essentially to the same effect, by the act of congress of May 15, 1820, c. 113, sec. 3, that "if any person, upon the high seas, or in any open roadstead, or bay, or river, where the sea ebbs and flows, commits the crime of robbery in and upon any vessel, or the lading thereof, or the crew, he shall be adjudged a pirate. So, if any person engaged in any piratical enterprise, or belonging to the crew of any piratical vessel, should land and commit robbery on shore, such an offender shall also be adjudged a pirate." According to a decision of the United States supreme court, robbery on the high seas is piracy by the act of congress, as well as by the law of nations.

—Kent holds, that it is of no importance, for the purpose of giving jurisdiction, on *whom* or *where* a piratical offense has been committed. "A pirate, who is one by the law of nations, may be tried and punished in any country where he may be found, for he is reputed to be out of the protection of all laws and privileges. The statute of any government may declare an offense committed on board its own vessels to be piracy, and such an offense will be punishable exclusively by the nation which passes the statute. But piracy, under the law of nations, is an offense against all nations, and punishable by all." "An alien, under the sanction of a national commission, can not commit piracy while he pursues his authority. His acts may be hostile, and his nation responsible for them. They may amount to a lawful cause of war, but they are never to be regarded as piracy." "If a natural-born subject was to take prizes belonging to his native country in pursuance of a foreign commission, he would, on general principles, be protected by his commission from the charge of piracy. But to prevent the mischief of such conduct, the United States have followed the provisions of the English statute of 11 and 12 William III., c. 7, and the general practice of other nations, and have, by the act of congress of April 30, 1790, sec. 9, declared, that, if any citizen should commit any act of hostility against the United States, or any citizen thereof, upon the high seas, under color of any commission from any foreign prince or state, or on pretense of authority from any person, such offender shall be adjudged to be a pirate, felon and robber, and, on being thereof convicted, shall suffer death. The act of congress not only authorizes a capture, but a condemnation in the courts of the United States, for all piratical aggressions by foreign vessels; and whatever may be the responsibility incurred by the nation to foreign powers, in executing such laws, there can be no doubt that courts of justice are bound to obey and administer them. All such hostile and criminal aggressions on the high seas, under the flag of any power, render property taken in *delicto* subject to confiscation by the law of nations."

—By the ancient common law of England, piracy, if committed by a *subject*, was held to be a species of treason, being contrary to his natural allegiance; and by an *alien* to be felony only: but since the statute of treasons (25 Edw. III., c. 2), it is held to be only felony in a subject. Formerly this offense was only cognizable by the admiralty courts, which proceed by the rules of the civil law; but it being inconsistent with the liberties of the nation that a man's life should be taken away unless by the judgment of

his peers, the statute 28 Henry VIII., c. 15, established a new jurisdiction for this purpose, which proceeds according to the course of the common law. It was formerly a question whether the Algerines and other African states should be considered pirates; but however exceptionable their conduct might have been on many occasions, and however hostile their policy might be to the interests of humanity, still, as they had been subjected to what may be called regular governments, and admitted to enter into treaties with other powers, they could not be treated as pirates. (M'Culloch.)

—What constitutes piracy, in violation of the law of nations, is not uniformly fixed everywhere. It is questioned whether (as according to English common law) self-interested design must be the motive of the attack. A majority of modern writers have answered this question in the negative. Another undecided question is, whether piracy may be committed by a mutinous crew against the vessel on which they serve. Acts of violence committed by duly authorized privateers against hostile, or, *bona fide*, against neutral, merchantmen, are not considered as piracy. Different from the crime of piracy, in violation of the law of nations, is the crime of piracy which is mentioned in and punished by the criminal laws of some countries. The description of the facts which constitute these two different kinds of crime may become doubtful, as when a party, being in a state of insurrection, and recognized as "belligerent" by the neutral powers, injures the maritime commerce of the other party in the course of a civil war. The slave trade, too, is to be considered piracy, according to the laws of seafaring nations, and according to the treaties which have been concluded for the purpose of suppressing that nefarious trade; but where the right to search suspected vessels on the high seas is denied to vessels under foreign flags, the punishing of the guilty in accordance with the provisions in relation to piracy can not be carried out practically. It is a strange fact, as compared with other codes, that sec. 4 of the German criminal code does not enumerate piracy among the crimes committed in foreign countries, which may be punished. (Holtzendorff.)

#### Footnotes for POLICE

[31.]Bär, p. 341, etc. According to Bär (p. 348), the most experienced judges, magistrates and prison officials in England have declared, that three-fourths to four-fifths of all crimes are the result of intemperance. In the year 1877, before a parliamentary committee, nineteen prison superintendents and clergymen stated that the number of prisoners who were victims of intemperance amounted to 60-90 per cent. of all criminals (p. 344). In Germany, according to Bär (p. 348), in the year 1875, of 32,837 prisoners, there were 13,706 drunkards (41.7 per cent.), 7,269 occasional drinkers (22.1 per cent.), and 6,437 habitual drunkards (19.6 per cent.).

[32.]The general economic principle, that the production accommodates itself to the demand for the article produced, is incorrect in so far as the number of drinking places and the retail trade in spirits are concerned, for the reason that the temptations to intemperance are increased by the frequency, convenience and cheapness of the opportunities offered for the gratification of the taste for intoxicants. Where taverns or "saloons" and the retail trade in spirits are completely free, the number of taverns, etc., is not proportioned to the want, but to the power of resistance of the people to the desire, for strong drink. The less this power for resistance is, the greater will be the

number of "saloons," and the more rapidly will intemperance spread. For this reason the retailing of spirituous liquors has in all states been subjected to police regulations, and where these regulations have been abolished, a speedy return to severer ones has been necessary. In England the public houses have to be licensed, and the license can be granted only by a permanent committee of the justices of the peace of the county, or of the city, and must be renewed every year. The license is granted only for one definite public house, on which a special tax is laid. (Laws of 1828 and 1872.) In France, by a decree of Dec. 29, 1851, a tavern or inn can be opened only by virtue of a license, issued by the prefect. The prefect may close a tavern, from motives of public security, or because the keeper thereof has been sentenced for a transgression of the regulations governing his traffic. The prefects are instructed to grant new licenses only after an extremely careful examination into the character of the person and of the demand, and to close a public house as soon as the keeper has become guilty of even the smallest transgression of the police regulations. (Ministerial Circular of March 6, 1872.) A peculiar system, and one worthy of attention, prevails in Sweden and Norway. In Sweden the laws of 1857 and 1869 provided, that in every parish the number of taverns should be determined by boards cooperating with the parish authorities, and that they should be leased to the highest bidder. In 1865 there was formed, in the city of Gothenburgh a joint stock company, which rented all the taverns in the city, with a view to limiting the retailing of spirituous liquors and opposing intemperance. All the profits of the business, by the by laws of the society, go to the treasury of the parish. The highly favorable results obtained by this company caused societies of the same kind to be formed in many other cities. In the year 1871, in Norway, a similar law was enacted, and the so-called Gothenburgh system was introduced there. This system, however, has its disadvantages; for a great number of secret drinking places were opened, and the police but seldom succeeded in suppressing them. In Germany an ordinance of June 21, 1869, makes the business of taverns, as well as the retail trade in brandy and spirits, dependent on the obtaining of a license. The license, however, can be denied: 1, when there is reason to believe that the person asking it is likely to abuse it for the encouragement of excessive drinking, gambling, or of immorality; 2, when the place intended for the trade, by reason of its position, etc., does not satisfy the requirements of the police. When it is not contrary to territorial laws, the territorial administrations may make the permission to retail intoxicants dependent on proof of actual public demand. This is the case in Prussia, Saxony, Mecklenburg, Brunswick, Saxe-Meiningen, Saxe-Coburg-Gotha, Saxe-Altenburg, Reuss and Schaumburg-Lippe. Nevertheless, the ordinance caused a notable increase in the number of retail shops for the sale of intoxicants.

[33.] To this effect, asylums for the inebriate were established in the United States (in 1857 in Boston), asylums in which cures are frequently effected. It has been claimed that in the asylums in the United States cures have been effected in 35 per cent. of the cases.

[34.] In the middle ages the church used to punish every kind of unchastity as an ecclesiastic transgression, but it is known how widespread sexual profligacy was in the middle ages among the clergy and laity, and how openly it was practiced. Loose women were not only tolerated, but public brothels were considered necessary institutions in a city. They frequently were the property of the lords of the country or

city; they were leased out by them, or kept for them by brothel masters or mistresses whom they appointed. Private brothels were licensed, and stood under the protection of public authority, but had to pay certain taxes. In most German cities brothels had to be tolerated under police supervision, and the laws against simple prostitution, as a rule, remained void of effect.

[35.] In Germany it was mainly the work of Cella on crimes and transgressions in the matter of unchastity (1786), that paved the way for the opinion that simple incontinence, which appears only as vice, without offending the rights of others, or creating public scandal, is not punishable.

[36.] For this reason, Mohl, on principle, advocates the toleration of brothels. V. Oettingen (Moral Statistik, p. 171, etc.) agrees with him in this.

[37.] Where brothels are tolerated, they should be subjected to strict supervision, not only in the interest of sanitary police, but, above all, to prevent their becoming hot-beds of vice. It is desirable to give prostitutes the possibility of emancipating themselves from the control of panders and brothel-keepers. The strongest objection against the toleration of brothels consists in this, that in most cases the return to a good life is rendered impossible to their inmates.

#### Footnotes for POLITICAL ECONOMY.

[38.] We may use the expression *medical sciences*, because medicine, the art of healing, is aided by several sciences, specially cultivated for its use: anatomy, physiology, pathology, therapeutics; but we should not say the *science of medicine*.

[39.] The very real distinction which we establish between science and art has nothing in common with that which, rightly or wrongly, is made between theory and practice. There are theories of art, as there are of science, and it is only of the former that we may say, they are sometimes in opposition to practice. Art dictates rules, but general rules; and it is not unreasonable to suppose that these general rules, though correct, may sometimes disagree with the practice in certain particular instances. But this is not the case with science, which neither ordains, counsels nor prescribes anything, which limits itself to observing and explaining. In what sense, then, can it be in opposition to practice? There is, to our thinking, a double error in the following passage from Rossi: "The school of Quesnay has been too much reproached with its *laissez faire, laissez passer*. It was pure science." No, it was not pure science; it was art, since it was a maxim, a precept, a rule to follow. As to the maxim itself, although susceptible, like all general rules, of many restrictions in practice, instead of saying, like Rossi, that it approached too nearly the school of Quesnay, we should say that it has not been sufficiently landed, because not sufficiently understood.

[40.] It is, however, proper to remark that these economists do not say precisely that there is no wealth except exchangeable values, but that exchangeable value is the only wealth which political economy can take into account.

#### Footnotes for POLITICS

[41.] An expression of the French president Jeannin, in Laurent. x., p. 344: "*Les princes font bien quelque fois des choses honteuses, qu'on ne peut blâmer, quand elles sont utiles à leurs états; car la honte éteint couverte par le profit, on la nomme sagesse,*" i.e., "Princes, indeed, sometimes do shameful things, which we can not find fault with, when they are useful to their states; for shame, in the mantle of profit or advantage, is called wisdom."

[42.] Circular of Prince Metternich, May 12, 1821: "*Conserver ce qui est légalement établi, tel a dû être le principe invariable de leur politique (des souverains alliés) le point de départ et l'objet final de tous leurs résolutions.*"

Footnotes for POPULATION.

[43.] According to Niebuhr, monogamous marriages resulted in more children than polygamous. Volney stated (*Voyage dans la Turquie*, vol. ii., p. 445), that married men in Turkey were frequently impotent at the age of the thirty. Roscher (vol. ii., p. 300, Amer. translation) says: "Polygamy, also, is a hindrance to the increase of population. Abstract physiology must indeed admit that a man may, even without any danger to his health, generate more children than a woman can bear. But, in fact, the simultaneous enjoyment of several women leads to excess and early exhaustion. \* \* In the civilized countries of the east the polygamy of the great may lead to the compulsory celibacy of the many in the lower classes, as a species of compensation. The monstrous institution of eunuchism, which has existed time out of mind in the east, is a consequence of this condition of things, as well as of the natural jealousy of the harem." The reader will find much of value in Roscher's chapters on "Population," and their copious notes.—*Translator.*

[44.] Roscher (Polit. Econ., vol. ii., p. 287, foot notes) quotes the "Edinburgh Review" and other authorities to the contrary.—*Translator.*

[45.] According to Dr. P. H. Chevasse, a child should not be nursed more than nine months; and he quotes Dr. Archer Farr as follows: "It is generally recognized that the healthiest children are those weaned at nine months complete. Prolonged nursing hurts both child and mother: in the child, causing a tendency to brain disease, probably through disordered digestion and nutrition; in the mother, causing a strong tendency to deafness and blindness." Dr. Chevasse adds: "If he be suckled after he be twelve months old, he is generally pale, flabby, unhealthy and rickety, and the mother is usually nervous, emaciated and hysterical. \* \* A child nursed beyond twelve months is very apt, if he should live, to be knock-kneed, and bow-legged, and weak-ankled, to be narrow-chested and chicken-breasted."—*Translator.*

[46.] Roscher, in his chapter on "Temporary Emigration," thinks such emigration would be a great national misfortune to the country from which the immigrants obtain their wages, inasmuch as its working class may thus be forced to a lower standard of living; and he queries whether the immigration of Chinese into Australia and the United States may not have a like result. In Australia a fine of £10 per capita was imposed to prevent such immigration. Recently (1882) the United States has passed restrictive laws in this regard. Even J. S. Mill, at the time when the national life of the

English people seemed threatened by the immigration of Irish laborers, would have had no hesitation in prohibiting this immigration, so as to keep the economic contagion from spreading to English workmen.—*Translator*.

[47.] Mr. Thornton's language is as follows: "Misery, the inevitable effect and symptom of over-population, seems to be likewise its principal promoter." "Except when people are placed in situations in which, being unable to estimate correctly the amount of employment, they overrate their means of subsistence; or, when some political arrangement, such as a charitable provision for the poor, encourages them to get families around them which they can not themselves maintain, it will, I think, be found that wherever population has received an undue influence, the people have been first rendered reckless by privation"—*Translator*.

#### Footnotes for PORTUGAL

[48.] *Political History during the last decade*. During the last decade the history of Portugal was more peaceful than that of Spain. A few riotous assemblies were held, and a few insignificant plots took place, but no civil war; neither did the parliamentary parties combat one another very violently, because in Portugal the republicans and social-democrats met with little sympathy among the people. The permanent financial deficit constituted the principal object of contention; it furnished to every opposition, whether conservative or liberal, both the means and occasion for opposing and overthrowing the cabinet for the time being in power. In the chambers the *regeneradores* (conservatives), under the counselor of state de Fontes Pereira de Mella, on the one side, were opposed by the historians under Marquis Loulé and Braamcamp, and the reformers (liberals) under the leadership of the bishop of Vizen. The historians and the reformers at times combined, forming a great progressionist party. The reformers there, as reformers in general are wont to do in other parliaments, spoke of retrenching the expenditures of the state, of reducing the taxes, of thorough reforms in all branches of the administration, and made motions to that effect, which, however, could not be entertained by a cautious and conservative government. The *regeneradores* tried to restore the national wealth, by going to the utmost limit of taxation, supporting industry and increasing trade, thereby gradually doing away with the deficit. One cabinet after another vainly tried to solve this difficult problem. The republican and communistic agitation, which originated in Spain after the abdication of King Amadeus, only slightly disturbed Portugal. A republican committee, consisting of Spaniards and Portuguese, in 1873, issued a manifesto to the people of Portugal, by which the latter were urged to agitate in favor of an Iberian republic. But just as in 1869, when King Louis of Portugal, as well as his father, the titular king, Ferdinand, refused to accept the crown of Spain, which had been offered to them, the majority of the population neither felt like tying their future to revolutionary Spain, divided by exceedingly extreme parties, nor like exchanging their independence for the blessings of a Spanish province. The Portuguese press most emphatically rejected the proposition of an "Iberian Union." The cabinet of d'Avila, which by imposing new taxes had caused great dissatisfaction, was succeeded, on Sept. 13. 1871, by a conservative ministry, of which de Fontes Percira was president and minister of finances. In a conflict with the chapter of the cathedral of Braganza the ministry energetically defended the rights of the state as against the church, and in

1875 a majority of the chamber and the press expressed themselves as opposed to the intentions of the clericals. The chambers of 1876 passed the bill for suppressing the last remnants of slavery on Sao Thomé. Although slavery had been abolished there, the emancipated negroes, who had been reduced to a state of bondage to the planters, were cruelly maltreated by the latter. Notwithstanding all its exertions within the province of economy and the increase of taxation, the Fontes Pereira cabinet was unable to do away with the deficit; for which reason the cabinet was violently attacked by the historians and reformers, and being unable to meet these attacks satisfactorily, the cabinet handed in its resignation March 6, 1877. Thereupon a cabinet of the coalition was formed, Marquis d'Avila e Bolams, whose supporters occupied a position midway between conservatives and liberals, becoming president of the cabinet and minister of foreign affairs and of the interior. This cabinet, formed from the moderate elements of the *regeneradores* and of the opposition, was only able to maintain itself as long as it did not by any measures arouse the hostile feelings of those who constituted the majority in the cortes. At the election for members of the city council in Lisbon the cabinet opposed the *regeneradores*, and it also appointed progressionists to the most important offices of the administration; for which reasons the *regeneradores* endeavored to overthrow the cabinet. In this they succeeded the more easily as the deficit had increased still more, and as the ministry had shown great weakness in dealing with the bishops. The vote of want of confidence offered by the *regeneradores* on the occasion of the debate on the address, and by which the ministry was accused of having violated the principles of liberalism and the rules of proper administration, was passed, Jan. 26, 1878. by a vote of 60 to 19. The cabinet thereupon resigned, and Fontes Pereira formed a new cabinet. This latter, it is true, had a decided majority in both chambers; but disagreement among the ministers themselves caused the cabinet to resign May 29, 1879. The new cabinet of the 1st of June was formed from the liberal opposition; Braamcamp, the leader of the historians, occupied the position of president and of minister of foreign affairs. But as, on the 3d of June, the conservative majority by 75 to 29 passed a vote expressing a want of confidence in the ministry, the latter dissolved the chambers and ordered a new election. The election resulted in a majority of 70 to 80 in favor of the ministry; the republican party was able to elect but one representative. The submission of the so-called Delagoa treaty, concluded with England in 1875, gave rise to severe conflicts. According to that treaty, England was to have the right to transport its goods through Delagoa Bay, a Portuguese possession in South Africa, from and to Transvaal free, also to build warehouses for goods free of duty, in the port of Lorenzo-Marques, to build a railroad from that city to Pretoria, in the Transvaal, and to operate the same on its own account. This was considered by public opinion as an abandonment of Portuguese territory and an actual repeal of the arbitration, made in 1875 by Marshal Mac Mahon in favor of the rights of Portugal to Delagoa Bay. The opponents of the Delagoa treaty, on March 8, 1881, asked to postpone the consideration of that matter until the English squadron should have left the harbor of Lisbon. The chamber of deputies, however, declined to pass this motion, and on the 10th of March sanctioned the treaty by a vote of 74 to 19: this vote was openly declared by the English press to be equivalent to a cession of Lorenzo-Marques to the British crown. The upper chamber, it is true, refused to entertain the vote censuring the government, which had been proposed, by a vote of 50 to 49; but, as there were two ministers among those who voted with the majority, the censure was in reality voted by a majority of 49 to

48. At that time great excitement prevailed in Lisbon. The republican party took the opportunity to call a meeting of the people, in which the government and even the dynasty were violently attacked. An emphatic protest against the treaty was voted, and handed to the president of the chamber by a deputation from the meeting. When the chamber, in spite of this protest, ratified that treaty, the ministers and their followers were publicly insulted by the mob, and cries of "Down with the ministry." "Long live the republic!" were heard. In view of the exasperation of the populace and of the vote of the upper chamber, the Braamcamp cabinet was unable to maintain its position, and it resigned. Thereupon Rodriguez Sampajo formed a new ministry on the 28th of March, composed of conservatives of the second class and of members of the independent party. The chamber was dissolved, and general new elections were ordered. By these elections the ministry obtained an overwhelming majority, while the reformers, who, in the previous chamber had been in the majority, had but six votes left. Nevertheless, this cabinet tendered its resignation on the 13th of November, because it had been accused of excessive indifference toward the reformist and republican agitation, and because the municipal elections resulted strictly in favor of the conservatives. In consequence thereof, Fontes Pereira, on the 14th of November, formed another conservative cabinet, which was completed on the 16th of the same month. Fontes took the presidency, the ministry of finances, and provisionally that of war. The deficit in the budget for 1882-3 still amounted to 5,622 contos; the revenues amounted to 29,654, and the expenditures (including the extraordinary expenses) to 35,276 contos. Besides the financial question, public opinion also agitated the question of reforming the constitution. The general demand was in favor of transforming the upper chamber into a senate, partly filled by election, and in favor of a change of the elections for deputies, for the purpose of facilitating the representation of the minority. Opening the cortes in January, 1883, the king declared, in his address from the throne, that the government was considering a reform of the constitution. For the purpose of securing its authority in the Congo district of Africa, threatened by France, Portugal, in March, 1883, concluded a treaty with England, promising freedom of trade and measures against the slave trade; England, in turn, acknowledging Portugal's sovereign authority. At the same time Portugal equipped an expedition for the Congo. intended to guard Portugal's interests in that part of Africa.

—*Late Statistics.* The number of Protestants in Portugal, mostly foreigners, does not exceed 500. They have chapels at Lisbon and Oporto. The superintendence of public instruction is under the management of a superior council of education, at the head of which is the minister of the interior. Public education is entirely free from the supervision and control of the church. Within the last few years, there has been great progress in primary education. The expenditure on public education by the government amounted to 868,648 milreis, or £193,033. in 1882-3.

—The following were the estimated sources of revenue and branches of expenditure of the budget, approved by the general cortes, for the financial year ending June 30, 1883:

REVENUE.

Direct taxes	£1,348,140
Stamp and register duties	683,488
Indirect taxes and customs	3,380,171
National domains and miscellaneous receipts	572,941
Repayments and sundries	245,484
	£6,230,224
Extraordinary receipts (loans)	859,555
Total revenue	£6,589,779

EXPENDITURE.

Public debt	£2,908,738
Treasury	1,280,860
Home office	480,255
Justice	139,416
War	1,022,906
Marine and colonies	869,715
Foreign affairs	68,552
Public works, ordinary and extraordinary	1,569,413
Total expenditure	£7,839,155
	6,589,779
Estimated deficit, 1882-3	£1,249,416

As remarked above, there has been no budget for the last thirty years without a deficit. The revenue of the kingdom during the thirty years 1850-80 increased by about 60 per cent. At the end of 1881 the debt was £97,512,000, the annual interest being £3,065,285. Included in the existing debt is the "old debt," which has been nearly all converted, only about £400 000 remaining unconverted. The external debt amounts to about £50,000,000, the last loan issued being one of £5,189,000 in 1882. The funded debt of Portugal, per head of population, is nearly as large as that of the United Kingdom, the quota of debt for each inhabitant amounting to £20 11s., and the annual share of interest, at 3 per cent. to 13s. 6d. Besides the funded debt, there is a large floating debt, estimated variously at from £2,500,000 to £4,000,000. A large portion of the foreign debt of Portugal consists of loans raised between 1877 and 1882. The first of these, a foreign loan of £6,500,000 nominal, at 3 per cent, was issued at 50 in 1877. Only £4,000,000 of this loan was subscribed at the time. This was followed by the issue of another foreign loan of £2,500,000, on the same terms, in July, 1878, and by a foreign loan of £3,000,000, issued in December, 1880, and, finally, in 1882, by a loan of £5,189,000, in 5 per cent. bonds. The floating debt of Portugal has been increasing in recent years, although its gradual extinction was decreed in 1873, when the government raised a loan for this special object. The interest on the public debt has frequently remained unpaid. Portions of the national debt have also been repudiated at various periods.

—The effective strength of the army is fixed annually by the cortes, and was nominally 78,200 officers and men, in 1882, on the war footing. The actual strength of the army in 1882 was reported to consist of 26,059 rank and file, chiefly infantry, the cavalry numbering 3,241, and the artillery 2,709, officers and men. The number of

troops in the Portuguese colonies amounts to 8,500 infantry and artillery, besides a reserve of 9,500 men. The navy of Portugal was composed, at the end of 1882, of thirty-one steamers and sixteen sailing vessels, most of the latter laid up in harbor. The steamers (1883) comprise: eight corvettes, of 2,300 horse power, having forty-six guns; ten sloops, of 687 horse power, having thirteen guns; nine gunboats, of 840 horse power, having thirty-one guns; two transports, of 420 horse power, having four guns; and two torpedo boats, of 600 horse power; making a total of thirty-one steamers, of 4,797 horse power, with ninety-four guns. The navy is officered by one vice admiral, ten rear admirals, forty-two captains, forty-one lieutenant captains, 149 lieutenants, and manned by 3,034 sailors. The commercial navy of Portugal consisted, on Jan. 1, 1881. of 433 vessels, including forty-one steamers, of an aggregate burthen of 88,829 tons.

—The total length of railways open for traffic in October, 1882, was 1,673 kilometres, or 1,045 English miles, with 144 kilometres, or ninety English miles more, in course of construction. All the railways receive subventions from the state.

—The number of postoffices in the kingdom, in September, 1881, was 858, besides forty-five on the islands. There were 20,338,171 letters and postal cards, and 15,276,552 packets and newspapers carried in 1881.

—The number of telegraph offices at the end of 1880, was 196. There were at the same date 4,369 kilometres, or 2,715 English miles, of telegraph wires. The number of telegrams dispatched in the year 1880 was 1,121,364, comprising 428,987 inland dispatches, and the remainder international or transit. Of the whole number, 688,065 were official dispatches.

#### Footnotes for PRISONS AND PRISON DISCIPLINE

[49.] There are but three possible varieties of sentences for crime, namely: fixed, discretionary, and indeterminate.

—A primitive state of society can be imagined, in which in the absence of any penal code, all offenses are visited with a single extreme penalty, or, at least, in which the amount of torture inflicted is limited only by the caprice of the despot who inflicts it. The invention of a scale of punishments (*échelle des peines*), and the application of punishment according to this scale, under rules prescribed by a code, may be regarded as the first step in the onward march of humanity in quest of that ideal justice which forever eludes discovery. Under an absolute code, sentences are fixed; that is, the penalty for each offense is named in the code itself, and no latitude is left for the exercise of discretion by the courts. But experience under an absolute code makes it apparent that the legislature can not adjust punishment to guilt; that in order to equality of punishment, punishment must be more flexible; that the heinousness of an offense depends not merely upon the character of the act, but upon the circumstances of its commission, and the character and motives of the actor, which can not be known, except as revealed by the evidence at the time of the trial. To this conviction is due the amendment of the code, by substituting for definite penalties the principle of maximum and minimum punishments: the amount of punishment in each actual

case is, within certain prescribed limits, determined by the court, and to that extent the sentence is discretionary. Under this system the legislature shifts from its own shoulders to those of the judiciary a large share of the responsibility for a just estimate of guilt. But the courts are as incapable of apportioning punishment as is the legislature: the inequality of punishment against which the system is a protest still exists: convicts feel it, prison officers see it, and judges confess it. One sole resource is left, namely, again to divide the burden of responsibility, by placing it in part upon the officials to whom the custody and oversight of prisoners are committed. The first suggestion of a possibility of such a solution was the creation, in the Australian colonies, of the ticket-of-leave. But the principle of conditional liberation, once recognized, gained adherents everywhere, and it has been incorporated in many penal codes. The "mark" system and "good-time" laws are outgrowths of this principle of variability in the duration of imprisonment, dependent upon the conduct of the prisoner himself. The indeterminate sentence is its highest and latest form. It exists only in theory, not having been reduced to practice by any government, but is advocated by many able men who have had practical experience in the administration of the criminal law and in the care of criminals. Under this ideal system, neither the legislature nor the courts prescribe any definite term of imprisonment; maximum and minimum penalties are abolished; the court passes solely upon the criminality of the prisoner under indictment; his release from prison depends upon his amenability to discipline, and the estimate formed of his character by those who hold him in custody and under observation, and by whom discipline or "treatment" is to be administered to him.

—To this definition of the indeterminate sentence it is essential to add the briefest possible account of the nature of the arguments for and against it. It has a close logical connection with that theory of crime, according to which criminal actions are the product of disease; crime is a neurosis, like insanity or idiocy, and should be so treated: in so far as it is analogous to insanity, the criminal has a right to cure, and in so far as it is analogous to idiocy, he has a right to education, training and development; prisons should be regarded and conducted as moral hospitals or training schools for moral imbeciles, rather than as places of punishment. It is also connected with that theory of moral responsibility which either denies its existence or denies that it can be judged by any but Almighty God; which would eliminate from criminal jurisprudence all thought of retribution or expiation; which would abandon the attempt to adjust penalty to ill-desert; and which denies the right of society, if not of God himself, to inflict punishment upon any sentient creature. Of the three possible bases of a penal code, it only accepts two, namely, the protection of society and the reformation of the offender. The *status* of the criminal is reduced to a dilemma: he can be reformed, or he can not; if he can be, he should be; if he can not be reformed, he should be held for life, if necessary, in order to protect society from injury at his hands. Hence, indeterminate sentences are sometimes called reformation sentences. In the terse language of Mr. Recorder Hill, of Birmingham, "To our limited faculties, crime and punishment have no common measure; our [present] course of proceeding is almost as vain in practice as it is absurd in theory; and in truth, there remain for us but two modes of usefully dealing with criminals—*incapacitation* and *reformation*."

—It is evident that the questions raised by the advocates of the indeterminate sentence

cover pretty much the whole field of human thought, in science, in religion, in philosophy, in morals, in politics and in law. To argue them exhaustively a profound knowledge of first principles and an extensive acquaintance with the facts of science and of history are essential prerequisites.

—But from the practical side, the point of view of the statesman and the legislator, the question is one of the concentration or distribution of power: what powers shall be conferred upon prison officers, what use they might make of them for good or for evil, what guarantees can be given that such enormous power over individuals will not be abused. On the other hand, it is a question what benefit, in the reformation of prisoners or the repression of crime, would follow the grant if made. It is an outward obedience only which is paid to power. The heart is moved by love; and it is not easy to see wherein there would be any more room for the exercise of love under the new than under the present system, while it is quite certain that an increase of power begets an increase of fear, and that under the influence of fear the moral character is more likely to deteriorate than to improve. It may well be asked: If the adjustment of penalty to guilt is a task beyond the power of any legislature or any court. is it not also beyond the power of any prison board? Or if we discard the idea of penalty, and consider the criminal as a man diseased, what assurance can we have, that the persistence of the criminal, as of the insane, temperament, will not defy every effort for its eradication? If we concede that the majority are susceptible of cure, is it just to incarcerate for life those who can not be cured, and yet whose criminality may be of too feeble a type to involve any serious peril to society as the result of their liberation? and if not, then how, and by what tribunal, and upon what principle, is the date of their release to be determined?

—There is no immediate prospect of the general acceptance of the indeterminate sentence; but the discussion opens up such a wide range of investigation and reflection as to make it interesting and profitable to all thoughtful students of penology. Its acceptance would put an end to the debates about cumulative sentences, restitution sentences, life sentences, a scale of penalties, the assimilation of penalties, and many other subsidiary questions of criminal jurisprudence. With the adoption of this form of sentence, society would return to its original position and conviction. that, in one way or in another, the expulsion of irreclaimable offenders is a necessity. No more complete confession of the failure of existing modes of dealing with crime can well be imagined.

#### Footnotes for PRODUCTION OF WEALTH

[50.]M. Danoyer here refers to the expression, "the carrying trade," the "commerce of transportation," and others similar.—E. J. L.

[51.]By *high arts*, M. Dunoyer here refers to such arts as that of the orator, the actor, the musician, the sculptor, etc.—E. J. L.

[52.]This, however true it may have been when M. Lunoyer wrote, is we are happy to say, no longer so, as witness Macleod's interesting exposition of the nature of incorporeal property, and the writings of Whateley, Senior, and others.—E. J. L.

[53.]M. Dunoyer includes actors, musicians, etc., among artists.—E. J. L.

#### Footnotes for PRODUCTS ON PAPER

[54.]With the principles, moral and politico-economical, which this article implies, no one will disagree. Yet, while there is much that is only too true in the views of the writer, more than enough to warrant its publication in a strictly scientific work, there are some things in which no economist can agree with him. The two exaggerations into which the writer has fallen, are, first, his apparently wholesale condemnation of "exchanges"; and, then, his seemingly equally wholesale condemnation of speculation. He plainly confounds the *use* of both with their *abuse*. "Exchanges," though abused, are far from having departed entirely from their original purpose. They are still real markets, with some who deal in them, like all other markets; with this difference, however, that commodities are not carried thither in kind, and that transactions are closed in them, for goods previously examined or supposed to have been examined or represented by samples.

—It is by means of "exchanges" that brokers are enabled to bring buyers and sellers together, which, after all, constitutes the whole of business. The utility of these meetings can not be denied, spite of the abuses with which they are almost inevitably connected; They enable merchants to save the time which they would otherwise have to employ in journeys, to an fro, to meet each other. Then, they obviate, in certain cases, for the buyer or seller, the disadvantage it might be to him, to be the first to take steps to meet the other. Business men will appreciate this practically; better, perhaps, than political economists, theoretically. And so with, speculation. A speculator, in the non-abused sense of the term, is nothing more or less than a person who buys commodities or other exchangeable things, when he thinks that their prices have fallen below their real value, and has reason to believe that at a future time he will be able to sell them at a higher rate than that at which he bought them. The difference between the price which he buys them at, and the price at which he sells them again, should cover the interest on the sum invested, the costs of storage, etc.; it should, further, cover the risk incurred in the purchase, and pay a just compensation for the personal labor of the man making the operation. When this care is taken, speculation is entirely legitimate: but in all cases of speculation, there should be, to render it legitimate, an actual and not an entirely fictitious investment of capital. Speculation acts like the governor is a steam engine; it prevents the too great fluctuation of prices, in which respect it serves both producers and consumers. It intervenes in favor of producers by increasing the demand, when prices go below the cost of production; in favor of consumers, it prevents too great a rise in prices by throwing the products of producers on the market when there is a scarcity of them. (See EXCHANGE, AN; SPECULATION.)—ED.

#### Footnotes for PROPERTY

[55.]Property and the family are two ideas, for the attack and defense of which legions of writers have taken up arms during the last half century. Recent systems, founded upon old errors, but revived by the popular emotions which they aroused, have in vain disturbed, misrepresented, sometimes, even denied, them. These ideas express

necessary facts, which, under diverse forms, have been and will always be coming forth; they may thus be justly regarded as the fundamental principles of all political society, because from them originate, to a great extent, the two principal objects which concern social laws, namely, the rights of man over things, and his duties toward his fellow-men.

—*The Right of Property.* If man acquires rights over things, it is because he is at once active, intelligent and free; by his activity he spreads over external nature; by his intelligence he governs it, and bends it to his use; by his liberty, he establishes between himself and it the relation of cause and effect and makes it his own.

—Nature has not for man the provident tenderness imagined by the philosophers of the eighteenth century and dreamed of before them by the poets of antiquity when they described the golden age. She does not lavish her treasures in order to make life flow smoothly along in abundance and idleness for mortals; on the contrary, she is severe, and yields her treasures only at the price of constant labor; she maltreats those who have not sufficient strength or intelligence to subdue her, and when we consider the primitive races whom the arts of civilization had not yet raised above her, we may ask ourselves, with Pliny, if she did not show herself a step-mother rather than a mother. Left to itself, the earth presents here deserts, there marshes or inextricable forests; the most fertile portions are ordinarily the most inaccessible, because, situated in the valley; they are encroached upon by stagnant waters, and infected by the miasms which exhale from them, or haunted by noxious animals which seek their food there; poisonous plants grow among the nutritious ones, without any outward sign by which to distinguish them, while yet we have not the warming of instinct which the animals have. The best fruits themselves have as yet, for the most part, only a coarse savor before cultivation has corrected their bitterness. Doubtless man can live, as he has, amidst this indifferent or hostile nature; but he would live there, timid and fearful as the roe of the forests, isolated, or collected in small groups, and lost in the immense spaces. in which his frail existence would be but an accident in the luxuriant life of organized beings; he would not feel himself at home, and would in very fact be like a stranger on an earth which he would not have fashioned according to his will, and where he would be neither the swiftest in the chase, the best protected against cold, nor the best armed for strife.

—What even now distinguished him from other creatures, in this state of profound barbarism, were the divine powers of soul with which he was gifted. However torpid they might as yet have been, they would have taught him, without any doubt, to emerge from his nakedness and his feebleness: from the earliest times, they would have suggested the means of arming his hand with an axe of stone, like those which, buried in the calcareous deposits of another age, tell us to-day of the miserable beginning of our race upon the globe; they would have taught him to protect his body against the cold with the skin of the bear, and to shield his home and family from the attacks of ferocious beasts by arranging a cave for his use or building a hut in the midst of water, not far from the shore of a lake. But already man would have left upon matter some impress of his personality, and the reign of property would have begun.

—When centuries have elapsed, and generations have accumulated their labors, where

is there, in a civilized country, a cold of earth, a leaf, which does not bear this impress? In the town, we are surrounded by the works of man; we walk upon a level pavement or a beaten road; it is man who made healthy the formerly muddy soil, who took from the side of a far-away hill the flint or stone which covers it. We live in houses; it is man who has dug the stone from the quarry, who has hewn it, who has planed the wood; it is the thought of man which has arranged the materials properly and made a building of what was before rock and wood. And in the country, the action of man is still everywhere present; men have cultivated the soil, and generations of laborers have mellowed and enriched it; the works of man have deemed the rivers and created fertility where the waters had brought only desolation; to-day man goes as far as to people the rivers, to direct the growth of fish, and takes possession of the empire of the waters. We reap the wheat, our principal food. Where is it found in a wild state? Wheat is a domestic plant, a species transformed by man for the wants of man. Thus products, natives of countries most diverse have been brought together, grafted, modified by man for the adornment of the garden, the pleasures of the table, or the labors of the workshop. The very animals, from the dog, man's companion; to the cattle raised for the shambles have been fashioned into new types which deviate sensibly from the primitive type given by nature. Everywhere a powerful hand is divined which has moulded matter, and an intelligent will which has adapted it, following a uniform plan, to the satisfaction of the wants of one same being. Nature has recognized her master, and man feels that he is at home in nature. Nature has been *appropriated* by him for his use; she has become his *own*; she is his *property*.

—This property is legitimate; it constitutes a right as sacred for man as is the free exercise of his faculties. It is his because it has come entirely from himself. and in no way anything but an emanation from his being. Before him, there was scarcely anything but matter; since him, and by him, there is interchangeable wealth, that is to say, articles having acquired a value by some industry, by manufacture, by handling, by extraction, or simply by transportation. From the picture of a great master, which is perhaps of all material productions that in which matter plays the smallest part, to the pail of water which the carrier draws from the river and takes to the consumer, wealth, whatever it may be, acquires its value only by communicated qualities, and these qualities are part of human activity, intelligence, strength. The producer has left a fragment of his own person in the thing which has thus become valuable, and may hence be regarded as a prolongation of the faculties of man acting upon external nature. As a free being he belongs to himself; now, the cause, that is to say, the productive force, is himself; the effect, that is to say, the wealth produced, is still himself. Who shall dare contest his title of ownership so clearly marked by the seal of his personality?

—Some authors have tried to establish the principle of property on the right of the first occupant. This is a narrow view: occupation is a fact and not a principle. It is one of the signs by which the taking of possession manifests itself, but it is not sufficient to make it valid before the philosopher or the lawyer. Let a man land upon a desert, and say: "As far as my eye can reach, from this shore to the hills which bound the horizon yonder, this land is mine"; no one would accept such occupation for a *bona fide* title. But let the man settle upon the most the most fertile hill-side, build a hut

there, cultivate the surrounding fields, and the possession of the portion actually occupied will become a right, because he has performed a proprietary act, that is to say, has by his labor thereon impressed on it the seal of his personality. International law makes a distinction, in regard to this, between individuals and states; what it refuses to the former, it grants to the latter; and it recognizes the validity of a summary taking of possession, which does not injure any anterior right. It is because the occupation is of an entirely different nature: the one having as its object useful possession, the other sovereignty, which implies only a general protection; the proof of this is, that in modern society the sovereignty frequently passes from one state to another without property changing hands.\* Montesquieu wrote: "As men have renounced their natural independence in order to live under political laws, they have renounced their natural community of possession to live under civil laws. The political laws gave them liberty; the civil laws, property". Bentham enlarged upon the same thought: "Property and law were born together, and will die together. Before law, there was no property; take away the law, and all property ceases." This was a narrow view. Montesquieu and Bentham, in order to consider but one side of the question, approached very near an exceedingly dangerous error, for it led to this consequence, that if the law had made property, the law could unmake it, and undid the very foundation which the authors intended to lay. It is evident that property originated before law, as before the formation of any regular society, since there has been appropriation of a certain part of matter ever since man had lived, and began, in order to extend his hand and his intelligence about him. Property and the family have been the cause, and not the effect, of society; and the laws, to follow the beautiful definition placed by Montesquieu himself at the beginning of his work, "are the necessary relations which flow from the nature of things"; the laws have consecrated this necessary relation which was established between man and matter, but they have not erected a relation which would have been factitious and accidental. It is true that, without law, property has no guarantee against violence, and that it lacks security and solidity. But what right is there the exercise of which would be secure outside of the social condition?

—It is also true that there are certain kinds of property which could not be produced without the protection of social law, because an advanced civilization and good government have the effect of widening the circle in which human activity can with safety move, and consequently extend the field of property. It is true, in short, that, in a certain number of particular cases in which natural right does not furnish sufficient light, the law decides and determines thus a positive right of property which it might perhaps determine otherwise, because it is important, in well organized society, that nothing, in such a matter, should remain in uncertainty, abandoned to the caprice of arbitrary power. But care must be taken not to confound a particular form or case with the principle of right itself.

—It is, then, to the human being, the creator of all wealth, that we must come back; it is upon liberty that it is expedient to base the principle of property, and if any one would know by what sign it is to be recognized, we will answer that it is by labor that man impresses his personality on matter. It is labor which cultivates the earth and makes on an unoccupied waste an appropriated field; it is labor which makes of an untrodden forest a regularly ordered wood; it is labor, or, rather, a series of labors

often executed by a very numerous succession of workmen, which brings hemp from seed, thread from hemp, cloth from thread, clothing from cloth; which transforms the shapeless pyrites, picked up in the mine, into an elegant bronze which adorns some public place, and repeats to an entire people the thought of an artist. It is labor which is the distinctive sign of property; it is the *condition*(or the means) of it, not the *principle*, which traces its origin to the liberty of the human soul.

—Property, made manifest by labor, participates in the rights of the person whose emanation it is; like him, it is inviolable so long as it does not extend so far as to come into collision with another right; like him, it is individual, because it has its origin in the independence of the individual, and because, when several persons have co-operated in its formation, the latest possessor has purchased with a value, the fruit of his personal labor, the work of all the fellow-laborers who have preceded him; this is what is usually the case with manufactured articles. When property has passed, by sale or by inheritance, from one hand to another, its conditions have not changed; it is still the fruit of human liberty manifested by labor, and the holder has the same rights as the producer who took possession of it by right.

—Violence, confiscation, fraud, conquest, have more than once disturbed the natural order of property, and mixed their impure springs with the pure sources of labor. But they have not changed the principle. Does the theft by which a lucky rascal is enriched interfere with the fact that labor is necessary for the production of wealth? Moreover, we must not exaggerate at pleasure the extent of these deviations from the general rule. It has been said that if we could go back to the origin of all landed property, possibly none would be found untainted with some one of these vices, on the soil of old Europe, overrun and successively occupied by so many hordes of invaders in ancient times and the middle ages. But how far would we have to go back across the centuries? so far that it could not be told in the case of ninety-nine hundredths of landed estates, except by mere conjecture, based on the probabilities of history. French laws, for instance, have established the thirty-years limitation, firstly, because it is necessary, in order to give some fixity to property, that it should not be left exposed to endless claims, and then, because long possession is itself a title, and because a man who has himself or by his tenantry, or farmers, put continuous labor on the same soil for a generation, has made, so to speak, the property his own. Now what is this short legal limitation beside the long limitation of ages, and how would any one dare contest the lawfulness of the owner's right over lands now richly cultivated, covered with farms and manufactories under the pretext that a Frank of the fourth century expelled from them a Gaul who was herding his flocks there? On the land has accumulated immovable wealth, which has sometimes increased the value of it a hundred-fold, and the origin and transmission of which are equally lawful. Out of the soil has grown the personal wealth which now forms a large part of the patrimony of society, and this wealth, the fruit of modern labor, is for the greater part free from the stain of brute force. War is no longer in our day a means of existence; it is rather a cause of ruin; conquerors aspire to usurp sovereignty, but they respect property. The political societies which have settled in new worlds, in America and Australia, have been established for the greater part by the clearings of the pioneers who made the land what it is, and bequeathed it to their children. There has been little or no violence there, in the many places where they have not had to strive against savage tribes, even

in the occupation of the land. In the main, if we consider property as a whole, how small a place is occupied by the exception as compared with the rule, by violence as compared with labor!

—*Social Utility of Property*. What is just always useful: Property has such a character of social utility that society could not exist without property, and there is no thriving society without individual property. Therefore, when persons have desired to bare property upon utility, arguments were certainly not lacking; but utility, which must be taken great account of in political subjects is, as we have remarked, a result, and not a principle, and we must content ourselves with saying that the excellent effects of property corroborate the lawfulness of the right. "Man", says M. Thiers, "has a first property in his person and his faculties; he has a second, less adherent in his being, but not less sacred, in the product of these faculties, which embraces all that is called the goods of this world, and which society is deeply interested in guaranteeing to him; for without this guarantee there would be no labor, without labor no civilization, not even the most necessary, but only misery, robbery and barbarism." We can not imagine a society entirely devoid of the idea of property; but we can conceive of one, and even find such in history, where property is in a rudimentary condition, and it would not be difficult to prove that such a condition is indeed, as M. Thiers says, misery and barbarism. Man is not a god; labor, which is a healthful exercise for both soul and body, is at the same time painful; it is only at the cost of an effort that man realizes his thought in matter, and oftentimes he would not make this effort, so painful to him, if he were not encouraged by the thought of producing a useful effect, and of himself enjoying the result of it. Who would take the trouble to fell a tree, to divide it into boards, if he knew that the next day a savage would seize upon it to make a fire with it, or even build a hut! Activity would have no object, because it would have no certain compensation; it would retire within itself, like the snail when threatened by danger, and would not venture out save for the satisfaction of the most immediate wants or the creation of property the easiest to defend—the hunting of game, or the manufacture of a bow or of an axe. In societies which have already risen to a certain degree of civilization, but which have not sufficient respect for property, this social imperfection alone is enough to impede progress and to keep men for centuries at a low level, to rise above which requires unheard-of efforts, and, above all, the knowledge of right. "All travelers," says M. Thiers elsewhere, "have been struck by the state of languor, of misery, and of greedy usury, in countries where property is not sufficiently protected. Go to the east, where despotism claims to be the sole owner, or what amounts to the same thing, go back to the middle ages, and you will see everywhere the same features; the land neglected, because it is the prey most exposed to the greediness of tyranny, and reserved for the slaves, who have no choice of employment; commerce preferred, as being able to escape more easily from exaction". A melancholy picture, but which has long been and still is, on a large portion of our globe, the true picture of humanity. When property, on the contrary, is fully recognized, respected and protected in its various forms, man does not fear to let his activity radiate in every direction. The picture of society is then entirely different: in place of a few thin, boughless shrubs, there will be seen a forest of immense oaks, spreading their branches far and wide, and exhibiting trunks more vigorous in proportion to the greater number of pores through which they breathe air and life. Far from injuring each other, men sustain each other by their individual development. For

property is not a common fund fixed in advance, which is diminished by the amount which each appropriates; it is, as we have said, a creation of the intelligent force which dwells in man; each creation is added to the previous creations, and, putting new vigor into commerce, facilitates ulterior creations. The property of one, far from limiting for others the possibility of becoming owners, on the contrary increases this possibility; it is the strongest stimulus to production, the pivot of economical progress; and if the nature of things had not made a law with regard to it, anterior to all agreement, human law would have established it as the institution pre-eminently useful to the welfare and morality of nations.

—*History of property.* It will be understood, that, although the principle of property is always the same, it has not been comprehended and applied in the same manner at all times and in all countries. It is with the right of property as with most natural rights, which remain long buried in barbarism, and emerge from it gradually with the progress of civilization. We tend at present toward the plenitude of the right of property, and the most advanced nations of Europe and the new world appear to be very far from the ideal of our conception. But how many centuries has it taken to free it from the exigencies or the ignorance of the past? The savages of America, who did not cultivate the soil, had no idea of landed property; custom made sacred the right of possession only for personal property; the land was common to all; it was a vast territory for fishing and hunting, open to all belonging to the tribe, but defended with jealous care against the encroachments of the neighboring tribes. When they improved and formed societies wisely organized, as in Mexico and Peru, they were necessarily obliged to take into account the appropriation of land, but their ideas even then did not rise to individual property. "No one," says Robertson, speaking of Peru, "had an exclusive right over the portion allotted to him. He possessed it only for a year. At the expiration of that time, a new division was made according to the rank, the number and the necessities of the family. All these lands were cultivated by the common labor of all the members of the community." In Mexico the grandees had individual property, but, he adds, "the bulk of the nation possessed the lands in a widely different manner. A certain quantity of land was allotted to each district proportionate to the number of families which formed it. This land was cultivated by the labor of the whole community. The product was taken to a common warehouse, and divided among the families according to their respective needs."

—The primitive nations do not appear to have risen much higher in the conception of the idea of property. Among the pastoral peoples of the east, property, composed principally of personal property and cattle, was almost wholly in the hands of the father of the family, of the patriarch, of the chief of the tribe; such are the customs of the Arabs, and we find them to-day in Algeria, where the land belonging to the members of the same *douar* or village in common, is distributed among them by the *caid*. The same system, ascending from the head of a family to the prince, has concentrated all property in the hands of eastern despots, and enfeebled the progress of those beautiful countries by cutting into the roots of individual activity. The Jewish law had conceived the idea of the cancellation of personal debts every seven years and the restoration of alienated lands every fourteen years, at the great jubilee, with the view of retaining property in the same tribes and families: a law, which appears, however, not to have been very well observed. In Greece, Sparta and Athens there

were indicated two opposite tendencies: one mutilating and suppressing almost the right of property, in order to fashion the citizen according to the will of the state; the other insuring, notwithstanding certain restrictions, civil liberty; but it is easy to see to which side the preferences of the philosophers inclined. Even in the laws, in which he tries to create a practical policy, Plato expresses himself thus: "I declare to you, as a legislator, that I regard you and your property as belonging, not to yourselves, but to yourselves, but to your family, and your entire family, with its property, as belonging still more to the state." Rome, while sanctioning territorial property more solemnly than most other ancient governments, guaranteed it to her own citizens only, and centred it in the hands of the father of the family; conquest, moreover, was still among the principal modes of acquisition, and had given rise to immense possessions of the state (*ager publicus*) and to the agrarian laws. During the empire the jurisconsults, under the influence of the new ideas propagated by the stoic philosophy and the Christian religion, set themselves to extricate persons too closely confined by family bonds, and property was the gainer by this advance in liberty. But in the middle ages the feudal system weighed heavily upon the land; confounding the ideas of property and sovereignty, it made the possessor of the land master of chattels and persons, bound both the one and the other by a multiplicity of bonds, the serfs to the glebe, the lords to the fief and interwove society in a vast net-work of reciprocal servitudes. Personal property, long smothered by these various systems, showed itself only with timidity, under the shelter of the franchise, in the guilds of the arts and trades; the laws of the princes protected it only by keeping it under strict tutelage; it gradually increased, however, and was even beginning to develop quite rapidly, when the discoveries of Christopher Columbus and Vasco da Gama had opened the great course of the ocean to maritime commerce. But, at this period, the absolute power of kings was being raised upon the ruins of feudalism in the principal states of western Europe, and if property freed itself somewhat *de facto* from bonds put on it, it *de jure* only changes masters without acquiring any further independence. Louis XIV., who may be regarded as the most illustrious and most fully convinced representative of absolute power, wrote, for the instruction of the dauphin: "Everything within the extent of our states, of whatever nature, belongs to us by the same title. You should be fully convinced that kings are absolute lords, and have naturally the full and free disposition of all property possessed as well by the clergy as the laity, to use as wise stewards". About a century later, in 1809, another sovereign, not less absolute, said during a session of the council of state: "Property is inviolable. Napoleon himself, with the numerous armies at his command, could not take possession of a single field, for to violate the right of property in one, is to violate it in all." His actions did not always exactly conform to this theory; nevertheless, this declaration shows what progress the idea of property had made in France, from the eighteenth to the nineteenth century. This was because the eighteenth century had passed between the two periods, and although it had not itself a clear idea of the sacred character of property, since it based it upon utility and the law, and declared it to have originated in a so-called primitive community, it had, nevertheless, shaken off the yoke of feudal servitude and the divine right of kings; it had pleaded the cause of liberty, and the revolution had made this cause triumph, by emancipating man, labor and the land; property could now be produced under its principal forms.

—*Of the Objections to Property.* Property triumphed with liberty, one of the forms of

which it is. It was just the time when it was about to be obliged to defend itself against the most malevolent adversaries, who attacked it in the name of a pretended equality; jealous of seeing large fortunes displaying themselves side by side with extreme poverty, they foolishly believed that to deprive of the fruits of their labor those who had lawfully acquired them, was to encourage labor and to relieve poverty. The convention, guided by principles entirely different from those of the constituent assembly, slid more than once down this declivity, and following the convention, Gracchus Babœuf collected and exaggerated the doctrines of the mountain out of which he created modern communism. "When", says he, "the minority in a state have succeeded in engrossing landed and industrial wealth, and by this means hold the majority under their rod, and use their power to cause them to languish in want, the fact should be recognized that this encroachment could take place only under the protection of the government, and then what the old administration failed to do in its time to prevent the abuse or to repress it at its birth, the present administration should do, in order to re-establish the equilibrium which should never have been lost, and the authority of the law should effect an immediate change in the direction of the ultimate principle of the perfected government, of the social contract: that all should have enough, and no one too much." There have been at all times those who have dreamed of a community of property, and who could do so the better as individual property was in their time less extended and less firmly established. Plato wrote his "Republic"; Campanella, his "City of the Sun"; Thomas More, his "Utopia"; Fenelon, his "Bætica" and his "Government of Salentum"; but they created a speculative philosophy rather than a policy, and intended, above all, to trace for mankind an ideal of virtue: a mistaken, erroneous conception, but more disinterested, nevertheless, than that of modern communists. The principal object of the latter is enjoyment; their theories have been suggested by the sight of the wealth which was increasing rapidly in modern society, but distributing its favours in an unequal manner, as it proportioned them to the labor, to the intelligence, to the capital of each one and to the circumstances of production: they have wished that those less favored should have a larger share without having a burden of labor and they have conceived of no better way to do this than to limit or confiscate capital, that is to say, property, which is the lever of labor.

—The Saint-Simonians, to attain this end, proposed to organize a powerful priesthood, composed of the ablest men in science, the arts and manufactures. This priesthood would have given an impetus to all society; the priest would have been "the living law"; there would have been no longer emperor nor pope; there would have been a father "disposing of all the capital and products, and distributing them to each according to his merits "They arrived at this conclusion, that "all property is property of the church," and that "every kind of business is a religious function." They did not see that property is the very reward of the labor which they were extolling, and the fruit of the economy without which labor deprived of capital, is reduced to impotence; they did not see that hereditary transmission is the consequence and the extension of property, and under pretense of increasing social wealth, wealth which for lack of being managed and renewed by the force of individual interests, would have insensibly melted away in the hands of their high priest, they ended in an immense despotism; in order to pursue the shadow of comfort, they would have forfeited, without knowing it, their real welfare, and they did not hesitate knowingly

to sacrifice liberty, the most important of all possessions in a society of civilized men. This is where the first of the systems hostile to property would have led to.

—That of Fourier dates from about the same period, that is to say, the consulate. But it found no echo until after the great eclat which Saint-Simonism caused at the beginning of the reign of Louis Phillipe. Fourier was not, properly speaking, a communist; he proclaimed liberty, and admitted capital. But, in fact, he incloses both the one and the other in a system of exploitation in common which maims them; there is no longer but one kind of liberty, that of abandoning one's self without restraint to one's various appetites; there is no longer but one kind of property, that of the phalanstery. Is that truly liberty which, with a firm will for a guide and responsibility for a guarantee, directs the spirit of man toward a definitive end? Is this truly property, that is to say, the full and entire possession of the various things which man had appropriated to himself by labor?

—The latest adversary of property is M. Proudhon, who in a famous pamphlet has taken up again a paradox of Brissot's, viz., that property is theft; M. Proudhon, does not recognize, either in possession or labor, sufficient reasons to justify property. "Since every man" he says "has the right to possess simply because he exists and can not do without material for exploitation and labor in order to live; and since, on the other hand, the number of occupants varies continually by birth and death, it follows that the quantity of material to which each laborer may lay claim is changeable, like the number of occupants; consequently, that possession is always subordinate to the population; finally, that as possession in law can never remain fixed, it is, in fact, impossible that it should become property." Elsewhere, in answering the argument of Ch. Comte, who sees a title to property in the superior value obtained by the possessor when the latter, thanks to his labors, has drawn subsistence for two persons from soil which had formerly fed but one, M. Proudhon adds: "I maintain that the possessor is doubly paid for his trouble and his industry, but that he acquires no right to the land. Let the laborer claim the fruits as his own; I grant that he should have them, but I do not understand that the ownership of the produce involves that of the material." This concession places all personal property outside of litigation, as it consists entirely of the produce which the laborer has made his own and has not consumed. There remains landed property, or, to express it more clearly, the very small portion of the value of real estate which is not the result of labor, a personal capital buried in the soil and confounded with it. Now, no economist maintains that every man, on coming into this world, has a right to a portion of it, and especially to a portion equal to that of others in the very country in which he is born. Possession is a fact, and not a right; it may give rise to a right when, having taken place upon land still unpossessed it is sanctioned by labor; that is all. Society guarantees the rights of individuals, it is her first duty; in the system, of M. Proudhon she would commit the double fault of wishing to do them too much good by seeking to make a fortune for them, and of doing them too much harm by spoiling some of a right logically anterior to herself, for the purpose of endowing others with a gratuitous benefit.—(The above note is the joint production of L. Wolowaki and Emile Levasseur.—ED.

\* The word "cultivate" (to work and sow) must not be taken too literally: possession of land may also be taken by placing flocks on it, by opening a mine on it or

otherwise. And if the government has taken possession in the manner indicated in the text, and an individual buys a piece of ground from it, this ground becomes individual property even if left unoccupied.

#### Footnotes for PROTECTION IN THE UNITED STATES.

[58.] In the above article the argument for protection is given. The principles advocated by the writer of it are at variance with those demonstrated in the article on FREE TRADE, as well as with the body of doctrine contained in the various articles of this work, whether political or politico-economical. It may be thought, that, on this account, the article should have no place here; and something may be said in favor of that view, since the Cyclopædia is a scientific work; and a consensus of political economists may be said to exist as to the truth, and therefore as to the expediency, of the principles of free trade. But, in the present condition of the public mind in the United States, when so many are looking for light, it was thought best not to exclude the argument for protection, which now has a living, and always will have an historical interest. Readers of the Cyclopædia, we presume, open its pages in search for truth. On the question of free trade and protection we have furnished them with an article on both sides. As a further contribution to what is still a matter of controversy with many in this country, we here give a summary of the case between free traders and protectionists from a very recent work by an eminent French economist, Emile de Lavelaye. Says M. de Lavelaye: "Colbert, the celebrated French statesman, once asked a merchant what was the best way to promote trade, and the latter answered: *Laissez faire; laissez passer* (see LAISSEZ FAIRE) *i.e.*, let it alone. The words were taken by J. V. de Gournay, and afterward became the watchwords of advocates of freedom of commerce, now called free traders.

—What, indeed, can be conceived more natural than to allow every man to buy and to sell where he can buy and sell with greatest advantage to himself, whether in his own country or out of it? We can excuse a state when it imposes an entry duty on certain kinds of goods, to procure a revenue, although such a duty is a bad kind of tax; but to impose duties under pretext of protecting home industries, is a measure both iniquitous and contrary to the general interest.

—By forcing consumers to buy of protected manufacturers dearer than they could buy in a foreign market, the government imposes a tax on consumers in favor of the protected manufacturers, a compulsory buying which has in it all the elements of injustice. In this compulsion and injustice consists the protective system.

—But, say the advocates of protection, protective duties are imposed to favor labor, and consequently to favor the working class.

—*Error 1.* The economic end sought is not to increase but to diminish labor. If I can get a number of yards of linen in a foreign market by one day's labor, it is contrary to that economic end to force me to spend two days' labor in order to acquire it. To force one to increase his labor without increasing the product, is what Bastiat rightly called *Sisyphism*, since it is to strain humanity in a useless effort, like Sisyphus, who was condemned to roll a rock, which always fell back again, toward the top of a mountain. The economic end to be sought is an increase of wealth and a decrease of effort.

—*Error 2.* It is not rendering a service to workmen to drive them into mammoth factories, by force of law and contrary to nature. Look at Italy at the present moment. What a pity that the tariff there has dragged workingmen and workingwomen from the field and from labor in the open air in that land of beauty, with its mild climate, to harness them twelve or fourteen hours in gloomy factories, while they keep time with the uniform movement of machinery.

—Free trade, by applying to nations the principle of the division of labor (see DIVISION OF LABOR) assures them the benefit of that division, and thus greatly increases their well-being.

—If, in a family, each of its members is employed in doing what he can do best, it is evident that the aggregate product, and, as a consequence, the share of each member of the family, will be the greatest possible. If, on the other hand, each is compelled, by legislative restriction, to devote a part of his time to a kind of work to the doing of which he is not adapted, all and each will be more poorly provided. Let us apply this to nations. If each of them employs its powers in those branches of labor which the nature of the country occupied by it specially favors, it will carry to the market a maximum of products obtained by a minimum of labor; and the consequence will be that the well-being of humanity will be increased in proportion to the increase in the productiveness of the labor of each country. The man who, wishing to be sufficient to himself, should endeavor to manufacture or produce everything he needed, food, shoes, clothes, furniture and books, would clearly be very ill-advised. Would the nation that imitated him be less so? If my land, which is sandy, is better adapted to the growing of rye than of wheat, the least onerous way for me to get wheat is not to cultivate it myself, but to obtain it in exchange from those who have clayey land. This very evident truth shows the absurdity of the protective system, which would compel me, whether or not, to cultivate wheat on sand.

—But, say the partisans of protection, foreign countries will inundate us with their products. Vain fear: foreign countries will not give us their goods for nothing. In payment of theirs, they will want ours. Commerce is always an exchange of products

against products. As many products must leave our ports as enter them. It more enter them than leave them, so much the better: for in that case foreign countries pay us a tribute, and we may increase our consumption. If more leave our ports than enter them, so much the worse; for then, it is we who pay the tribute.

—Protectionists want to buy little and sell much, in order that foreign countries may be compelled to pay the excess of their purchases in coin. What a contradiction in these aims! How can the different nations, exchanging with one another, always sell more than they buy? Plainly impossible.

—The principal cause of the progress of industry, is the competition of persons engaged in industry, each of them striving to manufacture better and cheaper articles and thus to monopolize the custom. The more generally the influence of competition is felt, the greater will be the advantage of all. Hence competition should not be restricted within the limits of a state, but extended from country to country.

—Monopoly engenders inertia, and protection routine. On the contrary, the manufacturer who is compelled to perfect all his wares, will conquer the market of the world in his endeavors to keep the national market. What is the effect of a railroad connecting two countries? To facilitate exchanges between them. What is the effect of entry duties on foreign goods? To hamper exchanges. How does it happen that the same men, at the same moment, do two things the effects of which are so completely opposed?

—You spend forty or fifty millions of francs to bore a tunnel through the Alps, and at both ends of that tunnel you, Frenchmen, and you, Italians, station a custom house officer, who, by the taxes he levies, destroys in great part the utility of that marvel of engineering skill. Inexplicable contradiction!

—A consistent protectionist should demand the destruction of machinery; for free trade and machinery have exactly the same effect: they diminish the labor necessary to obtain a given product. Thanks to machinery, the Frenchman can obtain coal at less cost; thanks to foreign countries, he can get it cheaper: the result is identically the same to him.

—Would you, Frenchmen, exclude foreign countries, then break your machinery. In both cases, you would have to put forth a stronger effort to procure the same quantity of coal.

—Capital spontaneously takes the direction of the most lucrative employment. Protection directs it toward a less lucrative employment, causing the difference to be paid by a tax levied on consumers. Production is diminished by so much.

—A last argument is resorted to by the protectionists. For the objects of prime necessity, they say, wheat and iron, for instance, a country can not depend on foreign nations: since in time of war it could neither feed nor defend itself. Answer: There is no instance in which a people in time of war wanted the necessary things. In our days such want is less to be feared than formerly: firstly, because of railroads, which

facilitate revictualing; and then because the treaty of Paris of 1854 has provided that neutral ships may continue to transport the goods of the belligerents. Hence the hermetic blockade of a state has become more impossible than ever. Is it wise to inflict an injury permanent and certain on one's self, in order to escape another which is remote and improbable?

—There are some things which free traders have not seen. To suppress labor, and not to increase it: such is the end. Free trade attains this end just as machines do. Hence both are a good.

—But, it will be said, there are men who live by the labor of their hands; and if you suppress them they have nothing left but to disappear. Free trade, like machines, may, therefore, cause a displacement of workmen, for they must leave the place in which the tariff forced sterile labor on them, to go where, with less effort, they will obtain more products. This is what happened in France, when the revolution of 1789 did away with the internal tariffs which separated the old French provinces. Abolish the tariffs which in our day separate the different provinces, and the same fact may be reproduced. The displacement effected, the men will be everywhere better supplied, for their labor will be more productive, but they will perhaps be differently distributed, which will not be done without hardship. The conclusion is: do not cause workmen to come into existence in a place in which nature has not accorded them sufficient remuneration. But when they exist, reform your tariffs with foresight and prudence.

—Much has been said of a system of temporary protection. No one has given a better exposition of this system than a German economist, Frederick List, the initiator of the customs union (*zollverein*) of Germany, which led to the political union of that country. 'The final end,' he says, 'is universal free trade; but in order that it may bring to each state, and consequently to the human race, the greatest possible good, it is necessary that each people should turn its natural resources to the best advantage. An exclusively agricultural country is necessarily a backward country: instance, Poland in the olden time. Doubtless it is bad that privilege should cause artificial industries to spring up, but there are many industries natural to a country which will not be developed in it, unless they are protected in the beginning. Hence the best way to reach free trade and to derive the greatest profit from it is temporary protection.'

—Such is List's opinion. Adam Smith and J. S. Mill expressed the same opinion. I admit neither the premises nor the conclusion. An agricultural country is not necessarily a backward country. If Poland was formerly a backward country, as List pretends it was, it was because a frivolous aristocracy, employed in amusements, disposed of the net revenue, and did nothing to instruct their serfs or themselves. In no country in the world were intellectual and moral culture, comfort and happiness so general as in New England before protection developed manufactures on a large scale.

—People are in the habit of measuring the industry of a country by the mass of products which its industry produces. Wrongly so. Never did civilization shine more brightly than at Athens, where arts and letters attained the highest point of perfection, but where industry remained in its infancy. Protection is no longer necessary in our

day, as in the time of Adam Smith. Discoveries and processes are immediately known everywhere. Capital and the spirit of enterprise and ceaselessly in search of natural wealth to exploit it, wherever it is to be found.

—Temporary protection becomes permanent for the reason that the protected interests enter into a coalition and oppose all reform." Compare preceding article.—ED.

#### Footnotes for PRUSSIA

[59.]The census returns of Dec. 1, 1875, showed that at that date there were in Prussia 12,692,370 males and 13,059,084 females, being an excess of only 357,684 females, less than in most other European states; in 1880 there were 13,414,846 males and 13,865,245 females. During the nine years from Dec. 1, 1871, to Dec. 1, 1880, the ratio of increase amounted to 1.13 per cent, per annum. The census of 1880 gives the average density of the population at 199 per English square mile. The variation, however, is considerable, the density being highest in the manufacturing districts of Disseldorf, in the Rhine province, where it is nearly four times the average, and smallest in the district of Köslin, Pomerania, where it amounts to but three-fifths of the average. There are a greater number of towns (1,289) officially enrolled as "Städte," most of them of very limited population, spread all over the kingdom. As in nearly all other states of Europe, so in Prussia, there is a strong movement toward concentration of the population in the towns. At the census of Dec. 1, 1871, the total population of the 1,289 towns of the kingdom was 7,968,545, and that of the rural communes (*Landgemeinden*), 87,987 in number, 16,637,652. Compared with the preceding census of Dec. 3, 1867, the increase in the towns amounted to 466,909, or 6.22 per cent., and that in the rural communes to but 167,951, or 1.02 per cent. Thus, while the town population increased at the rate of rather more than 1½ per cent, per annum, the rural population grew but at the rate of ¼ per cent, per annum.—S. M.

[60.]The estimates of public revenue and expenditure submitted by the government to the chambers are always prepared to show an even balance, without surplus or deficit; but in recent years the former has been constant, as a rule, and the latter an exception. The surplus of the five years from 1870 to 1874 varied from £1,425,000 in 1870, to £4,158,000 in 1872, reaching its maximum in the latter year. But there were deficits in 1875, in 1876 and in 1877.

—Up to the end of 1876 the finance estimates were for the calendar year, but it was then decided that henceforth they should be, as in Great Britain, for financial years ending March 31. The first financial year under the new arrangement commenced April 1, 1877, so that the preceding accounts were for a period of fifteen months, commencing Jan. 1, 1876, and ending March 31, 1877.

—The budget estimates of revenue and expenditure of Prussia were as follows, during each of the seven years, 1874-81:

YEARS.		Revenue.	Expenditure.
		Mark.	Mark.
1874	Ending Dec. 31.....	695,097,700	695,097,700
1875		694,484,900	694,484,900
1877 (15 mos.)	Ending Mar. 31	808,072,700	808,072,700
1878		657,520,344	657,520,344
1879		713,857,764	713,857,764
1880		711,500,758	711,500,758
1881		913,070,400	913,070,400

—The revenue in the financial estimates of Prussia, is divided under seven heads, representing the various ministerial departments. Receipts from state railways form the chief source of revenue, and, next to them, the direct taxes. In recent years the income from railways and other state undertakings, such as mines, has been largely increasing showing a tendency to become a far more fruitful source of revenue than all taxation, direct or indirect.

—In the budget estimates for the year ending March, 1883, the sources of revenue were given as follows:

*Sources of Revenue.*

1. Ministry of agriculture, domains and forests:	Mark.
Income from domains and forests...	73,128,214
Various...	7,000,340
Total...	80,128,554
2. Ministry of finance:	
Direct taxes:	
Land tax ( <i>Grundsteuer</i> )...	40,188,000
House tax...	28,056,000
Income tax...	28,827,600
Class tax ( <i>Klassensteuer</i> )...	25,146,100
Trade tax ( <i>Gewerbesteuer</i> )...	18,662,000
Railway dues...	2,986,000
Miscellaneous...	588,000
Total...	144,453,700
Indirect taxes:	
Share of imperial customs and taxes...	19,089,690
Succession tax ( <i>Erbschaftsteuer</i> )...	5,200,000
Stamps...	16,500,000
Bills of exchange...	70,440
Bridge, harbor, river, or canal dues...	2,200,000
Fines, etc....	53,500,000
Miscellaneous...	2,051,870
Total...	98,562,000
State lottery...	4,043,800
Naval commercial institution ( <i>See handlung</i> )...	3,000,000
The mint...	236,820
Miscellaneous...	127,863,384
Total receipts of ministry of finance...	378,159,204
3. Ministry of public works:	
Mines, produce of...	60,160,148
Furnaces, iron mills, forges, produce of...	19,172,536
Salines, produce of...	5,461,970
State railways...	369,150,347
Miscellaneous...	8,841,682
Total receipts of ministry of public works...	462,786,883
4. Ministry of justice...	6,596,000
5. Ministry of the interior...	8,592,383
6. Ministry of commerce and industry...	298,603
7. Ministry of public instruction and ecclesiastical affairs...	2,233,813
8. Ministry of state...	689,310
9. Ministry of foreign affairs...	4,500
10. Ministry of war...	667

Total estimated revenue... 934,589,917  
 —The expenditure in the financial estimates of Prussia is divided into ordinary (*fortdauernde*) and extraordinary (*einmalige and ausserordentliche*) disbursements. The ordinary is subdivided into current expenditure (*Betriebs-Ausgaben*), administrative expenditure (*Staatsverwaltungs-Ausgaben*), and charges on the consolidated fund (*Dotationen*). In the estimates for the financial year ending March 31, 1883, the branches of expenditure were as follows:

*Branches of Expenditure.*

Current expenditure:	Mark.
1. Ministry of agriculture, domains and forests	37,080,230
2. Ministry of Finance...	37,759,535
3. Ministry of Public works...	344,915,267
Total current expenditure...	419,755,032
Administrative expenditure:	
1. Ministry of Finance...	36,738,613
2. Ministry of Public works...	16,569,612
2a. Ministry of Commerce and industry...	1,515,075
3. Ministry of Justice...	78,762,100
4. Ministry of The interior...	40,402,367
5. Ministry of Agriculture, domains and forests-	11,314,550
6. Ministry of Public instruction and ecclesiastical affairs...	50,628,067
7. Ministry of State...	2,967,792
8. Ministry of Foreign affairs...	500,570
9. Ministry of War...	107,472
10. Ministry of General administration of finance	127,074,410
Total administrative expenditure...	366,575,628
Charges on consolidated fund:	
Addition to the "Krondotation" of the king...	4,500,000
Interest of public debt, inclusive railway debt...	87,094,613
Sinking fund of debt...	20,480,094
Annnities and management...	1,914,641
Chamber of lords...	171,360
Chamber of deputies...	1,200,520
Total charges on consolidated fund...	115,361,228
Total ordinary expenditure...	901,691,888
Extraordinary expenditure...	32,898,029
Total expenditure...	934,589,917

—In the budget for 1883-4 the revenue and expenditure were expected to balance at 1,089,583,000 mark. The expenditure for the army and navy is not entered into the budget of Prussia, but forms part of the budget of the empire.

—The public debt of the kingdom, inclusive of the provinces annexed in 1866, was, according to the budget of 1882-3, as follows:

answer the purpose. Therefore the government has demanded, but in vain, the repeal of article twenty-five, which prescribes gratuitous education.

[63.] The following table shows the quantities and value of coal and of lignite (*Braunkohle*), the quantities in 1,000 tons, and the values in 1,000 mark, in the various provinces of Prussia during the year 1880:

PROVINCES.	Coal.		Lignite.	
	Quantities in 1,000 tons.	Value, in 1,000 mark.	Quantities in 1,000 tons.	Value, in 1,000 mark.
Brandenburg .....			1,695 2	4,118
Posen .....			28.7	106
Silesia .....	12,656 8	57,187	417.8	1,469
Saxony .....	35.1	313	7,436 6	23,289
Hanover .....	414.5	2,744	1.0	4
Westphalia .....	14,871.0	67,816		
Hesse-Nassau .....	100 2	919	187.4	830
Rhine .....	14,095.3	81,638	128.2	350
<b>Total</b> .....	<b>42,172.9</b>	<b>210,617</b>	<b>9,874.9</b>	<b>30,166</b>

The following table shows the quantities and value, in 1,000 tons and 1,000 mark, of the iron and copper ore produced in Prussia in the year 1880:

PROVINCES.	Iron Ore.		Copper Ore.	
	Quantities in 1,000 tons.	Value, in 1,000 mark.	Quantities in 1,000 tons.	Value, in 1,000 mark.
Silesia .....	669.4	2,855	7.1	50
Saxony .....	59.1	288	405 6	10,748
Hanover .....	885.8	1,010	18.1	681
Westphalia .....	943.5	8,213	44.8	258
Hesse-Nassau .....	620.0	3,807	1 5	59
Rhine .....	1,007.5	9,509	3.8	198
<b>Total</b> .....	<b>3,679 8</b>	<b>25,132</b>	<b>480.9</b>	<b>11,994</b>

Not included in the tabular statements given above are zinc and tin ores, salines, and other mineral produce. Gold and silver ores are likewise found in Prussia, the quantities amounting to 206,000 tons, and the value to 3,812,000 mark, in 1880. The total mining produce of the kingdom amounted to 577,304,000 tons, and the value to 314,936,000 mark, or £15,746,800, in the year 1880.

—The production of the most important mineral, coal, in Prussia, after vastly increasing for about thirty years, from 1840 to 1871, reached its limit at the latter date, when there came to be an apparent exhaustion of the fields. But the years 1875 and 1876 again showed a large increase in production. The following statement gives, after official returns, the quantities of coal, exclusive of lignite (*Braunkohle*), raised in the kingdom during the period from 1838 to 1880:

YEARS.	Annual Average.	YEARS.	Annual Average.
	Tons.		Tons.
1838-41	2,901,713	1864	21,197,266
1842-46	3,817,190	1869	29,775,781
1847-51	5,027,690	1871	32,843,288
1852-56	8,571,070	1873	32,347,909
1857-61	13,037,015	1874	31,938,689
1862	16,903,520	1876	43,364,968
1863	18,330,779	1880	42,172,975

The coal mines in the Ruhr-Düsseldorf district, which extend over more than ten miles in length, contribute nearly one-half of the total produce, while the coal pits of the river Saar, situated in the southwestern angle of the Rhenish province, and which extend their strata into Bavarian and French territory, furnish about the sixth part of the coal produce of Prussia. The coal raised in Prussia amounts to 93 per cent. of the total coal production of Germany.

—Prussia has a very large and complete system of railways. On May 15, 1882, the length of the system open for traffic was as follows:

	Length, in kilometers.
Railways owned by the state...	14,843
Owned by private companies:	
Under state administration...	2,394
Under private administration...	3,745
Total...	20,982
English miles...	13,048

In 1878 the lines owned by the state had a length of only 4,989 kilometers, while those owned by private companies extended to 12,880 kilometers.

—All the lines of the former territories of Hanover, Hease, and Nassan are owned by the state, and the whole of the railways of Prussia will in time become national property.—S. M.

#### Footnotes for PUBLIC LANDS OF THE UNITED STATES

[64.] This area was also claimed by Virginia, and was included in her cession

[65.] These western reserve and fire lands, amounting in all to about 4,300,000 acres, were also ceded by Virginia. By "fire lands" are meant such as were donated by Connecticut to those of her citizens who had suffered by fire and raids during the revolution.

[66.] This exemption from local taxation was part of the credit system, its intention being to prevent any part of the means of the debtor from being drawn from him by taxation during the time given him to comply with his engagement to the government.

[67.] A similar law was passed in 1816.

#### Footnotes for RENT

[68.] A main point in Anderson's theory was, that increased demand for food leads to increase of price, and this permits additional cost to be bestowed in bringing inferior land into cultivation. (See Macleod's *Kon. Phil.*, vol. ii., p. 29.) E. J. L.

[69.] Surely M. Passy can not think that Genovesi, Beccaria, Verri, the physiocrats, Hume, Condillac, Bastiat, Whateley, and all the other economists who have considered the cause of value to lie in human desire, thought there could be no demand for anything except that on which labor had been expended! How would he account for the value of undeveloped mines, quarries, etc., and what is more, for the *value of labor itself!*—E. J. L.

[70.] Here M. Passy falls into the error (pointed out by Storch in his *Polit. Econ.*) of confounding the production of articles which have value with the production of their value.—E. J. L.

[71.] The income from talents and moral qualities, being due to the "natural fertility" or "productive power" of the mind, bears so many points of resemblance to what M. Passy treats of under the title "Rent of the Soil," that some economists put it in the same category. Storch, in his *Cours d'Economic Politique*, devotes a chapter (chap. v., book III.) to the "Rent of Talents and Moral Qualities." [Original reads "Rent of Talents..."—Econlib Ed.]

[72.] The reader will see how far this was from being a response.—E. J. L.

#### Footnotes for REPUDIATION.

[73.] It is impossible to state with accuracy the exact amount of the debt during this period. The table given is taken from an article by Robert P. Porter, "International Review," 1880, p. 556. Compared with other statements the figures seem by no means exaggerated.

#### Footnotes for REVENUE

[74.] *Selbstschätzung*, says M. Rau; self-taxation, an Englishman would say, according to the analogy of "self-government."

[75.] In addition to the facts of self-assessment, fully attested as occurring in Geneva, Bremen and Holland, must be placed to the credit of the morality of the Germanic peoples, those very numerous acts of restitutions to the treasury, which form what is in England termed "conscience money." In France the yield of reparations of this sort, though on the increase, has never been large.

[76.] Ajoutons que c'est par l'étude de la science économique en général qu'il serait bon de commencer celle des finances publiques. \* \* Mais, dira-ton, la solution des questions de finances comporte divers points de vue: le point de vue économique, et les divers points de vue, fiscal, politique et moral. L'observation est exacte. Mais les raisons fondamentales sont d'ordre économique. (Jos. Garnier.)

[77.] Sinclair, in his "History of the Revenue," stigmatizes escheat as "a species of confiscation."

[78.] By the revenue measures introduced by Mr. Gladstone in 1853, the tax upon the direct succession of a child to a parent was placed at 1 per cent.; that upon the succession of an entire stranger in blood, at 10 per cent. Intermediate rates were fixed for successions within certain degrees of consanguinity. If 10 per cent., why not 50?

[79.] The extortions of the early kings of England, under the pretense of administering justice, are very strikingly portrayed by Mr. Hume, in his "History."

[80.] Immense contributions were enforced by the Carthaginians from the towns on the Libian-Phœnician coast. "At one time," says Mr. Grote, "immediately after the first Punic war, they took from the rural cultivators as much as one-half their produce."

[81.] For the influence of these acts in the American colonies, see Bancroft's History of U. S., vol. v., p. 265-6.

[82.] See the speeches of Rt. Hon. Henry Fawcett on successive Indian budgets. "India," says Prof. Fawcett, "seems too often to be looked upon as if she had been specially created to increase the profits of English merchants, to afford valuable opportunities for English youths, and to give us a bountiful supply of cheap cotton."

[83.] See especially the works of Savigny, Ranke and De Tocqueville, *passim*.

[84.] M. Garnier states, that, in the budget of Chili guano stands for a revenue of 114,000,000 francs, against 4,000,000 from customs, and 1,250,000 from all other sources.

[85.] Thus, Brodie, referring to the soap monopoly, constituted by Charles I. of England, says: "Almost every article of ordinary consumption, whether of manufacture or not, was exposed to a similar abuse: salt, starch, coals, iron, wine pens, cards and dice, beavers, pelts, bone-lace, etc., meat dressed in taverns, tobacco, wine casks, brewing and distilling, lampreys, weighing of hay and straw in London and Westminster, gauging of red herrings, butter casks, kelp and seaweed, linen cloth, rags, hops, buttons, hats, gutstring, spectacles, combs, tobacco pipes, etc., saltpetre, gunpowder, in short, articles down to the sole gathering of rags, were all under the

fetters of monopolies, and consequently deeply taxed." Of Queen Elizabeth's system of monopolies Hume remarks that, had it been continued, the England of his day would have contained as little industry as Morocco or the coast of Barbary.

[86.]The regulation of weights and measures in England was, until 11 and 12 Wm. III. (c. 20) conducted to secure a profit to the state.

[87.]Baron Riesbeck, in his travels through Germany in the middle of the last century, thus speaks of the army of the great Frederick: "All the military regulations have these two ends in view; that of preventing the improvement of agriculture from suffering by the number of troops, and that of making them subservient to the circulation of money. For these purposes the annual reviews always take place at the end of the year, when fewest hands are wanted for the purposes of agriculture. Each regiment has a peculiar part of the country assigned it for recruiting, and in that, or near it, are commonly its standing quarters. By this means the troops are not only easily got together when they are wanted, but the father has always his son in the neighborhood to help him to improve his land; and, at the annual review time, the latter has not far to go to join his regiment."

#### Footnotes for RICARDO

[88.]Ricardo has been the subject of many different judgments. Some (Rossi and J. S. Mill being of this number) regarded him as the first of economists, after Adam Smith; others place him in the second rank; the truth probably lying between the two extremes. As a thinker, Ricardo appears to as superior, original and profound; as a writer, he sometimes obscures his thought by abstract formulas, the strictness of which is only apparent, though we do not wish to say that he is in error when he is obscure. He employs short sentences when enunciating propositions introduced by hypotheses and followed by explanations.

[89.]The date given by M'Culloch and Fonteyrand. The "Universal Biography" says the 11th of August of the same year, but M'Culloch and Fonteyrand must have known best.

#### Footnotes for ROMAN CATHOLIC CHURCH

[90.]This article is intended neither as an argument for, nor as an attack upon, the Catholic church. It is a simple statement of its own doctrines, written by a deep thinker profoundly versed in its doctrines and laws. See note at the close of the article.—ED.

[91.]We have here translated the German *Volksschulen* by *public schools*. In writing the article Dr. v. Schulte certainly did not have in view the public schools of the United States, in particular. The *Volksschule* is a school intended for the people. It seems certain that what Dr. v. Schulte says of the attitude of the Catholic church toward the *Volksschule* is true of its attitude toward the public schools of the United States.—ED.

[92.] In our opinion, Christianity is not only the basis but the living element of our civilization; yet the *legal* foundation of the state does not by any means rest on Christianity. The state has not grown *out of* the church, nor upon the church, but is completely independent of the latter and of her dogmas.—BLUNTSCHLI.

[93.] Bluntschli here inserts a note to the effect that the state introduced religious freedom into the world. The remark is certainly a correct one. The principle of liberty of conscience forced itself into the world through blood, we might almost say, spite of church and state authorities, as a means "not to determine rights, but to repress violence and terminate quarrels."—ED.

[94.] There are those who consider this provision in conflict with the principle of the equal rights of confessions or creeds, and of freedom of conscience. But is not the member of a recognized Christian denomination, the statutes of which he freely accepts, bound by them?

[95.] The above article (somewhat shortened here by the omission of matter relating exclusively to Germany) was written by a distinguished Catholic teacher of ecclesiastical law, John Frederick von Schulte, the author of a great number of works on the law of the Catholic church. It was written for the larger edition of Bluntschli and Brater's *Staatswörterbuch*. After the promulgation of the decree of the infallibility of the pope by the Vatican council, Dr. von Schulte, with Dr. Döllinger and other learned Catholic divines and laymen, formed themselves into the body known as the "Old Catholics," a party which rejected the doctrine of papal infallibility as subversive of the ancient constitution of the church, as the absorption of the church by the pope, and as contrary to the doctrine *Quod semper, quod ubique, quod ab omnibus*. This is not the place to discuss whether the decree of papal infallibility changed the constitution of the Catholic church. What concerns us most in this work is to lay before its readers the meaning of that dogma, as understood by the best informed in the church itself—a meaning, which, therefore, may be considered the meaning of the Church. We give it in the words of probably the most eminent and learned of Catholic dignitaries, one whose name has long been familiar to Protestants and Catholics as well as to disbelievers both in Protestantism and in the Roman church. He says: "The Vatican definition, which comes to us in the shape of the pope's encyclical bull called the *Pastor Æternus*, declares that 'the pope has that same infallibility which the church has':\* to determine, therefore, what is meant by the infallibility of the pope, we must turn first to consider the infallibility of the church. And again, to determine the character of the church's infallibility, we must consider what is the characteristic of Christianity, considered as a revelation of God's will.

—Our Divine Master might have communicated to us heavenly truths without telling us that they came from him, as it is commonly thought he has done in the case of heathen nations; but he willed the gospel to be a revelation acknowledged and authenticated, to be public, fixed and permanent; and, accordingly, as Catholics hold, he framed a society of men to be its home, its instrument and its guarantee. The rulers of that association are the legal trustees, so to say, of the sacred truths which he spoke to the apostles by word of mouth. As he was leaving them, he gave them their great commission, and bade them 'teach' their converts all over the earth, 'to observe all

things whatever he had commanded them'; and then he added, 'Lo, I am with you always, even to the end of the world.' Here, first, he told them to 'teach' his revealed truth; next, 'to the consummation of all things'; thirdly, for their encouragement, he said that he would be with them 'all days,' all along, on every emergency or occasion, until that consummation. They had a duty put upon them of teaching their Master's words, a duty which they could not fulfill in the perfection which fidelity required, without his help: therefore came his promise to be with them in their performance of it. Nor did that promise of supernatural help end with the apostles personally, for he adds, 'to the consummation of the world,' implying that the apostles would have successors, and engaging that he would be with those successors as he had been with them.

—The same safeguard of the revelation, viz., an authoritative, permanent tradition of teaching, is insisted on by an informant of equal authority with St. Matthew, but altogether independent of him: I mean St. Paul. He calls the church 'the pillar and ground of the truth'; and he bids his convert Timothy, when he had become a ruler in that church, to 'take heed unto his doctrine,' to 'keep the deposit' of the faith, and to 'commit' the things which he had heard from himself 'to faithful men who should be fit to teach others.'

—This is how Catholics understand the Scripture record, nor does it appear how it can otherwise be understood; but, when we have got as far as this, and look back, we find that we have by implication made profession of a further doctrine. For, if the church, initiated by the apostles and continued in their successors, has been set up for the direct object of protecting, preserving and declaring the revelation, and that by means of the guardianship and providence of its Divine Author, we are led on to perceive that, in asserting this, we are in other words asserting, that, so far as the revealed message is concerned, the church is infallible; for what is meant by infallibility in teaching but that the teacher in his teaching is secured from error: and how can fallible man be thus secured except by a supernatural infallible guidance? And what can have been the object of the words, I am with you all along to the end,' but to give thereby an answer by anticipation to the spontaneous, silent alarm of the feeble company of fishermen and laborers, to whom they were addressed, on their finding themselves laden with superhuman duties and responsibilities?

—Such then being, in its simple outline, the infallibility of the church, such too will be the pope's infallibility, as the Vatican fathers have defined it. And if we find that by means of this outline we are able to fill out in all important respects the idea of a council's infallibility, we shall thereby be ascertaining in detail what was defined in 1870 about the infallibility of the pope.

—1. The church has the office of teaching, and the matter of that teaching is the body of doctrine which the apostles left behind them as her perpetual possession. If a question arises as to what the apostolic doctrine is on a particular point, she has infallibility promised to her to enable her to answer correctly. And, as by the teaching of the church is understood, not the teaching of this or that bishop, but their united voice, and a council is the form the church must take, in order that all men may recognize that in fact she is teaching on any point in dispute, so in like manner the

pope must come before us in some special form or posture, if he is to be understood to be exercising his teaching office, and that form is called *ex cathedra*. This term is most appropriate, as being on one occasion used by our Lord himself. When the Jewish doctors taught, they placed themselves in Moses' seat, and spoke *ex cathedra*; and then, as he tells us, they were to be obeyed by their people, and that, whatever were their private lives or characters. 'The Scribes and Pharisees,' he says, 'are seated on the chair of Moses: all things therefore whatsoever they shall say to you, observe and do; but according to their works do you not, for they say and do not.'

—2. The forms by which a general council is identified as representing the church herself, are too clear to need drawing out; but what is to be that moral *cathedra*, or teaching chair, in which the pope sits, when he is to be recognized as in the exercise of his infallible teaching? The new definition answers this question. He speaks *ex cathedra*, or infallibly, when he speaks, first, as the universal teacher; secondly, in the name and with the authority of the apostles; thirdly, on a point of faith or morals; fourthly, with the purpose of binding every member of the church to accept and believe his decision.

3. These conditions of course contract the range of his infallibility most materially. Hence Billuart, speaking of the pope, says, 'Neither in conversation, nor in discussion, nor in interpreting Scripture or the fathers, nor in consulting, nor in giving his reasons for the point which he has defined, nor in answering letters, nor in private deliberations, supposing he is setting forth his own opinion, is the pope infallible.' (t. ii., p. 110.)\*\* And for this simple reason, because, on these various occasions of speaking his mind, he is not in the chair of the universal doctor.

—4. Nor is this all; the greater part of Billuart's negatives refer to the pope's utterances when he is out of the *cathedra Petri*, but even when he is in it his words do not necessarily proceed from his infallibility. He has no wider prerogative than a council, and of a council Perrone says, 'Councils are not infallible in the reasons by which they are led, or on which they rely, in making their definition, nor in matters which relate to persons, nor to physical matters which have no necessary connection with dogma.' (*Præl. Theol.*, t. ii., p. 492.) Thus, if a council has condemned a work of Origen or Theodoret, it did not in so condemning go beyond the work itself; it did not touch the persons of either. Since this holds of a council, it also holds in the case of the pope; therefore, supposing a pope has quoted the so-called works of the Areopagite as if really genuine, there is no call on us to believe him; nor again, when he condemned Galileo's Copernicanism, unless the earth's immobility has a 'necessary connection with some dogmatic truth,' which the present bearing of the holy see toward that philosophy virtually denies.

5. Nor is a council infallible even in the prefaces and introductions to its definitions. There are theologians of name, as Tournely and Amort,\*\*\* who contend that even those most instructive *capitula* passed in the Tridentine council, from which the canons with anathemas are drawn up, are not portions of the church's infallible teaching; and the parallel introductions prefixed to the Vatican anathemas have an authority not greater nor less than that of those *capitula*.

—6. Such passages, however, as these are too closely connected with the definitions themselves, not to be what is sometimes called, by a *catachresis*, 'proximum fidei'; still, on the other hand, it is true also, that, in those circumstances and surroundings of formal definitions, which I have been speaking of, whether of a council or a pope, there may be not only no exercise of an infallible voice, but actual error. Thus, in the third council, a passage of an heretical author was quoted in defense of the doctrine defined, under the belief he was Pope Julius, and narratives not trustworthy are introduced into the seventh. This remark and several before it, will become intelligible if we consider that neither pope nor council are on a level with the apostles. To the apostles the whole revelation was given, by the church it is transmitted; no simply new truth has been given to us since St. John's death; the one office of the church is to guard 'that noble deposit' of truth, as St. Paul speaks to Timothy, which the apostles bequeathed to her, in its fullness and integrity. Hence the infallibility of the apostles was of a far more positive and wide character than that needed by and granted to the church. We call it, in the case of the apostles, inspiration; in the case of the church, *assistentia*. Of course there is a sense of the word 'inspiration' in which it is common to all members of the church, and therefore especially to its bishops, and still more directly to its rulers, when solemnly called together in council after much prayer throughout Christendom, and in a frame of mind especially serious and earnest by reason of the work they have in hand. The Paraclete certainly is ever with them, and more effectively in a council, as being 'in Spiritu Sancto congregata'; but I speak of the special and promised aid necessary for their fidelity to apostolic teaching; and, in order to secure this fidelity, to inward gift of infallibility is needed, such as the apostles had, no direct suggestion of divine truth, but simply an external guardianship, keeping them off from error (as a man's guardian angel, without enabling him to walk, might, on a night journey, keep him from pitfalls in his way), a guardianship saving them, as far as their ultimate decisions are concerned, from the effects of their inherent infirmities, from any chance of extravagance, of confusion of thought, of collision with former decisions, or with Scripture, which in seasons of excitement might reasonably be feared. 'Never,' says Perrone, 'have Catholics taught that the gift of infallibility is given by God to the church after the manner of inspiration.' (t. ii., p. 253.) Again: '[Human] media of arriving at the truth are excluded neither by a council's nor by a pope's infallibility, for God has promised it, not by way of an infused' or habitual 'gift, but by the way of *assistentia* (Ibid., p. 541.) But since the process of defining truth is human, it is open to the chance of error; what Providence has guaranteed is only this, that there should be no error in the final step, in the resulting definition or dogma.

—7. Accordingly, all that a council, and all that the pope, is infallible in, is the direct answer to the special question which he happens to be considering; his prerogative does not extend beyond a power, when in his *cathedra*, of giving that very answer truly. 'Nothing,' says Perrone, 'but the *objects* of dogmatic definitions of councils are immutable, for in these are councils infallible, not in their *reasons*,' etc. (Ibid.)

—8. This rule is so strictly to be observed that, though dogmatic statements are found from time to time in a pope's apostolic letters, etc., yet they are not accounted to be exercises of his infallibility if they are said only *obiter*—by the way, and without direct intention to define. A striking instance of this *sine qua non* condition is

afforded by Nicholas I., who, in a letter to the Bulgarians, spoke as if baptism were valid, when administered simply in our Lord's name, without distinct mention of the Three Persons; but he is not teaching and speaking *ex cathedra*, because no question on this matter was in any sense the occasion of his writing. The question asked of him was concerning the *minister* of baptism, viz., whether a Jew or Pagan could validly baptize; in answering in the affirmative, he added *obiter*, as a private doctor, says Bellarmine, 'that the baptism was valid, whether administered in the name of the Three Persons or in the name of Christ only' (*de Rom. Pont.*, iv., 12.)

—9. Another limitation is given in Pope Pius' own conditions set down in the *Pastor Aeternus*, for the exercise of infallibility, viz., the proposition defined will be without any claim to be considered binding on the belief of Catholics, unless it is referable to the apostolic *depositum*, through the channel either of Scripture or tradition; and, though the pope is the judge whether it is so referable or not, yet the necessity of his professing to abide by this reference is in itself a certain limitation of his dogmatic action. A Protestant will object, indeed, that, after his distinctly asserting that the immaculate conception and the papal infallibility are in Scripture and tradition, this safeguard against erroneous definitions is not worth much, nor do I say that it is one of the most effective; but anyhow, in consequence of it, no pope, any more than a council, could, for instance, introduce Ignatius' Epistles into the canon of Scripture; and as to his dogmatic condemnation of particular books, which, of course, are foreign to the *depositum*, I would say, that, as to their false doctrine, there can be no difficulty in condemning that by means of that apostolic deposit, nor surely in his condemning the very wording in which they convey it, when the subject is carefully considered. For the pope's condemning the language, for instance, of Jansenius is a parallel act to the church's receiving the word 'consubstantial,' and if a council and the pope were not infallible so far in their judgment of language, neither the pope nor council could draw up a dogmatic definition at all, for the right exercise of words is involved in the right exercise of thought.

—10. And in like manner, as regards the precepts concerning moral duties, it is not in every such precept that the pope is infallible. As a definition of faith must be drawn from the apostolic *depositum* of doctrine, in order that it may be considered an exercise of infallibility, whether in the pope or a council, so too a precept of morals, if it is to be accepted as dogmatic, must be drawn from the moral law, that primary revelation to us from God. That is, in the first place, it must relate to things in themselves good or evil. If the pope prescribed lying or revenge, his command would simply go for nothing, as if he had not issued in because he has no power over the moral law. If he forbade his flock to eat any but vegetable food, or to dress in a particular fashion (questions of decency or modesty not coming into the question), he would in like manner be going beyond his province, because such a rule does not relate to a matter in itself good or bad. If he gave a precept all over the world for the adoption of lotteries instead of tithes or offerings, certainly it would be very hard to prove that he was contradicting the moral law, or ruling a practice to be in itself good which was in itself evil. There are few persons but would allow that it is at least doubtful whether lotteries are abstractedly evil, and in a doubtful matter the pope is to be believed and obeyed. However, there are other conditions besides this necessary for the exercise of papal infallibility in moral subjects: for instance, his definition

must relate to things necessary for salvation. No one would so speak of lotteries, or of a particular dress, or of a particular kind of food; such precepts, then, did he make them, would be simply external to the range of his prerogative. And again, his infallibility in consequence is not called into exercise, unless he speaks to the whole world; for, if his precepts, in order to be dogmatic, must enjoin what is necessary to salvation, they must be necessary for all men. Accordingly, orders which issue from him for the observance of particular countries, or political or religious classes, have no claim to be the utterances of his infallibility. If he enjoins upon the hierarchy of Ireland to withstand mixed education, this is no exercise of his infallibility. It may be added that the field of morals contains so little that is unknown and unexplored, in contrast with revelation and doctrinal fact, which form the domain of faith, that it is difficult to say what portions of moral teaching in the course of 1800 years actually have proceeded from the pope, or from the church, or where to look for such. Nearly all that either oracle has done in this respect, has been to condemn such propositions as in a moral point of view are false, or dangerous, or rash; and these condemnations, besides being such as in fact will be found to command the assent of most men as soon as heard, do not necessarily go so far as to present any positive statements for universal acceptance.

—11. With the mention of condemned propositions I am brought to another and large consideration, which is one of the best illustrations that I can give of that principle of minimizing, so necessary, as I think, for a wise and cautious theology; at the same time I can not insist upon it in the connection into which I am going to introduce it, without submitting myself to the correction of divines more learned than I can pretend to be myself. The infallibility, whether of the church or of the pope, acts principally or solely in two channels, in direct statements of truth, and in the condemnation of error. The former taxes the shape of doctrinal definitions, the latter stigmatizes propositions as heretical, next to heresy, erroneous, and the like. In each case the church, as guided by her Divine Master, has made provision for weighing as lightly as possible on the faith and conscience of her children. As to the condemnation of propositions, all she tells us is, that the thesis condemned when taken as a whole, or, again, when viewed in its context, is heretical, or blasphemous, or impious, or whatever other epithet she affixes to it. We have only to trust her so far as to allow ourselves to be warned against the thesis, or the work containing it. Theologians employ themselves in determining what precisely it is that is condemned in that thesis or treatise; and doubtless in most cases they do so with success; but that determination is not *de fide*; all that is of faith is, that there is in that thesis itself, which is noted, heresy or error, or other peccant matter, as the case may be, such that the censure is a peremptory command to theologians, preachers, students and all other whom it concerns, to keep clear of it. But so light is this obligation, that instances frequently occur, when it is successfully maintained by some new writer, that the pope's act does not imply what it has seemed to imply, and questions which seemed to be closed, are, after a course of years, reopened. In discussions such as these, there is a real exercise of private judgment, and an allowable one; the act of faith, which can not be superseded or trifled with, being, I repeat, the unreserved acceptance that the thesis in question is heretical, or erroneous in faith, etc., as the pope or the church has spoken of it. In these cases, which in a true sense may be called the pope's *negative* enunciations, the opportunity of a legitimate minimizing lies in the intensely concrete character of the

matters condemned; in his affirmative enunciations a like opportunity is afforded by their being more or less abstract. Indeed, excepting such as relate to persons, that is, to the trinity in unity, the blessed virgin, the saints, and the like, all the dogmas of pope or of council are but general, and so far, in consequence, admit of exceptions in their actual application, these exceptions being determined either by other authoritative utterances, or by the scrutinizing vigilance, acuteness and subtlety of the *Schola Theologorum*.

—One of the most remarkable instances of what I am insisting on is found in a dogma, which no Catholic can ever think of disputing, viz., that 'out of the church, and out of the faith, is no salvation.' Not to go to Scripture, it is the doctrine of St. Ignatius, St. Irenæus, St. Cyprian in the first three centuries, as of St. Augustine and his contemporaries in the fourth and fifth. It can never be other than an elementary truth of Christianity; and the present pope has proclaimed it, as all popes, doctors and bishops before him. But that truth has two aspects, according as the force of the negative falls upon the 'church' or upon the 'salvation.' The main sense is, that there is no other communion or so-called church, but the Catholic, in which are stored the promises, the sacraments, and other means of salvation; the other and derived sense is, that no one can be saved who is not in that one and only church. But it does not follow, because there is no church but one which has the evangelical gifts and privileges to bestow, that therefore no one can be saved without the intervention of that one church. Anglicans quite understand this distinction; for, on the one hand, their article says, 'they are to be had accursed (*anathematizandi*) that presume to say, that every man shall be saved *by* (in) the law or sect which he professeth, so that he be diligent to frame his life according to that law and the light of nature; 'while, on the other hand, they speak of and hold the doctrine of the 'uncovenanted mercies of God.' The latter doctrine in its Catholic form is the doctrine of invincible ignorance—or, that it is possible to belong to the soul of the church without belonging to the body; and, at the end of 1800 years, it has been formally and authoritatively put forward by the present pope (the first pope, I suppose, who has done so), on the very same occasion on which he has repeated the fundamental principal of exclusive salvation itself. It is to the purpose here to quote his words; they occur in the course of his encyclical addressed to the bishops of Italy, under date of Aug. 10, 1863: 'We and you know, that those who lie under invincible ignorance as regards our most holy religion, and who, diligently observing the natural law and its precepts, which are engraven by God on the hearts of all, and prepared to obey God, lead a good and upright life, are able, by the operation of the power of divine light and grace, to obtain eternal life.'\*\*\*\* Who would at first sight gather from the wording of so forcible a universal, that an exception to its operation, such as this, so distinct, and, for what we know, so very wide, was consistent with holding it? Another instance of a similar kind is the general acceptance in the Latin church, since the time of St. Augustine, of the doctrine of absolute predestination, as instanced in the teaching of other great saints beside him, such as St. Fulgentius, St. Prosper, St. Gregory, St. Thomas and St. Buonaventure. Yet in the last centuries a great explanation and modification of this doctrine has been effected by the efforts of the Jesuit school, which have issued in the reception of a distinction between predestination to grace and predestination to glory; and a consequent admission of the principle that, though our own works do not avail for bringing us into a state of salvation on earth, they do avail, when in that state of

salvation or grace, for our attainment of eternal glory in heaven. Two saints of late centuries, St. Francis de Sales and St. Alfonso, seem to have professed this less rigid opinion, which is now the more common doctrine of the day. Another instance is supplied by the papal decisions concerning usury. Pope Clement V., in the council of Vienne, declares, 'If any one shall have fallen into the error of pertinaciously presuming to affirm that usury is no sin, we determine that he is to be punished as a heretic.' However, in the year 1831, the Sacred *Pœnitentiaria* answered an inquiry on the subject, to the effect that the holy see suspended its decision on the point, and that a confessor who allowed of usury was not to be disturbed, 'non esse inquietandum.' Here again a double aspect seems to have been realized of the idea intended by the word *usury*. To show how natural this process of partial and gradually developed teaching is, we may refer to the apparent contradiction of Bellarmine, who says 'the pope, whether he can err or not, is to be obeyed by all the faithful,' (*Rom. Pont.*, iv., 2), yet, as I have quoted him above, sets down (ii., 29) cases in which he is not to be obeyed. An illustration may be given in political history in the discussions which took place years ago as to the force of the sovereign's coronation oath to uphold the Established church. The words were large and general, and seemed to preclude any act on his part to the prejudice of the Establishment; but lawyers succeeded at length in making a distinction between the legislative and executive action of the crown which is now generally accepted. These instances, out of many similar, are sufficient to show what caution is to be observed, on the part of private and unauthorized persons, in imposing upon the consciences of others any interpretation of dogmatic enunciations which is beyond the legitimate sense of the words, inconsistent with the principle that all general rules have exceptions, and unrecognized by the theological *Schola*.

—12. From these various considerations it follows, that papal and synodal definitions, obligatory on our faith, are of rare occurrence; and this is confessed by all sober theologians. Father O'Reilly, for instance, of Dublin, one of the first theologians of the day, says: 'The papal infallibility is comparatively seldom brought into action. I am very far from denying that the vicar of Christ is largely assisted by God in the fulfillment of his sublime office, that he receives great light and strength to do well the great work intrusted to him and imposed on him, that he is continually guided from above in the government of the Catholic church. But this is not the meaning of infallibility. \* \* What is the use of dragging in the infallibility in connection with papal acts with which it has nothing to do? Papal acts, which are very good and very holy, and entitled to all respect and obedience, acts in which the pontiff is commonly not mistaken, but in which he could be mistaken and still remain infallible in the only sense in which he has been declared to be so.' ('The Irish Monthly,' vol. ii., No. 10, 1874.)\*\*\*\*\* This great authority goes on to disclaim any desire to minimize, but there is, I hope, no real difference between us here. He, I am sure, would sanction me in my repugnance to impose upon the faith of others more than what the church distinctly claims of them and I should follow him in thinking it a more scriptural Christian, dutiful, happy frame of mind, to be easy, than to be difficult, of belief. I have already spoken of that uncatholic spirit, which starts with a grudging faith in the word of the church, and determines to hold nothing but what it is as if by demonstration, compelled to believe. To be a true Catholic a man must have a generous loyalty toward ecclesiastical authority, and accept what is taught him with

what is called the *pietas fldei*, and only such a tone of mind has a claim, and it certainly has a claim, to be met and to be handled with a wise and gentle *minimism*. Still the fact remains, that there has been of late years a fierce and intolerant temper abroad, which scorns and virtually tramples on the little ones of Christ.

—I end with an extract from the pastoral of the Swiss bishops, a pastoral which has received the pope's approbation: 'It in no way depends upon the caprice of the pope, or upon his good pleasure, to make such and such a doctrine the object of a dogmatic definition. He is tied up and limited to the divine revelation, and to the truths which that revelation contains. He is tied up and limited by the creeds already in existence, and by the preceding definitions of the church. He is tied up and limited by the divine law, and by the constitution of the church. Lastly, he is tied up and limited by that doctrine, divinely revealed, which affirms that alongside religious society there is civil society, that alongside the ecclesiastical hierarchy, there is the power of temporal magistrates, invested in their own domain with a full sovereignty, and to whom we owe obedience in conscience, and respect in all things morally permitted, and belonging to the domain of civil society.' "—JOHN HENRY CARDINAL NEWMAN.

\*Romanum Pontificem en infallibilitate poliere, qua divinus Redemptor Ecclesiam suam in definienda doctrina de fide vel moribus instructam ease voluit.

\*\*And so Fessler. "The pope is not infallible as a man, or a theologian, or a priest, or a bishop, or a temporal prince, or a judge, or a legislator, or in his political views, or even in his government of the church." (Introd.)

\*\*\*Vide Amort, Dem. Cr., pp. 205-5. This applies to the Unam Sanctam. Vide Fessler.

\*\*\*\*The pope speaks more forcibly still in an earlier allocution. After mentioning invincible ignorance, he adds: "Quis tantum sibi arroget, ut hujusmodi ignorantiae designare limites queat, juxta populorum, regionum, ingeniorum, aliarumque rerum tam multarum rationem et varietatem!" (Dec. 9, 1854.)

\*\*\*\*\*Vide Fessler also; and I believe Father Parrone says the same

Footnotes for RUSSIA

[96.]The Russian empire comprises one-seventh of the territorial part of the globe, and about one twenty-sixth part of its entire surface. Owing to the vast extent of the empire, and its social condition, no surveys that can lay claim to accuracy have yet been made, and the area is obtained in greater part from estimates. There has been, likewise, no general census of the population, but various enumerations, made by the government during the years 1870 to 1873, mainly undertaken for purposes of finance or war, serve to furnish an approximately correct return of the numbers of the people. The density of population of European Russia is considerably greater than that of the Asiatic part of the empire. Russia in Europe has, on the average, thirty-four individuals to the square mile, while Asiatic Russia has barely more than a single

individual to the square mile.

—By articles forty-two and fifty-nine of the treaty of Berlin, signed July 13, 1878, Russia added to its vast territories the province of Bessarabia, taken from Roumania, together with the districts of Ardahan, Kars and Batoum, in Asia Minor, detached from the Turkish empire. Bessarabia has an estimated area of 3,720 English square miles, with a population of 140,000. According to the most reliable estimates, the newly acquired district in Asia Minor, formed, provisionally, into the government of Kars, embraces an area of 5,670 English square miles, with a total population of 600,644, comprising 417,602 Mohammedans and 183,042 Christians.

—In 1881 most of Kuldja was restored to China, leaving Russia only 5,500 square miles and 26,000 inhabitants. To the above have also to be added the trans-Caspian territory, 123,250 square miles, 275,000 inhabitants, and Fergana, 28,040 square miles, 800,000 inhabitants. More recent enumerations give the population of Poland (1872) as 6,528,017; Finland (1879), 2,028,021; Caucasus (1873-6, inclusive of additions), 5,391,744; Siberia (1873), 3,440,302; and the whole of Central Asia, 4,401,876—According to official returns of births and deaths for the years 1867-70, the population progresses at an average increase of 781,000 a year; a percentage which, supposing the inhabitants always to multiply at the same rate, would double the population in fifty-eight years.

—The vast majority of the population of Russia are devoted to agricultural occupations, and dwell in villages, spread thinly over the vast area of the empire. According to local enumerations made at various periods, there are but seventeen towns containing more than 50,000 inhabitants. The list is as follows:

St. Petersburg (1881)...	861,900	Kasan...	78,602
Moscow (1871)...	611,970	Kief (1874)...	127,251
Warsaw (1878)...	336,703	Nicolaief (1875)...	82,805
Odessa (1873)...	184,819	Tiflis (1876)...	104,024
Kichenef (Bessarabia)...	103,998	Kharkof (1879)...	101,175
Riga (1881)...	160,000	Tula...	58,150
Saratof...	93,218	Berditchef...	52,786
Tashkend (1879)...	81,951	Samara...	51,947
Vilna...	79,265		

In the larger towns a considerable proportion of the trading and industrial population are either aliens, or of foreign extraction.

—The population of Russia proper is composed of three groups: Great Russians, or Veliko-Russ; Little Russians, or Malo-Russ; and White Russians, or Bélo-Russ. The first, numbering 35,000,000, all belonging to the Slavonian race, occupy the central provinces: the second, numbering about 11,000,000, compose the bulk of the population of Poltava, Kharkof, Chernigof, Kief, Volhynia, Podolsk, Ekatermoslaf, and the Taurida; the White Russians, about 3,000,000, inhabit the provinces of Monilef, Minsk, Vitebsk and Grodno. Besides these three groups of Russians proper, there is a great variety of national elements in the general population of the Russian

empire.

—Since the emancipation act of 1861 the cultivable lands of Russia proper in Europe have been approximately distributed as follows:

	Per cent.
Town lands, about...	0.4
Crown lands, about...	34.6
Lands attached to mines...	3.5
Lands held by peasants: 1, crown peasants, 15.6 per cent...	20.6
Lands held by peasants: 2, former serfs, 5.0 per cent...	
Lands held by landed gentry and nobility...	19.7
Lands held by other proprietors, or not surveyed...	20.4

It will be seen, that about one-third of the cultivable land in Russia proper is held by the state; one-fifth by landed proprietors; and one-fifth by the peasantry.—F. M.

[97.]The prohibition of celibacy in the Greek church is carried to such an extent that no priest can perform any spiritual function before he is married, nor after he becomes a widower; and as, by the rules of the church, he is not allowed to remarry, the death of his wife occasions the cessation of his clerical functions. A priest may, however, on the death of his wife, enter into a convent, and enjoy the privilege of becoming eligible to be a dignitary of the church. There are in Russia nearly 500 cathedrals and about 29,000 churches attached to the established faith, the latter employing (1883) about 70,000 secular or parochial clergymen. The Russian church formerly possessed immense wealth, but it was partly confiscated by Peter I. and partly by Catherine II. The latter sovereign appropriated the whole movable property of the church for the use of the state, assigning, in compensation, pensions to the chief ecclesiastical dignitaries. But, with the exception of a few benefices in St. Petersburg, Moscow, and other principal cities, the stipends of the clergy, even when increased by the offerings of the people, and by the fees on occasions of births, marriages and funerals, are scarcely adequate to provide for their subsistence. The total number of the established clergy, of all ranks and orders, is stated (1883) at 254,000.

—No member of the Russo-Greek church is permitted to renounce his creed; and when a marriage takes place between one of its members and a person belonging to another faith, the children must all be brought up in the established church.

—The number of members of the principal creeds in European Russia was returned as below for 1879:

Orthodox Greek Catholics...	63,835,000
United Greeks and Armenians...	55,000
Roman Catholics...	8,300,000
Protestants...	2,950,000
Jews...	3,000,000
Mohammedans...	2,600,000
Pagans...	26,000
—F. M.	

[98.] Under the ministry of public instruction, Russia is divided into eleven educational districts, each presided over by a curator. The nine universities, in 1878, were attended by 6,250 students. In 1876 there were 24,456 primary schools, with 1,019,488 pupils; in 1877 there were sixty-eight normal schools, with 4,596 pupils; while the various secondary establishments—lyceums, gymnasiums, district schools, etc.—had 88,400 pupils. In the budget for the year 1882, a sum of 18,030,867 roubles was set down for public education.

—The mass of the population of Russia is as yet without education. In 1860 only two out of every hundred recruits levied for the army were able to read and write, but the proportion had largely increased in 1870, when eleven out of every hundred were found to be possessed of these elements of knowledge. In the grand duchy of Finland, which has a system of public instruction separate from that of the rest of the empire, education is all but universal, the whole of the inhabitants being able at least to read, if not to write. The empire, Finland excepted, is divided, as above stated, into educational districts, each of which has a number of lyceums, at which the young men intended to fill civil offices are mostly instructed, besides gymnasiums, high schools and elementary schools, varying according to area and population. The eleven districts are those of St. Petersburg, Moscow, Kharkof, Kasan, Dorpat, Kief, Odessa, Wilna, Warsaw, Caucasus and Orenburg.—F. M.

[99.] The following was the composition of the regular Russian army in 1882:

	Peace Footing.	War Footing.
<b>Battalions</b> .....	1,045	1,766
<b>Squadrons</b> .....	404	412
<b>Guns</b> .....	1,562	3,772
<b>Horses</b> .....	94,789	258,056

The nominal strength of the various divisions of the Russian army, according to the returns of the ministry of war, was as follows in 1882:

ARMS.	Peace Footing	War Footing.
<b>1. Regular army:</b>		
Infantry .....	625,617	1,915,709
Cavalry .....	85,860	94,466
Artillery .....	108,610	210,772
Engineers .....	20,624	43,352
<b>Total .....</b>	<b>840,711</b>	<b>2,264,293</b>
<b>2. Irregular army:</b>		
Infantry .....	6,500	8,510
Cavalry .....	34,196	142,400
Artillery .....	2,912	12,650
<b>Total .....</b>	<b>43,608</b>	<b>163,560</b>
<b>General total .....</b>	<b>884,319</b>	<b>2,427,853</b>

To this has to be added the staff, gendarmerie, militia (raised only in time of war), etc., which would raise the war forces to a total of 2,733,305 men.

—By the law of Dec. 18, 1878, which came into force Jan. 1, 1881, personal military service is declared obligatory in Finland. The Finnish troops form nine battalions of riflemen, each with eighteen officers and 505 men, and number in all 4,833.

—Among the irregular troops of Russia the most important are the Cossacks. The country of the Don Cossacks contains from 600,000 to 700,000 inhabitants. By imperial decree, dated April 29, 1875, every Cossack of the Don, from fifteen to sixty years of age, is bound to render military service. No substitution is allowed, nor payment of money in lieu of service. Exemption from military service is granted, however, at all times, to the Christian clergy, and, in times of peace, to physicians and veterinary surgeons, apothecaries, and teachers in public schools. The regular military force consists of fifty-four cavalry regiments, each numbering 1,044 men, making a total of 56,376. The number of Cossacks is computed as follows:

COSSACKS.	Heads.	In Military Service.
On the Black sea .....	125,000	18,000
Great Russian Cossacks on the Caucasian line .....	150,000	18,000
Don Cossacks .....	440,000	66,000
Ural Cossacks .....	50,000	8,000
Orenburg Cossacks .....	60,000	10,000
Siberian Cossacks .....	50,000	9,000
<b>Total</b> .....	<b>875,000</b>	<b>129,000</b>

The military organization of the Cossacks is in eight districts, called *woisskos*. Each *woissko* furnishes a certain number of regiments, fully armed and equipped, and undergoing constant military exercise, so as to be prepared to enter the field, on being summoned, in the course of ten days. The two larger districts are the *woissko* of Kuban, which has the privilege of furnishing a squadron of picked men for an imperial escort in time of war, and the second the *woissko* of Terak, which furnishes a like escort in time of peace.

—The Cossacks are a race of free men; neither serfage nor any other dependence upon the land has existed among them. The entire territory belongs to the Cossack commune, and every individual has an equal right to the use of the land, together with the pastures, hunting grounds and fisheries. The Cossacks pay no taxes to the government, but, in lieu of this, they are bound to perform military service. They are divided into three classes: viz., 1, the minors, or *malolelniye*, up to their sixteenth year; 2, those on actual service, the *sluzhiliye*, for a period of twenty-five years, therefore until their forty-second year; 3, those released from service, the *otslavniye*, who remain for five years, or until their forty-seventh year, in the reserve, after which period they are regarded as wholly released from service and invalided. Every Cossack is obliged to equip clothe and arm himself at his own expense, and to keep his horse. While on service beyond the frontiers of his own country, he receives rations of food and provender, and a small amount of pay. The artillery and train are at the charge of the government. Instead of imposing taxes on the Don Cossacks, the Russian government pays them an annual tribute, varying in peace and war, together with grants to be distributed among the widows and orphans of those who have fallen in battle. Besides the regular Cossacks, there are, on the Orenburg and Siberian lines, the Bashkir Cossacks, numbering some 200,000 men.

—The Russian navy (1883) consists of two great divisions, the fleet of the Baltic, and that of the Black sea. Each of these two fleets is again subdivided into sections, of which three are in or near the Baltic, and two in or near the Black sea. The divisions, like the English, carry the white, blue and red flag, an arrangement originating with the Dutch, but without the rank of the admirals being connected with the color of the flag.

—At the end of the year 1880 the strength of the various divisions of the Russian navy was returned officially as follows: 1, the Baltic fleet, consisting of one hundred and thirty-seven men-of-war, comprising twenty-seven armor-clad ships, forty-four unarmored steamers, and sixty-six transports; 2, the Black sea fleet, consisting of thirty-one men-of-war, comprising three armor-clad ships, twenty-five unarmored steamers, and three transports; 3, the Caspian sea fleet, consisting of eleven unarmored steamers and eight transports; 4, the Siberian fleet, consisting of fifteen unarmored steamers and twenty-one transports. The total comprises 223 men-of-war, all steamers, armed with 561 guns, with engines aggregating 188,120 horse power.

—The iron-clad fleet of war of Russia, comprising thirty ships, twenty-eight in the Baltic and two in the Black sea, was made up, at the end of 1880, of the following classes of ships: 1st class, three mastless turret ships, 12 and 14 inch armor thickness; 2d class, nine sea-going cruisers, 4 to 6 inch armor; 3d class, sixteen vessels for coast defense, 4 to 4½ inch armor; 4th class, two circular monitors, 11 and 18 inch armor.

—The imperial navy was commanded, in 1880, by 17 admirals, 32 vice-admirals, 31 rear admirals, 201 first-class captains, 98 second-class captains, 303 captain lieutenants, 443 lieutenants, and 129 midshipmen of the special corps attached to the navy. The navigation detachment contained, at the same date, five generals and 508 staff officers; the naval artillery, four generals and 197 staff officers; and the naval engineers, six generals and 139 staff officers.—F. M.

[100.]The public revenue of the empire is derived to the extent of two-thirds from direct and indirect taxes, while nearly two-thirds of the total expenditure is for the army and navy, and interest on the public debt. There are annual budget estimates published by the government, and also, since 1866, accounts of the actual receipts and disbursements of the state, which, entering into minute details, can not be issued till after the lapse of a number of years.

—The following table gives the total actual revenue and expenditure of the imperial government, in roubles, for each of the years 1875-81:

YEARS.	Revenue.	Expenditure.
1875.....	532,306,209	529,050,426
1876.....	534,791,290	534,705,120
1877.....	537,784,596	537,776,074
1878.....	625,972,735	600,510,612
1879.....	661,954,192	641,924,957
1880.....	651,016,683	694,505,313
1881.....	651,754,008	762,393,837

The expenditure 1876-81 is exclusive of the large expenses incurred during the war

with Turkey, which in 1876 amounted to about 51,000,000 roubles, in 1877 to over 429,000,000, in 1878 to 408,000,000, in 1879 to 128,000,000, and in 1880 to about 59,000,000. It should also be remembered, that, during the last five years, the actual value of the rouble has only been about two English shillings.

—The following table shows the principal sources of revenue and the chief branches of expenditure of the government in roubles, according to the budget estimates for 1882:

*Sources of Revenue.*

1. Ordinary revenue:	
Direct taxes...	128,291,700
Indirect taxes...	390,687,940
Mint, mines, post and telegraphs...	26,183,328
State domains...	42,562,237
Miscellaneous receipts...	49,158,117
Revenue of Transcaucasia...	9,834,548
Total ordinary revenue...	656,717,870
2. "Recettes d'ordre"...	22,165,068
3. Extraordinary receipts...	83,121,574
Total revenue...	762,004,512

*Branches of Expenditure.*

1. Ordinary expenditure:	
Interest and sinking fund of the national debt...	191,776,287
Imperial chancery...	1,650,230
Holy synod...	10,300,800
Ministry of the imperial house...	8,954,000
Ministry of foreign affairs...	3,686,185
Ministry of war...	183,489,042
Ministry of the navy...	27,507,721
Ministry of finance...	78,430,477
Ministry of the imperial domains...	19,244,882
Ministry of the interior...	65,120,548
Ministry of public instruction...	18,030,867
Ministry of public works and railways...	16,072,905
Ministry of justice...	14,780,362
Department of general control...	2,367,225
Civil administration of the Transcaucasus...	7,252,291
Various...	931,329
Total ordinary expenditure...	658,595,151
2. Anticipated deficits in receipts...	8,500,000
3. "Dépenses d'ordre"...	22,165,068
4. Extraordinary expenses...	72,744,293
Total expenditure...	762,004,512

It is expected that the actual revenue will show a deficit of 4,500,000 roubles. The budget estimates for 1883 balance the revenue and expenditure at 778,505,423 roubles, or £111,215,060.

—In the budget estimates for the year 1882, the total amount, in roubles, required for interest on the public debt and sinking fund, was divided as follows:

Foreign loans:	
Terminable...	23,481,601
Perpetual...	23,486,172
Internal terminable loans:	
Debt to sundry departments...	125,837
4 per cent. bank bills (metallic)...	4,500,000
5 per cent. bank bills...	13,450,000
First and second lottery loans...	13,285,000
First and second oriental loans...	44,000,000
Treasury bills...	9,331,200
Polish obligations...	1,890,000
Debt on Polish "Fenilles de liquidation"...	3,184,123
Internal perpetual loans...	10,117,646
Interest and sinking fund on consolidated bills issued for construction of railways, etc...	51,924,708
Total...	198,776,287

—The finances of Russia, almost since the beginning of the century, exhibit large annual deficits, caused partly by an enormous expenditure for war, and partly by the construction of reproductive works, such as railways. But the war expenditure was by far the greatest cause of the deficits.

—According to official returns, issued in 1881, the total war outlay incurred by Russia during the four years 1876 to 1880, amounted to 1,075,396,653 roubles, or £153,628,093.

—To cover a series of annual deficits, and, at the same time, to procure the capital for the construction of a network of railways throughout the empire, a number of foreign loans were raised during the thirty-two years from 1850 to 1882. The most important of them were, first, a loan of £5,500,000, issued in 1850, to meet the expenditure for the railway from St. Petersburg to Moscow; secondly, a loan of £12,000,000, issued in 1859; thirdly, a loan of £8,000,000, issued in 1860; and fourthly, a loan of £15,000,000, issued in 1862, the latter three contracted partly for the covering of financial deficits and partly for the construction of railways. The subsequent foreign loans were: one for £2,600,000, issued in 1863, and two for £6,000,000 each, issued respectively in 1864 and 1866. The next was a foreign loan of £15,000,000, brought out in September, 1872, and the second raised in December, 1873. The following table gives the year of issue, nominal capital, interest per cent., and price of issue, of the foreign loans of Russia, fifteen in number—including early liabilities dating back to 1822—contracted up to 1882:

YEAR OF ISSUE.	Nominal Capital.	Interest.	Price of Issue
	£	Per Cent.	Pr Cent.
1822 -----	6,400,000	5	77
1850 -----	5,500,000	4½	93
1859 -----	12,000,000	3	68
1860 -----	8,000,000	4½	92
1862 -----	15,000,000	5	94
1863 -----	2,600,000	5	85
1864 -----	6,000,000	5	86
1866 -----	6,000,000	4	61
1867-9 -----	28,110,000	4	61-3
1870 -----	12,000,000	5	80
1871 -----	12,000,000	5	81
1872 -----	15,000,000	5	89½
1873 -----	15,000,000	5	90
1874 -----	1,480,000	5½	87½
1875 -----	15,000,000	5½	87½
1877 -----	15,000,000	5½	85
1880 -----	24,000,000	4	75
1882 -----	8,800,000	3	55
<b>Total. -----</b>	<b>202,990,000</b>		

Not

included in the above list are several loans for railways, guaranteed by the imperial government. The earlier of the foreign loans of Russia have become largely reduced at present, through the operation of sinking funds. Of the 1822 loan, issued by Messrs. Rothschild, more than one-half had been repaid at the end of 1875; of the 1850 loan, contracted for by Baring Brothers, the outstanding sum was £2,950,000, of the 1859 loan, issued by Thomson, Bonar & Co., the amount was £5,100,000; and of the 1860 loan, issued by Baring Brothers, it was £6,600,000 at the same date. But the repayments of the subsequent loans, through sinking funds, were comparatively small.

—The entire public debt of Russia, interior and foreign, was estimated to amount to 2,450,000,000 roubles, or £350,000,000, on Sept. 1, 1878, the total including an internal loan of 210,000,000 roubles, or £30,000,000, issued in 1877, soon after the commencement of the war against Turkey, and another internal loan, called "the second eastern loan," to the amount of 300,000,000 roubles, or £42,837,142, issued in August, 1878. On Jan. 1, 1880, the total debt had increased to 4,480,812,699 roubles, or £640,116,099.

—Included in the debt here enumerated is a very large quantity of paper money, with forced currency. According to official reports, the total amount of bank notes in circulation on Jan. 1, 1875, was 797,313,480 roubles, or £113,901,925. There were new issues of paper money to a very large amount during the years 1876-9. The total debt represented by paper money of forced currency, was estimated at 1,500,000,000 roubles, or upward of £210,000,000, in January, 1880.

—The destruction of public credit, through an unlimited issue of paper money, is, as remarked above, of old standing. In the reign of Catherine II., the first attempt, on a large scale, was made to cover the annual deficits by a very liberal supply of paper roubles, the sum total of which at the death of the empress, 1796, amounted to 200,000,000. During the subsequent wars with France and Turkey, new emissions of paper followed, with the consequence that in 1815 the notes had fallen to 418, that is, one silver rouble was worth four roubles eighteen kopecks in paper. Great efforts were now made by the government to improve this state of things, by withdrawing a portion of the paper from circulation. After ten years of improved financial management, there remained, however, still 600,000,000 of notes, circulating at the rate of three paper roubles to one silver rouble. As a final remedy, the imperial government withdrew, in 1843, the whole of the old paper money, introducing, in its stead, a new form of bank notes, with forced currency. By these and other means, particularly the establishment, in 1859, of a state bank, the bank of Russia, under the control of the minister of finance, the nominal value of the paper money was considerably raised, with a prospect of the resumption of specie payments in the course of a number of years.

—The grand duchy of Finland had a revenue of 32,320,714 marcs, or £1,292,828, and an expenditure of 35,131,146 marcs. or £1,405,245, in 1882. Its total debt on Jan 1, 1882, amounted to 61,422,865 marcs, or £2,456,914. In December, 1882, Finland contracted an additional loan of £810,000 at 4 per cent., for forty-two years. The special budgets of Poland ceased in 1867, on the final incorporation of the kingdom with Russia.—F. M.

[101.]The commerce of Russia with foreign countries is officially divided into trade with Europe, and trade with Asia: the former being subdivided into trade through the Baltic ports, through the White sea ports, through the southern ports, and over the European land frontier. The immense extent of the empire, and its ever-changing limits eastward, make it difficult to obtain exact returns of the aggregate amount of its foreign commerce, which must be partly estimated. According to official statements, the total value of imports in the five years 1876-80 averaged, in round numbers, 455,000,000 roubles, or £65,000,000, while the value of the exports during the same period averaged 476,000,000 roubles, or £68,000,000 per annum. The four principal articles of import during the period were raw cotton, iron and other unwrought metals, tea, and machinery of all kinds, while the staple articles of export were grain and other agricultural produce.

—The two principal countries trading with Russia (1883) are Great Britain and Germany. Of the imports, about 40 per cent. annually came from Germany, and 20 per cent. from Great Britain; and of the exports 35 per cent. went to Great Britain, and 20 per cent. to Germany, on the average of the five years 1876-80.

—The commercial navy of Russia consisted, at the end of the year 1879, of 2,368 sea-going vessels, of an aggregate burden of 261,231 ship last, or 522,462 tons. The total comprised 925 ships engaged in trading to foreign countries, and 1,780 coasting vessels, many of them belonging to Greeks, sailing under the Russian flag. Not included in the return were 389 trading steamers on the rivers and lakes of the empire,

very nearly two-thirds of this number being on the river Volga and its affluents.

—The internal commerce of the empire, as well as its foreign trade, has been greatly extended by the establishment, in recent years, of a comprehensive net-work of railways. The latest official returns state, that on July 1, 1880, the total length of the railways of Russia in Europe, open for traffic, amounted to 22,037 versts, or 14,145 English miles. At the same date 1,110 miles more of lines were in course of construction. The progress of railway construction in Russia is shown succinctly in the following table, which gives the length of lines opened at successive periods:

YEARS.	Versta.	English Miles.
1838 to 1865.....	3,578	2,885
1866 to 1870.....	6,514	4,343
1871 to 1875.....	7,608	5,071
1876 to 1878.....	2,719	1,812
<b>Total.....</b>	<b>20,417</b>	<b>18,611</b>

On the proposition of the minister of public works, the emperor sanctioned, in June, 1875, the extension of the then existing system by 6,500 versts, or 4,333 English miles, which, added to the 2,500 versts, or 1,666 English miles, previously sanctioned, raised the total to 9,000 versts, or 6,000 English miles. The new net-work is divided into four classes, according to different degrees of urgency, and the first of these classes will include the Siberian railway and the seven projected lines in the coal basin of the Don; 2,600 versts, or 1,734 English miles, are assigned to this class, at the head of which has been placed the immense Siberian line, reported as "most urgent" by a special commission on railways summoned in 1870. It is from a station on this line, probably Tinmen, that the Central Asian line to Tashkend is to take its rise, the continuation of the Orenburg line in that direction having been condemned as impracticable, owing to the inhospitable nature of the country it would have to traverse. The importance of the seven lines for the coal fields of the south is great, as the new railways will traverse this field in every direction, and connect it on one side with the Black sea and the sea of Azof, and on the other with the existing trunk lines of the empire.

—In 1880-81 a railway for military purposes was constructed from Mikhailovsk, on the southeast shore of the Caspian, to Kizil Arvat, and a tramway thence to Beurma, near Bami, about 200 miles in all; within 100 miles of Askabad, and 260 of Sarakhs, on the northwest frontier of Afghanistan.

—On Jan. 1, 1879, there were forty-five railway companies existing in the empire. Of this number ten had constructed their lines altogether without government assistance; while the remaining thirty-five were guaranteed, fifteen to the full amount of their capital, and the other twenty only to a partial extent. The entire sum guaranteed in 1874 by the state, in the shape of interest and repayment of capital, amounted to

51,177,627 roubles, or £7,311,089. In the year 1878 the sum of 14,392,172 roubles, or £2,084,596, being 78.52 per cent. of the sum total, was paid out of the exchequer to the railway companies. The charters granted to railway companies are for the most part terminable after between seventy-five and eighty-five years; but some small companies have charters only for thirty-seven years. The following table shows the gross receipts, the working expenses and the net receipts, in roubles, of the Russian railways during each of the eleven years 1869-79:

YEARS.	Gross Receipts.	Working Expenses.	Net Receipts
1869	65,272,518	35,469,959	29,802,565
1870	78,820,633	46,719,992	32,100,642
1871	95,075,742	60,886,666	34,689,076
1872	102,645,918	66,061,549	36,584,367
1873	123,696,908	72,248,948	51,447,960
1874	141,692,640	89,124,000	52,508,640
1875	142,004,655	92,941,455	49,063,200
1876	147,398,236	100,267,449	47,128,787
1877	193,223,874	121,494,777	71,729,097
1878	211,905,758	183,120,261	78,785,497
1879	212,771,418	151,175,558	61,595,860

It appears from official returns referring to the end of the year 1878, that at that date the capital of all the railway companies amounted to 1,450,288,196 roubles, or £207,184,028. The capital consisted of £135,446,153 in bonds, and £71,737,875 in shares. No less than £92,101,350 of the bonds and £8,055,750 of the shares were held by the government itself; 48.8 per cent. of the whole railway property of the country was therefore held by the government.

—The postoffice in the year 1880 conveyed 128,817,612 letters and post cards, 8,960,721 wrappers and parcels, and 88,168,700 newspapers. There were 4,458 postoffices in the empire in 1880. The total receipts of the general post in the year 1880 did not cover the expenditure.

—The length of telegraph lines in Russia, in 1880, was 59,000 English miles, and the length of wire 134,000 English miles. Of the total system, about seven-eighths was the property of the state. There were at the same date 2,838 telegraph offices, 1,185 belonging to the state, and the remainder to private companies. The total number of telegrams carried in 1880 was 7,298,429, comprising 5,768,255 inland dispatches, and the rest on international service. The receipts of the telegraph office, which were £1,226,762 in 1878, have shown, in recent years, a small annual surplus, which is, by imperial decree, always devoted to the extension of the telegraphic system.—F. M.

Footnotes for SANDWICH ISLANDS

[102.]The Sandwich islands are also known as the Hawaiian islands, Hawaii being the largest of the group. The latest statistics give the population at 57,985, 5,916 of whom are Chinese and 4,561 whites. The capital is Honolulu, with a population (1878) of 14,114. The receipts of the state from April 1, 1876, to March 31, 1878, amounted to \$1,151,713, and the expenditures to \$1,110,472. The state debt on March 31, 1878, was \$444,800. The standing army consists of only seventy-five men. There is a volunteer corps of 400 men.—M.

#### Footnotes for SAXONY

[103.]At the census of Dec. 1, 1880, the population of Saxony was composed of 2,876,138 Lutherans; 72,946 Roman Catholics; 1,467 German Catholics; 10,235 members of other Christian sects; and 6,516 Jews. The clergy are chiefly paid out of local rates and from endowments, the budget contribution of the state to the department of ecclesiastical affairs amounting to but 85,593 thalers, chiefly spent in administrative salaries. The government of the Protestant church is intrusted to the *Landes-Consistorium*, or national consistory. Public education has reached the highest point in Saxony, every child, without exception, partaking of its benefits. By a law of June 6, 1835, attendance at school, or under properly qualified teachers, was made compulsory. The kingdom has the second largest university in Germany, that of Leipzig, founded in 1409, and attended, on the average of recent years, by nearly three thousand students.

—The financial period extends over a term of two years. In the financial accounts, both the revenue and expenditure are divided into "ordinary" and "extraordinary," the latter representing income from state domains and disbursements for public works. The ordinary revenue for each of the two years 1882-3 was returned at 67,767,236 mark, and was balanced by the expenditure. The extraordinary revenue for each of the two years 1882-3, likewise balanced by the expenditure, was returned at 4,014,905 mark. More than one-half of the total revenue of the years 1881-2 was derived from domains and state railways. The chief branch of expenditure is that of interest and sinking fund of the public debt, amounting to 31,593,138 mark, for the years 1882-3. The debt was incurred almost entirely for the establishment and purchase of a network of railways and telegraphs, and the promotion of other works of public utility. The total debt had risen on Jan. 1, 1881, to 669,583,425 mark, and in 1882 to 673,445,475.

—The population of Saxony, by the census of Dec. 1, 1880, was 2,972,805, comprising 1,445,330 males, and 1,527,475 females. The area, in English square miles, and the population, of the *Hauptmannschaften*, was as follows at each of the two enumerations of Dec. 1, 1875, and Dec. 1, 1880:

Kreis-Hauptmannschaften.	Area, in Eng. Sq. miles	Population	
		Dec., 1875.	Dec., 1880.
Dresden .....	2,229	749,503	808,122
Leipzig .....	1,290	639,731	707,826
Bautzen .....	1,232	339,203	351,326
Zwickau .....	2,080	1,031,905	1,105,141
<b>Total</b> .....	<b>6,777</b>	<b>2,760,342</b>	<b>2,972,805</b>

#### Footnotes for SCOTLAND

[104.] Scotland has given to the world more than its share of genius, a fact largely attributable to its social, religious and political conditions. We may mention—1. *Poets.* John Barbour, Sir David Lyndsay, George Buchanan, Dr. Arthur Johnston, Gavin Douglass, Allan Ramsay, Robert Blair, James McPherson, John Logan. Dr. James Beattie, James Thomson (of the "Seasons"), Thomas Campbell, John Skinner, Lady Anne Barnard, Jane Elliott. John Leyden, William Laidlaw, John Graham, James Montgomery, Mrs. Joanna Baillie, Robert Burns. Baroness Nairn, Robert Tannahill, James Hogg (the "Ettrick Shepherd") Allan Cunningham, William Motherwell, William Edmonstoun Aytoun, J. Ballantine, Robert Buchanan.

—2. *Norelists,* Tobias George Smollett, Sir Walter Scott, Elizabeth Hamilton. John Galt, Susan Edmonstone Ferrier, Mrs. Christian Isabel Johnstone, Sir Thomas Dick Lauder, George MacDonald, William Black, etc.

—3. *Theologians.* John Knox, Ebenezer Erskine, Ralph Erskine, George Campbell, John Brown, Andrew Thomson, Thomas Chalmers, Edward Irving, Robert S. Candlish, Thomas Guthrie, Norman Macleod. John Tulloch, John Caird, John Ker.

—4. *Metaphysicians, etc.* Dr. Thomas Reid, Dugald Stewart, Lord Monboddo, John Abercrombie, M. D., George Combe, Sir William Hamilton. Sir James McIntosh.

—5. *Historians.* Hector Boece. David Hume, Dr. William Robertson, Patrick Fraser Tytler. Lord Hailes, Dr. John Gillies, Bishop Burnet, John Pinkerton, Sir William Napier, James Boswell, Dr. Thomas McCrie. Cosmo Innes, J. G. Lockhart, W. Stirling Maxwell, John Lord Campbell, Henry Lord Cockburn, Lord Macaulay, John Hill Burton.

—6. *Miscellaneous Writers, Essayists, etc.* Sir Andrew Fletcher, Dr. Adam Smith, Archibald Alison, Prof. John Wilson (Christopher North), John Gibson Lockhart, J. R.

M'Culloch, Francis Jeffrey, Lord Erskine, Henry Lord Brougham, Robert Mudie, Prof. Masson, Dean Ramsay, Dr. Robert Chambers, Rev. George Gilfillan, James Mill (father of John Stuart Mill).

—7. *Discoverers and Travelers*. Mungo Park, Hugh Clapperton, Captain Grant, James Bruce, Sir John Ross, David Moffat, David Livingstone, etc.

—8. *Scientists*. John Napier (inventor of logarithms), Sir David Brewster, James Watt, Prof. J. D. Forbes, Sir John Leslie, John P. Nichol, Sir James Clark, M. D., Thomas Clark. Dr. Alexander Bain, Sir William Fairbairn, Sir Charles Lyell, Sir Roderick Murchison, Hugh Miller, Prof. John Fleming, Archibald Geikie, Prof. John Playfair, etc.

#### Footnotes for SERVIA

[105.] The independence of Servia from Turkey was established by article thirty-four of the treaty of Berlin, signed July 13, 1878, and was solemnly proclaimed by Prince (now King) Milan at his capital, Aug. 22, 1878.

—The revenue of Servia is derived chiefly from direct imposts, including a general capitation tax, classified as to rank, occupation and income of each individual, and which is assessed, in the first instance, on the different communes or parishes. The budget for 1883 is as follows: revenue, £1,392,000; expenditures, £1,391,000; showing £900 surplus; and being an increase of revenue to the amount of £86,500 over the previous year. The increase (about the same) in the expenditure is chiefly due to the expenses incurred in reorganizing the Servian army on the German system. The national debt is about £5,500,000, £3,500,000 being incurred for the new railway (Belgrade-Vranja), the interest and amortization of which, during fifty years, is 6 percent.; £1,500,000 for a lottery loan, to repay the war requisition; £250,000 due to Russia; and £250,000 incurred in 1882 to pay the claims of the disinherited Turks in the annexed provinces. The interest and expenses on the debt amount to £310,000 in the budget for 1883.

—The standing army of Servia, on a peace footing, is 9,710 men—infantry, artillery, engineers and cavalry. Besides the standing army, there is the national militia; so that, on paper, in 1882, the total war force of Servia amounted to 210 battalions, with 225,000 men in all. This army has 810 officers, and some 300 pieces of artillery. The army is, however, being reorganized on the German system. By the new law every able-bodied Servian will be in the army from his twentieth to his fiftieth year. At twenty he enters for two years the regular army, afterward passing into the reserve until he reaches his thirtieth year. From thirty to thirty-seven he is in the first-class militia, and from thirty-seven until fifty in the second-class militia. The infantry will have fifteen battalions, and the cavalry two regiments. The total war force will be 135 battalions, with 160,000 men.

—Servia had, in 1883, a population of nearly 1,750,000. The inhabitants are almost entirely Slaves, the Turkish population on the territory (4,250 square miles) acquired from Turkey by the Berlin treaty having rapidly disappeared. There are less than

2,000 Jews (who have much of the commerce of the country in their hands). The gypsy population, it is stated, is turning to the cultivation of the land, on the advantageous terms offered to them by the government.

—The state is divided into twenty-one counties. In religion Servia is almost independent of the patriarch of Constantinople. There are about 10,000 Roman Catholics, chiefly subjects of Austria-Hungary, with about 460 Protestants. The excess of births over deaths amounted to 15,355 in 1880, and to 36,836 in 1881.

—The chief trade of Servia is with Austria. Besides, with that country, as remarked above, commercial intercourse is mainly carried on with France, the United States, Turkey and Roumania. The total imports are officially valued at about £2,000,000, and the exports at considerably less, mainly to and from Austria and Turkey. Live animals are the chief article of export, particularly pigs, which are kept in countless herds, feeding on the acorns which cover the ground for miles. Large quantities of cereals, hides and prunes, are also exported. The commercial resources of Servia are as yet wholly undeveloped, chiefly for want of roads, but a railway from Belgrade to Vranja is being constructed. There are 1,370 miles of telegraph.—F. M.

#### Footnotes for SHIMONOSÉKI INDEMNITY

[106.] Since this article was written, the indemnity has been paid, but paid without interest.

#### Footnotes for SMITH

[107.] While he occupied his chair at Glasgow, Smith was in the habit of giving certain lectures on the elements of political economy, as it was understood in his time, *i. e.*, upon those artificial regulations and restraints of civil society which statesmen conceive to be necessary or expedient. Here he was accustomed to draw those inferences in favor of a policy of freedom which he afterward expanded into his celebrated work. Neither he, nor, indeed, any one else, had ever elaborated at this time the laws under which the production of wealth is effectually secured.

—The modern science of political economy has been developed from a host of negative inductions. Statesmen, misled by the selfish misrepresentations of reputed experts, have from time to time controlled and misdirected trade in the fancied interests of trade. They have attempted to be wiser than nature. They have seen that order and government have been necessary to the well-being of society, and that confusion and mischief are the invariable result of uninstructed self-interest. But, forgetting that the business of government is to check aggression only, and to secure every man a fair field for the exercise of his own labor, they have unconsciously aided aggression, curtailed liberty, and narrowed the field in which labor could exercise itself. There is of course a border, for the occupation of which the advocates of liberty and control constantly contend. The wisdom of government in the days of Adam Smith, and frequently enough in our own time, is to extend the area of government, and, with it, to assert the just control of an administration over the innocent acts of individuals. Such a line of action on the part of a government may be adopted with the

best possible intentions, as Smith shows in the ninth chapter of his fourth book, where he sketches the policy of Colbert. Such a policy found its earliest and most complete refutation in the reasonings which are contained in the "Wealth of Nations." \* \* It has been objected to Adam Smith and Hume, that they did not foresee the French revolution, intimately as they were acquainted with the state of France. But the objection is shallow. What is called political prophecy is often mere guess work, which no wise man will seriously indulge in. The easiest way in which weak men think they can gain a reputation is by sinister predictions of political events. No one can anticipate the conservative forces of society, no one can gather enough information to make a safe induction as to the resistance which may be made to change, or, indeed, as to the forces which will compel change. But there is such a thing as political prescience. It is not difficult to discover the inevitable consequences induced by certain kinds of political action. This faculty Smith possessed in the highest degree, in a far higher degree than Hume, whose sagacity and acuteness he admired so much. Of this prescience his great work is the most noteworthy illustration. No person has ever pointed out with more exactness the effects of a mistaken commercial policy, the invariable reaction from a course of legislation which does not commend itself to the moral sense of a nation, and the mischievous consequences which ensue when a public law gives its sanction to private selfishness. \* \* The range of the subjects treated in Smith's work is very wide. Social history and the politics of commerce occupy his attention as much as mere abstract reasonings. His educational theories have been generally accepted. His rules of taxation are classical. His vindication of free trade is complete. His criticism of the great company has been the basis of the latest legislation on the Indian empire. His conception of the mutual relations in which nations stand, is as comprehensive as it is generous. It should not be forgotten that Smith did not propose to himself the discovery of a scheme which should make any one country wealthy or prosperous at the expense of the rest of mankind, but how the wealth of nations should be developed. He rose far above the peddling maxim, that the gain of one people is the loss of another. Hence his work is international, and has formed an effective protest against those shams of a sordid self-interest which masks itself under the name of patriotism.

—Among economists, Smith possesses the inductive mind in the highest degree. His work not only displays a wealth of varied reading, but is full of facts. Considering, too, how inexact were the statistical data on which he could in his time rely, his sagacity is remarkable. No example of this quality seems to me more striking than his inference that the precarious occupants in the ancient manor must have passed through a métayer tenancy before they reached the independence of the fifteenth-century yeoman, as described by Fortescue. Such was actually the fact, as I have been able to discover from a very large investigation of farm accounts during the epoch referred to by Smith. But, in fact, to be scientific, political economy must be constantly inductive. Half, and more than half, of the fallacies into which persons who have handled this subject have fallen, are the direct outcome of purely abstract speculation. In consequence, though he was the progenitor of the science, and necessarily left it incomplete, Smith is far more frequently in the right than his critics are. Almost every blemish in his work (some few inaccuracies of expression excepted, which arise from a somewhat loose use of terms,) is due to his exaggerated sympathy with the economic theories of his French friends and teachers. It is to this influence

that we can trace his errors as to the nature and causes of value, and whatever is defective in his exposition of rent. Even here, however, he seems to me to be much more in the right than Ricardo, who accounts for the origin of rent on grounds which have absolutely no warrant in fact. His most adverse critics have, however, united with his warmest admirers in his vindication of private liberty against the interference of government; that is, in his advocacy of what are called free trade principles. To the modern reader, who recognizes the vast services which the merchants and manufacturers of Great Britain have done for such principles as Smith advocated, the language which the author uses about the mercantile classes seems singularly harsh and bitter. "The passionate confidence of interested falsehood"; the policy of a "great empire" being guided by the policy of "shop-keepers"; "impertinent badges of slavery, imposed by the groundless jealousy of merchants and manufacturers"; "illiberal and oppressive monopolies"; "the mean and malignant expedients of the mercantile system," and similarly pungent comments on the machinations of the trading classes a century ago, are expressions of active animosity against interests which Smith must have thought hostile to the public good. But, at that time, the leading merchants deserved little sympathy from any person who considered this public good as the paramount object of economy and legislation. Their intrigues had prevented the establishment of bonded warehouses. The mercantile classes drove Walpole into the war of the right of search. The real or reputed interests of the same order precipitated and prolonged the seven-years war. The costs of that war, and the sustentation of the East India company, whose conquests had made it bankrupt, led to the uprising of the American colonists, and the war of independence. The merchants who stimulated, and the nabobs and planters who continued, these costly struggles, were no doubt powerful in Change alley. They were, moreover, ready to make the highest biddings for rotten boroughs. But they were detested by the people, and especially by those free-holders in whom, as Smith thought, the strength and hope of the nation resided. Macaulay has given, in a few words, a statement of how public opinion estimated these people, in his "Life of Lord Clive, "the greatest of the race.

—The most energetic attack, however, which Smith made on any institution of his time, was that on the East India company. To us the company is a thing of the past. In Smith's day it was the most brilliant phenomenon that the world had ever witnessed. A very few years had created the Indian empire; had changed a few timid and servile traders into a force of heroes, by whom successes had been achieved more amazing than those of Cortez and Pizarro. In the face of this extraordinary prestige, which affected the whole western world, the author of the "Wealth of Nations" dissected the pretensions of the great company, showed that it failed as a trader, and failed as a ruler; and proved that its government was mischievous to its subjects, and its monopoly a wrong upon the English people.—THOROLD ROGERS.

#### Footnotes for SOCIALISM AND SOCIALISTS

[108.] "The assailants of the principle of individual property," says John Stuart Mill ("Principles," book ii., §2), "may be divided into two classes: those whose scheme implies absolute equality in the distribution of the physical means of life and enjoyment, and those who admit inequality, but grounded on some principle or supposed principle of justice or general expediency, and not like so many of the

existing social inequalities, dependent on accident alone. At the head of the first class, as the earliest of those belonging to the present generation, must be placed Mr. Owen and his followers. M. Louis Blanc and M. Cabet have more recently become conspicuous as apostles of similar doctrines (though the former advocates equality of distribution only as a transition to a still higher standard of justice, that all should work according to their capacity, and receive according to their wants).

—The characteristic name for this economical system is 'communism,' a word of continental origin, only of late introduced into this country. The word 'socialism,' which originated among the English economists, and was assumed by them as a name to designate their own doctrine, is now, on the continent, employed in a larger sense; not necessarily implying communism, or the entire abolition of private property, but applicable to any system which requires that the land and the instruments of production should be the property, not of individuals, but of communities, or associations, or of the government."

—It is in this latter sense, evidently, that M. Reybaud uses the word "socialism" in this article,—ED.

[109.] Among the forms of socialism, German writers on political economy mention what they call *staatssozialismus*. or state socialism. understanding by the term "that system which would have economic relations regulated as far as possible by the state, and which would substitute state help for self-help" Prince Bismarck has shown a decided leaning to this form of socialism. The French have the expression *socialisme d'état*, which is the exact equivalent of *staatssozialismus*, or state socialism. That such a form of socialism has been finding favor with large classes of the people in recent times can not be doubted. Hence it has been not inappropriately styled by Professor Faweett, "modern socialism;" and much of what he says on its growth and probable consequences in certain countries of Europe is true as to its growth and consequences in the United States, but of course not to the same extent as in Europe. He writes: "It is each day becoming more evident that in every European country an increasing number of the laboring population are giving an enthusiastic adherence to certain social and economic principles, which, if carried into effect, will introduce even more fundamental changes than those brought about by the first French revolution. Never, perhaps, was there a time when it was more important to dispassionately consider the ideas, the wants and the aspirations of the workmen who are engaged in this movement, which may be described under the general title of modern socialism. Without such dispassionate consideration, there is certain to arise, instead of a kindly and intelligent sympathy, the rancorous enmity of bitter class prejudice. Those who are prepared to show this sympathy may have some chance of directing to purposes of inestimable good this new movement, which, if met with blind and unreasoning opposition, will at last gradually gather so much strength as to pass beyond control; Europe may then find herself involved in a terrible war of classes. It has been repeatedly shown that the friends of revolutionary changes derive their motive power from the bigoted opponents of progress, and from the stubborn upholders of unwise laws and unjust privileges. It might as well be supposed that the railway engine would move if it were deprived of steam, that wheat could grow without soil, or that man could live without food, as to imagine that a revolutionary propagandism could be

maintained if it were not kept alive by the recollection of some wrong inflicted, and by the continuance of some grievance unredressed. It is perfectly vain to expect that there will not be threatening of coming convulsions so long as the social and economic condition of great masses of the people remains what it is at the present time. England is constantly being glorified as the wealthiest of all nations. From every platform in the kingdom orators delight to parade the well-known statistics about our vast and growing commerce. Each quarterly return from the board of trade shows an augmentation of exports and imports. In spite, however, of all these evidences of accumulating wealth, the majority of our people have a severe struggle for existence, and no inconsiderable minority live in abject misery and in degrading poverty. The more wealthy the nation is admitted to be, the more perilous does it become, and the more ominous of future trouble, that one out of twenty of the nation should be a pauper; that to a great proportion of our laboring classes a life of incessant toil yields no other result than an old age of dependent mendicancy; that millions are so entirely uneducated as to be cut off from every intellectual enjoyment; that in many rural districts horses are stabled far more comfortably than laborers are housed; and that in our largest and wealthiest cities the poor are so crowded and huddled together, that in a countless number of instances all the members of a family herd together in a single room. Can any one who reflects on such facts be surprised that a wide-spread spirit of unrest and dissatisfaction is abroad? Ought it not to be regarded as almost incredible that a social structure resting on such a basis should have stood so long? But it may be said that if things are not as rapidly improving as can be desired, they are certainly not getting worse. Why then, it is urged, should there be this new outburst of discontent? No new laws vexations to the industrial classes have been imposed; many, on the contrary, have been repealed; taxation is not more burdensome, and duties on many of the necessaries of life which added greatly to their cost have been remitted. May it not, therefore, be fairly concluded that things will gradually improve; that the present dissatisfaction is unreasonable, and that the demands of those who are so discontented with society as it is now constituted should be simply met by undeviating resistance? As there is only too much reason to fear that many will assume this attitude of resistance, it is important to give the most emphatic warning as to the consequences which the adoption of such a policy may involve. As it is so frequently supposed that the movement in favor of organic social and economic changes has no solid foundation in reason or in justice, and that it is rather a temporary aberration of certain unsettled and mischievous people who love revolution for revolution's sake, it becomes important, in the first instance, to attempt to discover whether this is a true interpretation of the sentiments now widely prevalent among the industrial classes.

—As previously remarked, it no doubt, at first sight, appears somewhat difficult to account for the fact that this desire for change should have grown up with the repeal of many unjust laws, with the remission of many burdensome taxes, with a great stimulus in the productive industry of the country, and with the more wide-spread desire among those who are in comfortable circumstances to be good, kind and charitable to the poor. But does not the fact that all these circumstances have been in operation without producing any more marked effect upon the general well-being of the people, suggest an explanation of the phenomenon which we are seeking to elucidate? Scarcely any other result can be expected than that there should arise a feeling of angry disappointment, unreasoning distrust and unjust suspicion when

favorable agencies like those just mentioned are contrasted with such facts as those previously enumerated, which are only too truly typical of the social and economic condition of the country. For a long time the people were led to believe that the elevation of their class would be secured by bringing into operation various favorable material agencies. At one period it was supposed that the application of steam to manufactures and the improvement of locomotion by the introduction of railways, would so stimulate production as to bring to the laborer an age of golden plenty. At another time it was confidently stated that by the abolition of protection the markets of the world would be thrown open to us, and the supplies of cheap food thus procured would yield an increased store of comfort to every humble home. In one respect these predictions have been fulfilled, in another respect they have been cruelly falsified. Production has been stimulated beyond the expectations of the most sanguine, and supplies of food have been obtained from even the most distant countries in much greater quantities than could have been anticipated. Still, however, so far as the laborer is concerned, the age of golden plenty seems as remote as ever, and in the humble homes of the poor a not less constant war has to be waged against penury and want. From the bitter disappointment thus engendered, there has not unnaturally arisen a feeling of deep distrust of the fundamental principles on which society is based. A wide-spread opinion has grown up that it is no use relying upon the old remedies and the old nostrums. Resort must be had to far more radical changes; the very foundations on which our social system rests must be altered. This feeling of unrest, this desire to do away with the existing order of things, is sure to arise when the mass of the people become dissatisfied with their condition. On many previous occasions they had more reason than now to attribute their misfortunes to political causes. Unjust and vexatious taxation, combined with a reckless expenditure of a profligate and corrupt court, at length accumulated such misery upon the French people that an irresistible movement arose to sweep away every established institution. The first French revolution ought not consequently to be regarded as an uprising to substitute a republican for a monarchical form of government. The people, driven to a frenzy of despair by physical suffering, were not in a frame of mind calmly to reason upon well-devised schemes of relief. They wished to see everything changed, and they consequently waged an unrelenting war with the existing state of things. Again, the revolutionary movement in 1848, although it caused the fall of so many dynasties, was not so much a political as a social and economic movement. The dissatisfaction which prevailed at this period was not mainly due either to unjust laws or vexations taxation. It was the manifestation of an intense desire fundamentally to change the principles from which the vast Industrial system of the present time has been developed. *Competition and the separation of capital from labor may be regarded as the most prominent characteristics of modern industry.* It might, therefore, have been almost foreseen that these characteristics would be singled out for special reprobation, when the general condition of the industrial classes became unsatisfactory, and the great mass of the people in every country felt that they had to bear an undue amount of suffering, the hardest toil yielding to them a most inadequate share of comfort and enjoyment. There consequently arose a determination to substitute for the industrial system then existing one from which not only competition would be absent, but one in which capital and labor would be united, instead of being separated by the rivalry of hostile interests. The industrial ideas which were thus sought to be carried into practical effect may be described under the general name of

socialism or communism. The very mention of these words will no doubt to many minds suggest much that is ominous of danger, and much which is opposed to the well-being of society. Prejudice, however unfounded, often spreads so fast that it becomes most formidable to combat. To many, socialism and communism are supposed to be synonymous with confiscation and spoliation. A socialist exists vaguely in the minds of the comfortable classes as a sort of abandoned creature who wishes to live by robbing other people of their property, and who desires to see general pillage introduced. *In the present state of mankind, socialism would do nothing to increase the well-being of the people, and the socialistic schemes which have been propounded would inevitably end in disastrous failure. But, although this may be fully proved, yet nothing can be more unjust than to throw aspersions upon the character of socialists, and to misinterpret their motives. They no doubt have been mistaken enthusiasts, but it is impossible to deny that their motives have been pure and their aims lofty.* They have been animated by a desire which must have been felt by all who are not depraved by selfishness, to lighten poverty, to alleviate human suffering, and to diffuse more general happiness among mankind. The injustice which is so generally done to socialists will be perhaps more clearly perceived when attention is directed to the origin of the socialistic sentiment.

—It has been often remarked that the more a country advances in wealth, the wider and deeper seems to be the gulf between the rich and the poor. Not only is this shown by the fact that the augmentation in the number of the very wealthy is not accompanied either by a corresponding decrease in the number of the very poor, or by a proportionate diminution of their sufferings; but the separation between classes seems to become intensified in other ways. The time was when those who were engaged in any industry, master, foreman and workmen, dwelt near to each other, and between them there were often intimate personal relations. which have now completely passed away. Although the introduction of steam and the application of various mechanical inventions have completely revolutionized the conditions on which industry is carried on, yet there has probably been a not less marked change in the social and industrial life of the country. The supplanting of hand-loom weaving and pillow-lace making by vast manufactories filled with complicated and costly machinery, does not represent a greater change than that which is indicated by a comparison between the present mode of life of men of business and that which was adopted by them formerly. The merchant and the manufacturer used to reside close to where the daily work of their lives was carried on. Now, however, each year a greater distance separates the homes of the master and his workmen. Many who have accumulated princely fortunes seldom go within miles of the homes of any of their workmen. All these considerations show that the relations between employers and employed have gradually lost their personal character, and have become more and more commercial. This being the case, there can, of course, be little friendship or comradeship; there is too little of that personal sympathy which often arises among those who are fellow-workers at a common object; but, on the contrary, labor being bought and sold in the same way as any commodity of commerce, the only feelings between employers and employed are too often those which exist between the buyers and sellers of merchandise. It must not, however, be supposed that the present has thus been contrasted with the past with the object of implying that there has been no improvement, nor must it be imagined that it would be desirable to restore a state of

things which would in many respects be incompatible and incongruous with the requirements of modern times. But being perfectly ready to admit that there has been progress, yet this should not cause us to lose sight of those drawbacks associated with commercial development, which make the present in some of its aspects compare unfavorably with the past. It is, of course, far more prudent carefully to consider these drawbacks with the view of reaching the causes which produce them; for if this can not be done, if commercial progress is always to be presented to the mass of the people in no other aspect than that in which they now see it, there will certainly arise not only dissatisfaction, but a desire to effect organic changes in the constitution of society. Some idea may be formed of the extent to which discontent must be engendered, when every workman must be constantly reminded of the fact, that, while numbers are unable to obtain a sufficiency of the necessaries of life, others have so much superfluously wealth that they are able to squander it in useless and mischievous luxuries, and never devote themselves to one hour's useful employment. The more the distance widens between the rich and the poor, the more the belief is certain to gain ground that there is something radically wrong in the laws which regulate the distribution of wealth. It can not be wise and just, it is plausibly said, that the produce which the earth yields should be so apportioned among its inhabitants that, whereas many have far more than they need, others have to endure the bitter pangs of want. It is urged that if there was more equality in this distribution, there would be enough for all; if superfluities were taken away from the rich. and given to the poor, all would then enjoy adequate comfort. Those who are influenced by such ideas as these are at once, by natural sequense, led to the conclusion that the circumstances which produce inequalities in wealth are chiefly responsible for all the social and economic evils under which a nation suffers. It is consequently proposed that society should be regulated on principles which would. as far as possible, prevent inequalities in wealth. A feeling thus arises in favor of either abolishing, or greatly curtailing the rights of private property. Various schemes have, from time to time. been propounded with the object of giving effect to these ideas. Those who would not shrink from applying what they conceive to be a complete remedy, propose that society should be reconstituted on an entirely communistic model; associations being established in which there should be no private property, the wealth produced being the joint property of the community. Others suggest less thorough remedies, and propose, that, after a due maintenance has been guaranteed to all the members, any surplus which may remain might be appropriated as private property. St. Simon and Fourier in France, and Robert Owen in England, have identified their names with these communistic experiments. It is scarcely necessary to remark that all such attempts have hitherto failed to obtain any practical success. In fact, it is not too much to say that in the present state of mankind failure is inevitable. Men are not yet sufficiently advanced to work with as much zeal for the good of others as for their own advantage. Those who are industrious will not long remain content if they see that a considerable portion of the fruits of their labor is devoted to the support of those who are as well able to work as themselves, but who are so indolent and improvident that they rely upon others for their maintenance. It must, however, be remembered that such men as St. Simon, Fourier and Owen never proposed the confiscation of other people's property. They always contemplated that their communistic societies should legitimately acquire the land and other property upon which they first commenced operations. Robert Owen, in fact, purchased an estate in Hampshire for a

considerable sum of money, upon which he attempted to give practical effect to his socialistic ideas. Although these schemes have completely failed, yet failure has done little to weaken the sentiment which gave them birth. The ideas from which they have originated have not been and probably will not be ever extinguished. Each fruitless endeavor to carry them out not only stimulates a fresh development, but also causes them to assume another form. Unlike the socialists of former days, those who are at the present time under the influence of the socialistic sentiment are beginning to place their chief reliance upon state intervention. They seem to think that if individual efforts have been unable to achieve success, this provides the most cogent argument in favor of an appeal to the state. This is the reason which induces me to ascribe such grave importance to modern socialism. There was no cause to feel alarm or misgiving as long as socialism simply caused certain experiments to be tried by enthusiasts, against whom no other charge could be brought than that they showed too much zeal in their efforts to improve society. Even their failure did something to benefit mankind. It can scarcely be doubted that in these first socialistic schemes were sown the germs of a social and economic movement which has already effected great good, and which promises more for the future than any other agency yet brought into operation. It is well known that some of those who were the most strongly imbued with the teaching and doctrines of Robert Owen were the founders, and afterward the managers of our most prosperous co-operative institutions. Co-operation is as yet only in its infancy; it has hitherto been generally applied to the distribution of wealth, but rarely to its production. Enough, however, has been seen of its effects to justify a confident belief that its general adaptation to industrial undertakings would probably mark the greatest advance ever yet made in human improvement. Labor and capital, instead of being hostile interests, will be united, and by this union an incalculable stimulus will be given to production. \* \* \*—Until quite recently there was one most marked and important difference between the continental and the English workman. The former placed his chief reliance on the state, whereas it was the aim of the latter to free himself as much as possible from government control. One of the first uses which the French workmen made of their success in the revolution of 1848, was to compel the government to establish national workshops, and to advance loans to co-operative associations. One of the first things which the English workmen did, when they obtained political power by the reform bill of 1867, was to call upon parliament to repeal all the laws which interfered with the formation of voluntary trade combinations. The continental workman was constantly looking to the state as he would to a powerful friend or benefactor to aid and reward him. The attitude of the English workman has, until recently, been one rather of hostility toward the state. His habit has been to claim freedom from government control, so that he might have a free and open field for the exercise of his energies. This difference, however, between English and continental laborers is becoming less marked. It can scarcely have escaped notice that during the last two or three years English workmen have with much greater frequency asked for government assistance; and the demands for state intervention are constantly enlarging. There are many circumstances which have contributed to bring about this change. In the first place, it is probable, as previously indicated, that the growing tendency shown by so many of our artisans to rely upon the state may be traced to the false hopes excited, some years since, by those who taught the people to believe that the great end to be striven after was a larger production of wealth. This augmented production of wealth has taken place, and when

it is found to be unaccompanied by the predicted improvement in the condition of the poor, there is naturally aroused keen disappointment, and there is diffused through the industrial classes a general feeling of distrust. They get into just that frame of mind which causes them to give a ready acceptance to any doctrines differing from those by which they suppose they have been deceived. The opinions in favor of state intervention so current among continental workmen now consequently find a more ready acceptance in this country; these opinions are, in fact, transplanted to our shores under such favorable circumstances that, for a time at least, they seem to have taken root among us. \* \* \*—Fully, however, admitting that among those who hold these opinions are still to be found some of our ablest artisans, yet it can scarcely be denied by any who observe the signs of the times that, so far as England is concerned, the demands for state assistance are each year assuming more formidable proportions. This will be sufficiently shown by enumerating some of the many things which the state is, with increasing urgency, asked to supply for the people. It is now, for instance, often said that the government should pay the passage-money of emigrants; should furnish work at good wages for the unemployed; and should secure for laborers comfortable houses and wholesome food at a reasonable rate. Such proposals as these represent the opinions of those who may by comparison be regarded as moderate in their demands. \* \* \*—In one respect this growing tendency to rely upon the state is fraught with greater danger to England than to many other countries. This is not an appropriate place to discuss the advantages and disadvantages of government by party. There is, however, one aspect in which party government may be viewed, as having a very direct bearing upon the subject we are now considering. The two great political sections who contend for place and power have a constant temptation held out to them to bid against each other for popular support. [May not the same be said of political parties in the United States?] When therefore, it is perceived that any particular set of opinions has obtained a great hold upon the masses, place and power will seem to be the lot of the political party which promises to do most to give effect to these opinions. Under the pressure of this temptation, it may, consequently, any day happen that statesmen will accept doctrines and pursue a policy against which, if their judgment was unbiased, they would be the first to protest. This is a peril which hangs over this country, and recent events have shown that I am not conjuring up an imaginary vision of coming danger. During the last year [this was written in the early part of 1872] direct encouragement has been given to some of the most mischievous and alarming features of modern socialism by one who is, and by another who has been, a responsible minister of state. The budget of 1871 was framed in accordance with some of the financial principles of the international association; and no member of this organization ever made more reckless promises to the proletariat than did Sir John Pakington, when, as president of the social science association, he told the workmen, in his address at Leeds, that parliament ought to secure for them comfortable homes and wholesome food at reasonable prices. A few months before Sir John Pakington enunciated these mischievous doctrines, the people had been virtually told by the chancellor of the exchequer, that if they make some demand, the granting of which involves additional expenditure, the majority shall avoid contributing a single shilling toward the outlay, and shall be enabled to throw the whole burden upon the payers of income tax. Under such fostering care it is not surprising that there is rapidly growing up in this country an abnormal development of that new form of socialism, the cardinal principle of which is that all social

improvements must be effected by state agency, and must also be carried out by public money."—HENRY FAWCETT.

[110.] This is almost the system extolled by the famous German agitator, Ferdinand Lasalle. What is said lower of Proudhon applies to some extent to Karl Marx.

#### Footnotes for SOVEREIGNTY

[111.] "The words sovereign and sovereignty," says Theodore D. Woolsey ("Political Science," etc., New York, Scribner, Armstrong & Co., 1878), "are applicable to persons and to states; moreover, from the intimate connection between the state as a political organism and the territory where the laws prevail, the territory itself may be called a sovereignty, or the expression may be explained in the last case with greater reason as denoting something held in sovereignty, a province or district which is not dependent. The first nation in the world was that of being above or higher than others in power and jurisdiction. Thus, the sovereign ruler is above all other officers or magistrates, and above all the individuals belonging to the people. The quality of sovereignty, however, does not necessarily imply unlimited power or unchecked power; much less undelegated power. It can be used of all kingly and imperial power from that of a chief officer of state who is absolute, to the king who can do nothing without a legislative assembly. It has not, however, if we do not err, even been applied to the head of a democratic state whose office ceases after a term of years. For the most part, when used at present, it is either of dignity, denoting the superior person in the states or nation, or else it is used of a ruler; who can control the policy of a nation toward other nations in matters of diplomacy. Thus, the king or queen of England, although having, in matter of fact, an exceedingly limited power, is called sovereign to denote the dignity of the office as above all others in the kingdom, or as having constitutionally the power to control foreign relations, a power unchecked in theory, yet practically not expressing the sovereign's personal will.

—The abstract conception of sovereignty is thus unfolded by Mr. John Austin in the sixth of his lectures on "The Province of Jurisprudence," (1., p. 226, ed. 3): 'If a determinate human superior, not in the habit of obedience to a like superior, receive *habitual obedience* from the *bulk* of a given society, that determinate superior is sovereign in that society, and the society (including the superior) is a society political and independent. To that determinate superior the other members of the society are *subject*; or on that determinate superior the other members of the society are *dependent*. The mutual relation which subsists between that superior and them may be styled the relation of sovereign and subject, or the relation of sovereignty and subjection.' This definition looks at fact simply, and has nothing whatever to do with right. The *habitual* obedience would seem to be absolute, but persons called sovereigns at the present day have no right to require habitual obedience except within a very narrow sphere. *Subjection* is now used, if used at all in politics, of relations that are not personal, the term being retained while the feudal notion has left it. And again, few, I presume, of the subjects of the sovereign of Great Britain would allow to themselves be called dependents on the sovereign.

—But what is the sovereignty of a state? and how does it comport with the

sovereignty of a ruler? In the intercourse of nations, certain states have a position of entire independence of others, and can perform all those acts which it is possible for any state to perform in this particular sphere. These same states have also entire power of self-government, that is, of independence upon all other states as far as their own territory and citizens not living abroad are concerned. No foreign power or law can have control except by convention. This power of independent action in external and internal relations constitutes complete sovereignty. This definition of sovereign states would be inconsistent with the claim of sovereignty which has been set up in this country by communities called states, and in the treaty of 1783 with Great Britain called sovereign states; which, however, never made a treaty separately with foreign nations, never belonged in their separate capacity to the community of nations, and are incapacitated by the constitution from performing any international act; and which, moreover, by the same constitution, are precluded from doing many things within their own territory and in the exercise of state power, which sovereign states do and must do. This use of the word *sovereignty*, and, indeed, the use of the word *state*, shows the poverty of political language, but has helped on far greater evils than that of supplying false premises for syllogisms ending in secession.

—Is the sovereignty of the state a term emanating from the sovereignty of the ruler? or is the ruler properly called a sovereign only as representing the state? The state stands for an untold amount good to be secured to present and future generations by a just and wise government, at the head of which the ruler is placed. He is a means for a great permanent end; he dies, and some one else succeeds to him, and not by his will, for the most part, but by the law of the state. He disobeys the law, and seeks to overturn it; another is substituted for him, and all things go on, it may be, better than before. All this shows that the ultimate power in theory rests with the state or the people constituting it, and that the prince is a delegate or deputed sovereign. This of course touches the source of his power, and the object for which it is granted. The power itself may be absolute, and the grant may have been made in remote ages. The prince is a vicar of God, just as receivers of tribute are 'God's ministers, attending continually upon this very thing'. But he is such because the state and its authority are from God, and because he fulfills the end for which the helm of state is intrusted to him. If some democrats of the French school have talked of cashiering kings, the grossness of taste, and want of reverence for old dignities, were the result of an ill use of sovereign power. If the French kings had felt that they were created to minister rather than to be ministered unto, that their power, called sovereign, was delegated to them, the outrages of an extreme reaction against their sway might been spared to the world."

#### Footnotes for SPAIN

[112.]The national church of Spain is the Roman Catholic, and the whole population of the kingdom, with the exception of about 60,000 persons, adhere to the same faith. According to article twelve of the constitution of 1876, a restricted liberty of worship is allowed to Protestants; but it has to be entirely in private, all public announcements of the same being strictly forbidden. The constitution likewise enacts that "the nation binds itself to maintain the worship and ministers of the Roman Catholic religion". Resolutions of former legislative bodies, not repealed in the constitution of 1876,

settled that the clergy of the established church are to be maintained by the state. According to official returns laid before the cortes in July, 1876, the number of places of worship and schools of Spanish Protestants were as follows: fifty-three places of worship; ninety schools, with 2,500 enrolled members, and 8,000 attendants at service on Sundays at the various chapels; 3,000 children. The poorest receive Protestant education.—F. M.

[113.] It was found, at the general census of 1860, that of the total population of the kingdom, there were 2,414,015 men and 715,906 women able to read and write; 316,337 men and 389,211 women able to read, but not to write; and that all the rest, upward of 5,000,000 men and 6,800,000 women, could neither read nor write. At the preceding census, of 1846, the total number of persons of both sexes, able to write, was found to be on more than 1,221,001, while the total number able to read was only 1,898,288, or considerably less than one-fifth of the population.

—In 1878 there were stated to be 29,600 schools in Spain for primary education, with 1,611,000 pupils. Middle-class education is given in fifty-eight public colleges, by 757 professors, to 13,881 pupils. In first-class education the most remarkable feature is the large number of law students, namely, 3,755 in 1859-60, divided among ten faculties. There were, at that date, ten faculties of literature and philosophy, with 234 students; seven faculties of sciences, with 141; four faculties of pharmacy, with 544, seven faculties of medicine, with 1,718; and six faculties of theology, with 839 students—in all, 6,181 students. The expenditure for public education by the government amounted, on the average of the last years, to rather less than £250,000.—F. M.

[114.] The army of Spain, reorganized in 1868, after the model of that of France, was modified as to its organization by subsequent laws in 1877, 1878 and 1882. Under the new military law, the armed forces of the kingdom consist: 1, of a permanent army; 2, of a first or active reserve; and 3, of a second or sedentary reserve. All Spaniards past the age of twenty are liable to be drawn for the permanent army, in which they have to serve three years; they then pass for three years into the first or active reserve, and then for six years into the second reserve. Any one may purchase exemption from service by a payment of about \$300.

—The strength of the permanent army of the peninsula for 1882-3 was put down at 94,810 men; while for Cuba the number was 26,579; Porto Rico, 3,318; and the Philippines, 10,035. Of the infantry there are 140 battalions, and of the cavalry twenty-four regiments; six regiments of artillery, and ten battalions of pioneers. The civic guard consists of fifteen regiments, with 780 officers and 14,756 men

#### Footnotes for SPOILS SYSTEM

[115.] The phrase "merit system" was first used in Eaton's "Civil Service in Great Britain," and it is sufficiently defined by saying that it is everywhere the very opposite of the spoils system, in both theory and method. The merit of a candidate, the merit of a bill or the merit of a policy are equally the basis of all just claim for support. A system which everywhere, in politics and official life, holds merit to be a decisive

test, must everywhere recognize the public interests as paramount. Such a system is as thoroughly democratic and republican as it is thoroughly just.

#### Footnotes for STATISTICS

[116.] Statistics is the picture or representation of social life at given periods of time, and especially of the present time, drawn on a scale in accordance with the laws of development discovered by means of the theoretical sciences: political economy, the science of finance, administrative science, etc. Schölzer calls statistics *history standing still*. Statistics, as thus defined, is as far removed from saying too much as from saying too little. To give a complete tableau of its object, statistics should, of course, take in the life of a people in all its aspects. But it should look upon such facts only as its own property, the meaning of which it is able to understand; that is, such only as can be ranged under known laws of development. Unintelligible facts are collected only in the hope of penetrating into their meaning in the future, by comparing them with one another. In the meantime, they are to the statistician what unfinished experiments are to the investigator of nature.

—The view is daily gaining ground, that statistics should be occupied (without, however, confining themselves to them) with *present* facts, with "facts affecting society and the state which are susceptible of being expressed in figures." The more deceptive the immediate observation of an individual, isolated fact is, in cases in which a great number of simultaneous or scattered individual, isolated facts of national life are observed, the more important it is to discover proper numerical relations, by noting all the like acts or experiences of men, the time and place in question, and the relation of the aggregate of these phenomenon to the sum total of the population, or to the sum total of corresponding phenomena in other places. When this is done, and the facts are completely enumerated, and correctly recorded, there is no danger of subjective error. And this species of "political and social measurement," as Hildebrand calls it, may be applied not only to quantities, but to all qualities accessible to the observation of the senses; since the individual or isolated qualities of the things enumerated may be again made objects of enumeration. Without doubt, this mode of numerical procedure is the most perfect for all those divisions of statistics in which it can be followed, and hence it should be our endeavor to make the numerical side of statistics as comprehensive as possible. But one side of a science is not a science itself. As there is no natural science proper, called microscopy, embracing all the observations made by means of the microscope, so, care should be taken not to deduce the principle of a science from the chief instrument it employs. There will always be many and important facts in national life, which can not be subjected to numerical calculation, although they may be established with the usual amount of historical certainty. Were statistics to be limited in the manner mentioned above, it would remain a collection of fragments, and, instead of being a science, become a method. Besides, it is evident, that of statistics in general, economic statistics constitutes a chief part, and precisely the part most accessible to numerical treatment. As economic statistics needs to be always directed by the light of political economy, it also furnishes the latter with rich materials for the continuation of its structure, and for the strengthening of such foundations as it already has. It is, moreover, the indispensable condition of the application of economic theorems to

practice."—WILLIAM ROSCHER

Footnotes for STRIKES AND LOCKOUTS.

[117.] This is substantially the classification of Sir Rupert Kettle, in his admirable work, "Strikes and Arbitrations," London, 1866

[118.] This is Prof. T. E. Cliffe Leslie's definition. It does not seem to me that "a number of workmen in combination" are essential to a strike, and all strikes, using the word as Prof. Leslie does, to indicate strikes and lockouts, are certainly not refusals of workmen to work on the terms offered by the employers.

Footnotes for SUBSIDIES.

[119.] Owing to a misprint in the original report to congress, both this sum and the total are usually quoted half a million dollars too large

The adjective "white" before "male" in some constitutions, adopted before the 15th amendment, is here omitted.

a. Declarant means a male person of foreign birth, who shall have declared his intention to become a citizen of the United States, conformably to the naturalization laws of the United States. b. "Immediately preceding the election at which he offers to

vote." c. "The general assembly may prescribe a longer or shorter residence in any precinct or county, or in any ward in any city or town having a population of more than 5,000 inhabitants, but in no case to exceed three months." (Const., Art. VIII., Sec. 1.) d. "Provided no native of China shall ever exercise the privileges of an elector." e. "Provided that no person shall be denied the right to vote at any school district election, or to hold any school district office, on account of sex." (Const., Art. VII., Sec. 1.) And "The general assembly may enact laws to extend the right of suffrage to women of lawful age, and otherwise qualified. No such enactment shall be of effect until submitted to the vote of the qualified electors at a general election, nor unless the same be approved by a majority of those voting thereon." (Idem, Sec. 2.) f. "In the county, town or city in which he offers to vote." g. "The legislature may provide by law that any woman of the age of twenty-one years and upward may vote at any election held for the purpose of choosing any officers of schools, or upon any measure relating to schools, and may also provide that any each woman shall be eligible to hold any office pertaining solely to the management of such schools." (Const., Art., Vii., Sec. 8.) h. "Who have adopted the customs and habits of civilization." i. "persons of Indian blood residing in the state, who have adopted the language, customs, and habits of civilization, shall have been pronounced (by any district court of the state)capable of enjoying the rights of citizenship." j. "If twenty-two years of age or upward." k. "Provided, that no person shall at any time be allowed to vote in the election of the city council of the city of Providence, or upon any proposition to impose a tax, or for the expenditure of money in any town or city, unless he shall, within the year next preceding, have paid a tax assessed upon his property therein, valued at least at \$134." l. "Who have once been declared by law of congress to be citizens of the United States, and civilized persons of Indian descent, not members of any tribe."

(See notes to this table on p. 337.)

a.

A crime punishable by death or imprisonment in a state prison. b. The constitution adopted by California in 1879 expressly disfranchises for infamous crime, embezzlement or misappropriation of public money, and duelling, and says that laws shall be made to exclude from the right of suffrage persons convicted of the above starred crimes. c. Theft is the term used in the constitution of Connecticut. d. The legislature may make the forfeiture of the right of suffrage a punishment for crime. e.

No person who has been dishonorably discharged from the service of the United States is qualified to vote or hold office in Kansas. f. Since 1876 "the legislature may enact laws excluding from the right of suffrage, for a term not exceeding ten years," for this crime at any election. g. These crimes forever disqualify for voting. h. "Under the law of the state, or of the United States, unless restored to civil rights." i. "In any state or territory of the United States, unless restored to civil rights," j. The constitution of Nevada, Art. Iv., Sec. 10, makes intelligible for office persons convicted of embezzlement, or defalcation of public funds, or bribery, and empowers the legislature to make these crimes punishable as felonies; and by Art. II., Sec. 1. clony disfranchises. k. The constitution of New Jersey, Art. II., sec. 1. says that "no person convicted of a crime which now excludes him from being a witness, unless pardoned or restored by law to the right of suffrage, shall enjoy the right of an elector." The laws of the state make persons convicted of the tabulated crimes incompetent as witnesses, and if the crime is perjury or subornation of perjury, a pardon does not remove the incompetency. l. Disfranchises "*at such election*," as do all corrupt offers to give or receive money or other valuable thing for a vote, in both New York and Pennsylvania. m. Any person convicted of this offense "shall, in addition to any penalties provided by law, be deprived of the right of suffrage absolutely for a term of four years." n. "Any elector who shall receive any gift or reward for his vote, in meat, drink, money, or otherwise, shall suffer such punishment as the laws shall direct." o. "Subject to such exceptions as the legislature may make." p. "Any elector who shall receive any gift or reward for his vote, in meat, drink, money, or otherwise, shall forfeit his right to elect at *that time*, and suffer such other penalty as the law shall direct." q. "Petit larceny," r. "No person who is under conviction of treason, felony or bribery in an election, shall be permitted to vote *while such disability continues*." (Const. of W. Va., Art. IV., Sec. 1) This phrase, "while such disability continues," has not received judicial interpretation in West Virginia, but is constructed by election officers to mean *during imprisonment*. s. "These crimes are treason, felony, and the '*crimen falsi*.'"

—which term includes crimes which involve a charge of such falsehood as may injuriously affect the public administration of justice by the introduction therein of falsehood and fraud, such as forgery, perjury, subornation of perjury, or conspiracy to procure the absence of a witness." t. And persons "who may be under interdiction."

Footnotes for SWEDEN.

[122.]The commercial intercourse of Sweden is chiefly with Great Britain, as regards exports, and, next to it, with France and Denmark. As regards imports, the commercial intercourse is largest with Great Britain, Germany, Denmark, Russia, Norway and the United States, in the order here indicated. The imports consist mainly of textile manufactures, coal, and colonial merchandise, the last largely on the increase, while the staple exports are timber, bar iron and corn. Both the imports and exports more than doubled in the ten years from 1870 to 1880, the total imports rising from £7,500,000 to over £16,000,000, and the total exports from £5,000,000 to £12,500,000.

—The commercial navy of Sweden, at the end of 1880, numbered 4,385 vessels, of a

burden of 560,693 tons, of which total 3,613 vessels, of 474,095 tons burden, were sailing vessels, and 772 vessels of 86,598 tons burden, were steamers. The port of Göteborg had the largest shipping in 1879, namely, 277 vessels, of 87,674 tons, and next to it came Stockholm, possessing 253 vessels, of a total burden of 31,668 tons. In 1864 Stockholm had 110 vessels, of 28,216 tons, registered for foreign trade, and Göteborg 124, of 35,626 tons: so that the shipping of the latter port showed the largest increase in the course of the fourteen years.

—Mining is one of the most important departments of Swedish industry, and the working of the iron mines in particular is making constant progress by the introduction of new machinery. These were raised in the year 1878, throughout the kingdom, 15,821,520 cwt. of iron ore from mines, besides 115,585 cwt. from lake and bog. The pig iron produced amounted to 7,845,578 cwt., the cast goods to 489,454 cwt., the bar iron to 4,657,060 cwt., and the steel to 1,476,061 cwt. There were also raised in the same year, 2,983 lbs. of silver, 25,565 cwt. of copper, and 947,635 cwt. of zinc ore. There are not inconsiderable veins of coal in the southern parts of Sweden, giving 4,429,889 Swedish cubic feet of coal in 1878.

—Within recent years a network of railways, very important for the trade and industry of Sweden, has been constructed in the country, partly at the cost of the state. The state railways include all the main or trunk lines, the chief of which are the North Western, connecting the capitals of Sweden and of Norway; the Western, between Stockholm and Göteborg; the Southern, terminating at Malmö, opposite Copenhagen; the Eastern, from Stockholm to Malmö; and the Northern, passing from Stockholm, and connecting the capital with the north of the kingdom. The following table gives particulars concerning the length and cost of construction of all the Swedish railways open for traffic on Jan. 1. 1880, distinguishing the railways belonging to the state and the private railways:

RAILWAYS	Length in Eng. Miles.	Cost per Eng Mile
State railways .....	1,203	£ 8 446
Private railways :		
Gefle-Dalu .....	57	9,023
Upsala-Gefle .....	81	5,160
Frövi-Ludvika .....	61	10,249
East Vermland .....	42	5,371
Kaping-Hult .....	44	6,968
Stockholm-Vestèras-Bergslagen .....	151	4,787
Nora-Karlskoga and Nora-Ervalla .....	81	5,697
Vestervik-Atvidoberg-Berabo .....	57	.....
Uddevalla-Venersborg-Herrljunga .....	58	4,615
Näsijö-Oskarshamn .....	92	6,551
Vexjö-Karlskrona .....	70	4,084
Oxelösund-Flen-Vestmanland .....	97	6,816
Karlshamn-Vislanda .....	48	2,670
Hessleholm-Helsingborg .....	49	4,630
Bergslagens .....	302	7,400
Ystad-Eslöv .....	47	4,535
Forty-seven other private lines .....	088	.....
<b>Total .....</b>	<b>3,528</b>	<b>.....</b>

In the end of 1881 the total length of the railways of Sweden opened for traffic had increased to 3,830 English miles, of which 1,365 miles belonged to the state.

—All the telegraphs in Sweden, with the exception of those of private railway companies, belong to the state. The total length of all the telegraph lines at the end of 1881 was 11,598 kilometres, or 7,210 English miles, and the total length of telegraph wires 29,575 kilometres, or 18,380 English miles. The number of telegraphic dispatches sent in the year 1881 was 1,118,081, of which number 591,576 were from and for Sweden, 398,531 from and for other countries, and 128,271 in transit.

—The Swedish postoffice carried 68,731,121 letters, postcards, journals, etc., in the year 1881. The number of postoffices at the end of the year was 1,835. The total receipts of the postoffice in 1880 amounted to 5,132,211 kroner, or £285,122, and the total expenditure to 4,463,283 kroner, or £247,960, leaving a surplus of 668,928 kroner, or £37,162.

#### Footnotes for SWITZERLAND

[123.]The *abzugsrecht* is the old right of the state to confiscate a certain part of the fortune of a citizen who proposes to leave the country.

[124.]The act which establishes the neutrality of Switzerland is dated Nov. 20, 1815.

#### Footnotes for TAXATION

[125.]"But it may be said, that the state in taxing personal property situate beyond its territory, does not in fact tax the property, but the owner, over whom the state has jurisdiction in respect to such property. In answer to this claim, attention is here asked to the following extract from an argument made some years ago by Mr. G. P. Lowrey, of New York, before a committee of the legislature of New York, when this subject was up before them for consideration. 'This claim,' he said, 'involves a dangerous inaccuracy, and arises from a confusion of the idea of the assessment with the idea of the tax. These two stand upon altogether different bases. The *assessment* is to the person in respect to the property; but the *tax* is to the property in respect to itself alone. In the order of consequence a tax goes before an assessment. A tax stands upon an existing relation between the property and the state, as protector and protected, and is that portion of the public burden which the property ought to bear because of that existing *relation*. An assessment stands upon the existing relation between the property and its owner or possessor; it follows the tax, and is merely the method of securing it. The danger, in saying that the tax is to the *person in respect of his property*, is, that, by the form of the expression we justify an assessment upon a person for all property indiscriminately. We transpose the subjects, and make the law seek out the person, and then tax him according to his property, instead of first seeking property which it has a right to tax, and then as a secondary matter, a person to whom it may be assessed. Even if a knowledge of the property is obtained by inquiry addressed to the owner in the shape of a general assessment, still the rationale of the matter presupposes the right to tax on account of the property and our relation to it directly. If we disregard this rationale, we may, perhaps, register an assessment where we are not entitled to levy a tax.'

—The person to whom the assessment is made need not be the owner. He may be the agent, trustee, guardian, executor or administrator. This is because the property, which owes the tax by reason of being protected, has not hands wherewith to take from itself a portion of itself, to pay for protection to be accorded to the remainder. Therefore the law, following the property to get the tax, makes its demand upon whoever it finds in possession, without inquiring upon what interest the property is based. This it does, ignoring all persons beneficially interested in the title, even the owner himself. 'Every person,' says the statutes of New York, 'shall be assessed, etc., for all personal property owned by him, including all property in his possession, *or under his control*, as agent, trustee, guardian, etc.'

—Thus it will be seen, that, for the purpose of assessment, possession is a title superior to ownership. And I now reiterate, that, according to the theory of our government, a tax stands upon the just obligation of all property to contribute to the support of the power which protects it; but that the assessment stands upon the possession or power of the person assessed, over the property taxed. This may be further illustrated. Movables can never be out of the actual or constructive presence of some one, and, therefore, there is always a person *in esse* to whom the assessment may be made. But the case is very different with unmovables, and therefore, lands are

often taxed and assessed by their own name and designation, and specifically sold to satisfy the specific assessment, no person's name anywhere appearing in the proceedings.

—Keeping this vital distinction between an assessment and a tax clearly in view the mind will come by easy steps to an understanding of how it is that a tax, to a man who has no property in the state, is a tax upon his person. Process is the eye of the law. Its vision is limited by territorial boundaries. Whatever does not exist within that limit, does not, for any purpose of law, exist at all. The rich man, whose property is in Europe and the pauper, whose property is nowhere, are then equal, as persons, before the law. A tax upon a pauper would be a personal tax. A tax upon the rich man is, by unimpeachable parity of reason, the same. Such a tax would be a gross solecism on our system. The philosophy of our plan of voluntary political association, is that all individuals, and all the values within a community, shall aggregate into one mass all the power which they separately contain, which sum total shall constitute a sovereignty of the whole. This sovereignty—the soul of the state, which can not be impaired, and the state survive—reflects back upon its constituents, in detail, all that it has received from them. What it receives, and what it returns, is of two kinds, as to both source and object, viz., individual service *to* the government, and protection to the individual *from* it. Thus, in his individual capacity, a man is bound to perform military service, and the state, by the military arm, is bound to protect him from invasion. He is bound to do jury duty, and the authorities are bound, upon his demand, to provide him a jury. He is bound to aid the sheriff, and the sheriff is bound to execute process in his favor by *posse comitatus* if necessary. These personal services correspond to those which in feudal times the mesne lord holding a frank tenement owed the lord paramount. They can not be compounded for, for their value consists in their being rendered in kind. *Their performance is the only price which the citizen pays for his citizenship.* The terms are not only consistent and harmonious with our general scheme of government, but are highly politic. They are a liberal invitation to all men to come and add to ours their lives, their hopes, their strength, labor and courage, that we may build up a nation. To all political privileges we admit each one by virtue of his being a man, free born and of lawful age, we ask him nothing concerning his property, unless his property asks something from us."

[126.] A copy of an assessment roll of the time of Edward III. (1329-67) given by Lingard in his history of England, contains a list of articles, down to a towel and a bench; and the historian notes that in the returns are carefully mentioned the very rooms in which the articles were found, and that there were no exemptions except one suit of clothes for each person, which were supposed to be included in the tax levied on the poll or person.

[127.] "It is claimed that each individual owes the state annually a certain sum of money in the way of taxes, proportioned to his entire property. If he voluntarily pays, he escapes arbitrary measures. If he declines to pay, or tries to avoid payment, he has no just cause to complain if he is regarded in the light of a criminal, or if the same arbitrary measures are used to collect his tax, as if it were a debt owing by one citizen to another. But let us examine this averment. If the defaulting tax payer is to be regarded as a criminal, and as such placed in the worst possible light, be certainly

ought not to be deprived of the privileges of a criminal; which are, a right to a public investigation according to the rules of evidence adopted by free and enlightened communities, a right to be heard before condemnation, and the right to be presumed innocent of having property subject to taxation until the fact is ascertained otherwise by legal proof. But under the existing tax laws of most of the United States there are not accorded to the tax payer the privileges of a criminal; for no tax can be assessed on a large proportion of the personal property of the state according to any rules of legal evidence that any common law court would adopt. No assessor, under the laws of New York, for example, in assessing personal property, can act judicially. The law gives him no power to obtain legal testimony of a character that is admissible in a court; he must act the part of an arbitrary despot against an inculpated tax payer, or not act at all, and his conclusions for acting must be reached at best by the testimony of those who have no means of knowing anything, in a legal sense, about the subject matter under investigation. It seems clear, therefore, that any attempt to tax without legal evidence is an act of usurpation or despotism, wholly antagonistic to the principles of a free government, and that it is a mockery to characterize such acts as, in any sense, judicial proceedings. Nor does the right to reduce or regulate the assessment by the oath of the tax payer relieve the law in any degree of its unequal and despotic character; for every individual holding public office knows that oaths, as a guarantee of truth in respect to official statements, have ceased to be of any value. The assessments made according to the oaths of parties, furthermore, are not made according to legal evidence, upon examination and proofs; but according to the will and secret caprice of each tax payer, instigated by his selfishness, and the natural depravity of human nature. Each tax payer, under the present rule, becomes, therefore, the interpreter, not only of the law, but of the fact, and makes a secret interpretation of both, and we have as many interpreters of the law as there are numbers of tax payers; and also an indefinite multiplicity of assessors; for each person who unfairly reduces his own assessment, arbitrarily assesses thereby some other of the community for the difference. Could or would any people apply the same rules for the collection of debts? Is there any one who has so much confidence in human nature that he will propose a law, that a person who issued shall be discharged from all claims of indebtedness if he will make oath, interpreting both the law and the fact himself, that he owes the claimant nothing? Is it believed, that under tariff laws, the government could get sufficient revenue to pay for its collection, if the importer was permitted to offset debts against the value of his goods; or if the law was peremptory that his oath alone should be given, and that there should be no legal examination, inspection or proof of the value or character of the importations?" (Second Report of Commissioners of New York, 1873.)

[128.] The most curious and confirmatory evidence of this is to be found in a method of procedure adopted in the city of Boston, Massachusetts—a method which has no parallel except in the records of the middle ages and of the inquisition, and constitutes, in itself, a satire upon any claim to the enjoyment of a wholly free and enlightened government. For failing to obtain satisfactory information about the private affairs of any individual, the chief assessors and their subordinates in this city, to the number of some fifty, meet in secret session, in a large upper chamber set aside for the purpose, and appropriately termed the "dooming chamber," when the citizen in question, without being present either by counsel or in person, is arbitrarily doomed to

the payment of any sum which a majority of those present may think proper; and from which "dooming" there can be no appeal.

[129.]Holland, by reason of her immense national debt, the largest comparatively of any country, has been obliged to maintain a most rigorous and extensive system of taxation in order to raise revenue sufficient to the wants and requirements of the state. But it has been prominently brought out in recent years, that the decadence of Holland dates almost from the hour when taxes were imposed on manufactories, commerce, fishing industry, and moneyed capital. Business went elsewhere, and with the decline of business the ability to pay taxes diminished, and the burden of taxation augmented. (See *Journal des Economistes*, November, 1871; also, "Principles of Political Economy," J. R. M'Culloch, pp. 470-71.)

—Within recent years the local taxation of Great Britain has been made the subject of special inquiry and investigation by a committee of parliament; and, in addition to several official reports, two prize essays on the same subject have been published by the statistical society of London (*i.e.*, "On the Local Taxation of Great Britain and Ireland"; First and second T ayl er Prize Essays, by R. H. Inglis Palgrave, and John Scott, of the Inner Temple); while the necessity of raising increased revenue in France has also drawn especial attention to the subject of local taxation in that country; but it is particularly noticeable, that in neither England nor France has any prominent speaker or writer advocated the direct taxation of personal property; or even alluded to the subject, except to scout the very idea of such a proposition.

[130.]If we assume 5 per cent. as about the average profit of money, land or other property in the United States, over and above all charges and taxes, then an exemption of \$600 would represent an accumulation yielding an income of \$12,000. If the exemption is raised to \$2,000, as it was at one time in the United States, then it would represent \$40,000.

[131.]These views, it should be understood, are, however, heresies to some of the best thinkers and writers on political economy. Some confuse themselves on the subject, by first defining property as anything that can be bought or sold, and then, since a title—as, for example, a deed - can be bought and sold, accept the inference that a title is necessarily property. But let us analyze this definition and assumption. We can, without doubt, sell and deliver a deed to a farm, but what is sold in such instances is the farm, including a right, a right to have dominion over it. But it may be rejoined, that a right of dominion is property. Let us, therefore, carry the analysis a little farther. If the farm in California is property in the state where it is, and where it is taxed, any right or title to the same farm, held in New York or England, be it in the nature of a deed, a mortgage, a partnership interest, or any other form of title, can not be the property; for the same thing certainly can not be property in two separate states and jurisdictions, and in two distinct forms and manifestations, at the same time. On the other hand, if it be assumed that the title to the farm is the property, and, as such, can be rightfully taxed where it (the title) is, then it stands to reason that the subject of the title, the farm in California, ought not to be also regarded as property, and taxed in New York or England. In other words, if the title to the farm is property, then the farm is not really in California at all (unless the owner of the title resides there), but goes

out of that state in the pocket of the individual who walks off with the title to it. We have all heard of such concentration of meat that all that is valuable in an ox for food can be put into a quart can; but such a concentration of property as is here supposed is something much more remarkable; and admits of a man having a drove of oxen in his hand, ten acres of woodland in his hat, a church with a steeple in one coat pocket, and a four-story brick block and a mill privilege in the other.

[132.] In 1874 the real estate of Philadelphia was assessed at \$539,003,602, on an asserted full valuation. The personal property of the city subject to taxation at the same time, was returned at a valuation of \$9,464,873; and included horses, carriages, furniture, gold and silver watches. The system of taxation in Montreal, dominion of Canada the same year, was as follows: one-fifth of 1 per cent. on the value of real estate; one-fifth of 1 per cent. for school tax; one-twentieth of 1 per cent. on railway property; 7½ per cent. on rentals. In addition, there were water rates, and special taxes on insurance, telegraph, ferry and street railway companies, and on innkeepers, billiard tables, theatres, breweries, banks, brokers, etc., and licenses on grocers, butchers, exhibitions, dogs, etc.

[133.] On this subject the eminent French economist, Joseph Garmer, in his *Traité des Finances*, ch. v., says: "From the point of view of distributive justice and economic truth, and to attain an equitable apportionment of the public burdens, we must put the question: A tax being given, on whom does it fall in the last analysis? No absolutely satisfactory answer to this question, insoluble in its generality, has been given or could have been given. However, Ricardo, who made a profound study of taxation, thought that taxes, no matter of what kind, are always paid by the consumer, on his capital or on his income, the producer always making them enter into the cost of production; and employing his capital and his industry in other branches when he can not include the taxes he pays in such cost. James Mill likewise adopted the same opinion. This was Franklin's view also; he thought that the merchant always added the tax to his bill or invoice. It was likewise Adam Smith's idea, who, in passing, says: 'The tax is finally paid by the last purchaser or consumer.' ['Wealth of Nations,' edited by J. E. Thorold Rogers, vol. ii., p. 132.]—The physiocrats had been led to think that taxes finally fell, directly or indirectly, on the landed proprietor, to whom they thought the entire net product of production, which in the end is the only thing taxed, and which alone should be taxed by the legislator, comes back.

—J. B. Say says that Ricardo may be right in the abstract, but that, in fact, the producer does not always succeed in making the consumer pay the tax, a part of which he (the producer) must bear himself. The French economist adds: 'This subject does not admit of an absolute opinion. There is probably no kind of contribution which does not fall on several classes of citizens.' According to him, therefore, the subjects taxed (*bases de l'impôt*) should be increased sufficiently to attain this end: that those producers who are not reached by one tax may be reached by another.

—The views held by the physiocrats on production being incomplete and erroneous, their financial conclusion is no longer worthy of consideration. J. B. Say's conclusion is in harmony with those of Ricardo and Smith; but it is lacking in precision. That of Ricardo, if it be exact, should be amended thus: 'Taxes in general and *in the long run*,

fall on the consumer.' And, indeed, in the face of the facts, it is difficult to admit, that this diffusion or transmission of burdens is made directly, immediately and without effort. If we may so express ourselves, Ricardo considers the phenomenon as if it were happening *in vacuo*, whereas, in reality, the tax, to find its natural or definitive incidence and to traverse the successive strata of society, needs a pretty long lapse of time, a thing which is effected only after many and complex repercussions. The burden weighs at first on certain classes of citizens; then, by degrees, it apportions itself among a greater number of tax payers, or among all tax payers, and by successive repercussions it becomes an integral part of the price of things, in such a way that the person who buys most things pays most taxes. At first view the tax seems paid, whereas it has only been advanced.

—However, the solution of this question is not, we repeat, possible, as to taxation considered in general; it is possible, if possible at all, only if we consider the different kinds of taxes apart from one another, and according to their special assessment. It is necessary to consider apart their accidental and their permanent effects, their temporary and definitive effects. We must remark, also, that both for taxation and for the cost of production, the law of supply and demand is predominant. That law it is which permits, according to very variable cases and circumstances, the landowner, capitalist or workman to have the tax reimbursed to him by the leaseholder, the manufacturer, or the merchant, and which permits these latter to have themselves reimbursed, in turn, by the consumers; or which compels each of them to pay a part of the tax. It is, therefore, erroneous to affirm that the producer has himself always and equally reimbursed by the consumer. At the end of a period of time, the tax imposed on one or many categories of individuals is repercussed on other classes, and in the end *fiscal charges weigh on all the classes of the population*, even the taxes on the wealthy, which fall indirectly and in a certain proportion on the poor themselves, since for the labor of the poor there is less demand by the wealthy, whose saving or consumption the tax has curtailed.

—It is an error to say of a tax that its weight divided *ad infinitum* becomes almost insensible to those who bear it. This would be true of one sole tax, but it is not true when there is question of several taxes; taxes may apportion themselves and repercuss as much as you will, *but they must be paid*, and they produce their natural effects none the less. Division, diffusion and repercussion are unfortunately not synonymous with evaporation. We can, therefore, formulate no general law as to the incidence, the repercussion or diffusion of taxes. On this point there is among economists a great diversity of opinions and much hesitation."

—Lorenz von Stein, in his *Finanzwissenschaft*, maintains that *all* taxes, and even the fines paid by criminals, finally become component parts of the prices of things, just as do the costs of production, and in the last analysis fall on the consumer. Etienne Laspeyres, in the article *Staatswirthschaft*, in Bluntschli's *Staatswörterbuch*, defends the same view. As far back as 1790 the Marquis de Cassux published a work, "The Absurdity of the Land Tax," demonstrated by showing that all taxes, no matter of what kind, ultimately become part of the prices of commodities.

—In addition to the opinions of recognized economic authorities above noted by M.

Garnier, J. R. M'Culloch, whose article on "Taxation," contributed to the Encyclopædia Britannica, James Mill pronounced "masterly," thus expresses himself: "The truth is, that every burden laid, directly or indirectly, on any article for which there is any considerable demand, falls ultimately on its consumers." ("Taxation and the Funding System," p 17.) M. Thiers, as shown by an extract from his work, "Rights to Property," quoted in connection with this article by the author, was an unqualified believer in the diffusion theory of taxation. Adam Smith would also appear to have completely indorsed it, when he says, "No tax can even reduce, for any considerable time, the rate of profit in any particular trade"—*i.e.*, all business—which must always keep its level with other trades in the neighborhood." And again, in discussing the taxes upon luxuries, he says, "such taxes, though they fall indifferently upon every species of revenue, and are paid finally by whoever consumes the commodities upon which they are imposed," etc. The reader will, therefore, notice that Mr. Wells' views on this department of taxation are substantially in harmony with those of Adam Smith, Ricardo, James Mill, M. Thiers, J. R. M'Culloch, J. B. Say; they also found an earnest advocate in one of the soundest thinkers and shrewd practical observers America has ever produced—the late Isaac Sherman, of New York.—ED.

[134.]As applied to the wages of labor, the truth of this principle is equally incontestable. "The sewing girl performing her toilsome work by the needle at one dollar a day, the street sweeper working the mud with his broom at a dollar and a half, the skilled laborer at two and three dollars, the professor at five, the editor at five or ten, the artist and the songstress at ten or five hundred dollars a day, are all members of the working classes, though working at different rates. And it is only the difference in their effectiveness that causes the difference in their earnings. Bring them all to the same point of efficiency, and their earnings also will be the same." (W. Jungst.)

[135.]The method in which taxation diffuses itself has been thus illustrated by M. Thiers, in his work "Rights to Property." "In the same manner," he says, "as our senses, deceived by appearances, tell us that it is the sun which moves and not the earth; so a particular tax appears to fall upon one class, and another tax upon another class when in reality it is not so. The tax really best suited to the poorest member of society is that which is best suited to the general fortune of the state; a fortune which is much more for the possession and enjoyment of the poor man than it is for the rich; a fact of which we are never sufficiently convinced. But of the manner, nevertheless, in which taxes are divided among the different classes of the state, the most certain thing we can say is: That they are divided in proportion to what each man consumes, and for a reason not generally recognized or understood, namely, that taxes are reflected, as it were, to infinity, and from reflection to reflection become eventually an integral part of the prices of things. Hence the greatest purchasers and consumers are everywhere the greatest tax payers. This is what I call '*diffusion of taxation*,' to borrow a term from physical science, which applies the expression '*diffusion of light*' to those numberless reflections, in consequence of which the light which has penetrated the slightest aperture spreads itself around in every direction, and in such a manner as to reach all the objects which it renders visible. So a tax which at first sight appears to be paid directly, in reality is only advanced by the individual who is first called upon to pay it."

## Footnotes for TELEGRAPH

[136.]Aristide Dumont wrote in 1854: "The use of the telegraph, once it has been popularized, is called to render to the production of wealth services which have some relation to those created by economic and rapid ways of circulation, since these services shorten time, that stuff of which life is made, and since, in every industry, they impress greater activity upon production, and, as a consequence, diminish the amount of unproductive capital, lower the amount of current expenses in business, facilitate exchanges, and abridge transactions of every kind.

—But from another point of view, the telegraph is called to render much greater services to industry. If we suppose the net-work of telegraphs extended and popularized, not only over the entire surface of Europe, but over every civilized point of the world, a single day would be sufficient to exchange news between the most distant markets; thenceforth there would be none of those uncertainties which so frequently disturb commercial relations, and none of those rumors which facilitate stock-jobbing [?]. A sort of equilibrium would become established, and production would become more independent of the emotions produced by politics. Is it not true that if the electric telegraph had embraced, in the course of the year 1853, the Danubian provinces, Constantinople, St. Petersburg, Odessa; and that if it had been possible to exchange a dispatch, in one day, between these different points and Paris, France's public funds and industrial values would have undergone fewer fluctuations? Kept constantly informed of what was happening, Frenchmen would have been less excited, and this would have prevented the rum of a great many individuals.

—Thus the electric telegraph facilitates the production of wealth in two ways: 1, by saving time and permitting a diminution in the amount of unproductive capital; 2, by establishing a sort of equilibrium between all markets, and of thus diminishing the influence of the uncertainty of politics on industry.

—But if we consider the telegraph from the moral point of view, we believe that it has introduced into the world a revolution still more profound. If, in fact, the various continents are united, and they will-be united in the course of this century [a prophecy fulfilled not very long after it was made]; if communication can be had in a few hours between London, Canton, New York, Calcutta and Paris, a new force will be added to the civilizing power of humanity, to the diffusion of enlightenment and to the radiation of good upon evil. The limits which pen peoples up will be blotted out, and peoples the most remote from one another acquire solidarity and unity. Men will emigrate more freely, for they will be no longer morally separated by any barrier. The superabundant population of Europe will feel less repugnance to transfer their activity to shores hitherto unknown; for, if they go even to the antipodes, they will not be, as formerly, remote from their country, their relations and their habits. This fear of remoteness has been hitherto a great obstacle to the spread of civilization. Some peoples are less subject than others to this species of nostalgia, and it is they who have accomplished the greatest things. The telegraph will tend more and more to remove that obstacle."

#### Footnotes for TERRITORIAL WATERS

[137.] Different writers use the terms jurisdictional waters, water territory, maritime territory.

[138.] "Territorial Waters Jurisdiction Act (1878)," 41 and 42 Vict., cap. 78, notwithstanding its preamble, is such a claim.

#### Footnotes for THIRD ESTATE

[139.] The third edition of this pamphlet has this note: "This work, written during *les Notables* of 1788, was published in the first days of January, 1789.

#### Footnotes for TREATIES, Fishery

[140.] Prof. Hind's charges of intentional falsification of fishery statistics by the British authorities so widely published, are not sustained by evidence, and should not be entertained for a moment. The hundreds of errors which he has pointed out are evidently the result of inattention on the part of the responsible persons, and of childish incompetency on that of the clerks employed in their preparation.

#### Footnotes for UNITED STATES PENSION LAWS AND THE PENSION LAWS OF OTHER COUNTRIES

[148.] In justice to Mr. Ford it should be added, that he draws a distinction between pensions granted to civil servants of the government and those granted to military and naval servants, and this distinction is manifestly a just one to make. While the dangers of corruption attending the liberal use of civil pensions are many, and in fact might be said to be inseparable from the system, there exist strong reasons for granting allowances for military and naval service when there exist also the proper safeguards against abuse. If there be any principle recognized and established in this country it is that pensions must be confined to those who were separated by the nature of their

service from the great mass of the community, and who devoted themselves exclusively to military duties; who laid aside the character of a citizen, and became a soldier; who, in abandoning the pursuits, extinguished also the habits, of private life. But, in bestowing military pensions, it should be recognized that provision should be made only for those who, being unable to support themselves, are necessarily thrown upon public or private charity. "It would not, I think," wrote Attorney General Rush in 1815, "be going too far to say that in every case where an officer or private loses his health while in service, to such a degree as to be disabled from performing his duty any more, he is contemplated, *prima facie*, as an object of this charitable relief from the legislature." And more recently the expediency of military and naval pensions was defended in congress as follows: "The service which the soldier renders may be voluntary, but it is not a service which he may give or withhold at pleasure, but one which, if not offered, may be compelled by the strong arm of the government. The recognition by the state of the distinguished military services of its citizens in its support and defense in the form of a pension, though sometimes granted as a charity, or as an act of grace, is generally given in fulfillment of some promise made by the government, or inducement held out to the soldier either at the time or after his enlistment. It is not given to every man who performs military service, however distinguished and meritorious that service may be, but to those only who receive wounds or contract disease while in the line of duty. The purpose and design of the government is to make the soldier good, as far as money can do it, for the injuries he received, or in other words, to make up to him as much as he could have earned at his trade or vocation if he had not been wounded or had not contracted the disease. Under this rule—and in my judgment it is both just and magnanimous—no man is entitled to a pension for military service except those who have received disabling wounds or injuries during the war, and the widows, minor children and dependent relatives of those who were killed or who have since died from the effects of such service. This is the humane policy recognized and acted upon by every civilized country on the globe. It has been truly said that every pensioner is, in one sense, a burden upon his fellow-citizens, either directly or indirectly; and no reason can exist for imposing such a burden on behalf of men who did only their plain, simple duty as citizens, and received no material injury in its performance. A disabled soldier is not a pauper for taking a pension. A well man would be nothing else if he were to accept one. For this reason I do not deem it right or expedient to select out any particular class of soldiers, or men who rendered any particular service, or suffered any peculiar hardships and privations, and pension them, regardless of whether they can show any pensionable disability or not. Under the lenient rules adopted by the present commissioner of pensions, every soldier who was wounded or contracted disease while on active duty in the field, or during confinement in rebel prisons, can, if not already pensioned, apply for and receive one now under the general law. It is impossible for congress to grade and adjust pensions to the different degrees of suffering and hardship endured in the service. All that we can do is to grant them in cases where the evidence shows there is a pensionable disability: but if we should go beyond this rule we should be simply pensioning a large number of men, who, while they endured great suffering and privations, received no material injury, and are now able to earn their living. In this connection I desire also to say that I would not create a civil pension list by granting pensions to men who are injured in the civil service of the government. They go into that service voluntarily, and can not be compelled to enter it against their will,

and can leave when they please. When they assume the duties they take all the risks, and are paid for doing so. I believe pensions should only be granted to men who have been injured in the military or naval service of the country; and, without stopping here to elaborate the point, I will simply say that in my judgment we are not called upon in granting pensions to break down the barriers set up by our fathers between the military and civil service, and launch out into a sea which I fear would prove shoreless and bottomless." Nor is it any condemnation of such pensions to point out the great frauds that have arisen under various systems. That is the fault of the laws. "The state has in time of war a fundamental right to the money, the services, and, if need be, the life of every citizen, without other compensation than the security and protection it affords him at all times. The pension laws are not passed to secure to the maimed survivor of the war, or to the helpless dependents on those who lost their lives in the struggle, a right existent independently and in the nature of things, but as a voluntary and fitting assumption of care over those who, in the service of the nation, have lost the ability to care for themselves. It is doubly demoralizing and doubly shameful that beneficent laws like these should be made the cover of fraud and robbery—it not only despoils the public treasury and unjustly burdens the shoulders of the tax-paying masses, but it delays and often fatally prejudices the cause of really deserving applicants."

#### Footnotes for UNITED STATES SURPLUS MONEY

[149.] For statement of resources and liabilities of these banks see Report of Comptroller of the Currency, 1876, p. 43.

#### Footnotes for UNIVERSITIES

[150.] Quoted by Hallam, *Lit. Eur.*, i., 26.

[151.] The disciples of this philosopher were condemned for heresy by a council held in Paris in 1209.

[152.] The fault of this definition is that it might include a kindergarten, or a school of Choctaw.

[153.] So ascertained by Prof. F. B. Dexter.

[154.] It is proper to add, that two or three instances of fraudulent universities have been detected and crushed. They were simply scandalous ventures of unscrupulous persons to entrap the unwary into purchasing diplomas—and would not here be mentioned were it not that foreigners have sometimes been misled by announcements which to every educated American are obvious frauds. These sporadic appearances are counterfeit, not entitled to any nomenclature.

#### Footnotes for USURY

[155.] Instead of the prohibition of interest which prevailed in mediæval times, most modern states have established fixed rates of interest, the exceeding or evasion of

which, by contract or otherwise, is declared null and void, and is usually punishable as usury. If the fixing of the rate is intended to depress the rate of interest customary in the country, it uniformly fails of its object. If governmental control were great enough, vigilant and rigid enough, which is scarcely imaginable, to prevent all violations of the law, it is certain that less capital would be loaned than had been, for the reason that every owner of capital would be largely interested in employing his capital in production of his own. More capital, too, would go into foreign parts, and there would be less saved by those not engaged in any enterprise of their own. All this would happen to the undoubted prejudice of the nation's entire economy.

—If, on the other hand, the control of the government be not great enough, the law would, in most cases, be evaded; especially as each party, creditor as well as debtor, would find it to his advantage to evade it. The latter, who otherwise would not be able to borrow at all, is, as a rule, more in need of obtaining the loan than the creditor is to invest his capital. How easily, therefore, might he be induced to bind himself by oath or by word of honor'. He would, moreover, be compelled to pay the creditor not only the natural interest and the ordinary insurance premium against loss, but also for the special risk he runs when he violates the law threatening him with a severe penalty. Hence the last result of usury laws is either a material enhancement of the difficulty of obtaining loans, or an enhancement of the rate of interest.—WILLIAM ROSCHER.

#### Footnotes for WAGE FUND

[156.] In spite of Mr. Mill's complete recantation of the wage-fund doctrine, in 1869, his earlier statements are still found, unretracted and unqualified, in the latest edition of his "Political Economy."

#### Footnotes for WAGES

[157.] "The full-blooded American," said Michel Chevalier, "is encamped, not established, on the soil he treads upon."

[158.] "Many employers of labor," says Prof. Alfred Marshall, "in some parts of England more than half, have risen from the ranks of labor." Accepting this statement as correct, it is to be noted, that, in addition to business ability being the efficient cause of profits, in comparison of the employer with the non-employer, business ability becomes, in a still higher degree, the cause of profits, as between the employer on a large and the employer on a small scale.

#### Footnotes for ZOLLVEREIN

[159.] Says Henri Richelot, writing in 1862: "Since the year 1832 the Zollverein, although other influences concurred with its influence, has been the principal fact in Germany; and the progress of Germany since then has been, in great part, the progress of the Zollverein. The first advance of the Zollverein consisted in its material enlargement; this it accomplished by successive incorporations which leave nothing in Germany outside of its boundaries save Austria, the Hanseatic cities and Mecklenburg. The increase of population of the Zollverein was a necessary

consequence of the increase of its territory; but it has been more rapid; from twenty-three and one-half millions in 1834, the number of inhabitants of the Zollverein has risen to nearly thirty-four millions.

—The reports of the commerce of the Zollverein, containing only quantities and no values, do not enable us to give the total annual movement of its trade with non-Zollverein states and countries, and in this matter we have only more or less uncertain approximations. But the approximations warrant us in classing the Zollverein, in international commerce, immediately after England, France and the United States, although it is very far from these countries; and in assigning to it the incontestable rank of the fourth commercial power of the world, of the third in Europe, and of the second on the European continent. The manufacturing character of the Zollverein has become more and more pronounced in international commerce. The increase of its exports is apparent, not in its natural products, such as cereals and building lumber, but in manufactured commodities, in woolen, silk and cotton textile fabrics, in linen and hardware. In its imports we notice an increase in exotic articles of consumption, such as tea and coffee, an increase in the consumption of which is usually regarded as a sure index of general prosperity. The same may be said of the importation of articles used in manufacture. But so far as manufactured articles themselves are concerned, the salient point in the importation of the Zollverein is their decrease. In the vitality of the great German fairs which are still held, it is remarkable how German industry, little by little, thrusts aside its rivals in England, France and Switzerland. Lastly, in its expositions, the first of which took place in 1844 in Berlin, and the second in 1854 in Munich; and in the expositions of London and Paris in 1851 and 1855, that industry stood the test. If it had no originality or invention to boast of, all agreed that it possessed solid merit in the medium sphere which belonged to it." Its progress was still more noticeable in 1867 in Paris, and in 1873 in Vienna. The Zollverein thus seems to have advanced Germany much in the same way that the introduction of the policy of free trade promoted the wealth, well-being and industrial progress of England.—ED.
