ounce. In 1720 a long list of commodities receivable for public dues at prices determined by the general assembly, was issued, but was repealed in 1723, only to be renewed as occasion seemed to require. In 1727 silver was at seventeen shillings per ounce; good merchantable beef at £3 per barrel; pork, £5 10s.; winter wheat, eight shillings; summer wheat, seven shillings; barley and rye, six shillings; Indian corn, four shillings per bushel; and other commodities in proportion. The condition of affairs became worse in spite of numerous financial expedients for bettering them. In 1741 Gov. Shirley stated that exchange between sterling and Massachusetts paper was 450 per cent. in favor of the former. As showing the condition two lines may be quoted from an almanac of 1749:

"The country maids with sance to market come,  
And carry loads of tattered money home."

In 1748 the price of silver was forty shillings per ounce, and one year later had risen to sixty shillings per ounce, the prices of commodities following. Then began the oppressive measures of the English parliament, which ended in the revolution. The issues of continental currency deranged values everywhere.

—In 1776 monopolies and extravagant prices in the necessaries of life were important questions, and in 1777 Massachusetts passed a law fixing the price of labor and of commodities: Farm labor in summer shall not exceed three shillings per day; wheat, 7s. 6d. per bushel; rye, 5s.; wool, 2s. per pound; beef, 3d. and 4d. per pound; cotton, 3s. per pound by the bag; flannel, 3s. 6d. per yard; flour, 25s. per cwt.; bloomery iron, 30s. per cwt. at the place of manufacture, etc., etc.

—Much the same course of events was experienced in the other colonies. In Rhode Island, for example, rum, which sold for 13s. per gallon in 1746, brought £1 in 1748, and £1 8s. in 1754; molasses, £1 3s. per gallon in 1746, and £2 11s. in 1765, salt, 14s. per bushel in 1746, £1 16s. in 1748, and £2 13s. in 1765; flour, £18 1s. per barrel in 1748, and £45 4s. 9d. in 1769. In 1779 a convention fixed the price of rum at £6 15s. per gallon; of molasses at £4 16s. per gallon; and of salt at £10 per bushel. Tea was worth £5 17s. per pound; cotton, £1 17s. per pound; wool, 18s. per pound; Indian corn, £4 10s. per bushel; and bloomery iron, £27 per cwt. The wages of a common laborer was fixed at £2 8s. per day, and other labor in proportion.

—It must be obvious that little would be gained by a more extended study of these prices. They show a period of enormously inflated prices, induced by excessive issues of an irredeemable paper currency. When in 1781 the legislature of Virginia by law fixed the scale of depreciation of the continental currency at 1000 to 1, values were no longer measured in this medium. Throughout this period congress passed legal tender acts, laws determining the prices of labor and of commodities, and laws against "forestalling" and "engrossing," but all to no purpose. The currency was subject to higher laws than those of a legislative assembly, and prices were governed by the currency. As illustrating the effects of an over-issue of an irredeemable currency, the period is most instructive; but as regards prices, it is almost barren of results. After 1781 specie began to come into the country, and a more normal régime of prices was established.

—For the subsequent period there exist few data for any complete history of prices, and before attempting to summarize what material is at hand it will be well to look at the conditions of production and the means of marketing the results. The farmer himself was the principal consumer of the produce raised on his farm, and his few and simple wants were almost wholly satisfied by his household. In 1809 Gallatin estimated that about two-thirds of the clothing (including hosiery) and of the house and table linen, worn and used by the inhabitants of the United States not residing in cities, was the product of family manufactures. What few things could not be supplied in this way he obtained of the village tradesman or mechanic, between whom and the surrounding farmers a limited amount of exchanges took place. But everything was local. The roads were bad, the cost of transporting produce was such as to prohibit any resort to a distant market, and confined as he was to a limited territory there was little inducement for the farmer to grow more than was sufficient to supply his own wants. Prices also were local. In the neighborhood of cities, farm produce was higher in price than in the interior, and the further one went from the city the lower fell the price, because there was no market for it. Moreover, prices fluctuated widely; wheat might be very low one year, and at famine prices the next; it might be superabundant in one county while very scarce in a neighboring district, the difficulties attending its transportation prevented an equalization of conditions. Nor were there the means for marketing the produce, as the merchant class were rather engaged in a foreign and not in a home trade, the former being the more profitable. As the markets were limited, manufactures were in their infancy. In fact, everything was primitive, and prices also were in a rudimentary condition. "Where the economic life of a people is still undeveloped, and the production of one enterprise is not from the first based on the estimated consumption of another, the circulation of goods brings with it great profits and great losses; whereas, profits and losses grow smaller, but at the same time more uniform and regular, in proportion as the circulation of goods increases in rapidity and regularity." (Stein.)

—Such was the condition at the beginning of the revolution. Laws not only restricting their power of manufacturing, but also their power of trading, had been imposed on the colonies by parliament, so that they were forced to depend upon their own exertions, both for the munitions of war and the necessary articles of consumption, which had previously been chiefly imported from Great Britain. Exhausted by the long war, and without funds or credit, with no regular markets for their produce, jealous of one another on account of commercial regulations, and pressed with taxes, some of the states had recourse to paper money and legal tender laws. It was a period of great suffering and depression, and the range of prices differed in each state according to its currency, and in each district according to its natural characteristics and the means of access. On the formation of a stable central government, confidence was restored, and with the year 1795 one of our tables of prices begins. Already the chief industries of the country were agriculture and commerce. The European wars, which began in 1793, gave a great impetus to both, a great proportion of the carrying trade of the world being thrown into the hands of the neutral Americans. The wars lasted until 1807: in that period the registered tonnage increased from 367,734 to 848,306, and while the exports of domestic produce increased barely one-fifth, the export of foreign products increased nearly 125 per cent. In years of scarcity in England the export of grain would expand, and the export of cotton show some

growth; but generally speaking, the country had only a small foreign market, and was content to do the carrying trade for other nations. Pitkin says of these years: "We have before us a table giving the price of flour at Philadelphia from 1785 to 1828, a period of forty-four years, the accuracy of which, we believe, may be relied upon. The average price of flour, from 1785 to 1793, according to this table, was \$5.41 per barrel, while the price from 1793 to 1807 (excluding the years 1802-3, when Europe was at peace under the treaty of Amiens), being twelve years of war, was \$9.12, making a difference of \$4.71 per barrel. \* \* By adverting to the price from 1820 to 1828, after Europe had again settled down in peace, it was reduced to \$5.46, being only five cents more than in the first-mentioned period. The advanced price of agricultural productions, during the long wars in Europe, was accompanied by a great advance in the price of lands in the United States."

—In November, 1807, the Berlin decree and the British orders in council led to the withdrawal of the larger part of the foreign commerce of the country from the ocean. The value of the total exports fell from \$108,343,150 in 1807 (of which \$48,000,000 were of domestic produce), to \$22,130,960 in 1808 (of which but \$9,500,000 were of domestic origin). Shut out from foreign markets for the time, prices naturally fell sharply, and this our table shows. In 1809, however, the export of domestic produce rose, but was not so large as in 1806-7, and was seriously interfered with by the war of 1812-14, and fell in value in the latter year to less than \$7,000,000, although our table shows that prices ruled high. The carrying trade was for that year *nil*. This compelled a greater attention to the development of the internal resources of the country, which had up to this period remained almost unnoticed. By shutting off commercial relations with the outer world the embargo acts, non-intercourse laws,

and, finally, the war, gave an impetus to domestic manufactures, by creating, as it were, a market for their products. During the war prices ruled high, and in some of the states were further inflated by redundant paper issues. In 1812-13 silver flowed to New England, being displaced in the other colonies by the paper currency. In 1814 business was brisk and prices rapidly advancing, when the bubble burst, and all banks outside of New England suspended. The paper issues increased, and prices continued to rise. "Money lost its value. The notes of the city banks depreciated 20 per cent., and those of the country banks from 20 to 50, and specie so entirely disappeared from circulation, that even the fractional parts of a dollar were substituted by small notes and tickets, issued by banks, corporations and individuals. The depreciation of money, enhancing the prices of every species of property and commodity, appeared like a real rise in value, and led to all the consequences which are ever attendant upon a gradual advance of prices. The false delusions of artificial wealth increased the demand of the farmer for foreign productions, and led him to consume in anticipation of his crops. The country trader, seduced by a demand for more than his ordinary supply of merchandise, was tempted to the extension of his credit, and filled his stores, at the most extravagant prices, with goods vastly beyond what the actual resources of his customers could pay for, while the importing merchant, having no guide to ascertain the real wants of the community, but the eagerness of retailers to purchase his commodities, sent orders abroad for a supply of manufactures wholly disproportioned to the effective demand of the country. Individuals of every profession were tempted to embark in speculation, and the whole community was literally plunged in debt. The *plenty of money*, as it was called, was so profuse, that the managers of the banks were fearful they could not find a demand for all they could fabricate, and it was no unfrequent occurrence to hear of individuals solicited and urged to become borrowers, under promises as to indulgences the most tempting. Such continued to be the state of things until toward the close of the year 1815." (Quoted in Gouge.) As in New England specie payments were maintained, this speculative mania was not reflected in our table. The abuses of "banking," which at that time was considered to be issuing notes, were the main cause of the fluctuations in prices from this period even down to 1860. Almost every state had a circulation of its own, and the scale of depreciation differed in each state. To make the currency more uniform, congress established a national bank in 1816, and the state banks resumed specie payments in 1817. In the next two years banks were greatly multiplied in the west, nearly all issued circulating notes, and conducted their operations in a reckless manner. The national bank speculated in its own shares, forcing the price up to \$156.50 per share in September, 1817, but in December, 1818, it had fallen to \$110 per share. In 1819 the crisis came, and a period of stagnation and depression succeeded. Land in Pennsylvania was worth, on the average, in 1809, \$38 per acre; in 1815, \$150; in 1819, \$35. "The newspapers of 1819 contain numerous accounts of riots, incendiary fires, frauds and robberies. The house committee spoke of the 'change of the moral character of many of our citizens by the presence of distress.' The distress extended to New England, but was less severe there than elsewhere. In the west it was intense. \* \* Stagnation and distress lasted throughout 1820. Prices were at the lowest ebb, and liquidation went slowly on. Wheat sold at twenty cents per bushel in Kentucky. A man in western Kentucky stopped "Niles' Register" because one barrel of flour used to pay a year's subscription; now three barrels would not. At Pittsburgh flour was \$1 per barrel; boards, 20 cents per hundred; sheep, \$1. Imported goods were at the old prices. \* \* \*

Rent of a given house in Philadelphia fell from \$1,200 to \$450; fuel from \$12 to \$5.50; flour from \$10 to \$4.50; beef from 25 cents to 8 cents per pound. \* \* Wages were low on half time." (Sumner and Gouge.) In 1821 occurred a slight reaction, but prices fell again in 1822. Stop laws, stays of execution and execution acts were passed, in the hope of relieving the distress. Briefly summarized the course of events was as follows: 1821, business was dull in the beginning of the year. The effects of an expansion, apparently commenced in the spring, began to be felt in June or July, and by October the spirit of speculation was tolerably active. In 1822, a reaction commenced in May; some kinds of imported goods fell 15 per cent. in Philadelphia; and United States bank stock which had been held at 115 in February, was sold in New York on the 1st of May at 102, and before night had fallen to 98½. The effects of the reaction were felt throughout the year. In 1823-4, banks extended their operations, increased their issues, and the spirit of speculation was excited, resulting in the crisis of 1825. In April (1825) news came of a great rise of prices in English markets, and excited great speculation here. Twenty-seven cents were offered for upland cotton, and refused, though the holders would, a week before, have been happy to obtain 20 cents; cotton yarn, No. 15, rose from 35 to 45 cents; Muscovado sugars advanced a dollar on a hundred, and St. Domingo coffee rose from 17½ to 21 cents per pound. The rise in the prices of tobacco, drugs and spices was very considerable. The mania applied chiefly to cotton, and lasted through May and June. The "Charlestown Patriot" mentioned that "the same parcel of cotton had changed owners six or seven times within a week without leaving the hands of the factor." Corn was uprooted in order that cotton might be planted. In July the news of a fall of 3d. a pound in the price of cotton in Liverpool pricked the bubble and precipitated a crisis. The effects of the reaction continued through 1826, in a general dullness of business. "In the southern states the consequences were most trying, as the high price of cotton had led to an over-extension of the culture of that article, and as the planters, encouraged by the demand for their staple, had plunged themselves in debt to support a splendid style of living. The manufacturers of cotton were, also, great sufferers. Cotton cloth, which it cost 18 cents per yard to import in 1825, was imported in the spring of 1826, at 13 cents." (Gouge.)

—We must now retrace our steps, and note two important influences which were beginning to be exerted on prices in this period. During the war large amounts of capital were invested in manufactures, especially in woolen and cotton mills. On the return of peace there occurred, as we have seen, an era of speculation, and enormous important were made without regard to the condition of the markets and the ability of the purchasers. During the first three-quarters of 1815 the value of imports was \$83,080,073, and from October, 1815, to the same month in 1816, the value amounted to the enormous sum of \$115,302,700, of which but \$18,000,000 were re-exported. About \$70,000,000 of the imports represented woolens and cottons. The domestic manufacturers could not make any progress in the glutted markets, and appealed to congress. The tariff act of 1816, having especial reference to cotton and woolen manufactures, was passed, and as the first really protective tariff it marks the beginning of that long course of legislation which has materially affected the prices of manufactured goods. Hence forward this must always be taken into account, as it artificially raises prices and introduces a disturbing influence. The fact may be noted, without attempting to trace the effects of the many tariff laws on prices. Manufactures

began to extend as population increased, as their demands became enlarged, and as the great natural resources of the country were developed. The introduction of machinery supplanted the household industries, and the growth of a market for manufactured goods allowed the concentration of processes in large establishments, where a more minute division of employments could be carried out; the rise of manufacturing towns, and the wider cultivation of the raw materials of manufactures accompanied these altered conditions. This resulted in a gradual fall in the prices of manufactured goods, as improvements in processes were introduced, or a wider market, both to buy and to sell in, arose. From this time on, prices of manufactures became steadier, and followed, in a general way, the economic condition of the markets.

—Another important influence consisted in the improved means of transportation and of marketing goods, which brought the producer near to the consumer, reduced the cost of transporting products, and thus extended the markets, while at the same time equalizing prices by allowing a freer and more rapid interchange of commodities in all parts of the country. As early as 1790 Pennsylvania undertook to construct canals, but the attempt was abortive, and ended disastrously. It was not until the completion of the Erie canal, in 1825, that extensive schemes of internal improvements were laid out. In ten years (1822-32) the amount of tolls collected on the Erie canal had increased from \$44,486 to \$1,196,008. "By means of this extensive water communication through a country naturally extremely fertile, the farms of the west are placed nearly upon an equality with those of the east, in the vicinity of the great market towns and cities." (Pitkin.) The success attending this canal aroused a spirit of emulation in the neighboring states, and the construction of canals in Pennsylvania opened up the coal fields, thus bringing to the market a most important factor of production. Delaware, Maryland and Virginia also constructed canals, and the spirit for canal improvement passed into Ohio, nearly 400 miles of artificial inland navigation being completed before 1835. Pitkin estimated, that, in 1835, upward of 2,867 miles of canals had been built, at a cost of \$65,000,000, and the expenditure had been made chiefly during the previous fifteen years. Steam navigation was being introduced on the rivers, and, beginning with 1826, railways for the transportation of passengers and merchandise were being built, and their rapid extension, superseding in a great measure all other modes of conveyance, has resulted in making the country practically one market. The two important factors in making prices were a vast increase in production, and a greater degree of accessibility to markets. The population, or market, at each decade since 1830, is in the following table compared with the growth of railroad facilities.

<b>YEARS.</b>	<b>Population.</b>	<b>Miles of Railroad.</b>
1830.....	12,866,090	23
1840.....	17,069,453	2,818
1850.....	23,191,876	9,021
1860.....	33,443,821	30,635
1870.....	38,558,371	52,914
1880.....	50,155,783	93,671

—From 1831, with which year our second table of prices begins, it may be said that the prices follow almost regular cycles of raise and fall, following closely the periods of speculation and subsequent depressions. Commercial crises occur periodically about every ten years, and the course is pretty much the same in every case. The extension of credit may occur under a redeemable, as well as an irredeemable, currency, but the consequent prices are higher, and their fluctuations greater, under the latter. In 1825, as we have seen, there was a crisis, which had been preceded by inflated prices. The years 1837, 1839, 1857 and 1873 were each marked by great financial disturbances, which were reflected in the industry of the country.

the republic. Men of reputed capital, who have withstood the shock of former changes and times; men who for the last forty years have stood firm, erect and undismayed before the tempests of the times that have assailed them, are now tottering on the verge of bankruptcy and ruin. Their fall bears excessively heavy on the poor and laboring classes, who, by the way, are in reality the principal sufferers. \* \* Within the last ten days, within the circle of the ten adjacent miles (Providence), upward of 2,500 people have been suddenly and unexpectedly thrown out of employment, and the distress that such an event has produced can be far better imagined than described." In the next two years money was plentiful, and prices began in 1830 to rise. "In 1831, which was a year of great expansion, rents rose enormously in many parts of the town (Philadelphia), store goods advanced in price, and such fresh provisions as are sold in the market were higher than they had been at any time since the resumption of specie payments; but the money rate of wages was hardly affected." (Niles.) In 1834 there was distress, incident to the fear of results attending the withdrawal of public deposits from the United States bank, and in the same year prices were influenced by an alteration in the coinage laws which practically changed the standard from silver to gold. In 1835 the government was out of debt, and possessed a surplus, and the expansion of bank issues began. A speculative period followed, and speculation in cotton was especially marked. Whereas the price of upland cotton in 1834 was 12.5 cents per pound, in 1835 it was 16.7 cents, and in 1836, 16.6 cents per pound, when its price was suddenly lowered by the stringency in the money market. Thousands of persons had been tempted by the high prices to embark in the cultivation of this staple, and when the fall came, it proved disastrous. Speculation had extended in every direction, and even to western lands, an unlimited quantity of which might be had at a fixed price. The revulsion ran through the whole speculative system. In May a delegation of the merchants of New York represented that real estate in New York had in six months shrunk \$40,000,000: in two months 250 firms had failed, and stocks had shrunk \$20,000,000; merchandise had fallen 30 per cent., and within a few weeks 20,000 persons had been thrown out of employment. (Quoted in Sumner.) The banks throughout the country suspended, and the distress was increased by a failure of the wheat crop, grain being imported from abroad. In 1835 wheat was selling at \$1.22 per bushel, in 1836 at \$1.78, in 1837 at \$1.69, and in 1838 at \$1.90. The next year it had fallen to \$1.24 per bushel. In 1838 a great number of the banks resumed, but in 1839 came a bank crash, chiefly due to speculation in cotton. Cotton (upland) in 1838 sold for 10.6 cents per pound, in 1839 at 13.3 cents, and in 1840 at 8.7 cents. In 1843 it had fallen as low as 6.6 cents per pound, nor did it recover until 1847. Prices were falling until 1843, when they began to rise again under the more improved conditions, the banks having resumed in 1842, which allowed a new and healthy development of industry and credit. The prices reached in 1843 have rightly been called the "low-water mark of the century," as the limit has never since been reached. "The fall of prices from 1839 to 1843 was not due to any forced contraction of the currency. The more correct explanation of the phenomena is that the destruction of the banking system brought with it a collapse of the industry of the country. \* \* The year 1843 was one of the gloomiest in our industrial history. The grand promise of ten years before was now entirely obscured. Mortgaged property was passing into the hands of the mortgagees. Factories were idle. Trade was dull, investments slow." (Sumner.) In 1844 prices began to mend. In 1847 the exports of breadstuffs were very large, owing to a partial failure of the crops in England, and the abolition of the British corn laws

opened up a market for the agricultural produce of the country. Immigration commenced to flow into the country on a larger scale, and the internal development of the country kept up with these improved conditions. The discovery of the California mines in 1847 aided this growth, and in the following year large sums of foreign capital were sent here for investment. The rise in prices was very rapid between 1850 and 1853, and continued until 1857, aided by an expansion of bank issues. Cotton sold for 9 cents in 1852; in 1856 for 10.6, and in 1857 for 14 cents per pound. In 1857 the crisis came, banks suspended, and prices dropped, reaching their lowest limit in 1861, after which time they were unnaturally increased by the changed conditions forced upon the country by the rebellion. All banks suspended in 1861, and in 1862 an era of irredeemable paper currency was entered into, which lasted until 1879. The financial policy pursued, only aggravated the disturbance. In 1863 gold was at 140-150, and the paper dollar was worth only 65 or 70 cents; under further issues gold rose to 200-220, making the paper worth 45 or 50 cents. A tariff, higher and therefore more restrictive, than the country had ever before experienced, was built up between 1861-6, the duties collected in 1865 being 54 per cent. of the dutiable imports. An onerous system of internal taxation was adopted, under which a commodity and its various parts were subject to many different taxes, thus vastly increasing its price. The special commissioner of the revenue (Mr. David A. Wells), in his report for 1866, says that a somewhat extended investigation respecting the advance in the prices of the leading articles of consumption and of rents, indicated an increase of nearly 90 per cent. in the year 1866, as compared with the mean of prices during the four years 1859 to 1862. The price of cotton varied from 300 to 500 per cent. above the price in 1860. The price of labor, however, did not advance in an equal ratio with the price of commodities, being but about 60 per cent. The effect of the great increase and disturbance of prices thus noticed, he summarizes as follows: a decrease of production and consumption, and a partial suspension of national development.

—At the end of the war the country showed a wonderful recuperative power. In 1868 over-production was complained of, and prices continued to fall until 1871. Some of the burdens to which the industry of the country had been subjected by the war were removed in these years, and, although prices were low, the country was being prepared for a period of great speculation and inflation, which culminated in 1873. During the next six years the country experienced one of the most, if not the most, severe periods of commercial and financial depression it ever felt, and one of its marked characteristics was the great shrinkage everywhere felt in values. In 1879 there again occurred a great revival in business, marked by a rapid increase in prices; but this led to such an enormous production in the great industries, notably in iron, woolen and cotton manufactures, and paper industries, that in less than three years prices had nearly touched the low level they had reached in 1878.

—Such, in brief, has been the general course of prices in the United States. Each commodity, however, has its own history, and ought to be studied carefully, not only by itself, but also in connection with all other commodities. This, however, the limits of the present article would not permit, and this "sketch" must be sufficient. The first of our tables shows the prices of leading commodities in Boston, and was prepared by Mr. John Hayward. Our second table is taken from the report of the director of the mint for 1881; all gold prices.

—AUTHORITIES. The works of Rogers (*Agriculture and Prices in England*, 1259-1582, 4 vols.) and of Tooke and Newmarch (*History of Prices*, 1793-1856, 6 vols.) are two of the most valuable contributions ever made to economic science. The essays of Felt, Phillips, Bronson, Gouge, and Raquet, on American currencies, are valuable and Sumner's *History of American Currency* is the best work that has yet appeared on this subject. The same author's *Life of Jackson* should also be studied. Niles' *Register* contains much that throws light upon the course of prices. Walker's *Money* shows the changes that have occurred in the value of the precious metals, and the reports of the various international conferences on silver should be consulted. The French economist A. de Foville has made a special study of prices during the present century, and the results of his studies were published in *L'economiste Français*. Giffen's *Essays in Finance* and Grosvenor's *Does Protection Protect?* contain suggestive special studies of prices, as does Cliffe-Leslie's *Essays in Political and Moral Philosophy*. The reports of Mr. David A. Wells while special commissioner of the revenue should be carefully studied.

## PRIMARY ELECTIONS.

PRIMARY ELECTIONS. Primary elections, the caucus and the caucus system, are terms used to designate the political action through which nominations for elective officers are made. In a restricted sense, primary elections would only refer to the election of delegates and committees in the primary assemblies of the people, or to political associations for political purposes; but the phrase is used herein as comprehending the theory and action of both those associations and of the delegates they select.

—By reason of the very restricted suffrage in Great Britain, until within a few years, her history affords little instruction in regard to such elections. Her politicians are now looking to our system, as by far the most developed, for light in dealing with problems which the ballot and her enlarged suffrage have lately presented.

—In a sparse population, or even before considerable cities arise, there are so few officers elected, and all political affairs are so simple and transparent, that if what may be called a "primary system" exists, it rarely develops abuses. Those who are most worthy of office, and the merits of those who seek it, are known to nearly all the voters. Complex machinery for nominations and for the support of candidates, is equally unnecessary and unavailing. The gains to be derived from controlling caucuses and coercing officials, are too small to enable political manipulators to convert such matters into a profitable business.

—But the growth of cities and of the complexity of life which creates a need for elaborate police and sanitary administration, soon causes some organization for making nominations to be indispensable. At first it is very simple, hardly more than an informal coming together of the more patriotic citizens just before the election. The caucus system of New England, said to have been devised by Samuel Adams, was in theory, and at least in early practice, little more than an extemporized consultation by the voters generally—or by a portion of them and the recognized leaders of the others acting publicly for those who did not attend in person—for the purpose of deciding upon the proper persons to be voted for at the next elections. The idea of dictation, monopoly or gain, was no part of the motive force of the system. Such, too, is that system as now being generally carried into effect in the country districts. But in the larger cities of New England, as in other cities, it has lost much of its original justice and purity in the growth of vicious methods more or less analogous to those of New York and Philadelphia.

—The long habit of treating whatever action precedes the election as beyond the domain of law, and hence as within the range of the absolute, irresponsible liberty of the citizen, naturally causes every proposal to bring primary elections within statute regulation to be denounced as a species of despotism, repugnant to the just liberty of parties and the private rights of politicians. They appeal to the past as illustrating the true sphere of law and of the liberty of partisans, precisely as the authors of

intolerable nuisances and the builders of unsafe houses make the same appeal, when for the first time safe walls and good sewerage and ventilation are required by law.

—A resort to the same reasoning is also prompted by other motives. The control of primary elections by party managers—by chieftains and bosses in their final development—creates powerful combinations and interests in behalf of its continuance. A specious appeal to a pretended natural right and to familiar usage is thus made to cover gross forms of corruption and extreme methods of despotism.

—Further than this, those who make a trade of politics, and find a profit in giving their time to manipulating primaries and dictating nominations, charge those who can not give so much attention to politics with neglecting their political duties, and with complaining of abuses of which their own neglect is declared to be in large measure the cause. There is unquestionably some foundation for this charge; but it is vastly overstated. The important question is, whether we have a good primary system, whether a better one is practicable, and whether the facilities for making a lucrative trade of politics may not and should not be checked by law.

—There is yet another cause worthy of notice, which facilitated the toleration of those abuses until long after their magnitude had required the hand of the legislator. Besides, being of a character little open to observation, they were connected with a discharge of public duty by those causing them, the very performance of which seemed to supersede the need of the citizens giving much attention to the elections. To assail the abuses, therefore, seemed to combine ingratitude with self-condemnation. It was only when the evil began to be alarming that the higher public opinion began to boldly condemn such specious arguments, and to reason soundly on the subject.

—It was in the very nature of these abuses that they should be the greatest in New York city, where population is most concentrated, the greatest number of officers are to be elected, and the extremes of ignorance, poverty and wealth are the most developed. They had there become so threatening before 1866, that in that year the New York legislature, in a statute in a loose way covering the principle of adequate legislation, made penal certain forms of bribery at primary elections. The active and venal classes interested in the corruptions of her primary system have thus far, however, been strong enough to prevent an efficient execution of the law. But, in the meantime, the sense of peril and duty has developed far more potentially, demanding more comprehensive enactments in the same spirit. This demand caused two limited enactments on the subject by the New York legislature of last winter. In the same spirit there has been legislation on the subject in Ohio, Virginia (applicable to Richmond) and in Pennsylvania, though on several points it is yet very defective. The two laws enacted in Pennsylvania last winter are far more comprehensive and penal than those of the same date enacted in New York. But in some respects the statutes of Ohio on the subject are superior to both. In Ohio (Rev. Stat., vol. i., §§ 2916-2921, and vol. ii., §§ 7039-7044), primary elections are in large measure brought under the general election laws. Notice of the elections must be published and posted. Judges, clerks and supervisors of the elections are to be sworn. Any qualified elector may challenge any one offering to vote, and questions must be put touching his

qualifications. The offering or accepting of money or reward by a voter to influence his vote at a primary election, or the making of threats, or any attempts to intimidate or distract a voter at such election, are made penal, and are also a disqualification; and so is the asking or receiving of any money or property by any delegate from any candidate for nomination, or the paying or promising of any money by any candidate to any delegate for the purpose of obtaining any influence or vote in a convention. It is also made penal and a disqualification for holding the office, for any candidate for nomination by a political party for an office of trust or profit, to do any act forbidden as aforesaid, for the purpose of securing influence in his behalf. These provisions are in a high degree comprehensive and salutary, and they deserve the attention of other states. Yet they are less complete, in important particulars, than the English bribery and office-brokerage laws in this article referred to.

—The statutes of California make the calling and holding of primary meetings under the election laws optional. But, in case they are so held, some special provisions of a mild character are added. The entire provisions are meagre and inadequate. (Political Code, section 1357.)

—In New York the corruption and despotism of her system of primary elections are now regarded as so intolerable that the state convention of each party, for the present year, has made a pledge in its platform to reform that system. But much diversity of opinion exists as to the most appropriate and efficient means.

—To comprehend the system is the first essential step toward a remedy for its abuses. Wherever such abuses exist, they tend to become identical with those in New York, falling short as do population, complexity and ignorance. If a remedy can be found there, it can be found everywhere. If the evil grows at that great centre, it encourages imitation in every other city. Let us, then, see what they have become.

—The vastness of the population and the great number and variety of the officers to be elected are important elements of the problem. In towns and villages, every shoemaker at his bench, and every woman over her wash tub, may know the merits of the candidates. But in a city of 1,200,000 people, not one voter in a hundred is acquainted with one in twenty of the candidates. Besides voting for governors and federal electors, the city elects seven members of congress, five state senators, and twenty-four members of the assembly. To these the local judges, justices, coroners, the mayor and aldermen, and other officers, both executive and judicial, who are elective, must be added. Each party, and sometimes each faction, has its candidates. An official list of the candidates to be voted for in November, 1881, though no governor or lieutenant governor, only two members of congress, and no judge of any one of the three higher courts in the city, were to be elected, yet shows 165 candidates in the field to be voted for on the same day. At some elections hardly less than 200 candidates are pressing their claims. There are 688 different places where the votes are received in the city. The legislative officers of a town or village represent the peculiar local interests and views as to the corporation, of which the voters are well informed. These views and interests are the basis of responsibility and the test of fidelity. In a great city, the districts or wards, in which such officers are elected, and which in theory they represent, are little more than nominal divisions—the dwellers in

so many blocks of houses separated only by streets from the next divisions—having no organic relations and no peculiar interest or opinions to be represented; such conditions are very unfavorable to a high sense of responsibility to constituents. They make all local test of fidelity almost impossible. The boundaries of the 688 polling districts are as arbitrary as those of the districts for representation. The voters, on an average, perhaps do not know by sight one in twenty of the persons who vote at the same place. All such facts add new facilities to those afforded by the heterogeneousness of the population and the great number of the candidates, for double and treble false voting, fraudulent personation and counts at these numerous polling places—evils which the most stringent registry laws and the most efficient inspection can do little more than mitigate. Ignorance on the part of the voter of much that he needs to know, a sense of irresponsibility on the part of candidates and officials, and an almost impenetrable complication in the whole machinery of primary elections, are natural under such conditions. They suggest the possibility of making a vast and profitable business and a potent influence in politics, through controlling "the primaries," and thereby predetermining the elections. For many of those candidates the whole city votes; for others only a few wards or districts: for still others only a single one of the smaller districts. The great parties—the chieftains, bosses and their lieutenants who have reduced the nominating machinery to a system and become experts in its management—are a central power, the whole force of which can be concentrated upon the smallest district. Those who confront it there stand alone. Citizens who do not make a business of politics lack the organization and time necessary for resisting successfully the aggressive and ceaseless activity of the great party managers. The greed of many for office; the ambition of scheming leaders for patronage and supremacy; the fierce zeal of partisans for party victory; the heat, recklessness and impetuosity born of nearly 200,000 voters contending together in the political arena of a single city, in which a nomination at the primaries, unless there be a popular uprising, is essential to an election: these are but a part of the elements which give importance to primary elections, and concentrate upon them all the cunning, intrigue and interests of the politician class. That class acts upon the theory that the primary elections practically decide who is to be elected, and that the control of them is, in a general way, the control of the legislative, executive and judicial authority, by which 1,200,000 people are governed.

—The other elements of the primary system are more venal and corrupt, being in part the outgrowth of the abuses of the primary system itself. 1. There are subordinate to these elected officers, about 10,000 officials and many employés in the city, of whom the annual compensation (including that of the elected officers) is nearly eleven millions of dollars. And of federal officials there are in the city more than 2,500 (besides employés), whose annual compensation exceeds \$2,500,000. There are to be added also many salaried officials of the state who serve in the city. It has long been the practice of both parties (and sometimes even of chieftains and bosses on their own account) to levy upon such salaries and wages amounts varying from 1 to 3 or 4 per cent., under the name of "political assessments" (see ASSESSMENTS, and "North American Review," for September, 1882); and the large sums thus extorted have been used to meet the expenses both of the primary system and of party management generally. 2. This habit of assessment extortion, which is really the enforcement of an annual rent upon his office against the public servant (a practice vigorously supported

by the elected officers) naturally led to the practice of demanding money for a primary nomination. Vast sums are thus obtained, to be used for the same objects as the assessment collections. Here is a practice having all the iniquity of a public sale of offices. There is, in fact, what may be called a customary price required for nomination to the respective grades of office, and good reason for thinking that from \$500 to \$1,000 is exacted for a nomination to the legislature and from \$1,000 to \$5,000 for nomination to a judgeship. (See last citations.) The demoralizing effects of such practices, and the vicious and almost irresistible potency they give to the regular nominating machinery, are obvious. 3. The other great element of corruption at the primaries is not less powerful and demoralizing. Under the spoils system (see article under this heading), this vast army of subordinates, federal, state and municipal, have had their appointments dictated by the elected official and the party chieftains. It has been a part of the conditions of the nomination, not only that they should pay such assessments or be removed, but that, subject to the same penalty, they should render active feudal service to the powers that gave them places. Failing to do this, they are, under that system, sure to be removed. (See REMOVALS.) These thousands of officials under such a tenure, have swelled the list of obedient voters at the primary meetings, and of subservient workers for the election of the nominees of such meetings.

—In these facts we find the intimate relations between the purification of the primaries and the great problem of civil service reform. If the primaries were honest and made worthy nominations, the great officers could no longer secure money and henchmen by plundering and enslaving the humble member of the civil service. If the civil service was filled by the more meritorious, selected through competitive examinations (see CIVIL SERVICE REFORM), subordinate officials would be under no pledges and have no inclination to pay assessments or perform degrading partisan work.

—With such facts in mind, let us see what kind of a primary system has been developed in New York. The practical methods of that system, as it is now enforced by either party, were matured under the control of the Tammany society. That society, generally designated as "Tammany Hall," was founded in the first year of Washington's administration, and was incorporated in 1805. It had originally a benevolent or patriotic purpose, and a distinguished membership. But as early as 1812 it was seeking political control. In 1827 it began to meddle with the primaries, and by 1834 it was dominant in city politics. There seems to be good authority for saying, that, in the forty-eight years since which New York has elected her mayors, Tammany Hall has controlled their nomination for at least thirty years. Its power had become absolute alike over nominations, appointments, assessments, removals, and all city expenditures, long before the saturnalia of corruption, pillage and despotism, during which Tweed, Barnard, Fisk, and their associates, flourished. The society is permanent. It has a central general committee with autocratic power, whose action is final and secret. There are subcommittees in each of the twenty-four assembly districts, whose members are drawn from each of the 784 election districts in the city; there being, in all, from 2,500 to 3,000 of these working committeemen. The general committee appears to have power to supersede any nomination made in any of the districts, and it may remove any subcommittee man for insubordination. While this

great central authority has not wholly prevented the growth of powerful factions in the democratic party, it has, with slight exception, controlled with a resistless hand all the primary elections of the party, and no rebellious faction has long survived. It has sold nominations, and levied assessments in vast amounts, to fill its treasury, and has used the money to pay its expenses, to bribe the press, to purchase the support of persons of influence, and to reward its own chieftains. It has also rewarded its friends and bribed its opponents by the gift of places in the public service. It has converted those who fill that service into henchmen as servile, and into voters as compliant, as its own dependent committees. Its perpetuity of corporate life; its long experience in the arts of manipulation; its ability to fill its own treasury by indirectly plundering, through assessments, that of the city, state and nation, as well as by the sale of nominations; its great army of workers made up of its own subordinates and the public officials: these vast elements of power have made Tammany Hall almost as irresistible as it has been audacious, greedy and aggressive. It only needed the authority to say who should be members of the primaries, and, as a result, who should be allowed to vote for delegates and nominations, in order to make such an organization absolutely despotic. That final step was not difficult. With resources so unlimited, within the partisan circles, it was easy to dictate the terms upon which the new generations should enter them. It was not long after 1834 before such authority was acquired. The primary organizations in the smallest districts were changed into partisan (Tammany) clubs, with a continuing membership and strict tests for admission. Neither long adherence to the party, nor sincere devotion to its principles, would secure admission to the local primary. Every applicant must secure the vote or consent of a majority of the old members after his election, before he would be admitted. If elected, he must come under two pledges: 1, to obey all orders of the general committee, and 2, to support all regular nominations, before his membership would be complete. The members of these primaries were the only recognized members of the party, and hence the only persons eligible to any office or able to participate in any action or honors of the party. Whoever attempted, even in the most obscure district of the city, to bring forward any candidate not approved by the great central mercenary authority, at once felt the crushing weight of this powerful, all-pervading, despotic primary system. How hostile such a system is to all free and noble aspiration, to all exposure of abuses, and to all disinterested effort in politics, and how naturally and rapidly official degradation followed from such a system, need not be pointed out. It is plain enough, too, that such a system would never give a true representation of the people, especially of the more patriotic and self-respecting portion of them.

—The-republicans not only found this primary system complete, but, early, there came into their ranks thousands of politicians familiar with its enforcement, and greedy for its spoils. The time and manner of its reproduction in the republican party we need not recount. It is enough that, not long after the war, assessments, nominations made for a price, officials converted into partisan henchmen, the old democratic primary methods, an aristocratic secret central committee, and servile pledges of support and obedience at the gates of the primaries, were all a part of the machinery of the new party. No one could become a member of a primary unless elected by a majority of the old members. No one not a member, however true and worthy a republican or noble a citizen, had any vote for a delegate, any chance for an office, any recognition by the party leaders. The smaller the membership of the

primaries, the more easily they were manipulated by the chieftains and bosses, and the more certainly the henchmen could outvote the more independent members. At no time did that membership exceed in number a fourth of the city voters of the party, and for several years it has hardly been one-sixth. All nominations and all platforms, save when the independent unite in rebellion, are made by the delegates of these primaries. The pledges and servility required for getting into a primary have excluded the more independent and conscientious voters. There is nothing in the republican primaries corresponding to the original primary meetings of New England, in which every adherent of the party was presumptively a member. Hence there is, even in theory, no real representation of the party, but only a confederation of selfish, partisan clubs, under the name of primaries and the pretense of representation. The organization of the twenty-four republican primaries of the city is as complicated, and the access to membership is as difficult, as that of any private club. The name of the applicant must be posted on a bulletin, and there stand until the next monthly meeting, before it can even go to the committee on admissions. If favorably reported, it must yet gain a majority of those present at a monthly meeting of the primary; a result quite problematical if the pliant obedience of the candidate is not made clear, or if he is not a member of the faction or the follower of the boss domineer in his primary; and his application must be to the primary of his district. If he secures a majority, he must yet not only take in substance the old Tammany pledge, "to obey all orders of the general committee" (whose action is secret), and "to support all nominations approved by that committee," but he must also bind himself not to join any organization which does not recognize the authority of the primary association he seeks to join! This is, of course, intended to prevent all movements for reform. If elected, he may at any time be expelled by a majority of the members at any meeting of the association, if he is held to have violated any of those pledges. After an expulsion, he can get back only by a vote of the primary. Such is the liberty of a member.

—The growth of these evils has long been apparent. The servile conditions of membership have repelled the better class of citizens. A large part of the money gained by assessment and the sale of nominations has found its way into the pockets of the henchmen and schemers, by whom, generally, the primaries have been controlled. From the same fund venal demagogues and mercenary journals have secured liberal pay for doing the dirty work of politics. An unscrupulous, greedy generation of partisans has made a profitable trade of party management, and has obtained the control of the city primaries. These classes have brought the party management under a low morality and poor ability, in the same degree that they have disgusted and alienated its worthy members. Such causes have greatly increased the indefensible inclination of many citizens to stand aloof from politics.

—It is in such associations, and through the votes of members thus deprived of half their manhood and all their independence, that the delegates of the republican party are selected, by whom the seats of its conventions are filled, the declarations of its principles are framed, and the nominations of its great officers are made. Nowhere else in the state is the primary system so arbitrary as in the city of New York, but much of its theory is enforced in all the municipalities, and its spirit is felt even in the towns. It is such a system in New York, and hardly less in Philadelphia, which has made possible the servility in conventions, the feudal despotism of party leaders, the

shameless forgeries for carrying nominations, and the open warfare of factions, by which the better citizens are disgusted, politics are degraded, and great parties have been enfeebled, demoralized and corrupted. In a letter dated August, 1871, the present governor, Mr. Cornell, then chairman of the republican state committee of New York, after saying that "the interests of the party could not be intrusted to the republican primaries, and that their rolls contain fictitious names," declares that "when the delegates to the general committee of 1871 were elected, *a very large portion of the true republicans in every district declined to take part in such election*, on account of the frauds and violence and the facts hereinbefore set forth"; and that "many of the presidents of the republican associations were in the direct employment of the city officials. \* \* Members of the general committee have since acknowledged that they were paid large sums of money to vote in accordance with the dictates of the Tammany officials. \* \* As might be expected, *the elections of delegates to conventions in nearly all of the districts were mere farces.*"

—There has been but very inadequate improvement since. George Bliss, district attorney under President Grant, in a letter to President Arthur, dated November. 1879, says: "The rolls are deceptive; in one district half the names of those on the rolls are not known in the district. These bogus names afford a convenient means for fraudulent voting. The rolls of many of the districts are full of the names of men not republicans, and are *used by the managers to perpetuate their control of the associations*. On the other hand, desirable members, good republicans, who have an absolute right to become members, are excluded. Sometimes this is done by a direct rejection, but oftener by a refusal to vote upon the names presented. \* \* At elections they are or are not members, according as they are or are not prepared to vote a ticket satisfactory to the controlling powers. So notorious is it that elections in the associations are not fairly conducted, that contests are of rare occurrence." He says, "a reform of the primary system must be made," or the republican party of the state "must and will be swept out of existence." There has hardly been any change in New York for the better since 1879, if indeed her primaries have not become more mercenary and proscriptive. Such are the reasons which have made the question of primary elections in the leading states, and must, not long hence, make them in other states, a subject of great peril and difficulty.

—As the fate of elections and the general welfare is plainly involved in this primary action, there can be no more question of the sound policy of extending the laws over it than there is as to the expediency of registering voters or educating the poor. The real question is, how to do it effectively.

—1. It is plain, that, in the voting for members of the primaries, in their proceedings as organized bodies, in the methods of selecting delegates, and in the discharge of duties of the delegates, there is every opportunity for injustice, fraud and corruption that there is in the formal elections of officers, or in the discharge of their duties. The New York state convention, for example, has just been disgraced by flagrant cases of forgery which have affected, if they have not decided, the nomination of a governor. No New York statute covers such cases, though that of Ohio probably would. It is plain enough, therefore, that the provisions, in principle if not in detail, which punish cheating, falsehood and violence at the final election, should be extended to the

primary elections also. A committee of the legislature of New York reported, last winter, that the fraudulent practices at the primary elections now unpunished can be prevented from soon extending to the official elections, only by legal prohibitions. More stringent legislation on it is essential. The two Pennsylvania laws enacted upon this subject in 1881, go far beyond the New York statutes of the same year, and are examples of legislation which well illustrate the better spirit which is becoming potential in both states.

—2. Recognizing the possibility that a disciplined band of politicians may gain too much power in the primaries, whatever legal safeguards may be thrown around them, other bills offered on the subject, and especially in New York have gone further than mere penal provisions, by providing for a *direct vote of the people* in the primaries for the candidates for election, instead of for delegates to make nominations. The primary elections are thus practically converted into a first vote for officers; the second vote being the elections themselves, at which, however, only those can be voted for who have received the highest vote of the party at the first election. On this theory, strictly applied, delegates and conventions are made unnecessary, but, in some forms of its proposed application, delegates for specific purposes are to be voted for at the time of the first vote. There are also provisions in some of the bills allowing a given number of citizens to put forward a candidate, at the first election, they being in the sense of the law "a party," though not in the popular sense of the word. Their candidate, having the majority of their votes, could therefore be among the highest eligible to be voted for at the second or final election. Much as that device might at first curtail the present power of the primary despots, it is plain that their vicious nominating machinery could be put in force to forestall the first election by making nominations therefor. Without adequate provisions for making a fictitious legal party as aforesaid, it is plain that the rule of confining the final vote to the party candidates having the most votes, would greatly increase partisan tyranny and monopoly. It would make partisan tests more mischievous and controlling than they now are in municipal elections. As both elections, on this theory, are made legal and public proceedings, the expenses of both alike are to be paid from the public treasury. It can not, therefore, be doubted that the legitimate expenses of elections would be considerably increased; though, if the sums gained by assessments and the sale of nominations are added, it is very likely the expenses of the new methods would be less. This experiment of double voting appears to have been tried with some benefit in Richmond, Virginia. The need of bringing the action of the primaries under legal provisions is so plain and imperative, the subject is so complicated, difficult and new to legislation, that the expediency of attaching to it new and doubtful methods of elections is at least very questionable. It may cause great delay.

—3. Other legislation and further remedial measures are needed for the purification of the primary system. We must by penal statutes suppress the raising of money by assessments and the sale of nominations. So long as partisan managers are allowed to gain by such means abundant money for filling their own pockets and those of their camp followers, for bribing the press, and for compensating demagogue oratory, they will be stimulated to a pernicious and almost irresistible activity. The unnatural spectacle will continue, of the lowest class of partisans, having the least stake in the welfare of the country, being the most active in politics and the most influential in the

elections. Why should we expect any other result as long as that corruption fund can be divided among them by their own vote or the order of their chieftains? What is it but partisan despotism awarding the prizes for political corruption and servility?

—4. We must also, as an essential condition of honest primary elections, take from the great politicians and the elected officers their corrupt patronage, by reason of which, through threats of removal, they make the public officials their servants, and through actual removals they make places and spoils for their followers, who do the basest work of the elections. (See PATRONAGE.) The reform of the primaries is largely dependent upon the reform of the civil service. So long as we allow such opportunities of prostitution and corruption to be the prizes of elections, we have no right to expect them to be pure, and no reason for surprise that honest voters are discouraged and the baser elements so often triumph. If the better classes would elect their candidates, they must use their own money to pay expenses, and must forego the use of places for rewarding their mercenary supporters. The existing system allows the public treasury to be indirectly plundered, and the public service to be directly prostituted, by the politician class for their own ends; and when that system is arraigned, those who live upon its spoils declare that the abuses at the primary are caused by the neglect of the honest and independent voters to attend. In the very outset of their resistance, such voters must take money from their own pockets to match the tens of thousands which machine politicians plunder from the public servants, for campaign expenses. Let both classes alike be compelled to appeal to the voluntary contributions of the voters. When corrupt patronage shall be suppressed by filling the subordinate places through competitive examinations, and assessments and the sale of nominations shall be made penal, so that all classes alike must tax themselves for the election of their candidates, we shall no longer see the most mercenary and [Note: Next two letters missing in original, possibly "un"—Econlib Ed.]patriotic citizen the most active at the elections. Take from the vulgar lords of the primaries in New York or any other great city, the money they gain by extortion and the patronage they dispense by favor; force them thus to organize and to vote, like good citizens, on the basis of principle and duty, and the feverish, mercenary activity of those leaders will cease. The most intelligent and patriotic classes will be not only the most active but the most potential in our politics.

—5. The abuses of the primary system are as intimately connected with the sums which candidates pay, if not directly as a bribe for a nomination, yet indirectly by reason of its having been made, as they are with the moneys extorted through political assessments. A citizen of New York has, in the pending canvass, publicly refused to be a candidate, because the nomination was tendered on the condition of a money payment. The funds secretly gained by either means are secretly expended without legal responsibility, and often in ways utterly corrupt. In England, the laws have for some years required a public statement and official audit of election expenses; and these safeguards, together with her office-brokerage laws, have been a considerable check upon the corrupt use of money for influencing elections. These statutes are worthy our study.

—It might also be found an improvement if the voting papers were furnished, and portions, at least, of the legitimate expenses of the elections were, after proper audit,

paid from the public treasury. Such payments would remove various excuses for assessment extortion and the sale of nominations; and, while taking an unjust advantage from candidates who can command money, would make it easier for worthy and scrupulous citizens of limited means, to stand as candidates.

—It would be altogether reasonable, and it would not be difficult, to compel every candidate for an elective office to file a statement, for public inspection, which should clearly set forth all money he had paid or become responsible for, directly or indirectly, by reason of his nomination or toward the expenses of his election; and he might also be made subject to a properly guarded examination before a judge upon the whole subject. The British government gave this theory of opening official doings to public inspection a very radical application nearly a century ago. (See 24 George III., chap. 25, sec. 55, and Eaton on "Civil Service in Great Britain," p. 140.) And an application somewhat analogous has been made in the laws applicable to the city of New York. (Laws of New York, 1873, chap. 335, sec. 109.)

—The purification of the primaries in great cities would be much facilitated by increasing the length of terms and by reducing the number of elective officers. The great number of candidates for election confuses and disgusts the voters in much the same degree that it makes the business of caucus management intricate, active and profitable. The election of such officers as constables, county clerks, secretaries, justices and judges, whose functions are in no sense representative, and who were appointed until the spoils system had become established, is indefensible upon any sound principles. The changes that made them elective were naturally desired by all those interested in the patronage of party chieftains or gains of primary elections. The honest voters, alarmed at the abuses of the appointing power, too readily consented to the change, in the hope that it would be an improvement. But for the abuse of that power, such officers would never have been made elective. With a true reform they will again be made appointive. (See REMOVALS.) Here, again, we see the close connection between the reform of the civil service and the reform of the primary system. To make the reappointment of such officers safe and satisfactory, we must reform the civil service. To relieve the primary system of the demoralizing duty of selecting officers in no sense representative, and only ministerial and administrative, we must make such officers again appointive.

## PRIORITY OF DEBTS DUE TO THE UNITED STATES AND TO THE STATES

### PRIORITY OF DEBTS DUE TO THE UNITED STATES AND TO THE STATES.

In the first decade of its existence under the constitution, congress passed several laws giving priority to debts due to the United States. As early as July 31, 1789, it was enacted, that the claims of the national government upon bonds given by importers for the payment of duties should have precedence over all other obligations. (U. S. Statutes, 1789, chap. 5, § 21.) Subsequent revenue acts contained similar provisions. (U. S. Statutes, 1790, chap. 35, § 45; *Ib.*, 1792, chap. 27, § 18; and *Ib.*, 1799, chap. 22, § 65.) On May 3, 1797, a bill became law which regulated in detail the settlement of accounts between the government and revenue officers. (U. S. Statutes, 1797, chap. 20.) It contained a section (§ 5) which gave preference to debts due to the United States in all cases whatsoever, whether "a revenue officer or other person" was the debtor, and however he might have become indebted, if only the debtor became insolvent, or if his estate after his death was insufficient to pay his creditors. This sweeping clause, curiously inserted in a bill of limited scope, still remains in force; and in all cases of insolvency or insufficient assets in the hands of executors or administrators, debts due to the United States are first satisfied.

—It is easy to ascertain why congress gave priority to the claims of the government. These statutes were framed for the purpose of building up our system of customs, and preference was given the debts of the government simply to increase the revenue and make it more certain. The heavy national debt which the confederation had left behind it made such a course especially desirable. The section which extended this preference to all debts passed as a part of the revenue laws. These statutes neither recognize nor adopt any traditional prerogative. They rest the right of priority, not on the dignity, but on the need, of the government. In 1805 the supreme court at Washington held that the constitutional right of congress "to pay the debts of the United States," (Constitution, art. 1, § 8), and "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers," (*Ib.*), included the right to make laws preferring debts due to the government. (*Fisher vs. Blight*, 2 Cranch, 358.) Our highest tribunal thus bases this priority on the power of congress to use whatever means it considers eligible to raise revenue for the purpose of paying the debts of the nation. No legal objection to the preference of debts due to the national government could be made on the ground that it interferes with the rights of individual states, because the constitution, and the laws of the United States made under it, are the supreme law of the land. (Constitution, art. 6.) The insolvency of the debtor which gives preference to the United States under the act of 1797, must be legal insolvency, manifested by some notorious act. Mere inability on the part of the debtor to pay his debts is not enough, unless it is accompanied by a voluntary assignment of all his property for the benefit of creditors. The courts usually construe the act strictly, and do not allow the right of priority unless it is clearly established.

—Would this right of preference have existed independent of statute? Our national and state governments are the successors of the British crown, and, as such, they acquired those prerogatives of the crown which are adapted to the changed condition of things in this country. This right of preference is a royal prerogative in England. Where the king's right and that of a subject meet at one and the same time, the king's is preferred. (8 Bacon's Abridgment, Prerogative E. 4, p. 91.) In a case which was several times argued in the court of common pleas during the reign of Elizabeth (Skrogs vs. Gresham, Anderson, 129, case 176), Lord Chief Justice Anderson decided that the queen should be preferred in the payment of debts before any subject, partly because of the requirements of *magna charta*, and for various other "self-evident reasons," (*et per divers auters reasons queur jeo omit pur ceo que sont evidents*). These reasons are not as evident to-day as they were then, and it is a pity that the learned chief justice did not give them at length.

—Did the United States and the states themselves inherit the right of priority from the crown? Our courts have divided on this question. As the state and nation are equally sovereign in their own spheres, the arguments which apply to one apply also to the other. The supreme court of the United States has distinctly held that the national government had no right to prior payment before the acts were passed. (1815, United States vs. Bryan, 9 Cranch 387.) In South Carolina the state has no right of priority. The court there holds that the state has not succeeded to all the prerogatives of the crown. A monarchy is a government for the benefit of the king, while a republic is a government for the protection of the citizens. The state, therefore, has no privileges but such as are granted by its constitution, or by act of the legislature, or such as are necessary to the proper administration of the government. (State vs. Harris, 2 Bailey, 599.) In Maryland, on the other hand, preference is given to debts due to the state. Its court recognizes the right as a common law prerogative of the government. (State vs. Bank of Maryland, 6 Gill and Johnson, 205.) In most of the states the question has never been settled. This is the case in New York, but at one time the court of appeals seemed to favor the right of priority. One of the judges, in an opinion of the court, said that there was great force in the suggestion that the people of the state have succeeded to all the prerogatives of the crown in so far as they are necessary to the effectual exercise of the essential powers of civil government, and that consequently taxes should here be paid first, as they are in England. (In re Columbian Insurance Company, 3 Abbott's Court of Appeals Cases, 239.)

—The statutes of the states have declared and altered the law in many cases. Taxes are usually preferred by express enactment, but in some cases this preference only applies to insolvents, and in others only to bankrupt estates in the hands of executors or administrators. The reader must examine the statutes of each state to ascertain the law. It is to be noted that the right of priority existed under the Roman law, and that it usually prevails now wherever the civil law is followed.

—See on the general subject, 1 Kent's *Commentaries*, Lecture 12; see also *U. S. Revised Statutes*, § 3466 et seq.

ERNEST HOWARD CROSBY.

## PRISONERS OF WAR

PRISONERS OF WAR. Persons coming under any of the following heads can not be regarded as prisoners of war, namely: those who are connected with the service of the army, but who do not form part of the combatants; innocent subjects of the enemy who have not taken part in the hostilities; soldiers who have committed acts of violence without orders from their commanders; those who have spontaneously, without order from the state, armed themselves against the enemy; spies, deserters and fugitives. These classes do not include surgeons, chaplains and sutlers, quartermasters, drummers and fifers; they form part of the combatants, and are considered as belonging to the active army; they are likened to soldiers, and classified as prisoners of war. (In pursuance of the convention agreed upon Aug. 22, 1864, between nearly all the countries of Europe, and completed in 1868 by additional articles, all medical persons, and even the wounded in ambulances, as well as chaplains and nurses, are considered as non-combatants. In the war of 1870-71 complaints were made on both sides of infractions of these treaties, but we do not believe that these infractions were voluntary, even supposing that the complaints were well founded. M. B.)—"Even in the best days of pagan antiquity, the laws of war, from which the law of conquest was derived, said, with inflexible severity: 'For the possessions of the enemy, confiscation and pillage; for the person of the enemy, slavery or death.' But, under the influence of Christian principles, customs have become modified. The laws which our fathers, after having conquered the Roman empire, made in fire, in action, in impetuosity, in the pride of victory, they softened; these laws were harsh, they made them impartial. The Burgundians, the Goths and the Lombards always desired that the Romans should remain a conquered people; the laws of Euric, of Gondebaud and of Rotharis made the Romans and barbarians fellow-citizens." (Montesquieu, *Esprit des lois*, book x., chap. 3.)

—To slay an enemy after the battle, or to reduce him to slavery, is no longer permitted by international law; to make him lay down his arms, and to hold him as prisoner of war until the re-establishment of peace (unless a free retreat be granted him, either at once or at a stated time), are what the laws of modern warfare prescribe.

—The effects of captivity date from the moment of surrender. The prisoners are then placed in the interior of the country under the surveillance and authority of the conqueror, and restored to liberty *either unconditionally or on bail, or for a ransom, or in exchange.*

—The decree of May 25, 1793, breathing the spirit of human dignity, declares that no person taken from the enemy shall be forced to serve in the army of the state which has taken him.

—The law of June 20, 1792, places prisoners of war, in France, under the safeguard of the nation, and orders that they shall be protected, the same as French citizens, against all insult or outrage. This law contains also other orders full of humanity.

—A decree of April 4, 1811, says: Any prisoner of war, having the rank of an officer, and any hostage, who, after having given his parole, violates it, shall, if recaptured, be regarded and treated like a soldier, as to pay and rations, and confined in a citadel, fort or castle.

—The rules relating to the exchange of prisoners have been established by several legislative provisions. Until very recently, it was customary to agree as to the exchange and the pecuniary ransom according to rank, at the same time, in order to settle the account in case of an inequality in the number or rank of the prisoners. We find an example of this in the cartel of March 12, 1780, between France and England. But France set aside all ransom during the war of the revolution, by decreeing, May 25, 1793, that only an exchange of man for man and rank for rank should be allowed. (See EXCHANGE OF PRISONERS.)

—We see that legislation with regard to prisoners of war in Europe is founded upon generous sentiments. If the fatal laws of war permit a belligerent power to make prisoners and to hold them, whether to prevent them from again bearing arms or to weaken the enemy, or even to lead them to accept equitable conditions of peace, they do not permit violence or ill-treatment toward them so long as they do not disturb the quiet of the state. It is also customary to allow a greater degree of liberty to higher officers than to non-commissioned officers and soldiers. They are, as a general rule, placed upon honor (parole) in a certain town, and it is not unusual to see them sent back to their own country upon the promise of paying a ransom, and virtually under engagement not to bear arms against the government which has restored them to liberty.

—The victorious state can not, however, be disarmed against prisoners of war and their breach of parole. Thus, besides the penalty which we have cited above in the decree of April 4, 1811, to punish violations of sworn faith, it was necessary to provide for cases in which prisoners of war, taking advantage of their number, might organize a resistance against lawful authority. This was done by the decree of the 17th of frimaire, year XIV., which orders as follows: "All mutiny, resistance to the police or the national guard, all plots of which prisoners of war may be guilty, shall be punished by death."

—Outside of this, the life of a prisoner of war is sacred, inviolable, according to law. The distinction is easily understood. In the later case, there is no longer any question of the application of the laws of war, but of the defense of society and the repression of a crime under the principles of common law. Publicists, however, have propounded this question: "Are there cases in which the care of one's own safety, and the danger to be incurred, will not permit us either to make prisoners or to retain those whom we have already made?" This question recalls a frightful episode of the French-Egyptian campaign. The French army had just taken Jaffa and sacked it during thirty hours of pillage and massacre. There remained several thousand prisoners who could not be kept for want of food, nor yet sent back to swell the ranks of the enemy. The unfortunate wretches stood on the shore with their hands tied behind them, waiting for their doom to be pronounced. "Bonaparte," says M. Thiers (*Histoire de la Révolution*, vol. viii., p. 401), "determined on a terrible measure, the only cruel act of his life.

Transported to a barbarous country, he had involuntarily adopted the customs (morals?) of it; he caused the remaining prisoners to be put to death. The army, appalled but obedient, completed the execution with which it had been charged." "Who shall answer to posterity for so horrible an act? Those who commanded it," adds M. Dalley ("Natural and International Law," No. 123), "unless they tried every means, even in face of the enemy, to prevent it. For the principle is self-evident, that war, even the most just, can legalize only such injury to the enemy as is absolutely necessary."

—Can a monarch and his family be made prisoners of war? International law has decided in the affirmative. Nevertheless, it has long been customary among the civilized powers of Europe, first, to consider it as contrary to the laws of war to take aim at a hostile sovereign or prince of the blood royal; secondly, to treat his family with distinction by exempting them from detention; thirdly, to alleviate for the hostile sovereign personally, or for his family, the evils of war, in all respects which would not affect the result of military operations. (It seems to us that there should be no question as to declaring women and children and non-combatants *prisoners* of war, even in the case of queens and princesses. Nevertheless, if a queen regnant should command an army, she would be justly considered a combatant. M. B.)

—On the principle that war alone can make prisoners, as cause produces effect, it follows that any act by which the subject of a nation should be declared prisoner of war, even though he had not taken an active part in the hostilities, can be regarded only as a violent measure, in opposition to all the principles of civilization. Such is the provision of the decree of Berlin (Nov. 21, 1806), stating that any English individual in the countries occupied by France or its allies, is declared a prisoner of war. Such a principle, poorly veiled under the pretense of reprisal, demonstrates how far contempt of international law may carry a conqueror irritated by seeing limits put to his ambition. This sad example is happily the only one presented to us by modern history. It is proper to say, that since the war of 1870 the Germans have been driven away, even when a long time settled, and that any of them found upon the territory would have been made prisoners.)

PAIGNON.

## PRISONS AND PRISON DISCIPLINE

PRISONS AND PRISON DISCIPLINE. The extirpation of crime is the highest aim possible in a penal code. Since to extirpate crime is practically impossible, all existing penal systems content themselves with an effort to repress crime. Crimes are committed by men: therefore they can be repressed or prevented only by the exercise of some restraining influence or power upon the men who commit them. Men are influenced by motives. Their action is the outgrowth of their personal character and experience, which produce in them a greater or less susceptibility to hope, fear, and the sense of moral obligation, and lead them to say, as the case may be, I ought. I must, or, I will. The efficiency of every actual or proposed system for the repression of crime may, therefore, be measured by the knowledge of human nature and the harmony with its fundamental laws displayed in the elaboration of the code. In every good code there is a distinct purpose, and the means employed are wisely adapted to secure the end sought.

—Crime may be repressed in either of two ways, namely, by physical or by moral agencies.

—The highest form of forcible repression is execution, or the death penalty, called capital punishment, because it stands at the head of the list of possible punishments, so that all other punishments are said to be secondary. Capital punishment has been inflicted in many ways, by different nations, and at different stages of their development, among which may be named decapitation, strangulation, burning, breaking upon the wheel, stoning, crucifixion, burying alive, drowning, poison, starvation, shooting, driving a stake through the body, disemboweling and quartering. Most of these punishments are obsolete. The more usual modes of execution in modern times are by means of the gallows and the guillotine, except for military offenders, who are commonly shot to death. Electricity has been suggested as an instantaneous and painless mode of inflicting the death penalty, and an apparatus for its application devised, but not adopted. It is so obvious that a dead man can never again commit crime, that the killing of the offender appears to be the form in which the first rude conception of justice naturally presents itself to the savage mind. It is the usual form in which punishment is inflicted by a mob. But with the advance of civilization, we may trace the gradual disappearance of the stain of blood from the codes of Christendom. Sentence of death, which was formerly pronounced against a long list of crimes, is now reserved, for the most part, for actual murderers. The law even of homicide has been so modified, by the introduction into it of subtle distinctions, as to relieve from execution the majority of those accused of imbruing their hands in the blood of a fellow-creature, by the substitution of imprisonment for the gallows. It can not be denied that the tendency of modern thought is in the direction of the total abolition of the death penalty. The arguments urged against it are: that it is unnecessary; that it is useless, since men are not in fact deterred from the commission of crimes through fear of death; that it is unjustifiable, since society has no more right to take human life than has an individual; that it is unscientific, because it does not admit of degrees in its application, according to the degree of culpability of

the offender; that it is irrevocable, which no human punishment, in view of the possibility of a mistaken verdict, should ever be; that it exerts a demoralizing influence upon the spectators and upon the public at large, by exciting the worst passions of human nature, by awakening popular sympathy for the victim, and by rendering punishment uncertain, in consequence of the reluctance of juries to assume the responsibility for a capital sentence; and finally, that if the soul is immortal, the consequences of capital punishment may be eternal, for it terminates abruptly the supposed or real culprit's chance of repentance and reformation. The apologists of the death penalty, on the other hand, appeal to the authority of the ancient law recorded in the book of Genesis, in the sacred Scriptures, "Whoso sheddeth man's blood, by man shall his blood be shed"; they insist that retribution is a natural instinct; a philosophic principle, a divine command; they urge that society has the same right to protect itself, which is conceded to individuals, that in face of extreme perils, extreme measures of safety are lawful, and that the fear of death has more power to deter a criminal from yielding to his criminal impulses than any other known motive; they also point out that there is a natural passionate reaction, on the part of communities against flagitious offenders, which, if it does not take the form of duly authorized legal process, will find an outlet in mob law, against which it is the duty of human governments to protect individuals and the public. The universality of capital punishment is in its favor; opposed to it is the fact, that, with the gradual amelioration of the severity of punishments, punishment has become more certain, and crime has diminished in volume and intensity. It is evident that the question can be settled only by experience of the practical results of the gradual disuse of this extreme penalty. Executions, in the United States, are almost wholly private.

—A second form of forcible repression is transportation; or the establishment of penal colonies, remote from the mother country, to which criminals are removed. England, Russia and France have resorted to this mode of punishment; but England has abandoned it, and even in Russia the system appears to be doomed to speedy extinction. The history of English transportation is a veritable romance. Little more than a century after the landing of Columbus, the English government began to ship convicts to the wilds of North America. From the year 1718, all offenders sentenced for a term of not less than three years were liable to be transported to America. Convicts were delivered by the courts to masters of vessels as merchandise, which they were at liberty to dispose of to the planters of Virginia, Maryland, Jamaica and the Barbadoes. Not infrequently those who were rich enough bribed the masters to let them go, at landing, and so set the law at defiance. But with the achievement of American independence, this practice of necessity came to an end. The result was, that by the year 1787 the number of prisoners in the hulks on the river Thames amounted to more than 15,000, for whom the government was discussing the propriety and necessity of building prisons. Profiting by the preoccupation of Europe with the events which preceded the French revolution. England had, however, taken possession of the newly discovered continent of Australia, of which the famous navigator, Captain Cook, had given the most glowing description; and accordingly New South Wales was determined upon as the site of a penal colony. On Jan. 18, 1788, after a voyage lasting eight months, 850 convicts, men and women, landed on the east coast of Australia, where the city of Sydney now stands. Thus was laid the foundation of a new empire, the history of whose early struggles and rapid

development constitutes one of the most interesting chapters in the history of the world. A few years later, a second colony was established in Van Dieman's Land, an island south of Australia, now known as Tasmania. It was the policy of the government to encourage free emigration to these colonies by grants of land, which were also made to convicts who had served their time and were called emancipists. Subsequently the governor of the colony was empowered to assign convicts to landholders or other free colonists, something after the manner in which prisoners are leased to private persons in the southern states of the American Union. This practice led to the formation of chain gangs and road parties. The worst convicts were sent to penal settlements, of which there were three; that on Norfolk island, which is of volcanic origin and about 900 miles east of Australia, has become famous in the history of prison discipline through the labors of Capt. Maconochie, who, from 1840 to 1844, was governor of the island, where he introduced the mark system, of which he was the inventor. Transportation was opposed by John Howard, at the outset, but in vain. Twenty years after Howard's death, Romilly and Bentham renewed the attack upon it. But it may be said to have received its death-blow, when Richard Whately, archbishop of Dublin, wrote two letters to Earl Grey, in which he characterized it as "a system begun in defiance of all reason, and continued in spite of all experience." In 1837 a parliamentary commission on transportation was formed, of which Sir William Molesworth was chairman, and Robert Peel and Sir John Russell were members, which reported in favor of its abolition, on the ground of its excessive cost, the injustice to the colonies involved in its maintenance, and its effect in increasing crime. This committee pointed out, that, as a punishment, transportation is unequal, because of the extreme variations in the personal fortunes of the expatriated, and because it is the occasion of the severest pain to the better class of convicts, while habitual and hardened offenders feel it the least. Its deterrent influence was said to be very slight, while upon some minds the prospect of emigration at the expense of the public operates as an inducement to commit crime. Transportation to New South Wales ceased in 1840, and to Van Dieman's Land in 1848. The colony in West Australia, established in 1829, still remained, but the number of convicts sent to it was small. From the year 1847 the principle of probationary punishment in the mother country, prior to transportation, was incorporated in the English criminal code. In 1853 parliament passed an act authorizing penal servitude at home as a substitute for transportation. By the act of 1857 transportation was formally abolished, but under the name of penal servitude it in fact continued until 1867, when the last cargo of convicts was sent to West Australia. During the latter years of its continuance the character of the system underwent a complete transformation. It became a reward for good conduct on the part of prisoners during their incarceration. Its final abolition was not so much the voluntary act of the English government, as it was a necessity arising from the vigorous protest against it by the inhabitants of South Australia.

—The transportation of Russian criminals to Siberia dates from the year 1710, in the reign of Peter the Great.

—France has made two experiments in this direction. The first, in Guiana, is admitted to have been a failure; but it is contended that the penal colony of New Oaledonia is a valuable addition to the resources of the French penal system.

—The question of transportation, as an alternative for imprisonment, has a certain limited interest for Americans, owing to the occasional appearance in the newspapers of articles suggesting the propriety of converting Alaska into a penal colony for the United States. But apart from the objections arising from the location and climate of Alaska, the realization of such a scheme as this would involve a revolution in the entire system of prisons throughout the Union. and the assumption of the task of repressing crime by the national government, instead of leaving it to be dealt with by the several states. De Tocqueville has said, in substance, that a nation which does not know what to do with its criminals at home, ships them beyond seas, which is a polite way of saying that nations, like individuals, are selfish, and seek to make others bear the burdens which properly belong to themselves. The question has three branches, namely, the effect of transportation upon the criminal himself, upon the colony to which he is sent, and upon the home country. It is not easy to defend the system upon either of these grounds. Transportation has in itself no reformatory influence; it relieves the home country from the presence of the criminal, but it does not, like hanging, relieve the world; it simply changes the scene of his exploits; and it affords no guarantee that the exile will not return. The supervision of criminals at a distance is difficult, expensive and unsatisfactory. Their presence in the colony is a constant menace and a social peril. Under the most favorable circumstances, the system needs to be surrounded with proper safeguards. In 1846 the Australians demanded of England that as many honest emigrants should be sent out as convicts, as many women as men, and that the families of convicts should be allowed to accompany them.

—The third and only other possible form of forcible repression is imprisonment, by which culprits are removed from society, though not to another world, nor even to another country. Reduced to its lowest term, the fundamental idea of the prison is that of forcible seclusion from the outside world. Society ejects the prisoner, with no higher motive than that of self-protection. According to this view, the prison is a substitute for execution and for transportation, but nothing more.

—In the history of the development of the prison it is easy to trace a certain logical and necessary sequence, corresponding to the order of thought upon this subject. In ancient history small mention is made of prisons, and what little is said about them leads to the inference that their principal use was as temporary abodes, for safe-keeping, of offenders awaiting execution, although there is abundant evidence that prisoners were often released, probably by an act of executive clemency on the part of the ruler, and sometimes they were for years forgotten, as was the case with Joseph, in Egypt. There can, however, never have been any age in which prisons, in some form, were not a necessity, for one purpose or for another; and while the prison, in its present form, is a modern invention, some of the features of our modern system are clearly foreshadowed in the records of the past. It is related, for instance, that in China the young king, Tai-Kia, deaf to the monitions of his minister, Y-in, instead of following the example of his predecessors, gave himself up to every species of vice. The minister tried to reform him; but the king would not listen. There upon Y-in declared: "The conduct of the king is but a series of vices; his associations accord with his nature. No communication must be allowed him with evil companions. (Solitary confinement.) I will cause to be built a palace in Tong. There, near the ashes

of his royal sire, I will give him instructions, to the end that he may no longer pursue a vicious life." (Reformatory discipline, with education as its chief feature.) Accordingly, the king took up his solitary abode in the palace of Tong, put on mourning (a prison dress?), and at length entered into the true path of virtue. From the statement in the Chinese work, "Shu-King," written about 2,600 years before the Christian era, that a considerable inclosure of land was assigned to the inmates of a prison, M. Beltrani-Scalia has argued that the convicts must have been employed in cultivating the soil. The allusions to prisons in the Bible are numerous, but too familiar to require citation here. It is, however, worthy of remark, that there is no provision for imprisonment in the Mosaic law. At one time a single prison sufficed for the use of the Roman people, as appears from the third satire of Juvenal:

Felices proavorum atavos! felicia dieas  
Sæcula! quæ quondam sub regibus atque tribunis  
Viderunt uno contentam carcere Romam.

This was probably the Mamertine prison, erected by Ancius Marcius, to which a second was added by King Tullius, which is supposed to have been built immediately under the Mamertine. The remains of this famous structure are still pointed out to travelers, for many of whom a special interest attaches to the spot, on account of the tradition that the apostle Paul was confined here. In the subsequent history of Rome, transportation was known, under the name of *relegatio ad insulam*; and penal labor was required of offenders, who were employed upon public works and in mines and quarries. A description of the *latomiæ*; of Syracuse may be found in Cicero's oration against Verres. The great thinker Plato anticipated the best thought of our own times, in his book "De Legibus," where he has expressed his opinion in the following words: "Let there be three prisons in the city—one for the safe-keeping of persons awaiting trial and sentence; another for the amendment of disorderly persons and vagrants, those guilty of misdemeanors, to be called a *sophronesterion* (that is, a house of correction, a place for teaching wisdom and continence), which should be visited, especially at night, by the magistrates called *sophronestoi*; a third, to be situated in the country, away from the habitations of men, and to be used for the punishment of felons." But this was an ideal not realized by the ancient world, a legacy to us.

—In order to comprehend fully the evolution of existing prison systems, it is necessary to remember that the progress of civilization has been from a condition of slavery to one of freedom, and that it has been characterized by the gradual substitution of the will of the community for the will of the individual, and by legal forms instead of summary process. Under the patriarchal and tribal systems of social organization, the father of the family, or the chief of the tribe, administered justice, according to his personal conception of it, which was often crude and barbarous enough. He alone was free; all the world beside were slaves. Then followed the invention of caste, the emancipation of one portion of the community, the distinction made between slaves and freemen: under this system justice was administered to the slave by his immediate owner and master. The *ergastula* of the Romans were the outgrowth of this phase of progress—strong, well guarded buildings, in which criminal and refractory slaves, or slaves disposed to run away, were confined. The feudal system came next, under which the face of Europe was dotted with castles,

which served as prisons, as well as fortified places of residence. Our word "dungeon" is a modification of the French "donjon," or castle-tower, in which the feudal lord confined, at his own will, his vassals or his enemies. With the disappearance of the feudal system, this arbitrary power of imprisonment came to an end. The twenty-ninth section of *magna charta* provides that "no free man shall be taken or imprisoned unless by lawful judgment of his peers, or the law of the land." The liberty of the subject was further guaranteed, in England, by the writ of *habeas corpus*. Under the modern system of criminal jurisprudence, punishment is inflicted only by order of the courts, after judicial inquiry into the guilt or innocence of the prisoner, and the prison itself has become a mode of punishment, which in ancient times it was not.

—Thus we are led to consider the second step in the evolution of the modern conception of the prison. The power to imprison can not, in any age, have been dissociated from the desire to make a display of the power possessed, in order to intimidate others. The appeal to fear always precedes the appeal to any higher motive. From the earliest times the greatest cruelties were perpetrated upon prisoners. Prisons have always been places of execution. They have often, especially in the middle ages, been places of torture. Not only have they been constructed with reference to their adaptation to create discomfort and terror on the part of prisoners, of which notable examples may be found in the *pozzi*, or wells, in the ducal palace of Venice, and the *oubliettes*, or bottled-shaped pits, of which the church name was *vade in pace*, into which, from deference to the maxim *Ecclesia abhorret a sanguine*, certain ecclesiastical prisoners were thrust, to die there of starvation; but they have been provided with the most elaborate and varied apparatus for the infliction of physical pain. Beccaria, in Italy, whose book on "Crimes and their Punishment" appeared in 1764, was the first who impressed the world with a doubt as to the right or the utility of torture. The rack and the boot and the thumbscrew have disappeared, together with such cruel corporal punishments as mutilation, hanging by the armpits, branding with a hot iron, etc., but the difference between these and the scourge or shower-bath is only in degree, not in kind, while science has invented a new torture, in the application of electricity to a refractory prisoner. The experience of the world has demonstrated the truth of the principle that punishment in itself exercises no reformatory influence; on the contrary, it hardens the man upon whom it is visited, and excites his companions in crime to reprisals. In the war between society and the criminal class there must be a disarmament upon both sides before peace can be declared.

—But without corporal chastisement the greatest suffering may exist in prisons, through the ignorance, neglect, brutality and cupidity of those to whom the custody of prisoners is intrusted. Promiscuous association of prisoners—the innocent with the guilty, the novice in crime with the hardened villain, the young with the old—and even, in some cases, of the two sexes; defective sanitary arrangements; the absence of all attempt at cleanliness or decency; the lack of discipline, or the failure to exercise any restraint upon the conduct of prisoners to each other, varied by occasional sudden and violent acts of interference; and the practice of extortion by granting special privileges to prisoners who pay for them; these were the evils which, little more than a century ago, aroused the world to a sense of the necessity for a reformation of prisons.

—In order that the reader may have a more distinct understanding of the order of events, in the history of the prison reform movement, a chronological table of principal events is here inserted, which is not, however, designed to interrupt the course of the narrative. The list does not pretend to be complete; it is only intended to serve as an illustration.

TABLE.

1618. Geoffrey Munshull. of Gray's Inn, Gent., an insolvent debtor, published his book, "Essayes and Character of a Prison and Prisoners."
1619. James I. shipped 100 prisoners to Virginia, the beginning of English transportation.
1622. Vincent de Paul appointed chaplain to the galleys, at Marseilles.
1624. John Grevius, a minister, who had himself been a prisoner for a year and a half, on account of his religious belief, published a book against torture.
1698. Jacob Doepler's "Theatrum Pœnarum."
1699. Organization of the Christian Knowledge Society. Dr.-Bray, chairman of committee of prisons, reported, and afterward published, an "Essay toward the Reformation of Newgate and the other Prisons in and about London," in which he proposed that every prisoner should be kept in a separate cell.
1704. Pope Clement XI. built the juvenile prison of Saint Michael, with the inscription: *Parum est improbos coërcers pœnâ, nisi bonos efficias disciplinâ.*
1710. Peter the Great established transportation to Siberia.
1724. "Reflections on the Prisons of the Religious Orders," by Mabillon, appeared in France.
1728. General Oglethorpe (afterward the founder of the state of Georgia) acted as chairman of a committee of the house of commons, to inquire into the state of English jails.
1735. A second parliamentary committee, of which William Hay was chairman.
1748. Montesquieu's "Spirit of Laws" published. France abolished the galleys, and substituted for them the *bagnes*.
1764. Beccaria on "Crimes and their Punishment."
1765. Blackstone's "Commentaries."
1771. Vilain XIV., of Belgium, published his First Memoir, proposing to convert the citadel of Ghent into a workhouse.
1772. Charles Lorraine ordered the construction of the original prison of Ghent, octagonal and star-shaped. Organization of the Society for the Relief of Poor Debtors. Denne's published Letter to Sir Robert, advocating separate imprisonment.
1773. John Howard, sheriff of Bedford.
1774. Jail fees abolished in England.
1776. Organization of the Philadelphia Society for Alleviating the Miseries of Public Prisons.
1778. Howard printed the first edition of his "State of Prisons." An act for the establishment of a penitentiary in England was passed by parliament; this act was the joint production of Howard, Blackstone and Eden, but remained inoperative in consequence of the determination of the government to transport convicts to Australia.
1780. The "preparatory question" (torture for the purpose of securing a confession of guilt) abolished in France.
1783. Parliament, at the instance of Sir George Paul, passed an act for a new jail and penitentiary in Gloucester.

1786. Capital and corporal punishment abolished in the state of Pennsylvania, and the solitary system of imprisonment adopted as a substitute. Construction of the Walnut street prison.
1787. England sent out the first cargo of convicts to Australia.
1788. Organization of the Philanthropic Society of London.
1789. France abolished torture.
1790. Death of John Howard in the Crimes.
1791. Jeremy Bentham's "Panopticon." The French National Convention adopted a penal code: simple imprisonment recognized as punishment for the first time in France.
1792. The Gloucester jail, in England, completed, on the solitary plan.
1801. Torture abolished in Russia.
1813. Elizabeth Fry's visit to Newgate.
1814. Louis XVIII., of France, ordered the construction of a model prison.
1815. Organization of the London Society for the Improvement of Prison Discipline.
1816. Mrs. Fry opened a school in Newgate. Creation of the Auburn penitentiary, in the state of New York.
1818. Organization of the New York Society for the Prevention of Panperism. Buxton's "Inquiry"
1819. Milbank penitentiary, in London, begun. Organization of the Royal Prison Society of France. Organization of the Prison Aid Society of St. Petersburg. John Falk, of Weimar, organized the "Friends in Need."
1821. Edward Livingston, of Louisiana, began the preparation of his "System of Penal Law."
1822. Act. 4 George IV., c. 64—the English jail act.
1824. Organization of the Boston Prison Discipline Society.
1825. Opening of the New York House of Refuge for Juvenile Delinquents.
1828. M. Charles Lucas published "The Penitentiary System of Europe and America."
1829. Opening of the Eastern Penitentiary of Pennsylvania, at Philadelphia.
1831. De Tocqueville and Beaumont's tour of inspection of the penitentiaries of the United States.
1833. Dr. Wichern established the *Rauhe Haus*, at Hamburg.
1835. Colonel Montesinos appointed governor of the prison at Valencia, in Spain.
1836. Crawford's report to the English government, on American prisons.
1837. Visit of De Metz to the United States.
1838. Juvenile prison at Parkhurst, in the Isle of Wight.
1839. Opening of the Agricultural Colony of Mettray, near Tours, based on religion, the family principle, and military discipline. Matthew Davenport Hill made Recorder of Birmingham.
1840. Alexander Maconochie appointed governor of Norfolk Island. Prince Oscar, of Sweden, published a book on "Punishments and Prisons."
1842. Pentonville prison, in London, opened, on the Philadelphia plan.
1844. Organization of the New York Prison Association.
1845. International Prison Congress, at Frankfort-on-the-Main.
1846. International Prison Congress. at Brussels.

- 1850. Formation of the board of directors of convict prisons in England.
- 1852. Creation of French penal colony at Cayenne, in Guiana.
- 1853. English penal servitude act.
- 1854. Formation of the board of directors of convict prisons in Ireland, of which Capt. Walter Crofton was made chairman.
- 1857. Transportation abolished by the English parliament. International Prison Congress at Frankfort-on-the-Main. Organization of the British Association for the Promotion of Social Science.
- 1870. National Prison Congress at Cincinnati: organization of the National (U. S.) Prison Association.
- 1872. International Prison Congress of London.
- 1877. Organization of the Société Générale des Prisons at Paris.
- 1878. International Prison Congress of Stockholm.

—The above skeleton will serve its purpose, if it illustrates the thought that there is a natural order of progress in prison reform; that prisons are first places of detention, then of punishment, and, last of all, of reformation; reformation being their highest, as custody is their lowest, aim. There have been isolated spirits who have perceived this truth in advance; but it was many centuries before it took possession of the public: yet its acceptance has in the end been rapid and all but universal, for which, possibly, thanks may be due to steam and to electricity, the magicians of the nineteenth century. A review of the history of the movement will show that the first reformers have been those who have had opportunities to observe prison life from the inside; that sympathy has first been awakened for the innocent victims of the prison system, namely, for poor debtors; that the cruelties formerly practiced in prisons excited a reaction in noble minds, which, acting like leaven, communicated itself in the end to the public; and that science and religion have both contributed to the development of a more rational and humane prison discipline. It will also show that the first step in prison reform, everywhere, is classification of prisoners, which may or may not go to the extent of individual separation, but which leads to a classification of prisons; that for the realization of this end, a central administration is essential. By classification, the action and reaction of prisoners upon each other is checked, if not wholly prevented. The second step is kindness and conciliation, which prepare the prisoner for the reception of instruction, and incline him to yield to the influence brought to bear upon him for his conversion from an enemy into a friend of social order. The third is education, which includes not only religious instruction, but mental development, indoctrination in the laws of social life, and the acquisition of a trade or some other means of earning an honest livelihood. The last of these ends can only be secured by the introduction into prisons of organized and profitable labor, which has the further recommendation, that, by employing the prisoner's time and thoughts, it makes discipline more easy, while it also tends to reduce the cost of punishment. A system of reformatory influence, such as is here indicated, implies trained officials, by whom alone it can successfully be administered, and that again implies reasonable stability and permanence in office, which further implies non-interference for political reasons. Success in the effort at reformation implies the release of the prisoner, absolutely or conditionally, when reformed. Failure in this effort implies the necessity for punishment of the refractory prisoner, either by the infliction of suffering, by the

deprivation of privileges, or by the increased duration of his term of imprisonment. Thus it may be seen that the modern prison system, at every stage of its evolution, revolves around one central thought—the possibility of reformation; that the reformation of the prisoner is its one animating purpose; that the hope of reformation is the motive to which it owes its origin; and posterity will pronounce judgment upon it from this one point of view. All this is clear, from an attentive study of the history, of which the table given above is an outline. Reformation, instead of removing the prisoner from society, restores him to society, by removing him from the criminal class. It is, therefore, the highest interest of society. The only question is, whether it is possible, which is a question of the prisoner himself, his nature, his antecedents and his habits.

—The attempt to solve this question has led to the development of two distinct systems of prison discipline, which are commonly known as the Philadelphia and the Auburn plans, or the separate and the congregate systems. The first of these insists upon the separation of prisoners by day and night; the second, by night only. From these two a third has been evolved, which is, in a certain sense, a combination of the two, but has also distinct features of its own; this is commonly known as the Irish system, because, under Sir Walter Crofton, it has been most fully and successfully applied in Ireland.

—The first experiment with the strictly cellular system (by day and night), sometimes called the solitary or separate or individual system, was made, under the influence of the society of Friends, in the Walnut street prison, in Philadelphia: it is sometimes called the Pennsylvania system, because Pennsylvania is the only one of the United States which has not abandoned it. Its essential principle is the complete physical separation of prisoners. It rests upon the conviction that mutual contact between them is of necessity corrupting, and that classification upon any basis except that of individual character is impossible; in other words, each prisoner is a class by himself. At the outset, solitary imprisonment, without labor or recreation or mental contact with any human being, even with the officers of the prison, except in case of necessity, was the form which this experiment assumed; but the severity of this rule has now been relaxed, on account of the injury which it wrought, in some cases, both to the body and the mind of its subject. At present, useful, remunerative occupation is furnished to every prisoner, in his cell, and care is taken to preserve the activity of his mind by intercourse with the officials and with authorized visitors from the outside, who endeavor to exert upon him a salutary and reformatory influence. Certain incidental advantages of this system are obvious, namely: the impossibility of combination on the part of prisoners, which renders revolt impossible, and gives to the prison authorities more easy and certain control; there is, therefore, less occasion for the exercise of physical force in the discipline, which is an advantage to the prisoner himself; the discipline can be more varied, in accordance with the physical and mental condition, tastes and aptitudes of individual convicts; and the prisoner, when discharged, is not liable to be recognized by any who were incarcerated with him; he makes no acquaintances in the prison. These and other beneficial features of the system have occasioned its very general adoption upon the continent of Europe. Even its opponents concede its merits, when they advocate cellular imprisonment for short terms of sentence, and applaud the Irish system, of which cellular imprisonment

is the initial measure. That it has produced excellent results is beyond dispute, and its friends claim, that, more than any other system, it reduces the number, of *recidivists*, that is, of discharged convicts who lapse again into crime.

—The Pennsylvania system had no rival in the United States, for many years. The prison at Auburn, in the state of New York, was organized upon this plan; but after a year's trial it was abandoned, and the "silent" system was devised, to take its place. By the new method the prisoners were employed in large workshops during the day, and separation between them, the necessity for which was acknowledged, was secured by the institution of a rule forbidding them to communicate with visitors or with each other. For the enforcement of this rule (which could, at best, be only partial), flogging was the main reliance of the keepers, and the use of the whip was, for many years, a marked feature of the system. But with the lapse of time the requirement of absolute silence has been relaxed, so that all congregate prisons with separate cells for sleeping are said to be on the Auburn plan, even though two prisoners occupy one cell jointly. In this modified sense the Auburn system has so far displaced its predecessor and rival, that the Eastern penitentiary of Pennsylvania, in the city of Philadelphia, is now the only strictly cellular prison for convicts of the higher grades, in the United States. Many causes have conspired to effect this result, among which may be named the impression made upon spectators by the sight of hundreds of men at work, side by side, with their eyes bent down, and not uttering an audible word; the comparative cheapness of construction and maintenance of congregated prisons; the ease with which profitable labor can be introduced into them, especially in connection with machinery of all sorts; the facilities which they afford for contracting out the labor of convicts, thus relieving the administration of financial responsibility; and the popular dread of the consequences of solitary confinement. These have probably had more to do with it than any higher considerations relating to the comparative reformatory influence of the two systems.

—The Irish system was, in its origin, an outgrowth of the experience of Capt. Maconochie, as governor of the penal settlement of Norfolk island. Conditional liberation, or the "ticket of leave," was an Australian invention; when it was first transplanted from Australia to England, it created a panic. The "mark" system was also an Australian invention, the product of Maconochie's own inventive genius. Add to these "progressive" classification, and the "intermediate" prison, and we have the four elements of the Crofton system. M. Bonneville de Marsangy, of France, foreshadowed it, in an address delivered before the bench and bar of Rheims, in 1846, in which he advocated association instead of separation of prisoners; but association modified by an initial period of cellular incarceration, by a certain number of separate and successive stages, by the employment of marks, by the intermediate prison, and finally by conditional liberation. In 1854 Capt. Crofton (afterward Sir Walter Crofton), who had for one year previous been one of the commissioners to inquire into the state of Irish prisons, was appointed chairman of the directors of convict prisons in Ireland. He was knighted in 1862 for his successful administration of this office, which he held for eight years, during which he established a mode of dealing with convicts which has attracted the attention of the world, and received the indorsement of the Baron von Holtzendorf of Prussia, Count Cavour and M. Beltrani-Scalia of Italy, Dr. Guillaume of Switzerland, Prof. Mittermaier of Heidelberg, Lord

Brougham of England, and others equally illustrious and equally competent to judge of its merits. Briefly described, it is as follows: it consists of four separate stages, of which the first is not less than eight months of strictly cellular confinement in the Mountjoy prison, Dublin, with short rations and no employment but picking oakum for the first half of the time; the second is an indefinite period (not less than one year) of associated imprisonment at Spike island, at the southern extremity of Ireland, where the prisoners are divided into four classes, and are promoted from one to the other, according to their conduct, industry and diligence at school, an account being kept with them by the use of marks, and their promotion depends upon their record; the third is a short period (not less than six months) of probationary detention in a condition intermediate between imprisonment and freedom, at Lusk, about twelve miles from Dublin, where the men are trained for entire freedom, and their capacity for it is tested, prior to their liberation; the fourth is conditional liberation, with police supervision. The intermediate prison for women is the Golden Bridge Refuge, three miles from Dublin. This system is supplemented by a very perfect system of obtaining employment for prisoners after their discharge. It is possible that its beneficial influence in preventing recommitments is also aided by the readiness with which the Irish emigrate to America. The principles which underlie it are: an inexorable justice, which will not remit punishment in the case of any convict; the holding out to every prisoner of the hope of a speedy release, to be effected by his own exertions; the employment of means to make him the agent of his own reformation; the regard shown for the public, in refusing to discharge any prisoner until expiration of sentence, unless he gives positive evidence of his capacity to resist temptation; the terrible severity with which a lapse into crime is punished; and the recognition of the necessity for mental and social contact between prisoners, after cellular separation, in order to prepare them for a re-entrance into the world.

—There can be no prison system which is not, in some form, a modification of one of the three here mentioned and described. The application of these several forms to different classes of prisoners (to the young, to women, to first offenders, to misdemeanants, to felons, to prisoners awaiting trial, to convicts under short and long sentences, etc.), and their adaptation to the social state of different nations, constitute the problem of penitentiary science.

—The details of prison administration, though of intense interest to specialists, would occupy more space than can be given them in the present article. Questions which have been much discussed, and concerning which a great variety of opinion exists, are such as these: prison architecture and sanitation; the prison staff; mode of appointment of officers; tenure of office; prison dietaries; labor in prisons—as a reformatory measure, as a means of reducing the cost of crime, as a preparation for the rehabilitation of the criminal, as it affects the interests of labor outside the prison walls, and the best mode of carrying it on, that is, whether under the immediate control of the prison authorities, or by contracting it out to private persons or corporations; prison schools, including the question of normal schools for training prison employés in their duties; religious instruction in prisons; prison libraries; the correspondence of prisoners; visits to prisoners by their friends and by other persons; the rights of convicts in prison; the privileges which it is expedient to grant them, and especially the effect of allowing them a percentage of their earnings; the dress of

prisoners; disciplinary punishments in prison; prison registers, and the use of photography as an aid to the identification of escaped prisoners, or of recidivists; prison statistics; the proper treatment of sick prisoners and of convicts who are or who become insane; the duration of imprisonment, [49](#) as it is affected by life sentences, by cumulative sentences, by "good-time" laws, and by executive interference; the effect of transition from a state of imprisonment to a state of freedom upon the prisoner himself, and the necessity for continued care of him subsequent to his discharge, with especial reference to securing him honest employment.

—The tests of successful prison administration are: 1. The behavior of prisoners during incarceration. An increased percentage of suicides, or of attempted escapes, or of riotous demonstrations, or even of disciplinary punishments, is an indication of weakness, cruelty, or vacillation in the discipline. 2. The sanitary condition of prisons, and especially the death rate. 3. The number of recidivists, or recommitments. 4. The general increase or decrease in the amount of crime perpetrated. 5. The financial result; but too much relatively may be made of financial success, since it may be attained by the sacrifice of other ends infinitely more important.

—For the application of these tests, scientific observation, continued for a term of years, is essential; such observation must be by inspection, and by the accumulation and digestion of statistical information: it implies trained observers with authority to collect information, and an organized system of returns. Hence the effort to organize a system of international penitentiary statistics, of which M. Beltrani-Scalia is perhaps the most intelligent and persistent advocate, but which has thus far failed. As for this country, the absence of any approach to unity in the organization of our prison system renders it peculiarly difficult to collect data for a trustworthy estimate of its actual effect in the repression of crime. The percentage of failure is undoubtedly large. The causes of this failure are obscure: whether it is due to the persistence of the criminal character, or to the want of experience and of devotion on the part of prison officers, or to faulty methods of organization and discipline.

—The failure of the prison everywhere to accomplish the work which is desired and expected of it, has led some bold thinkers to predict its abolition, but without clearly indicating what is to take its place. There are very many who believe that too much reliance is placed upon it, and too much use made of it; they would prefer to see more use made of judicial admonition and police supervision. One thought seems to run through all the publications with which the press has teemed, for some years past—books, pamphlets, reports, addresses, transactions of prison and other societies, and of prison congresses at home and abroad: it is that the prevention of crime is to be aimed at, rather than its repression. To prevent it, we must stop the operation of the causes which produce it. These causes are to be sought, either in the character of the individual who commits crime, or in his circumstances. The criminal himself has become the object of attentive study, in his physical as well as in his mental and moral organization, with a view to determine how far he is normal and how far abnormal, and how far any departure from a normal type which he presents for our consideration, is due to hereditary predisposition to crime; in other words, whether there is a criminal neurosis. The connection between crime and the social *milieu* has become apparent, and causes of crime are found not only in ignorance, in

intemperance, in idleness, in destitution, and in the want of friends and of a home, but in the relations of labor and capital, in the character and amount of the food supply, in bad legislation and vicious customs, in inefficient police regulations, and a lax administration of justice. Human nature is as sensitive to its surroundings as is an electrometer to the electric current, and whatever tends to elevate mankind, to improve its condition either physically or mentally, tends also to the elimination of crime. The reformation of morals is a part of the general advance of civilization, and each part must advance with the whole, something as a railway carriage goes forward or backward with the train of which it forms a part. Too much dependence is not to be placed upon any prison system. It is always to be remembered that no system will succeed in the hands of an incompetent or dishonest man; while even a bad system, in the hands of an earnest and able man, may be productive of the best results.

## PRIVATEERING

PRIVATEERING is the act or the employment of attacking and seizing vessels or other property belonging to an enemy, at sea, by means of privateers—Privateers are armed vessels that are owned, equipped and officered by one or more private persons, but sailing under a commission, usually called letters of marque, from a belligerent state, which empowers the person or persons to whom it is granted to attack and seize, at sea, vessels or other property of its enemy.

—The right to use such vessels in maritime war is recognized by international law; their employment was necessary till states established permanent public navies; their use since that time has been claimed to be advantageous to states having small navies, because it enables them to increase their naval force in a short time, and at a small cost, and thus tends to prevent a state, with a powerful navy, from having an undue advantage over another state whose marine is mainly commercial.

—The disadvantages of using privateers are, that, their services being obtained by allowing their owners to appropriate to themselves and to their crews the whole or a part of the vessels or other property they may capture, and their officers and crews not being under naval discipline, the desire of prize tends to lead both officers and crews beyond the limits of legitimate war, to produce disregard of the rights of neutrals, and to continue lawlessness after the return of peace.

—These evils, the rapid growth of neutral interests, and the increasing difficulty of fitting out vessels, by private means, suited to the conditions of modern maritime war, have led, during the past century, to repeated efforts to abolish privateering. In 1785 a treaty between the United States and Prussia, negotiated by Franklin, bound the contracting states, in case hostilities arose between them, not to use privateers. In 1792 the French assembly agreed to suppress privateering, but without effect. In 1823 the United States unsuccessfully tried to secure the same object by treaties with Great Britain, France and Russia. In the Mexican war the United States issued no letters of marque, and although Mexico issued such letters, they were not taken by foreigners, because municipal laws or treaties forbade. In the Crimean war neither of the belligerents issued letters of marque. At the close of this war the principal states of Europe, uniting in the belief that private armed ships, maintained at private cost for private gain, and often necessarily for a long time beyond the reach of the regular naval force of the state, could not be kept under proper control, signed the declaration of Paris (April 16, 1856), the first article of which reads: "Privateering is and remains abolished." Since that time all the important states in Europe and the Americas have become signatories of the declaration of Paris, except the United States, Spain and Mexico. This declaration binds only its signatories when at war with each other, and leaves them free to use privateers when at war with other states.

—The refusal of the United States to sign the declaration of Paris, which secured to its signatories privileges which it had been the traditional policy of the United States to obtain, was due to a change in the attitude of the government since 1823, and a belief

that the United States, with its large commercial marine, might be unable to adequately protect itself against belligerent states with powerful navies, without the aid of privateers. The United States, however, agreed to become a party to the declaration if its signatories would amend it by adding a provision protecting from capture all private property at sea, not contraband. This proposition, called the "Marcy" or "American" amendment, not being accepted by the signatories, was withdrawn in 1857.

—In 1861, Great Britain unsuccessfully sought to induce the confederate government to accede to the declaration of Paris. The United States thereupon offered to accede unconditionally to the declaration of Paris, hoping thereby to obtain an international right to treat confederate privateers as pirates. Great Britain, having accorded the character of belligerents to the confederates, had practically recognized their right to employ privateers, and the offer of the United States was declined unless the United States would admit that its signature should not have "any bearing, direct or indirect, on the internal differences (now) prevailing in the United States." This attempted restriction by one state of a declaration of so general and permanent a character, and to which so many states were parties, was not acceptable to the United States, and its accession to the declaration of Paris has not yet been made. The confederate states having offered letters of marque to subjects of all countries, the congress of the United States authorized the president to issue letters of marque, but, as nearly all the maritime powers had warned their subjects, that, if they served in privateers in the war, their governments would not interfere to protect them, and as the United States had threatened to treat such persons as pirates, no avowedly foreign private armed vessels took letters of marque (from the confederate government), and the ostensibly confederate vessels were commissioned as of its regular navy; and the president of United States did not make use of his power to issue letters of marque.

—During the Franco-German war, in 1870, a royal decree of Prussia ordered the creation of a volunteer navy. The owners of vessels were invited to fit them out for attack on French ships of war; bounties were offered; the crews were to be under naval discipline, but they were to be furnished by the owners of the ships; the officers were not be regular naval officers. The French government protested against the use of such a volunteer navy as an evasion of the engagement not to employ privateers, by which Prussia was bound by the declaration of Paris. The sole real difference discoverable between privateers and such a volunteer navy is, that the latter is under naval discipline.

—In war all captives vest originally in the state, and the commission which alone gives privateersmen a legal interest in a valid prize must be kept on board of their vessel. Sailing under a commission from each of two belligerent states is piratical acting under two or more commissions granted by allied states against a common enemy is irregular, but not piratical. The persons to whom, whether aliens or citizens, and the conditions upon which, states issue letters of marque, vary with their municipal laws. Persons applying for such letters are usually required to give large bonds that they will conform to the usages of war, obey the instructions of the granting state, observe the rights of neutrals, and bring into port, except in cases of overwhelming necessity, all captures for adjudication by a prize court.

—Where, as in the United States, no positive municipal law exists upon the subject, the general rule is, that the owners and officers of privateers are liable in damages for illegal conduct, when admittedly engaged in privateering beyond the amount of security given, and that the measures of damages is the value of the property unlawfully injured or destroyed.

—Treaties of varying duration have been made, and some of them by the United States, with France, Holland, Sweden, Prussia, Great Britain, Spain, and Colombia, which forbid the citizens or subjects of either contracting state, while they are at peace, to accept letters of marque from a third state, at war with the other contracting state. Municipal laws often prohibit the citizens or subjects over whom they are set from taking privateering commissions from a foreign state. Thus, the laws of both Great Britain and the United States impose severe penalties on citizens or residents who accept commissions, equip privateers or enlist men for service in any foreign war. ## PRIZES

PRIZES, Maritime. A maritime prize is a vessel or cargo or other property which is lawfully captured in war at sea by authority of a belligerent state.

—By modern international law the fact of maritime capture does not vest the thing seized with the character of prize, nor pass a perfect title to the belligerent state under whose authority the capture is alleged to have occurred, or, through it, to any of its agents, until, upon satisfactory proof that such seizure was made in accordance with the usages of war, a competent court of the belligerent state by whose authority the captor acts, has pronounced a sentence of condemnation. Nor can property in the thing captured at sea be transferred in favor of a neutral vendec or recaptor, so as to bar the original owner, until such a court has pronounced sentence of condemnation; and the possession of the thing captured at sea by the belligerent state of the captor, until such court has pronounced sentence of condemnation, is a trust for the benefit of those who may be ultimately found to be entitled.

—A competent court, for the purpose above described, is any court of the belligerent state under whose authority the capture is alleged to have occurred, which has jurisdiction in cases of maritime capture. Such a court is commonly called a prize court. In the United States such jurisdiction is confined to the federal courts, beginning with a district court, with appeal up through the circuit courts to the supreme court. A prize court may sit either in the territory of the state of the captor or in that of any allied state, but not in that of a neutral state, and its sentence of condemnation may be valid, though the thing captured has never been in its actual custody, or is in a neutral port or is not in existence, when pronounced.

—The necessity of inquiry by a prize court into the lawfulness of maritime captures results from the responsibility of belligerent states to neutral states for aggressions upon the persons and property of their subjects, and the fact that a large proportion of maritime captures are neutral property "charged as involved in violation of rights of war, or property whose nationality as neutral or hostile is doubtful."

—The duty of a captor in war on stopping a vessel, according to the authorities below cited, is to make such examination as circumstances permit, and to release the vessel unless there is probable cause for a fuller examination by a prize court. If such cause is found, the captor's duty is to send the vessel, as speedily as possible, into a convenient port of his own state (the modern practice of neutrals prohibiting the use of their ports by the prizes of a belligerent, except in cases of necessity, and only while the necessity exists) for such fuller examination, together with all the papers, cargo and other evidence on board, unaltered, and with all persons on board likely to be useful to the owners as witnesses. If the vessel stopped is a neutral vessel, the captor's duty is, after examination, either to release the vessel absolutely with her cargo, papers and passengers, or to complete his capture, and send her into a convenient port of his own state for further examination by a prize court. He can not take any middle course in such a case. Necessity will excuse the captor from sending

in the vessel seized. If she is unseaworthy, or there is imminent danger of immediate recapture, or if an infectious disease is on board, he may destroy or abandon the vessel seized, but he must preserve all papers and persons on board, for the validity of his acts is, even in such cases, matter for the adjudication of a prize court.

—If, after seizure of a vessel, she escapes from her captor, or is retaken, or if the owner ransoms her, before sentence of condemnation, the property is thereby revested.

—Even though no controlling necessity prevents the sending into a convenient port of the thing seized, some states (among them, the United States) allow their captors to release the vessel or other property captured at sea, upon a written agreement, made and delivered by or on behalf of its owners, to give something of value to the captor. This written agreement is called a ransom bill, and with it hostages have sometimes been given to the captor as collateral security for the fulfillment of the contract. The receipt for the ransom bill is a passport, entitling the releasee to pursue a definite voyage within a definite time without liability to capture by any one acting under authority of the state of the captor, or its ally. Failure to comply strictly with the terms of the ransom bill revives the liability to capture, unless it can be clearly proven that such failure is due to unavoidable necessity. If the ransomed vessel or other property is lost before completion of the prescribed voyage, the ransom is still due, unless the captor expressly insured the releasee against the perils of the sea. If the ransomed vessel or other property is recaptured on a different voyage from that described, or after the time limited, and is adjudged a lawful prize, the price of the ransom is deducted from the proceeds of the prize, and given to the first captor, and the residue is given to the second captor. The recapture of the ransom bill discharges the obligation of the releasee, but the death or flight of hostages given with the ransom bill does not.

—If a captor, stopping a vessel at sea, is not relieved, after such examination as circumstances there permit, from the duty of sending her in for adjudication, and if she is not revested in her original owner by recapture or ransom, a fuller examination of the vessel or other property will be made by the prize court, and the property will either be restored to its original owner or condemned. The procedure in prize courts is summary, and not in the nature of litigation *inter partes*, or *ex parte*. *Prima facie* the vessel or other property captured is the property of the state. Opportunity is given to any person or state, not an enemy, who has an interest in the vessel or other property, to establish a right of restitution. If no claimant establishes a right to restitution, the vessel or other property is condemned. If any claimant establishes a right to restitution, he is entitled, not only to the captured property, but to damages from the captor, if the seizing and sending were without probable cause. If a state does not submit the question of prize to adjudication, or if its prize court is not constituted, or does not proceed, in the manner recognized by the usages of nations, or if the state should confiscate property against the decision of its own prize court, the state whose rights or whose subject's rights are affected has cause of complaint, and the question becomes political.

—Upon condemnation, the disposition of the proceeds of a prize depends upon municipal law. Some states distribute such proceeds, called prize or head money, among the captors as a reward for bravery, and to encourage future maritime captures from their enemies.

—The compensation to which recaptors are entitled, called salvage, is determined by municipal law between vessels of the same state, and by treaty between vessels of allied states, and, commonly, by the principle of reciprocity between vessels of other states.

## PRODUCTION OF WEALTH

PRODUCTION OF WEALTH. The word *production*, which, in ordinary language, means the giving birth to, or producing, without regard to the utility of the thing produced, or the outlay required for that production, takes, in economic science, a particular meaning, much more restricted, more exact and more absolute. This word, in political economy, is applied to that particular branch of the science which has for its object the *creation of values*, considered apart from their distribution and their consumption; and, scientifically speaking, it can be applied only to work resulting in a product of a value superior, or at least equal, to that of the services of every kind which that operation has taken. It is only when this balance is obtained, that there is truly production. There would be destruction on the contrary hypothesis, that is, if the value produced was found to be inferior to the sum of those necessarily consumed in order to obtain it; and this is so true, that, if one attempted to repeat the same operation a certain number of times he would finally destroy the entire sum of the values he had originally employed in the experiment, so that it would become physically impossible to repeat it. There is, then, no doubt that in political economy, what is called *production*, and the only operation susceptible of being characterized as productive, is that which, taking everything into account, results in a sum of values superior, or at least equal, to that which has had to be devoted to it; and, in truth, it is this exact estimation of the result, this strict reckoning of the consequences, for good or evil, for profit or loss, advantage or disadvantage, of our labors, our operations, our enterprises of every kind, which, more than anything else, has given to the investigations of political economy the character of a science, and which has made its intervention sometimes appear to ignorant or evil-intentioned rulers so much to be dreaded.

—But if it is not possible to raise a question as to the essential meaning given to the word *production* in political economy, we must admit that we are still far from having exhausted the controversy: in the first place, on the determination of the kinds of labor that should be called productive: and secondly, on the analysis of the means by which production takes place. This controversy has lasted ever since the first systematic efforts were made, more than eighty years ago [now more than a hundred years ago.

—*Translator*], to raise political economy to the condition of a science; and, first to speak only of the question of knowing what kinds of labor are susceptible of being qualified as productive, it seems to us that people are not yet well settled in that regard, either as to the category of the kinds of labor which act upon things, or, above all, as to that of the kinds of labor whose efforts are exerted directly on man. One can not deny, for example, that the nomenclature of kinds of labor of the first category presents omissions and inaccuracies that are quite serious.

—There is, in the first place, one entire class of labors, viz., that of the extractive industries, which has become far too considerable for it to be possible to take an account of it, and which, at the same time, differs too much from all the others for it to be allowable to confound it with any other class. How incomprehensible that any

one should omit to speak of a class of industries capable of throwing upon the market masses of products comparable to those furnished by hunting, fishing, the industry of the wood cutter, the quarry man, and, above all, the miner! and, on the other hand, how permit them to be confounded, as is sometimes done, with agricultural industry! What is there in common between arts, which, confining themselves to extracting from waters, forests and earth the materials for a multitude of industries, employ for that purpose only mechanical forces, and an art which, like agriculture, is devoted to the multiplication and improvement of useful animals and vegetables, and which, for that purpose, makes use of a force so special, so little understood, so delicate to manage, as *life*? Perhaps it would be better to confound them, as is also done, with the transportation industry; for, like that industry, the extractive arts do, in fact, change the place of things which they supply for consumption. But they are not, like it, confined to bringing about a change of place: their craft especially consists in the very fact of extraction, an industrial action very difficult to practice, in all cases very unlike that of transportation; and there is no other way but to make of it an altogether separate classe of labors, under the name of the extracting arts or extractive industries.

—Another serious inaccuracy to be noted in the nomenclature of the arts which are exercised in the material world, is the application of the term *trade* to the business of transportation.<sup>50</sup> Trade has put people in the way of that industry, has taught them to specialize it, has led them to recognize how an intelligent removal of things so as to bring them within reach of whoever needs them, may contribute to production; but it has not, for all that, become the art of transportation, the carrying industry. The carrying industry is a vast business, clearly distinguished from all others, and should accordingly have its separate name. We can not give it the name of *trade* without doing violence to language, without miserably mutilating it, in fact; and it is so much the more impossible to call the transportation industry *trade*, because the term *trade* is applied to a class of facts altogether different, which should also have its appropriate appellation. To *trade* is to buy in order to sell again; it is not an act peculiar to one class of workmen; it is an act absolutely common to all and, to speak the truth, there is not a business, from the highest to the lowest, in which people do not begin by purchases and end by sales. If the owner of a vessel or other means of conveyance buys things in one place to sell them in another, the manufacturer buys them under one form to sell them under a different one; whoever practices any handicraft, art or function, has begun by acquiring aptitudes, talents, faculties, which he afterward continually sells under the form of services. Everybody, then, buys and sells, and buys in order to sell. Only, between the purchases and the sales which every one makes, there intervenes some labor, some art, the intelligent practice of which constitutes his avocation: and, to recur to the people whose business is to distribute things abroad in the world, and to put them within reach of whoever needs them, there is, between the purchases and the sales they make, and art, which consists less in the act of buying, selling and trading, which all kinds of workmen do, the same as they, than in the judicious change of place of things, and in the marvelous and peculiar labor they perform, from which it is but reasonable that their industry should receive its name.

—Finally, a last inaccuracy to be mentioned in the nomenclature of the great classes of labors which act upon the material world, is the order in which they have been arranged. It is certainly not very natural to call attention first to the one of these

classes which is the most difficult, which was the last to originate, and which, by the nature of the particular agent it employs, viz., *life*, most nearly approaches the high arts<sup>51</sup> which act directly on the human race; and a logical arrangement would have placed agricultural industry last, instead of first. We have elsewhere given the order in which we should think it proper to class the kinds of labor in this first category.

—But if science is not yet well settled as to their classification, or as to their nomenclature, does it, at least, now recognize that they all contribute to production? and does it know how they co-operate in it? It would be difficult to assert this of the long category of arts which act directly on the human race. As to these, we are where we have long been in regard to the others. We know how tardy was the recognition that the latter participated in the creation of wealth, and what difficulty there was in discerning how they participated in it. The truth in regard to this, which was first admitted in reference to the extractive arts and agricultural industry, was long denied in reference to manufactures, and still longer in regard to the industry of transportation, improperly called commercial. The only real products were those which were the immediate result of the extractive and agricultural industries. Manufacture transformed them; but it was supposed, without creating new products, since it took nothing more from the earth. The industry of transportation changed the places of things; but still less than manufactures did it create new products, since those it transported remained identically the same. It was only after much difficulty that the matter was relieved of its confusion, and people were made clearly to perceive how these industries added new values to existing wealth.

—Here is where we now are as to the arts which act directly on men. People still deny, at this very day, that they add to the mass of wealth created. Most books on political economy, even to the last, including the best,<sup>52</sup> have been written with the supposition that there were no real riches, or values susceptible of being qualified as wealth, except those which labor had succeeded in embodying in material objects. Smith sees scarcely any wealth save in things palpable. Say starts by designating by the name of wealth, lands, metals, moneys, grain, dry goods, etc., without adding to that enumeration any class of values not realized in matter. Whenever, according to Malthus, wealth is in question, our attention is drawn almost exclusively to material objects. The only kinds of labor, according to Rossi, with which the science of wealth is concerned, are those which enter into the struggle with matter to adapt it to our needs. Sismondi does not recognize as wealth products which industry has not clothed with a material form. Riches, according to Droz, are all the material goods which serve to satisfy our wants. "The opinion most true," he adds, "is that we should see it [*i.e.*, wealth] in all the material things which serve men." Finally, the writer of these lines can not forget that he had to maintain, only a few months ago [probably written in 1863 or 1864.

—*Translator*], a long debate with several economists, his colleagues in the academy of moral sciences, without succeeding in persuading them that there are other riches than those which are so improperly called *material*.

—Not only do economists recognize as wealth only values realized in material objects, but they declare unproductive the arts which are not exercised on matter,

mentioning by name those which act directly upon man. Smith, after having enumerated them, presents them all, from the noblest to the meanest, as leaving nothing with which one could afterward purchase an equal quantity of labor. "Their work," he adds, "perishes the very instant of its production." ("Wealth of Nations," book ii., chap. 3.) We have elsewhere cited the opinions of a list of well-known economists, who all say the same thing. Tracy, Malthus, Sismondi, and James Mill, in speaking of the labor of magistrates, instructors, priests, savants, artists, etc., say of their services that they are productive only at the moment when they are rendered, and that there remains nothing of them, or that there remain only intellectual or moral results, and that people do not store up that which appertains only to the soul. Droz, whom we did not mention, after having represented the arts which act on matter as the only ones which produce wealth, elsewhere considers those who work on the mind as not creating. J. B. Say, who essays an innovation on this point, represents as productive all the long category of kinds of labor performed directly on man; but, from a misapprehension which prevents him from arriving at the truth, he sees the products of these labors in the works themselves, instead of seeing them where they are, that is to say, in the useful and lasting results they leave behind them; and, while qualifying them as productive, he is led to say of them all that the others say to prove that they are not so, namely, that their products are attached to nothing, that they perish as fast as they are created, that it is impossible to accumulate them, that they add nothing to the wealth of society, that there are even disadvantages in multiplying them, and that the expense incurred to obtain them is unproductive.

—It is very singular, that, while thus in accord in declaring the arts unproductive which act directly on the human race, these economists are unanimous in finding them productive when they consider them in their consequences, that is to say, in the utilities, the faculties, the values, which they finally succeed in realizing in man. Thus, Adam Smith, after having said, in certain passages in his book, that literary people, *savants*, and other workers in the same category, are workmen whose labor produces nothing, expressly says elsewhere that "the useful abilities acquired by members of society" (abilities which could have been acquired only by the aid of these men whom he calls unproductive) "are a capital fixed and realized, as it were, in the persons who possess them, and constitute an essential part of the general funds of society—a part of its fixed capital." ("Wealth of Nations," book ii., chap. 1.) Thus, also, J. B. Say, who says of the same classes of workers, that their products are not susceptible of accumulation, and that they add nothing to the wealth of society, formally pronounces, on the other hand, that the talent of a public functionary, and that the business of a mechanic (evidently creations of these men whose products can not be accumulated), form an accumulated capital. Thus, M. Sismondi, who, on the one hand, declares the labors of instructors, etc., unproductive, affirms positively, on the other hand, that literary men and artists<sup>53</sup> (the incontestable work of these instructors) constitute a part of the national wealth. Similarly M. Droz, who somewhere makes the observation that it would be absurd to consider virtue as wealth, properly so called, terminates his book by saying it would be falling into a disgraceful error to regard the magistracy which makes justice rule, the savant who diffuses intelligence, etc., as producing nothing. It is, however, obvious that the same labor can not be at once *productive* and *non-productive*, result in products which at the same time *perish* and *become permanent*, which *vanish as fast as they are created*, and which *accumulate in*

*proportion as they are created*; and seeing to what contradictions the founders of the science are brought on this capital point, it is easy to recognize that the question needs a more satisfactory explanation than that which they have given of it. This explanation we have elsewhere produced, and we think it will compel assent. It arises obviously from the quite natural distinction to be made between *labor* and *its results*.

—It was, as we have said, because of not having distinguished labor from its results, that Smith and his principal successors fell into the contradictions which we have just pointed out, and that they so badly resolved the question whether or not the arts, which act directly on man, should be considered productive. All the useful occupations, whatever they may be, those which work upon things as well as those which operate on men, perform labor which vanishes as fast as performed, and they all create utility which is accumulated as fast as it is obtained. It is not necessary to say, with Smith, that wealth is *accumulated labor*; we should say that it is *accumulated utility*. It is not labor that one accumulates, it is the utility which labor produces. The labor passes away as fast as performed; the utility it produces remains.

—To be sure, the lesson which a professor gives is consumed while being produced, the same as the manual labor expended by the potter on the clay he holds in his hands; but the ideas inculcated by the professor in the minds of the men, who listen to him, the shape given to their intelligence, the salutary impression wrought on their susceptible faculties, are products which remain, quite as much as the form impressed on the clay by the potter. A physician gives advice, a judge pronounces a sentence, an orator delivers a discourse, an *artiste* sings a song or recites a tirade; this is their labor; it is consumed as fast as produced, like all possible kinds of labor: but it is not their product, as J. B. Say erroneously claims: their product, like that of every kind of producers, is in the result of their labor, in the useful and durable modifications that both kinds have wrought on the men upon whom they have acted, in the health the physician has restored to his patient, in the morality, the instruction, the taste, which the judge, the professor, and the *artiste* have spread. Now, these products remain, they are susceptible of preservation and increase, of accumulation; and we can acquire more or less virtue and knowledge, just as we can impress upon any portion of matter some of the utilities which are of a nature to become fixed in things, and which give them more or less value.

—It is true, that instruction, taste, talents, are *immaterial products*; but do we ever create any other kind? and is it not surprising to see J. B. Say distinguish between material and immaterial, he who has so judiciously remarked that we can not create matter any more than we can annihilate it, and that in all things we only produce utilities, values? The form, the figure, the color, that an artisan gives to rough bodies, are things just as immaterial as the knowledge that a professor communicates to intelligent beings: both only produce utilities, and the only real difference that can be observed between their industries, is that the one aims to modify things, and the other to modify men.

—It can not be said that the labor of the professor, the judge, the comedian, the singer, *is attached to nothing*, nor that *nothing remains of it*: it is attached to the men upon whom it operates, and there remain from it the useful and lasting modifications which

it has wrought in them; just as the labor of the spinner, the weaver, and the dyer, is realized in the things which receive it, and leaves upon them the forms, the figure and the colors which it has impressed on them.

—It can not be said that the values realized in men, the capacity, industry and talents that have been communicated to them, *are not susceptible of sale*. What are not sold, at least in countries civilized enough to have no more slaves, are the men in whom human industry has developed these qualities; but, as to the talents which these men possess, they are quite susceptible of sale, and are, in fact, continually being sold; not, I readily admit, in kind and in themselves, but under the form of the services, the labor, and the instruction which is commonly employed to communicate them to others.

—No more can we say that the values which labor succeeds in impressing upon men *are not of a nature to be accumulated*: it is as easy to multiply in ourselves the useful modifications of which we are susceptible, as to multiply, in the things which surround us, the useful modifications they can receive.

—Nor can it any more be said that *there is disadvantage in multiplying them*. What can not be multiplied without disadvantage, are the expenses necessary in order to obtain any kind of products whatever; but, as to the products themselves, it can not surely be said that there is any disadvantage in increasing them. We do not hear men complain of having too much industry, taste, imagination, skill or any good quality, and more than we hear them complain of possessing too many utilities of any other kind.

—It can not be said that *the expense incurred to obtain these products is unproductive*. What would be unproductive, would be the incurring of needless expense in creating them: but as to the necessary outlay for that purpose, it is not unproductive, since it may result in actual wealth, and in wealth greater than the expense of producing it. It is surely not rarely that acquired talents are worth more than the expense incurred to acquire them: it is not impossible that a government should give rise, by an active and firm administration, enlightened by justice, to a value infinitely superior to the expense required to obtain so valuable a result.

—It can not, in short, be said that these products add nothing to the national capital: they augment it as really as products of any other kind could do. A capital of mental acquirements or of good habits is worth no less than a capital of money or of any other kind of values. A nation has not alone physical wants to be satisfied; it naturally experiences many intellectual and moral wants; and, however little culture it may have, it will place virtue, instruction and taste in the category of its most real and most valuable riches. These things, then, which are in themselves true wealth, on account of the pure and elevated pleasures they procure, are, besides, absolutely indispensable means for obtaining that other species of values which we succeed in embodying in material objects. It is not sufficient, in fact, in order to create these latter values, to possess workshops, tools, machines, provisions, moneys: there must be strength, health, knowledge, taste, imagination, good private and social habits; and the men who work to create and bring to perfection these products may justly be considered

producers of the wealth called material, just as much as those who work directly to create it. It is obvious, in a word, that if a nation increases its capital by extending its area of cultivation, improving its lands, perfecting its workshops, its implements, and its cattle, still more does it increase it by perfecting itself, that which is preeminently *the* force, the force which directs and gives value to all the others.

—Will some one be kind enough to tell us how it is, that, after all this, any one can maintain that the men whose efforts are exerted directly in the cultivation of their fellow-creatures, create products which *vanish in being produced*? The truth in regard to these laborers, as well as to all, is, that in the work of production it is only their labor which vanishes, and that, as to their products, they are as real as those of the classes most manifestly productive. What better, in fact, can be done to increase the capital of a nation, than to multiply the number of men, vigorous, skillful, educated, virtuous men, trained to act well and live well? What wealth, even if we took into account merely the question of deriving profit from the material world, could appear superior to this? What wealth is more capable of giving rise to other kinds? Now, this is exactly what all classes of laborers who act directly upon man, produce, different from those who work for him only by acting on things. A government, when it is what it ought to be, is a producer of men subject to public order, and trained to the practice of justice; a true moralist is a producer of moral men; a good instructor is a producer of instructed and enlightened men; an *artiste* worthy of the name is the producer of men of taste and of soul, of men trained to sensibility to all that is good and beautiful; a teacher of fencing, horsemanship or gymnastics, is a producer of bold, agile, vigorous men; a physician is the producer of well men. Or, if we choose, these various laborers are, according to the nature of the art they practice, producers of health, strength, agility, courage, instruction, taste, morality, sociability—all things which people count upon acquiring when they consent to pay for the services designed to produce them, and all services whose price is, so to speak, quoted, having consequently a sale value, and forming the most valuable and most fecund portion of the productive forces of society.

—These opinions were published by the author of this article, a number of years ago (in 1827, in the April number of the *Revue Encyclopédique*); and he confesses that it was not without great surprise, that, referring lately, at a meeting of the *Institute*, to these former remarks, he beheld *savants* who were his colleagues, and, among the number, able professors of political economy, combat propositions so evidently correct, and seriously deny that economic science could concern itself with the arts which act upon man; relying, to justify their opinion in that regard, on these two reasons, among others, viz., that it could not take notice of them without exceeding its just limits; and that, on the other hand, it was not possible to make, from the product of these arts, an article of exchange or of commerce.

—But (to pass immediately on the merits of the first of these allegations), how, pray, is the science of political economy naturally limited? Is it by the nature of the arts alone which they would have it investigate, or by the general manner in which it regards all kinds of labor? Does it treat directly and exclusively of certain arts, for example, of those which act on the material world, of extractive industry, of that of transportation, of manufacture, or of agriculture? It has to deal with questions which

are peculiar to no art, to which all arts equally give rise, and which are the special object of its study: it investigates how all kinds contribute to production, what part is played by the labor of the various orders of means on which the power of all labor rests, the separation of occupations, the perfecting of the instruments employed, the scientific notions, the talent for applying them, and a number of others which we refrain from enumerating here: it also investigates the manner in which the products resulting from the co-operation of all the social activities are distributed among all, by the contrivance of exchanges and the aid of everything that can facilitate them. Now, these questions, wholly economic, and which it is though natural it should discuss relative to the arts exercised on things, it is obvious it may enter upon, without departing any more from its object, in reference to the arts which act directly on man; and if political economy does not encroach on the instruction of the technologist or the agronomist when it explains how the manufacturer or the agriculturist adds to the value of the materials he transforms, it is evident that it no more encroaches on the labors of the *savant*, the *artiste*, or the magistrate, when it attempts to show how these particular orders of workers contribute to the improvement of the people on whom their influence is exercised. Certainly, to tell what part a good division of labor, or the employment of improved instruments, plays in the teaching of the sciences, is not to devote one's self to teaching the sciences. Certainly, too, to say the *artiste*, the priest, the instructor, can no more do without security and liberty, than the man who plows his field or who keeps his workshops in operation, is neither to be a professor of æsthetics, of morals, or of pedagogy. Finally, it is manifest, that to raise an economic question in relation to the arts which act upon man, is no more to go outside of the bounds of political economy, than it is going outside to treat that question in its relation to the arts whose activity is expended on matter.

—And not only does the economist no more go out from his domain when he concerns himself, from an economic point of view, with the arts whose activity is devoted to the education of the human race, than he goes out of it when he gives his attention to those which act on things; but we must say, that, to completely fill his *role*, he must concern himself with all, without distinction. There is not one, in fact, which does not indispensably need the co-operation of all the others; and the economist would have only a very incomplete idea of the phenomenon of production, and of all the means on which the powers of production are based, if he did not know how every kind of labor that the economy of society comprises, participates in it. The economist, in a word, must necessarily be instructed in two things: the first is, that man can not be developed in one respect alone; that he can not become rich exclusively; that, in order to become rich, he must also become skillful, trained, enlightened, polished, moral, social; and the second is, that there is not one of these happy qualities which is not a direct source of wealth to the arts which procure them for him; that the *savant*, the *artiste*, the magistrate and the moralist enrich themselves while laboring for his education, just as the mechanic and the agriculturist do while adjusting material nature to his wants.

—But, they say (and this is the second objection brought against us), political economy treats essentially of *exchangeable* wealth; and for it to concern itself with the high arts which labor for the education of man, they should give rise to products which could be a current article of exchange. Now, what do, in fact, come from them,

even on the supposition that they succeed in forming men who are well taught, able, honest, capable of rendering services in all respects excellent? And where are the products susceptible of being exchanged, in which their labor is realized? The answer naturally arises from the question. These products are in the very-aptitudes they give the men on whom their labor is expended, and in the services these aptitudes permit them to render. These services are not palpable products, it is true; but have the only arts with which some persons think political economy should concern itself, the arts which act on the materials world, only this kind of products to offer? Do not these people know that the larger part of their agents present themselves on the market with only labor, that they have only services to offer? And if one will please consider that labor, industry and human services are a current article, a constant article, a universal article, of exchange, will he deny that the arts, whose mission is to form men adapted to render services, contribute as much as of any other class to bring exchangeable products into market? Do not the whole world know that there is a trade in services going on, as considerable as that in material things adapted to serve? And do they not also know that the most material of products have been acquired only in view of the services they can render, and that in reality it is only services which are bought and sold?

—This surely is undeniable; and if political economy can justly be reproached with not having made a sufficiently exact and complete classification of the kinds of labor acting on material nature, which contribute to production, it may still more justly be reproached with not having also been able to admit into the number of productive are the classes of labor, so important and so numerous, whose united activity is devoted to the cultivation of the human race. It is certain, that, in order to have a sufficient idea of the phenomenon of production, it should embrace them all and investigate both without distinction. There may indeed be something in this enlargement of the domain of the science of political economy, to disconcert a little those who cultivate its acquaintance; and we can understand, that, after having made the products clothed with material forms and the kinds of labor which create that sort of products the exclusive object, thus far, of their investigations, it costs them somewhat to extend their attention to the more complicated arts, which concern man and products so different, which are put into circulation under the form of services; but it is nevertheless true, that, to well comprehend the phenomenon of *production*, they must particularly investigate this class of products and of labors, and there is likewise an additional reason for making them the subject of especial investigation, in the little attention they have hitherto accorded them.

—We will add, that, if it is necessary to investigate equally all the kinds of labor embraced in the economy of society, in order to have an adequate conception of the phenomenon question, it is not less so to have accurate and complete knowledge upon the co-operation of what means the power of labor naturally depends; and that on this second point, as we showed at the commencement of this article, the economists have not yet succeeded in coming to an agreement any more than on the first. If they have not made it sufficiently appear what all the trades and professions are which it is essential for political economy to investigate, neither have they sufficiently shown, at least as it seems to us, by what means the various kinds of business produce, and in the combination of what causes lies the potency of their action. That illustrious man,

J. B. Say, the one of these writers, who, in our opinion, has made the most learned exposition, the most detailed and most extended analysis, of the general means of industry, appears to us, nevertheless, to have fallen far short of having made a complete list of them, or even, in many respects, an accurate list.

—To begin with, before entering upon an examination of that analysis, we will express our regret, in common with some other economists, that J. B. Say should have assigned several causes as the origin of production, and represented that man was indebted for the acquisitions he has made, not alone to his efforts, without with, however, the forces of nature, beginning with his own faculties, would have been of no value to him, but to his efforts simultaneously with the co-operation of nature and of capital, which, according to J. B. Say, have labored for his progress conjointly with himself. "There exists something else than human labor in the work of production," he says. \* \* Industry, left to itself, could not give value to things; it must possess products already existing, without which, however skillful we may suppose it to be, it would remain inactive: it is necessary, besides, that nature should combine her labor with it and with its instruments." Human industry, according to J. B. Say, never figures as more than one-third in the act of production. In every product a part of the result obtained comes from nature, and another part from capital.

—We fear, as we have already said elsewhere, that in thus assigning to production several primordial causes, J. B. Say has brought confusion where he desired to introduce greater order, and that, far from throwing light on the subject, he has made the primitive source of all our progress more obscure. We think, with Adam Smith, and particularly with M. de Tracy, who on this subject was still more clear than Smith, that labor has been the only generating cause.

—To be sure, human activity is not the only force there is in nature. Outside of that, there exists a multitude of others, which man has no more created than he has created his own faculties, and which he could no more annihilate, and whose existence is wholly distinct from and independent of his. There are dead forces, and there are living ones. The hardness, the strength, the ductility of certain metals, are inert forces. The sun, water, fire, wind, gravitation, magnetism, electricity, the vegetative force of the soil, the vital force of animals, are active forces. But if such forces exist, external to man, there is nothing in them which announces that they exist for him; and, left to themselves, they would show themselves perfectly indifferent to his happiness. For them to serve him, he must bend them to his service; for them to produce, he must force them to produce. To be sure, man does not create them; but he creates the utility that they are to him: he creates them as agents of production, as productive forces. It is also true that he has to take more or less trouble for that: every kind of steel is not equally suitable to make a file; every kind of soil can not be rendered equally adapted to vegetation; but he must put his hand to all things, and nothing is arranged by nature to serve him. How could the qualities of iron have been of service to production, if industry had not been able to separate the metal from the ore, and impress upon it the form suited to render its qualities useful? How could the wind have served to turn a millstone without the fans of the mill? How could the magnetic fluid have served to direct navigators, without the invention of the mariner's compass? How would the rain and the sun make plants germinate, without the previous labor which presents to the

dew of heaven and the warmth of the solar rays a plat of land suitably plowed, manured, prepared and sown? These agents and many others, in short, are equally all the disposal of all men: of what use are they to the savage who has not learned how to derive advantage from them? Yet again, the forces of nature exist independently of human labor; but relatively to man, and as agents of production, they exist only in human industry, and in the instruments by means of which industry has taken hold of them. This it is which has created these instruments and directs their use; this is the only source from which have sprung, not things, nor the properties of things, but all the utility which man derives from things and from their properties.

—J. B. Say is then wrong, we think, in saying that wealth originally came from the combination of three forces, industry, capital and natural agents, among which he gives land an important place. Industry, he says, would have remained inactive, without the aid of pre-existing capital. But, if this is so, it is no longer conceivable how it was able to begin to act; for it is very evident that the existence of capital could not precede the labor which gave rise to it. To appropriate things to his use, man had at first only his native faculties, his instincts, his intelligence and his hands. Soon, by the aid of these levers he procured others: he put tools in his fingers; he substituted machines for tools; he added to his forces those of animals, metals, water, fire and wind. By degrees all the powers of nature, some being subjugated by others, under the intelligent direction he gave them, entered his service without disturbance, and began to work for him. The capital thus composed of the combined forces which he added to the little he had on coming from the hands of nature, and including, of course, the successive developments of his own faculties, is of human creation. A piece of land is, as M. Tracy well observes, like a block of marble or a mass of mineral, only a certain portion of matter, endowed with certain properties, and which man may dispose of, and he disposed of, as with a multitude of other things, so as to render its properties useful. Man does not create this matter, nor the properties it has, any more than he creates matter or the properties of matter, from which are formed a hundred other kinds of capital; but he creates, by his successive efforts, the power to derive advantage from both: he creates them as instruments of production, and these forces which J. B. Say represents as acting from the beginning conjointly with human industry, are themselves, at least as instruments of production, creations of industry, and ought to be included in the list of means which it has given itself, and of agents which it has made for itself, while it has developed its own forces. Consequently, and let us note well the fact, it is not necessary to go outside of human activity, to find the origin of the powers which human labor possesses. It is from this that everything visibly proceeds, and no other force is perceptible at the beginning. In other words, man has created all his powers, beginning with those he has derived from himself and from the marvelous faculties whose germ Heaven placed within him. He has created, I repeat, neither these faculties nor the forces throughout nature; but all the power that he has of deriving from both, he has, I say, given himself.

—Then, after having thus referred the forces which J. B. Say represents as acting from the beginning conjointly with man, to a place among the general means of production that man has created, we will repeat that M. Say has made, and others after him will continue to make, following his example, an analysis of these means which appears to us neither sufficiently complete nor even sufficiently accurate.

—We will observe, in the first place, that the author of the *Traité de l'Économie Politique* excludes from the mass of its productive funds, as the author of the "Wealth of Nations" had done, all that part of the general fund of society which is employed in satisfying public or private, particular or general, want. This is the natural consequence of the error which makes them consider the arts which act on man unproductive. Thus all that portion of the social fund which individuals employ in maintaining their physical strength, increasing their intellectual faculties, improving their moral habits, bringing up children who will some day be of help to them, would, according to J. B. Say, constitute no part of their means of the production. And, in like manner, all that part of the same fund employed in satisfying public wants, as for example, maintaining order in the community, creating habitual respect among its members for personal and property rights, procuring instruction for classes which would not naturally receive it, would also not constitute any part of the productive forces of society. All these would serve to satisfy demands, to be sure, and very imperious demands; all these would be productive of utility and gratification, but not of wealth: the service people made of them would add nothing to the wealth and forces of society.

—This affects us, we acknowledge, as one of the most obvious of errors. It is absolutely impossible for us to admit that the portion of his means that a manufacturer employs in keeping his manufactory in repair, constitutes a part of his productive capital; and that that which he employs in maintaining himself, the head of the manufactory and the prime agent of manufacturing production, constitutes no part of it. It is impossible for us to admit that the buildings and the food which an agronomist employs for the preservation of his beasts of burden should constitute a part of his productive capital; and that his dwelling house, his furniture, his clothing, his food, and all that part of his wealth which is employed to keep him, and he himself, the head and the prime agent of agricultural production, constitute no part of it. There are, quite probably, a certain number of men in society incurably worthless, either absolute do-nothings, or employing the little activity they have in preserving their existence, seeking enjoyment, and procuring for themselves agreeable sensations. We are quite willing that all that part of the capital of society which is employed in maintaining such beings should be struck off from its productive funds. But if there are many people in the world who live only for pleasure, happily a still greater number live to act, and make their happiness consist in some profitable employment of their powers; and who, in fact, habitually use them in a way that really benefits humanity. Now, we can not comprehend, we say, how any one can strike out from the productive capital of society the part of its funds it employs in suitably maintaining these men, these who are assuredly the most valuable, the most noble, the most fruitful of all its products, the one without which no other would exist. Everything that a worthless man expends for the satisfaction of his wants is lost: nothing results from it but the maintenance of a useless man. Everything that a useful man gives to his pleasures, without any advantage to the increase or preservation of his faculties, is equally lost: nothing remains of that expense. But what the same individual devotes to the maintenance or the increase of his powers, however little the forces preserved or acquired may be worth above the outlay in preserving or acquiring them, is reproductively employed, and constitutes part of his means of production: of this there can be no doubt.

—In this mass of means of every kind, of which the general productive fund of society is composed, Smith had already discerned a great number of means and of forces: he had seen those prime materials more or less raw, and those more or less worked; tools and machines of every sort designed to shorten or to facilitate labor; buildings devoted to every kind of labor; lands brought into the condition most, suited for cultivation and tillage; a great number of talents and much useful knowledge acquired by the members of society; a certain total of moneys designed to facilitate exchanges, etc.; and, of all these means, he had composed two classes of capital, fixed capital and circulating capital, both designed to maintain that fund for consumption from which men derive all the means of preserving and improving their existence.

—J. B. Say has gone farther than Smith, and done better in some respects. He first divides the productive funds of society into two great divisions, one of which is composed of the industrial faculties of the labourers, and the other of their implements. Then he distinguishes, among the industrial faculties, that of the *savants*, that of business managers, that of workmen: and, among the instruments, the natural agents not appropriated, such as the sea, the atmosphere, the heat of the sun, and all the powers of physical nature; the appropriated natural agents, such as cultivable lands, regular watercourses, mines in the way of exploitation, etc.; and the different kinds of capital, among which he distinguishes unproductive capital, capital productive of utility and of gratification, and capital truly productive; dividing again the latter into *fixed* and *circulating*, and giving particular attention to capital which exists in the form of *machines*, and that which exists in the form of *moneys*; while Smith only describes the functions of money, and does not speak of the influence of machines. Such is the analysis of J. B. Say.

—It is surely having made progress in analyzing this vast mass of levers and forces of every kind of which the general productive funds of society is composed, to have distinguished the *industrial faculties* themselves from the *industrial implements*. But, while firmly maintaining that essential and excellent distinction between industry and its implements, or, rather, while forming two well-separated classes of the natural and acquired powers which man possesses in himself, and of those which he has appropriated to himself from all nature, and that it depends upon him to add to those he draws from his own resources, we think there is a better analysis to be made of both. Let us speak first of those which exist in man himself.

—J. B. Say only remarks here a fund of industrial faculties. We shall soon see that there is in him something else than industry, and something, too, which, in the interest of production, it is important to observe. But we will first investigate the industrial funds. J. B. Say only distinguishes among industrial funds the three classes of talents of the *savant*, the business manager and the workman, or, rather, of *theory*, *administration* and *execution*. The first observation that occurs to the mind, is, that he here confounds two very distinct orders of faculties, which it was essential to keep as separate as possible, viz., those which pertain to the understanding and management of affairs, and those which relate to the execution and the art.

—The talent for affairs is composed of several sorts of important faculties which J. B. Say has not described, or even designated, and of which it was, nevertheless, essential

to speak; for they occupy a high rank and play a very important part in all kinds of labor, without exception, which the economy of society embraces. This is a considerable omission. The order which J. B. Say assigns to science, in the faculties which pertain to art, is not, I think, the true one: things, in this world, did not begin by *theory*; a certain practical acquaintance with a trade preceded scientific instruction. People began by acting *empirically*; then came *theoretical* knowledge; then the talent for *applications*, which J. B. Say places among the attributes of the business man, and which is much more in the domain of art; finally, the *execution* has followed the thought, and has been more or less skillful, according as the thought itself has become more elaborated, and as it has become more natural and more familiar. In all this, as we can see, whether it is a question of *business* or of *art*, the only things concerned are address, skill, knowledge and capacity.

—But how is this! are these, then, all there is in man? or does he need no other faculties in order for production? Is he not quite as susceptible of morality as of knowledge? And should we not regard as indispensable that his good abilities should be aided by good breeding, if it is permissible to designate by the familiar phrases, good abilities and good breeding, the whole of the intellectual and moral means of which the powers of the human race are composed? Is a fund of good moral habits any less necessary to the work of production than a fund of industrial faculties? Here again, we say, there seems to be an important and much-to-be regretted omission in the analysis which Smith, J. B. Say, and their successors have made of the general means of production. One can already perceive how much this analysis leaves to be desired in what touches upon the social fund, that which is composed of all the forces which laborers have developed in themselves. Let us pass on to the account of those which they have fixed and accumulated in things.

—We have said that here J. B. Say distinguished unappropriated natural agents, appropriated natural agents, and capitals. We will here, to confirm our first remarks, call attention to the fact that the forces which he designates by the term unappropriated natural agents, such as all the laws of physical nature, could not be considered as instruments of industry, so long as man could not get hold of their power. These agents really exist for him only in the labors, the works, the machines, by means of which he has succeeded in getting hold of them and applying them to his ends. We think we have already rendered this truth palpable. From the moment it is perceived that there are no natural agents for man, except those he has himself got hold of, that he has succeeded in imprisoning in his sails, his gearing, his ingenious and innumerable mechanisms, and which he has made his own by previous and adequate labors of appropriation, it is clear that no such distinction is to be made as unappropriated and appropriated agents. To human industry, only appropriated agents really exist.

—In the list of appropriated agents, we discover absolutely no reason for making two separate classes of capitals and land. Nothing, in fact, seems to distinguish the vegetable or mineral land from the other objects in nature of which man has taken possession, which he has put to his service, in which he has accumulated and capitalized more or less of values; and we can see no more reason for investigating, as J. B. Say has done, how capital and land unite to produce industry, than to call

attention to the manner in which industry, capital and currents of air or currents of water, or vapor, or the sun, or any other such agent of nature which man has been able to associate with his labor in any manner whatever, combine for the same object. The special distinction of *land*, in the number of appropriated agents, should then be put aside.

—In the mass of forces within and without himself which man has appropriated to his services, or, to employ language which designates all these forces by one single word, in the mass of *capitals*, J. B. Say distinguishes unproductive; productive of utility and gratification; and productive of wealth, or, simply, productive. *Unproductive* capitals (and by these J. B. Say means all buried treasure and unemployed capital), *unproductive* capitals, we say, scarcely merit figuring in an analysis of the instruments of *production*. They are, it is true, a potential force: they are capable of being employed; but so long as they remain inactive, they are as if they did not exist, and can hardly be included in an analysis of the social forces. All that part of capitals *productive of utility and gratification*, which is employed in frivolous or harmful expenses, merits still less being included in the mass of instruments of industry. All that which, on the contrary, serves to bring up useful men, to preserve, extend and improve their faculties, is, as we have explained above, eminently productive, and demands to be ranked among the most valuable and the most effective means of production. There remain, then, simply, *productive* capitals, which Say distinguishes from natural agents, in which he induces neither land, mines nor water courses, and among which he ranks neither the material of public administration nor the dwelling houses of private citizens, nor their furniture, their clothing, their books, or anything that serves directly for the education of the human race, and in the naming of which, on the contrary, we need not hesitate to combine all the material elements of human industry, all the external forces that it has employed, all the means of action, outside of itself, which it has learned to draw upon and appropriate to its ends, and to which has been able to give a useful direction.

—We will only remark, that, even in comprehending thus under the term *capital* all the external instruments of industry, we would still be giving to that appellation too restricted an application, and that it is proper to combine under this word all the forces whatsoever that man has accumulated and that he can employ acquiring new ones: that a nation's capital is composed of the forces it has accumulated within itself, quite as much as of those which it has put itself in a position to derive from things; that we may say, and we must say, a capital of knowledge and of good habits, just as we say a capital in money, and that J. B. Say should have been the less averse to this language, because he calls man an *accumulated capital*, and applies the term *accumulated capital* to the talent of a workman, an administrator, or an officer. Consequently, man and the world being given, such as they were at the beginning, it is necessary, starting with the active intelligence of the human race as the primordial cause from which all our resources have sprung, to consider as capital, not any particular instruments which man has appropriated, rather than certain others, but all the useful force of every kind, which he has succeeded in developing either in himself or in the things by which he is surrounded, or which he has converted to his use. This being stated, and these various remarks made, here are what seem to us to be the composition of the capital or general productive funds of society, what the various orders of means we discover in

it, and the total of the causes with which, in our opinion, the productive power of all kinds of labor is connected.

—In the first place, the social fund or capital is divided, we think, into two great classes of forces: that which labor has developed in men, and that which it has realized in things. The effective power of all kinds of labor comes from the combination of the two classes. In the number of powers which men have succeeded in developing in themselves, the first which strikes us, that which naturally takes a place at the head of all the others, that which is most indispensable to the success of all enterprises and the well-directed action of all the arts, is the *genius for affairs*, a talent in which we discover several very distinct faculties, such as capacity for judging of the state of demand or knowing the wants of society; that of judging of the state of supply, or estimating the existing means of satisfying these demands; that of administrating with ability enterprises wisely conceived; and finally, that of verifying, by regular accounts, intelligently kept, the previsions of speculation. After this list of faculties relating to the conception and the conduct of enterprises, and of which the genius for affairs is composed, those which are needed for execution, and from which is formed the *genius for art*, next present themselves. Such are a practical knowledge of a trade, theoretical notions, a talent for applications, and skill in workmanship.

—All these faculties are industrial. But, again, are these all? No, certainly not; and if, in the fund of the personal faculties of workmen, we discover a great variety of *industrial* forces, we also remark there a great number of *moral* qualities. We distinguish in them all that series of habits which guide them in their conduct in regard to themselves, and which concern in some sort only the individual. We also distinguish there all that series of habits of another order, which govern relations and which interest society more particularly. The effective power and the free action of all branches of business depend in the highest degree, as might easily be shown, on the perfection of both. We could not take too much pains to note and call attention to the happy influence exerted in all kinds of labor, by good private morals in laborers and the improvement of their habits as citizens.

—Finally, outside of these various orders of faculties to which labor has given rise in men, and which form, in some sort, the intellectual and moral capital of society, its fund of personal faculties, we perceive a multitude of utilities, forces, levers, Powers, which it has succeeded in fixing in things, and which form, if one chooses so to call it, its real or material capital. In this part of its general funds we perceive, under countless aspects, lands cleared, plowed and planted, regular watercourses, canals, routes, enclosures, constructions, buildings, machines, tools, raw products, provisions, moneys, wages, and an infinite variety of instruments and means of action of every kind. All these, variously brought together, form multitudes of establishments, workshops for labor; and if we very attentively observe these workshops, we notice that, however truly appropriated they may be to their object, it is essential that they be well situated, well organized, that labor in them be skillfully distributed, and that they be provided with a sufficient quantity of well-selected tools, materials, and supplies of various sorts.

—Such is the analysis of which this general fund of society, where are found in deposit all our faculties and all our resources, seems to us susceptible; and such are the various elements of power which we there discover. It would now be necessary, in order to complete the exposition of the important phenomenon which this article aims to describe, to show what particular influence each of the means we have just pointed out, exerts in production. This is a task which we have performed in our work on "Freedom of Labor," from which we have taken almost literally a considerable portion of the remarks that have just been read, and nearly two volumes of which are devoted to explaining either the part which these means play in labor in general, or the diversity of the applications that are made of them in the various kinds of labor that social economy embraces; and it would be impossible for us to give here, even in a summary, any adequate idea of that analysis. We can only refer the reader to that book.

—It has been remarked, that, in so extended an analysis as this of the means of labor, we had omitted to speak of the most considerable of all, namely, capital. As if, beginning as we did, with the natural faculties of man, and enumerating the various orders of forces that he had developed in himself, or had appropriated from without, we could have spoken, and did in fact speak, of anything else! As if, under their own names, the various orders of intellectual, moral or material means that we had pointed out, could be and were anything but different portions of the capital of society! As if, in short, after having spoken successively of all, one particular class of forces or of resources could remain to be treated of, under the name of capital, especially when we had said, in terms so explicit, that this term *capital* did not apply to any one kind particularly, and that it embraced without distinction all the means of production that man had accumulated around him and within himself!

—No; our error, if such it is, consists in having discarded, at the outset, that trinity of *land, labor* and *capital*, which the school makes assist simultaneously in the beginning of all our acquisitions of wealth and of forces; which appeared to us to be a cause of trouble and confusion in the exposition of the science; which, while leading to useless explanations, had in our eyes the error of being at the same time incorrect and inadequate, and, taking man and the world in their primordial state, of having made everything arise from the activity of the human race acting at the same time on things and on itself. But, taking thus our starting point in the activity of man, we have the consciousness of having omitted none of the great categories of productive forces that he has developed in the external world and in himself, no portion of the social capital; and we think we have made a more complete and true analysis of the general instruments of labor, as well as of the kinds of labor which social economy embraces, than we had found in the best books on the science.

—We will only say, in closing, that production does not alone derive its forces from the various categories of personal faculties and material means which have just been enumerated, but also from all the great orders of labor which society contains; that there is not one of them which is not indispensable to the activity of all the others, and that, to make the phenomenon of production fully comprehended, one would have to designate the place that each of these kinds of labor occupies in society, the part it performs there, the mutual assistance they render one another, etc. This is what we

endeavored to do in the work on "Freedom of Labor," which we have already mentioned, and to which we are obliged again to refer the reader.

## PRODUCTS ON PAPER

PRODUCTS ON PAPER.<sup>54</sup> A curious off-shoot of the growth of this century is found in the multiplication of so-called "exchanges." The original idea of an "exchange" was a mart where a man with some definite commodity to sell could always find a buyer at some price, and where a man wanting to buy some definite commodity could always find a seller at some price. Thus, in their origin, "exchanges" were economic blessings, for they brought about between buyer and seller a maximum of nearness, with a minimum of friction. As "exchanges" grew, their original object pretty nearly vanished, and, instead of being marts, where commodities are exchanged, they have become places where bets on prices may be made, recorded and paid.

—In exchange jargon the only term now used, which indicates the original object to "exchanges," is "cash sales;" the rest savor of their degeneration, or, at least, of their change. "Shorts," "longs," "puts," "calls," "straddles," "spreads," "options," "privileges," and the like, are not indicative of commerce, but of speculation pure and simple.

—Taking the annual reports of the leading exchanges of the country, it is manifest that the majority of transactions are only bets; because far greater quantities of cotton, corn, wheat, petroleum, etc., are annually sold than the soil produces. It follows, then, that in our so-called "exchanges," the business of members is not so much to exchange commodities, either for themselves or their constituents, as to exchange opinions, and to fix a pecuniary penalty on the party who happens to be wrong, making it payable to the party who happens to be right. Dealing in these opinions may be very accurately called "trading in products on paper." If the word speculation be preferred, it means, in its nakedness, giving the producer of food, clothing, shelter, etc., the least possible for what he produces, and in making the consumer pay the most possible for what he eats, wears, builds, etc. Speculation produces nothing by itself, neither does it consume anything by itself: hence, the most flattering term we can give it, is to call it the middlemanism of trade. Speculation has never, and can never, benefit any country; the more rampant it has been, is, or may be, the worse its effects. Historically, look at the "South sea bubble," the craze for French assignats, the mania for Dutch tulips, etc., etc.

—Commerce is the exchange of facts; speculation is a chase of phantoms. It follows that the more time people devote to phantom-chasing, the less they have for the securing of facts. Suppose every man, woman and child in this country should to-day turn speculator, or dealer in products on paper, how much corn, wheat, cotton, pork, etc., would be produced? To-day's stock would be the maximum supply, and it would dwindle shortly to the zero point. Reserve the position, and assume that all dealers in products on paper should engage in producing or distributing the products of the soil, would there be any fewer mouths to feed, or backs to clothe? Would we have a bale less cotton, or a bushel less wheat?

—The flimsy argument that speculation affords labor a certain market hardly needs refuting. What sort of a market does speculation cause to exist? It is bound, by the nature of things, to injure labor either in its so-called producing or consuming phase. Has any system of trading any excuse for existence, when the best that can be said of it is, that it necessarily does something bad? The moral effect of dealing in products on paper it always debasing; for such dealings lead to idleness, and the road from idleness to vice is an air-line with a single steel-laid track.—"Quick come, quick go," is a truth as old as the stars; and the winnings made by dealing in products on paper are far more apt to be dissipated than the slower returns of legitimate ventures. A more practical way of regarding trading in products on paper is to examine how the business is done. In a majority of cases the man who promises to deliver what he does not possess, deposits in the hands of a third party some valuable thing, that is, some product of labor, as a guarantee of his sincerity. In exchange jargon this is called a "margin," and is but a fraction of the valuable things he has promised to deliver. Against this deposit, the man who promises to receive what he does not want, deposits a similar "margin." What mean these so-called "margins"? Are they not practically the same as the "stakes" wagered on a horse-race or a cock-fight? The conclusion, then, is forced upon us, that trading in products on paper amounts to gambling, more or less refined, and is as far removed from legitimate commerce as the equator from either pole. By promising to buy and receive that which he does not want, a speculator may make higher prices for producers; so much the worse for consumers. By promising to sell and deliver what he has not, he may make lower prices for consumers: so much the worse for producers.

—All production is the result of labor, capital, and some natural agent. Consumption is the same, for nothing can be consumed unless something equal be produced. Denying this, we must deny the indestructibility of matter. The equation of exchange, then, is  $P$  (or production)

— $C$  (or consumption): now, if we add or subtract products on paper from either side of the equation, we get  $P \pm S - C$ , or  $C \pm S - P$ , either of which is absurd; for two things equal to one another can not remain equal to one another when either be increased or diminished, while the other remains unchanged. Reducing one and increasing the other makes the equation of exchange still more absurd. Unless it be claimed that production can exist without consumption, or consumption without production, it follows, mathematically, that speculation must injure labor.

—If a man have 100 bushels of wheat, the product of his labor, and I have ten gold cagles, the product of my labor, and we exchange each for each, the equation of exchange is labor—labor; if, however, I bet the man owing the wheat that within sixty days my money will buy 110 bushels of wheat instead of 100, and he bets to the contrary, the only exchange is one of opinion. At the end of the sixty days either I have some of his wheat and have given nothing for it, or he has some of my money and has no return to make. In either case something has been sliced from somebody's labor. Philosophically speaking, then, trading in products on paper benefits labor in no respect.

—And now let us see how it affects capital. Many speculators borrow money (which is capital in its most active form), but they borrow it on the products of others' labor, not on labor of their own. If the dealer in products on paper had not "middlemanized," the same amount of labor's product would call for the aid of capital to move it from a point of abundance to one of scarcity. If a thousand bushels of wheat passed through a thousand hands, it would never be but a thousand bushels of wheat.

—Speculation has for its *vade mecum* the doctrine of chances. Commerce seeks to actually have those things which people actually want. The hinges of speculation are two ifs; the hinges of commerce are two facts. Speculation is the subjunctive mood of the verb "to trade"; commerce is the indicative.

—A lighted lamp during a summer's night draws countless moths and other insects; the brighter it burns the more there are drawn: so it is with speculation; its lurid light attracts only to destroy, and its most certain victims are those who, in their first flight around it, feel only an exhilarating warmth. The smallest of the hovering unfortunates generally burn first, but, sooner or later, a common cremation furnace is the end of all.

—As speculators neither produce anything, nor consume anything, and, like all others, must live, it follows that they must either live on outsiders, or, like fishes, on one another.

—The world has no record of a speculator who died happy and respected. All one trader in products on paper wins, another must lose; the grand law of commerce, the law of mutual benefit, can not exist between traders in product on paper; the knife of every one is against the throat of every other; to take all, and give nothing, is the object of all.

—If, then, no one can gain without somebody losing in trading in products on paper, it seems fair to conclude that such trading will never add a whit to the wealth of nations.

T. T. BRYCE.

## PROFITS

PROFITS. The theory of profits, as developed by the leading English economists, has been simple but inadequate. Starting from English agriculture as a type of productive industry, they have divided the returns into rent, wages and profits; have described profits as the surplus remaining after rent and wages are paid; and have analyzed this surplus into the three elements of interest, insurance and wages of superintendence. This treatment has caused several mistakes. It has led men to speak of profits as an element in the cost of production in the same way that wages is an element. It has led them to think that what is here called wages of superintendence is properly classed with ordinary wages. It has been based on a circle in the definitions: for after defining rent as what is left after wages and profits are satisfied, they go on to speak of profits as what is left after rent and wages are satisfied. It was adopted to meet the case of a large body of men doing business on other people's land with their own capital, in the production of staple articles comparatively little subject to speculative change in value. If any of these conditions are changed, the theory needs re-statement. And in the United States to-day nearly all these conditions are changed. In those industries which furnish the most serious problems for a theory of profits, we generally find men doing business on their own land, but depending for their circulating capital upon an exceedingly elastic credit system; dealing in goods and services whose values may change or vanish in a hundred different ways, and are made the subject of speculation at every turn.

—In business as now organized the current expenses may be grouped under three heads; 1. raw materials; 2. insurance and repairs; 3. wages. The first of these elements may take the form of a rent charge, as in certain systems of agriculture and mining, or may fall away almost altogether, as in transportation of certain kinds; the second and third are tolerably constant in their form, though of course not in their importance. Any excess in the value of the product over these expenses may be termed gross profits, and nearly coincides with the definition of profits used by the English economists. But gross profits are received by the capitalists as a return for two distinct services. As owners of capital they receive a reward for their saving in the form of interest; as employers of capital they receive a reward for their business abilities in the form of net profits. Gross profits consist of earnings less current expenses; net profits consist of gross profits less interest on capital invested.

—A century ago it was natural to group these two elements together, because these two services were largely rendered by the same men. The employer of capital was then the owner of capital. In many localities and industries the same thing is true to-day; mainly so in the case of handicraft, and partially so in the case of joint stock companies. But it is certain that the tendency of the day is to separate these two functions; for a man of business ability to control far more capital than he really owns, and in some form pay the owners a fixed interest on which he himself takes the chances of loss or of extraordinary gain. There is no room here for a systematic discussion of the causes which affect the rate of interest. We must confine our main

attention to the element of net profits, or entrepreneur's profits, as they are called by Gen. Walker, who has done more than any one else to develop this distinction.

—The minimum of net profits is roughly determined in the same way as the minimum of wages. The business man, like the workman, must make a living according to his own standards of comfort and decency. But the application of this principle to profits is less simple than its application to wages. In the latter case we have a large body of men ready to work for a certain remuneration, but liable to become a burden on society if the pay sinks below that amount. In business the margin of difference between what will induce men to begin and what will compel them to stop, is far greater. No man will begin business unless he expects to make more as a capitalist than he was previously earning as book-keeper or foreman. But once engaged in business he can not go out of it when he fails to make the expected profits, without sacrificing a great part of his invested capital and losing the chance of ever again doing business on the same terms. He will then hold on as long as he can meet his expenses and sees any chance of making a profit in the future. In hard times he will actually produce at a loss to save his capital and connections, in the hope of a better future. Thus, we have not a fixed but a varying minimum, in times of expanding credit and increasing production on a level with the wages of a superintendent, foreman or head clerk in the same industry; in times of diminished credit and production falling away to nothing, or less than nothing.

—Now, the price of goods is approximately determined by the cost of production of those produced at the greatest disadvantage that is, by men earning this minimum of profits. If any individuals carry on the business on more advantageous terms, so that the cost of production is less, every such advantage means, for the time being, just so much increase in their profits. Cheap raw materials, cheap transportation, cheap labor, will, other things being equal, have the effect either to drive less favored competitors out of the business or to secure the margin of advantage to the capitalist in the form of additional profit. It is to causes like these that local variations in the rate of profit are due. These are not as great as might seem likely, because in the presence of any of these special advantages other things are not often equal. In general, cheap raw material means high interest, cheap transportation means high rent, cheap labor means inefficient labor. It is to the personal qualities of the capitalist rather than to his environment, that extraordinary instances of profit are to be ascribed. Skill in organizing labor, quickness in utilizing improvements, and sagacity in foreseeing high prices, are qualities which give the capitalist the power of raising his own profits almost indefinitely above the minimum.

—The effect of skill in organizing labor manifests itself chiefly in capacity for carrying on business on a large scale. A man who can make a given profit by superintending the work of ten men, ought to be able to make nearly twice as much if he can superintend the work of twenty with equal efficiency; or to sell his goods cheaper (in case he must do so to extend his market) without sweeping away all the added profit. Why, then, it may be asked, does not production on a large scale prevail altogether in competing against smaller concerns? It undoubtedly tends to do so. In 1850 the establishments enumerated in the United States census of manufactures employed on an average less than 8 hands, with an average of \$4,300 returned capital.

In 1860 the averages were 9 hands, and \$7,100. In 1870 this advance had received a check; but in 1880 the numbers had risen to 10.7 hands, and about \$11,000 capital. But there are two causes which operate to restrain this tendency. In most industries and with most men the efficiency of superintendence rapidly decreases when carried beyond a certain moderate limit. And, on the other hand, a man's power of borrowing capital can not be extended out of all proportion to his own property. Both borrower and lender feel the growing insecurity as the proportion of borrowed capital increases. The former is unwilling to take the risk of bankruptcy for the chance of inordinate gain. The latter indemnifies himself for the extra risk by a high interest rate, which soon sweeps away the margin of profit.

—The matter of utilizing improvements in production requires a word of explanation. The ultimate tendency of any such improvement is to cheapen both the cost of production and the price of the goods. But until the use of this improvement has become widely extended, the price will not fall very rapidly; and those capitalists who first use the new method gain a great temporary advantage during the time of adjustment. In connection with this opportunity of gain, there is an opportunity of loss. The effect of such improvements will render valueless a certain amount of capital already invested. The existence of a new and better machine makes it impossible to run the old machine except at a loss. In many branches of industry these changes are so slow that the expense incurred on their account may fairly be classed under the head of repairs. But there are other branches where the liability to sudden changes of this kind forms a main item of risk and expense; and the impossibility of estimating this risk forms a main difficulty in attempting to draw deductions from the statistics of industry.

—The third element increasing profits is the power of foreseeing high prices. It differs from the other two in the fact that the additional profit is made, not by lessening the cost of production, but by knowing when to produce a larger quantity. Apart from this adaptation of the quantity to the market, these changes of price affect, not the margin of extra profit, but the minimum rate; not advancing or depressing the special gains of a few individuals alone, but the general profits of the trade. Unless the business is a virtual monopoly, they thus of necessity cause a reaction. Men of no special business talent are attracted by the high temporary rate for every one; they rush into the business, and cause an over-production, from which they are themselves the first to suffer. A sudden increase in demand, or "boom," in a particular line of business, furnishes one example of these effects; a distinct advance in price from the imposition of a tariff, furnishes another. It is the men who are already on the ground that gain the great benefit from the change; those who follow after them come just in time to suffer from the over-production.

—It is these high margins of extra profit of a few individuals, who manage to sell at prices far in excess of what the goods have cost them, that constitute the important fact for us to recognize and explain. It is not enough to treat them as a mere appendage to interest, or to set them aside as wages of superintendence. Nor can we, in general, properly speak of them as insurance against risk. The term is used because in those industries where there is a chance of great gain, there is apt to be a chance of great loss. As long as a capitalist offsets his own losses at one time or place by his

own gains at another, the use of the term is legitimate. But when we attempt to offset as insurance one man's gain against another man's loss in the same industry, it is as unwarranted as it would be to apply the term insurance to the gains of a practiced stock operator. The justification of high profits is found in the fact that society can far better afford to pay high rewards for this kind of work than to let any of it go undone. In our present complicated system of industry, production and consumption are so widely separated in time and place that it is easy to make fatal mistakes in adjusting one to the other. We want to do the right thing with the least waste of labor; and as long as a business man helps to secure that end, society can afford to pay him almost any price for so doing. As long as he reaps the advantage of high prices under free competition without securing artificial monopoly, the interests of the capitalist and of society coincide.

—We may sum up our conclusions as follows: 1. The minimum of net profits is, in good times, equal to wages of superintendence; in hard times, it will fall away entirely; 2. Any exceptional advantage that an individual has over his competitors raises his profits for the time being just so much above the minimum. This excess is not properly regarded as wages of superintendence, nor, except in a limited degree, as insurance against risk; but as a premium paid by society in order that its working forces may be applied in the way best adapted to meet the economic wants of the community.

—Had the figures obtainable been more trustworthy, this explanation might well have been cut short to make more room for statistics concerning the rate of profit in different times, places and industries. But almost every cause combines to prevent our obtaining such statistics. The business men who know the most striking facts have an interest in keeping them secret. The reports of experts are few and fragmentary. The European states make no attempt to give such figures in their census. The United States makes the attempt, but with so little power of enforcing accuracy that the total amount of invested capital may not improbably vary 300 per cent. from the amount returned. ("Compendium of the Census of 1870," p. 798.) The returns of capital are thus all but useless for our purposes. Those of product, wages and materials are much better, and can be studied with advantage. The figures of gross profit obtained from these data will necessarily include more than our definition authorizes, because we have no means of making any deduction for repairs. They mean value of product less materials and wages.

—1. *Variations in Time.* Much has been said of the tendency of profits to fall as a nation advances. The reasons given are such as affect interest rather than net profits. Even for interest the figures do not show this tendency as markedly as we might expect. Perhaps the most careful investigation of the facts, though based only on English data, is given by Farr. ("On the Valuation of Railways, Telegraphs, Banks, etc.," *Journal of the Statist. Soc.*, xxxix, 465.) There is no *a priori* reason why net profits should show this tendency. They are kept above the minimum by complex organization, new improvements, new wants. These are to-day increasing faster than ever before. Compare the figures of four successive censuses.

YEARS.	Number of Establishments.	Product.	Gross Profit.	Av. Gross Profit of each Establishment.
1850 .....	123,025	\$1,019,107,000	\$ 227,228,000	\$1,800
1860 .....	140,433	1,885,862,000	475,578,000	3,400
1870 .....	252,148	4,232,325,000	968,314,000	3,800
1880 .....	263,832	5,369,379,000	1,024,601,000	4,000

The values for 1870 should be reduced one-fifth, on account of the gold premium. Compare, also, figures cited above as to hands employed and capital invested.

—2. *Variations in Place.* Here again the variation of interest has been studied instead of that of net profit, and the attempt has been made to value the disinclination of capital to emigrate. The variations in profit do not seem as great as we should expect. In these comparisons we may make a guarded use of the returns of invested capital, since the causes which give rise to an underestimate in one locality may be assumed to operate in the same way in another.

STATES.	Number of Establishments.	Product.	Gross Profit.	Av. Gross Profit of each Establishment.	Profit on Invested Capital.
California .....	5,885	\$ 116,210,000	\$ 23,545,000	\$3,800	Per cent. 37
Georgia .....	3,593	36,441,000	7,081,000	2,000	34
Massachusetts .....	14,352	631,135,000	115,847,000	8,100	38
Michigan .....	8,873	150,715,000	32,501,000	3,700	35
Missouri .....	8,592	165,985,000	30,278,000	3,500	42
New York .....	42,789	1,080,697,000	302,450,000	4,700	40
Pennsylvania .....	31,232	744,818,000	145,742,000	4,700	31

The average rate per cent. on reported capital for the whole country is 36 <sup>2</sup>/<sub>3</sub>. While these figures warrant us in no positive conclusions except as to concentration of industry, we are put on our guard against the danger of assuming too great difference in rates as due to locality.

—3. *Variations in Different Industries.* The figures below are presented as a summary of the facts in the leading manufacturing industries in the United States, rather than as a basis for generalizations. Agriculture could not be included, on account of inadequate wage returns. Mining, transportation and mercantile business were, on various accounts, unavailable for direct comparison.

INDUSTRIES.	Number of Establishments.	Product.	Gross Profit.	Av. Gross Profit of each Establishment.
Agricultural implements .....	1,943	\$ 68,640,000	\$31,749,000	\$11,200
Boots and shoes (factory) .....	1,969	165,050,000	30,607,000	10,500
Boots and shoes (wholesale) .....	17,972	196,920,000	30,838,000	1,700
Brick and tile .....	5,631	32,834,000	9,613,000	1,700
Carriages .....	3,841	64,952,000	15,398,000	4,000
Clothing .....	6,166	209,548,000	32,245,000	5,200
Cotton goods .....	1,005	210,850,000	51,570,000	51,300
Floor .....	24,338	505,180,000	46,219,000	1,900
Foundry .....	4,368	214,378,000	45,051,000	9,100
Furniture .....	4,843	69,038,000	16,237,000	3,400
Iron and steel .....	1,006	296,558,000	49,510,000	49,500
Leather .....	8,105	113,348,000	18,798,000	6,100
Malt liquors .....	2,191	101,098,000	22,023,000	14,600
Lumber .....	25,708	233,280,000	55,268,000	2,100
Mixed textiles .....	470	66,222,000	15,677,000	33,400
Paper .....	692	55,110,000	12,638,000	18,300
Printing .....	3,457	90,789,000	27,797,000	8,000
Slaughtering .....	872	308,562,000	25,515,000	29,000
Sugar and molasses .....	49	155,485,000	7,912,000	16,100
Woolen goods .....	1,990	160,807,000	33,225,000	17,000

It is worthy of mention, that the two industries showing decidedly the largest gross profit per establishment—cotton and iron—also show decidedly the lowest percentage of gross profit to capital invested, namely, 24 and 22. This fact may easily be a mere accident of the returns. The other percentage results have no special interest to justify their insertion.

—This article has been based on the facts of manufacturing industry, as furnishing, on the whole, the best type for treatment. It has not seemed necessary to show how all the individual points would have to be modified in applying the same explanation to business of other kinds.

ARTHUR T. HADLEY.

## PROHIBITION

PROHIBITION (IN U. S. HISTORY) has been an issue in purely state politics, but only in some of the states since about 1850. There have been occasional nominations for the presidency by prohibitionists; but they have met no attention, and it is difficult to see their exact object, for prohibition is as yet altogether outside of the domain of the national government.

—In state politics the object of the prohibitionists is well defined: they aim to prohibit by law the manufacture and sale of intoxicating liquors, except for use in medicine and in the arts. The arguments which they offer seem to be as follows, as far as a summary can give them fairly: 1. The most moderate estimate of the annual sales of liquors in the United States is that of Edward Young, chief of the bureau of statistics in 1871: he puts it at \$600,000,000, more than the combined manufactures of cotton goods, woolen goods, boots and shoes, molasses and sugars, and nearly equal to the annual wages of all the manufactories. Whether this item be one of \$600,000,000 a year or more, it is waste. 2. Manufacturers generally estimate the loss of productive powers, due to drunkenness and the inefficiency arising from drunkenness, at 8 to 12 per cent. of total wages. As the census of 1880 puts the total annual wages of the United States at \$947,953,795, this per cent. of waste must be a large amount. 3. Pauperism is, to a large but doubtful extent, the product of drunkenness, and the expense of the maintenance of paupers by the state is, to that extent, chargeable to the sale of liquors, since open sale is the common inducement to drunkenness. 4. The connection between crime and drunkenness must be largely a matter of estimate; but the authorities competent to estimate are practically unanimous in stating that over 60 per cent. of the crime of the country is due to drunkenness. From Sir Matthew Hale, in 1670, who put the proportion at 80 percent., down to the various state boards of charities, prison associations, and prison inspectors of our own day, no one who has studied the subject carefully, and has become familiar with it, puts the proportion of drunkenness to crime at less than 60 per cent.; and most of them make it larger. Even if their figures are only estimates, they can not be successfully impeached by the naked contradictions of men who profess to know nothing of the subject. If they remain unimpeached, a large part of the state's expenditure for police, criminal courts and prisons, must go to the account of the sale of liquor. 5. The sale of liquor tempts men to habits which ruin their health and unfit them for the physical defense of the state, when that is necessary. 6. Drunkenness bears heavily upon the defenseless classes, upon women and children, upon the wives and families of drunkards, of drunken paupers, of drunken criminals, and of the victims of drunken crime. These have a right to look to the state for active protection, instead of being continually oppressed by the state's permission for the further sale of liquors. A single case of rape or murder, due to the state's permission for the sale of liquor, may entail indirect distress for which the state can make no money satisfaction.

—On such a showing, that the open sale of intoxicating liquors is hostile to the productive energy of the state, to its moral power, to its physical force, and to its families, the prohibitionist claims a hearing. Of his five classes of arguments, the third

and fourth are disputed: it is claimed that drunkenness, the accompaniment of pauperism and crime, is mistaken for their cause; and, as to all of them, it is asserted that prohibition will not prohibit them, and that a high license system will be more efficient than prohibition in controlling an evil which can never be wholly removed. The prohibitionist answers that prohibition is not expected to entirely stop the sale of liquors; any more than laws against stealing will entirely stop stealing; but that, in either case, prohibition will be more efficient than any license system. The issue thus made seems to be one which can only be decided by experience.

—In *Massachusetts*, of which Maine was a part until 1820, the license system was in force until 1835. Power to grant or refuse licenses was then given to the county commissioners, and they were made elective, so that "local option" was practically put in force. In three years, this had become prohibition in nearly all the counties, and the "fifteen gallon law" was passed in 1838. It prohibited the sale of less than fifteen gallons of liquors at one time; but it was repealed the next year. In 1852 a prohibitory law was passed, and remained in force, with many amendments, until 1875, except that a license law took its place for a year in 1868. In 1875 a license law was passed, and has since remained in force, in spite of annual efforts to renew prohibition.

—In *Maine* the "act to prohibit drinking houses and tipling shops," the so-called "Maine law" was passed in 1851, and has since been the law of the state, except for the two years, 1856-7, when a very stringent license law took its place. *Vermont* passed the Maine law in 1852, and has since retained and enforced it. *New Hampshire* passed it in 1855, and has since retained it without enforcing it thoroughly. *Rhode Island* passed it in 1852, substituted license and local option in 1863-5, passed the Maine law again in 1874, and returned to license the next year. *Connecticut* passed the Maine law in 1854, never enforced it, and repealed it in 1872. *New York* passed the Maine law in 1855, and repealed it in 1857. The *Ohio* constitution forbids the passage of any license law by the legislature: that is, the sale of liquor must be free or prohibited. In 1832 the republicans adopted the policy of taxing the sale by the "Pond Law"; but the supreme court of the state pronounced it unconstitutional. The dominant party then proposed a prohibitory amendment to the state constitution, which has not yet (1883) been ratified. As a substitute, the "Scott law," for taxing sales of liquor, was passed and pronounced constitutional in 1882-3. (See OHIO.) In *Michigan* the constitution of 1850 forbade license laws. The Maine law was passed in 1855, and repealed in 1875; and in 1876 the no-license clause of the constitution was repealed. *Iowa* passed the Maine law in 1855; and in 1882 a prohibitory amendment to the state constitution, having been passed by two legislatures, was ratified by a remarkably large popular majority. The state courts, however, declared it void on account of informalities in its passage. *Kansas* adopted a prohibitory amendment in 1880, and in 1881 the legislature passed a stringent act to enforce it. In 1882, Gov. St. John, the leader of the prohibitionists, was renominated by the republicans; but about 16,000 of his party voted against him, and he was the only republican candidate defeated. In 1881 a prohibitory law, proposed for popular ratification by the legislature of *North Carolina*, was defeated by a vote of 166,325 to 48,370.

—Nothing is certain in prospective American politics, and very few things are even probable. But there are some indications that this question of prohibition is to take a

larger place in political conflict than heretofore. The only probable alternative, a high and almost prohibitory license, is now under trial in Nebraska; and much will depend on the result there and in the other states which may take the same course. In any event, the opposition to prohibition will be as sincere and hearty as its support, and will arise mainly from a dislike to that infringement of personal liberty to buy and sell which is necessarily implied in prohibition.

—The views of prohibitionists may be found in Hargreaves' *Our Wasted Resources*; Pitman's *Alcohol and the State*; Lee's *Text Book of Temperance*; *Prohibitionist's Text Book*.

ALEXANDER JOHNSTON.

## PROMOTION

PROMOTION, in the political sense, is the advancing of a person in official service to a higher grade, and generally to a higher salary. In the departments there is a nomination for promotion, as for an original appointment, and each promotion is in law an appointment. The authority for promotion is, in fact, a part of the appointing power, and should be exercised with a sense of the same moral and legal obligations which attend any other exercise of that power. But, on the part of those who exercise it and of those who are affected by it, it is not infrequently regarded as a mere matter of official favor. Yet every conscientious public official possessing it must, on reflection, feel it to be a high trust, in the performance of which no other considerations should have influence except the interests of the public and the merits of the applicant. Every omission to promote the most worthy, hardly less than every promotion of the unworthy, is a breach of that trust; the first being a special injustice to the meritorious officer, and the act and the omission alike being a wrong to the whole people.

—The authority to make promotions is also an important part of the means of discipline and subordination in the great offices. Indeed, the incidental effects of the enforcement of just rules of promotion upon discipline, and all the conditions of order and efficiency on the part of numerous officials serving together in the same office, are so great that these effects, as well as the character and capacity of the individual seeking advancement, should be taken into account in the regulation and ordering of all promotions. If within certain limits, promotions should be based solely upon personal worth and efficiency, yet a wise system for promotions, especially for large offices, must look beyond the individual promoted, to the effect of the principle governing them upon the subordinates as a body. It is of great advantage to the public service, that those who have become most expert and accurate through experience in doing the public business, though not the most talented of officials, should be encouraged to remain. In order to give that encouragement, it may often be a gain to the public service to promote a man of long experience even in preference to a man of more natural capacity who is new to the service. The belief that long tried fidelity, united with fair capacity, is considered in making promotions may even enable the government to secure competent service at lower salaries than would be accepted were promotions hopeless or but accidental, except on the part of the brightest minds in its ranks. And experience has amply shown, in the older countries, that the same persuasion is sufficient to induce a better class of young men and women to enter, than could be secured without such reasonable assurance of the higher honors and salaries being awarded with some reference to seniority or long experience. It is easy, on the other hand, to go to an extreme in favoring mere seniority. Superannuated officials and dullards may be kept too long. The bright and aspiring, having talents to lead and direct, may be thus prevented from entering, or they may withdraw in disgust, by reason of such obstacles in the way of their promotion. It requires great wisdom to avoid both extremes.

—It needs no argument or experience to make it plain that the public service must seem far more honest and respectable, and hence far more attractive, to all worthy young men or women, when its higher grades and salaries are presented as so many rewards to be secured either by fidelity or competency alone, or by good character united with mental superiority, than when they are known to be the good luck of favorites, the recompense of subserviency, or the bribes of partisan influence.

—But exactly in what degree either of those meritorious claims should prevail; how seniority should be weighed against ability, and experience against quickness of mind—when good character is in both scales—is not easy to decide. It should be made a fundamental rule, however, from which there should be very few exceptions, that the higher places and salaries in every bureau, office and department, are to be bestowed as the honors and rewards for which every subordinate, with a confidence proportioned to his just claims, may justly aspire, and which in conformity to a sound principle, his superior merits may surely gain. Thus hope is kept alive; an honorable ambition is aroused; and constant fidelity and studious preparations for higher functions are stimulated and rewarded.

—Every worthy subordinate justly feels insulted, and wronged, every useful quality in the public service is discouraged, and the public interests are grossly disregarded, whenever a favorite of a great official or politician—perhaps ignorant of the duties he is to perform—is arbitrarily appointed or promoted, over those who have been continually faithful and efficient, to the head of an office. Nothing on the part of those relying on their own merits in the public service can be more discouraging or debasing than the conviction that years of faithful performance of duty and of studious preparation for higher functions are unavailing as against those who have the favor of great officials or the influence of party chieftains to advance them. Toiling on hopelessly, and seeing fortunate dunces and favorite flunkies of party lords and great officers take the higher places and salaries, the faithful veteran in the public service feels a natural resentment, if not a spirit of retaliation, against a government which allows such injustice, and cares not to honor those who worthily serve it. Why should he make any special effort for economy or efficiency in the public service, when he sees the government neglect those most competent for securing such results, making them the underlings of novices and favourites? Certainly, the government which allows such injustice and folly does not deserve, and is not likely to secure, the most worthy which its salaries, under wise and just regulations, might be made to draw into its service. To deny or defeat in practice the claim of the most meritorious to promotion, is as disastrous to the people as it is offensive to the common sense of right and duty on the part of all fair-minded men.

—In framing a system of promotion, few points have been found more perplexing than the claims of seniority. In some positions, plodding fidelity and accuracy are the highest merit; in others, prompt conceptions, tact for business, and genius for leadership. In the practical exercise of the power of promotion, those diverse claims have not been less embarrassing than they are in theory.

—It is one of the difficult problems of administration to so regulate promotions that the hope of them shall be a salutary stimulant of all subordinates, while the

government is left free to select those for the higher places who are the most competent to lead and to command. Nor is this the whole problem; for, in some cases, as, for example, where capacity is lacking in the lower grades, or a vicious method has become chronic in a bureau, the government must be allowed to seek the suitable person outside the bureau or department, or even outside public service altogether. But this necessity, always humiliating to subordinates, would be greatly diminished, if not well-nigh excluded, by establishing adequate tests of merit (of which the best are competitive examinations) for original entry to the service.

—These observations have no reference to the selection of heads of departments, who, being in a sense political officers, and the constitutional advisers of the president should, for that reason, be selected with due reference to their political opinions. They are members of the political household of the president, whose advice he takes upon important questions of policy.

—In aristocratic and despotic countries, it was almost a matter of course that promotions would be very generally made by reason of birth, wealth and influence, rather than by reason of superior capacity and character. In fact, a monarchy or aristocracy may be in part described as a form of government under which the higher offices and salaries as well as pensions, titles and decorations, are by intention bestowed on the basis of birth, favor and influence; and a republic as a form of government in the spirit of which all appointments and promotions alike should be made by reason of merit alone. How great in later years has been the departure from intrinsic theory in the practice of each, has been noticed under the head of REMOVALS.

—It has been found possible under republics for partisan influence and the politician class to secure a monopoly and enforce a proscription, in the matter of promotions as well as removals, almost as complete as were ever developed in feudal times under an aristocracy; while, on the other hand, some of the leading monarchies now base their promotions almost wholly upon merit alone.

—In the military and naval services of the leading states of Europe, if in practice favours are still accorded to the aristocratic class, yet, in general, merit is quite as much tested by rigid examinations, and is quite as surely honored and encouraged by promotions, as in our army and navy; for, with us, mere political influence is more potential than in those states. The influence of promotions based on merit, and the high capacity thus secured, have greatly contributed to the efficiency of European armies and navies in later years.

—It is nearly a century since (in an act of 1784 relating to British India) the government of Great Britain found it needful to make laws in aid of promoting the most worthy in her civil service. To defeat favoritism and corrupt bargains, that statute gave great consideration to seniority, and required records and public reports concerning the grounds of promotions. In 1820 Lord Liverpool, at the head of the treasury, with a view of arresting the pernicious patronage of members of parliament, laid down and enforced the principle that "all superior officers in the customs service should be supplied by the promotions from the inferior ranks." In 1830 the rule was

formally reaffirmed by Lord Grey, and it has been enforced in Great Britain ever since. Promotions in her customs service, as in nearly every part of her administration, are now made on the basis of experience and merit alone. Mere patronage, favor or partisan influence in making promotions, are thus almost excluded. To a considerable extent, merit, as the ground of promotions, is tested by competitive comparisons. And everywhere careful records are kept, which show the fidelity and efficiency of candidates. Even in the act for creating the metropolitan police force, sir Robert Peel caused a provision to be inserted that "no one should be an inspector or superintendent who had not been trained by actual service in each subordinate rank" (See "Eaton on Civil Service in Great Britain," pp. 140, 156, 301, 302, 382, 383, 446.) These conditions of promotion all British statesmen, and the British people as well, now recognize as not only just and invaluable in their practical effects upon the public servants, but as having largely contributed to the economy, purity and vigor of every branch of the administration. The placing of mere politicians or manipulators, or, indeed, of any person not experienced for its administration, at the head of a revenue office or a large postoffice, in Great Britain, would be as impossible, without serious damage to a party, as it is disastrous in practice and absurd in point of theory and principle. We tolerate such pernicious trifling with the public interests only because we have been blinded by long familiarity with partisan theories and usages.

—Not even a trained subordinate is promoted to the head of the larger British custom houses, unless he has had charge of *every branch* of the customs service at a port of entry. All recommendations for promotion by outsiders are interdicted; and when made, they are treated, until the contrary is proved, as having originated with the person recommended. It is the enforcement of these principles for promotion, which, untied with competitive examinations of merit for original appointment, have so effectually excluded party politics and official favoritism from British administration.

—In the British service, much attention has been given to the relative advantages of awarding promotions largely on the basis of competitive examinations, or solely on that of carefully kept records of work done. There are advantages in both forms of tests. If competition for promotion be made exclusive and supreme, there is a danger that discipline may be impaired and mere memory and attainments may be too much regarded. The best administrative capacity may not be secured. Sufficient authority and discretion may not be allowed to the superior officer. The result has been that, in one office, the rule has been established that one-half the promotions are to be made upon each basis: that of competitive examinations alone, and that of records of efficiency and good conduct alone. That competitive examinations for promotion under suitable restrictions are of great advantages to some parts of the public service, has been shown in that service, as it has been also in the limited trials of them in the public service of the United States; but it is by no means clear that they should be the sole tests for promotion.

—Soon after the adoption of the civil service rules under President Grant, treasury regulations were promulgated (in 1874), under which, (articles 1036 to 1038), promotions in the customs service were, in general terms, required to be made on the basis of merit, length of service, however, being taken into account. No examinations

were provided for in the regulations, though the president's civil service rules required them for promotions.

—These regulations, feebly as they were generally enforced, unquestionably in some degree, within their limited range, secured justice and higher qualifications in making promotions. But the refusal of congress to make any appropriation, in 1875, for the enforcement of the civil service rules, caused the rules and regulations alike to be disregarded.

—Promotions, with some marked exceptions (especially in the New York naval office, custom house and postoffice, and in the interior department under Secretary Schurz), like original appointments, have since very generally been affected by favoritism, patronage and influence. (See CIVIL SERVICE REFORM, REMOVALS.)

—The importance of making promotions in the civil service in the public interest has yet received but the slightest attention from congress or the writers of text books. An act of 1879 provides that promotions from the lower to the higher grade of letter carriers shall be made on the basis of "the efficiency and faithfulness of lthe candidate during the preceding year." Beyond this, congress has made no provision (except in the civil service act passes Jan. 16, 1883) for promoting the civil servants of the people by reason of their merits. Congressmen boldly push their favorites for the higher places and salaries; and executive officers stand against them and for the public interests and common justice at the peril of calling down upon themselves the revenge of all patronage-mongering legislators.

—The regulations of the postoffice department provide that promotions in the railway mail service shall be based on "good conduct, faithful service and efficiency," and this requirement has doubtless much improved that branch of the postal service. The civil service rules promulgated by the president in 1883, declare that there shall be competitive examinations for promotion, but reserve the preparation of special rules on the subject for the future. These meagre provisions, confined to such narrow limits—in aid of a better system for promotion—but make the more conspicuous the facts that the legislators and administrators of other enlightened states have been more disinterested and sagacious than our own in dealing with the subject, and their experience, rich and abundant, is now open and plain before us. It will certainly require some self-denial on the part of our congressman and politicians, as it did many years ago on the part of British legislators and nobleman, to enforce a just and wise system of promotions, which does not allow members, by pleading, promising and bullying in the departments, to advance their favorites and henchmen over the heads of the most meritorious of those who serve the people. "Senators and representatives," said the late President Garfield in a speech in 1870, "throng the offices and bureaus until the public business is obstructed and the patience of officers is worn out; \* \* they at last give way and appoint, not because the applicant is fit, but because we ask it."

—For the army and navy of the United States a system of promotions has been established for more extensively based upon character, capacity and seniority than any

enforced in the civil administration. Cadets, after passing successfully the rigid tests of the military academy at West Point, are promoted (by appointment) to be second lieutenants in the regular army. Any vacancies left, after exhausting such graduates, are filled by promoting those shown to be sufficiently meritorious from among the non-commissioned officers of the army; and if there are still vacancies unfilled, appointments to them may be made from civil life. But neither the promotion nor appointment last named can be made until after detailed reports as to merits and an examination of the qualifications of the candidates by a board of five officers. The age of the candidate must be between twenty and thirty years. No officer of the corps of engineers, below the grade of field officer, can be promoted until he shall have been examined and approved by a board of three engineers, senior to him in rank; and very nearly the same rule of promotion in prevails in the ordnance department.

—Promotions to the rank of captain are made regimentally on the basis of seniority. Promotions in established regiments and corps are also made according to seniority. But seniority does not prevail in the selection of a brigadier general or of any officer above that grade. And when, anywhere in the army, an officer in the line of promotion is retired, the next officer in rank must be promoted to his place, according to the rules of the service. Promotions from the army to be an ordnance officer are based on examinations.

—General officers appoint their own *aides de camp*; and here, therefore, is a kind of promotion hardly otherwise regulated than by the discretion of the general making it. Vacancies in the places of commissioned officers are filled by promotion through a nomination by the president in his discretion, subject to confirmation by the senate. Promotions in the navy stand upon principles closely analogous to those enforced in the army. Appointments to active service are made from the naval cadets graduated from the academy at Annapolis. No naval officer can be promoted to a higher grade, in the active list, until he has been examined by a board of naval surgeons and found physically qualified; and no line officer below the grade of commodore, and no officer not of the line, can be promoted on the active list until his mental, moral and professional fitness to perform all his duties at sea have been established to the satisfaction of a board of examining officers of not less than three senior officers appointed by the president. In time of peace the condition of a satisfactory examination applies even to a commodore seeking promotion to the grade of admiral on the active list. The examining board is authorized to take testimony under oath, and to examine the files and records of the navy department. These, with other provisions for which we have not space, seem to require in some particulars a more rigid test of merit for promotion in the navy than is required in the army.

—Our limits will not allow us to set forth the rigid tests of promotion enforced in the naval and military service of the European states.

—There can be no doubt that the higher public respect and social position enjoyed by officers of the army and navy, and warranted by their superior qualifications, and infrequency of their misconduct, as compared with the civil servants of the government, are largely a consequence of such wise and just conditions of appointment and promotion. Every advance in the official scale thus made proclaims,

not a triumph of political influence, but a manly victory won in one of those examinations, in which the official record and the personal merits of the candidate are investigated and adjudged. That the effects of the vicious methods and the selfish and partisan influences which have so largely prevailed in making promotions in the civil service, have made themselves felt to a considerable degree in the execution of the army and navy systems for promotions—causing pernicious exceptions and evasions in their enforcement—can hardly be doubted. To arrest those influences, to remove political forces and favoritism more completely, as the means of securing promotions and privileges in the army and navy, are duties which congress can not too promptly perform. Every meritorious officer would welcome such a reform, and all others would hope for less advantage from neglecting their duties and studies in order to secure political influence and the interposition of congressmen and politicians in their favor.

DORMAN B. EATON.

## PROPERTY

PROPERTY. I. *Right of Property.* Political economy inquires into the principles which preside over the formation and distribution of wealth. It takes for granted the existence of property, which is its starting point; it considers it as one of those primary truths which manifest themselves at the origin of society, which are everywhere found impressed with the seal of universal consent, and are accepted as necessities of the civil order and of human nature, without even dreaming of discussing them.

—Read the fathers of economic science: they are almost uniformly silent on this great question. The chief and oracle of the physiocrats, Quesnay, who understood and enlarged upon the social importance of property, does not take the trouble to define it, except in a treatise on natural law. Turgot, the statesman, philosopher and economist, Turgot, who in his work on the distribution of wealth, has thrown brilliant light on the origin, has nothing to say on the principle, the right or the form of property. The master of masters, the author of the "Wealth of Nations," Adam Smith, scarcely makes mention of it, without doubt because he saw in it no subject for discussion. J. B. Say decides debate on this subject to be futile, and undeserving the consideration of the science. "The speculative philosopher," he says, in the fourteenth chapter of his book, "may busy himself in finding out the real foundations of the right of property; the juriconsult may lay down the laws which govern the transmission of things possessed; political science may show what are the surest guarantees of this right; but so far as political economy is concerned, it considers property simply as the strongest incentive to the production of wealth, and pays little attention to what establishes and guarantees it." In other place (vol. ii., chap. iv.) he says: "It is not necessary, in order to study the nature and progress of social wealth, to know the origin of property or its legitimacy. Whether the actual possessor of landed property, or the person by whom it was transmitted to him, obtained it by occupation, by violence, or by fraud, the result, as regards the revenue accruing from that property, is the same."

—At the time when J. B. Say wrote, the problem which absorbed and agitated men's minds was the production of wealth. The European world felt itself poor; it began to understand the productiveness of labor, and craved wealth. Credit extended its operation; commerce spread in spite of war; and manufacturing industry, developing rapidly, presaged already the marvels which have since marked its course. Production in its different forms was the great business of the time. This rising tide carried all with it, population, labor, resources. All had a clear road to travel with their goal before their eyes, nor did they stop to revert to their own situation or that of others. Property seemed then a sort of common stock from which all, with a little effort, might draw in abundance, and which would reproduce itself unceasingly. No one dreamed of calling the right to it in question. The silence of economists is but a translation of the rational indifference of public opinion on the subject.

—At a later period, population having increased in all the states of Europe, the value of land and the rate of wages having generally risen, personal property, thanks to the progress of commerce and industry, equaling or nearly equaling immovable property,

and competition, which affected every kind of work and all investments, reducing profits as well as the outlets for human activity, the problem of the distribution of wealth came to the front. The number of poor persons seemed to increase with the number of the rich. It was even believed, for a time, that industrial civilization tended to increase the inequality which naturally exists among men. In this transition period, which still continues, sects were formed to preach to those discontented with the social order, we know not what sort of a future, the first step to which was the abolition or transformation of property.

—Favored political revolutions, those fatal doctrines which at first held subterranean away in some sort until they had hardened the hearts and corrupted the minds of the people, broke loose in the streets of France; the arguments used against society served to load the muskets and point the bayonets of revolt. At first it was necessary to defend social order by armed forces; and now, whether we be economists, philosophers or jurisconsults, we all understand that our duty is to point out in such a way as shall convince the most incredulous, that society, having force on its side, has also reason and right in its favor.

—It was in the light of events that the programme of political economy was extended. A place has now been assigned it in the discussion of the origin and right to property. It must base its intervention here on observation of facts, just as philosophy does, in expounding and commenting on principles. Socialism, by attacking the foundation of social order, compels all the sciences to contribute, each its share, to its defense.

—II. *Opinions of Philosophers and Jurisconsults on Property.* Until our time the question of property had been abandoned to philosophers and jurisconsults. The usefulness of their labors is incontestable; they prepared the ground and paved the way for political economy. If they did not always completely observe and demonstrate the nature of things, they had at least had glimpses of it. It was Cicero who showed that the earth became the patrimony of all by labor, and proved that the person who attacked this right of appropriation violated the laws of human society. After him Seneca, although he exaggerated, in accordance with the ideas of his time, the rights of sovereignty, yet recognized that property was an individual right. *Ad reges, protestas omnium pertinet, ad singulos proprietatis.*

—Nevertheless the person would wander from his road who sought to find in the writings of philosophers or jurisconsults, either a complete theory of property, or even an exact definition of it. Grotius, who is in the front rank of doctors of natural and international law, has given in a few lines a history of property from which communism might draw its arguments. According to this author, after the creation God conferred on the human race a general right to everything. "This was done," he says, "that each might take for his use whatever he wished, and consume what it was possible for him to consume. \* \* Matters remained thus until, from the increase in the number of men as well as of animals, the land, which was formerly divided by nations, began to be divided among families, and since wells are a supreme necessity in dry countries, and are not equal to supplying a large number, each appropriated what he was able to seize."

—Charles Comte remarks that the publicists of this school, Wolf, Pufendorf and Burlamaqui, confined themselves to paraphrasing the ideas of Grotius. All supposed that, in the origin of societies, men, to satisfy their wants, had only to take what they found ready at hand, that the earth produced without labor, and that appropriated was nothing but occupation or conquest.

—Montesquieu did not understand, any better, the part played by labor in the formation of individual property. "Just as men," he says (book xxvi., of the "Spirit of the Laws,") "abandoned their natural independence to live under political laws they renounced the *natural commodity of goods* to live under civil laws. The first laws gave them liberty, the next property." Montesquieu, the only publicist since Aristotle who undertook to base the laws of social order on observation, was nevertheless unable to prove among any people, however primitive, the existence of that supposed community of goods which, according to him, has its origin in nature. The most savage tribes, in ancient as in modern times, had a very definite idea of mine and thine. Property and the family have everywhere served as the foundations of order, and law has only confirmed, by giving expression to them, relations already established.

—Blackstone does not go farther than Montesquieu, whose ideas agree with those of J. J. Rousseau, on the state of nature. Bentham himself, the writer who, more than any other, departed from the accepted ideas of his times, declares that property does not exist naturally, and that it is a creation of the law.

—There is some consolation for proprietors in Bentham's assurance, that property will perish only with the law. As human society can not exist without law, and since the end of the law would be the end of society, property may safely count on a long lease of life. Besides, Bentham, following the example of Montesquieu, confounded the idea of property with that of the guarantees which property receives from civil and political laws, guaranteed fifty represented by taxation. The best refutation of Bentham's theory is to be found in some passages from Charles Comte, which it may be well to reproduce here. "If nations can only exist by means of their property, it is impossible to admit that there is no natural property unless it be admitted that it is unnatural for men to live and to perpetuate themselves." "It is true that there is no image, no painting, no visible feature which can represent property in general; but it can not from this be concluded that property is not material, but metaphysical, and that it belongs entirely to the conception of the mind. There is no visible feature by which a man in general can be represented, because in nature there exist only individuals, land what is true of men is true also of things." "Individuals, families and peoples subsist by means of their property; they could not live on metaphysical relations or conceptions of the mind. There is in property something more real, more substantial, than a basis of expectation. A false, or at least a very incomplete idea is given of it when it is defined as if it were a lottery ticket, which is also a basis of expectation." "According to Montesquieu and Bentham, it is civil laws which give rise to property, and it is clear that both mean by civil laws the decrees of public power which determine the possessions which each one may enjoy and dispose of. It would, perhaps, be more correct to say that it is property which gave birth to civil laws; for it is hard to see what need a tribe of savages, among whom be property of

any kind existed, could have of laws or of a government. The guarantee of property is undoubtedly one of the most essential elements of which it is composed; it increases the value of property, and assures its duration. A great mistake would be made, however, were it supposed that this guarantee was all there is of property; the civil law furnishes the guarantee of property, but it is human industry which gives birth to property. Public authority is needed only to protect it and to assure to all the power of enjoying and disposing of it." "Were it true that property exists or is created by decrees and by the protection of public authority, it would follow that the men who in any country were invested with the power of legislation, would also be invested with the power of creating property by their decrees, and could, without committing injury to the right of property, despoil some of it to the advantages of others: they would have no other rules to follow than their own desires or caprices."

—The Scotch school, from Locke to Reid and Dugald Stewart, was the first to give a nearly correct definition of the right of property; as the physiocratic school was the only one, previous to 1789, that understood its importance, and brought out into relief the beneficial influence it exercised on the economy of society. But at the time of the French revolution these teachings had not yet corrected the ideas of all; for Mirabeau said to the constituent assembly that "private property is goods acquired by virtue of the laws. *The law alone constitutes property*, because it is only the political will which can effect the renunciation of all, and give a common title, a guarantee to the use of one alone." Tronchet, one of the jurists who contributed most to the drawing up of the civil code, shared at that time this opinion, and declared that "It is only the establishment of society and conventional laws which are the real source of the right of property."

—There is not much difference between Mirabeau's statement and that of Robespierre, who wrote, in his declaration of rights, "Property is the right that each citizen has *to the enjoyment of that portion of goods guaranteed to him by the law.*" And Robespierre is not far removed from Babœuf, who desired that the land should be the common property of all, that is, that it should belong to nobody. Mirabeau, who pretends that the legislator confers property, admits, by so doing, that he can take it away; and Robespierre, who expressly reserves the state's right in property, and reduces the proprietor to the position of a mere usufructuary, by refusing him the power of selling or disposing of it by will or otherwise, is the direct and immediate forerunner of communism.

—I know that the convention gave, in the declaration of rights which serves as a preamble to the constitution of 1793, a very reassuring and very sound definition of the right of property. Article sixteen reads: "The right of property is the right belonging to every citizen, of using and disposing as he likes, of his goods, his revenues, of the fruit of his labor and his industry." And article nineteen adds a guarantee, which all subsequent French constitutions reproduced: "No one shall be deprived of the least portion of his property without his consent, except when public necessity, legally proven, evidently demands it, and then only on condition of just compensation previously made."

—But, doubtless, the convention reserved the application of those fine maxims, as it did the abolition of capital punishment, for times of peace. No government ever committed more flagrant outrages on the right of property. Confiscations and maximum laws, to say nothing of the inflation of assignats and bankruptcy, marked its savage away, and if it made France victorious and terrible abroad, it ruined and impoverished her at home. The convention evidently thought, with Saint-Just, that "The man who has shown himself the enemy of his country, can not be a proprietor in it." It treated the nobles and priests as Louis XIV. had treated Protestant refugees after the revocation of the edict of Nantes. It adopted, in the interests of the republican state, the theory of feudal origin, that the sovereign, the king, had direct and supreme dominion over the goods of his subjects.

—M. Troplong called attention to the concordance of the demagogical doctrine of property with the maxims of despotism: "All that exists throughout the length and breadth of our states," said Louis XIV. in his instructions to the Dauphin, "whatever be its nature, belongs to us by the same title; you must be fully persuaded that kings are the absolute lords, and have naturally the full and free disposition of all the goods possessed both by church people and by laymen, that they may use it in everything; likewise husbandmen." Put this absolute sovereignty into the hands of a socialistic republic, and it will assuredly lead to the measures demanded in the following lines by Gracchus Babœuf: "The land of a state should assure a subsistence to all the members of that state. When, in a state, the minority of its people has succeeded in monopolizing its landed and industrial wealth, and by that means holds the majority under its sceptre, and uses the power it has, to cause that majority to languish in want, it should be known that such encroachment could only occur through the bad institutions of the government; therefore what former governments neglected to do, at the time, to prevent that abuse or to stifle it at the beginning, the actual administration should do to re-establish the equilibrium which should never have been lost, and the authority of the laws ought to operate a reform in the direction of the final maxim of the perfected government under the social contract: '*Let all have enough, and no one too much.*' "

—At last the era of the civil code dawned on France and on Europe. Then for the first time the public power laid down and sanctioned the true principles respecting property. M. Portalis expressed himself before the legislative assembly in the following terms: "The principle of the right of property is in ourselves; it is in no way the result of human convention or of positive law. It lies in the very constitution of our being, and in our different relations to the objects which surround us. Some philosophers seem astonished that man should become the proprietor of a portion of the earth which is not his creation, which will outlast him, and which obeys only laws that are not of his making. But does not this astonishment cease when all the marvels of man's handiwork are considered, that is to say, all that human industry can add to the work of nature." Yes, legislators, it is by our industry that we have conquered and reclaimed the land on which we live; by it we have made the earth more habitable, and better fitted to be our abode. Man's task, so to speak, was to complete the great work of creation. \* \* Let us put no faith in systems which pretend to make the land the property of all, that men may have a pretext for respecting the rights of no one."

—The civil code (articles 544, 545), collecting and condensing the principles laid down in previous constitutions, defined property as follows: "The right of using and disposing of things in the most absolute manner, provided that they are not used in a way prohibited by the laws or regulations." Charles Comte has rightly pointed out that this definition applies to the usufruct's right as well as to property. The definition of the civil code sins in another way: it does not limit the power which is given to legislators, or to the administration, of making rules regarding the use of property. On that account, property lacks all guarantees; it is not defended against arbitrary power. The law might forbid a landowner to sow seed, to plant vines or trees, to erect any building on his land, to sell, exchange or give his property away. In a word, the definition of the civil code admits of Egyptian monopoly as well as of French liberty. Fortunately, legislative custom and public morals correct the rashness of the legal text.

—The civil code declares property inviolable. Following the examples of the constitutions of 1791, 1793, and 1795, it declared that no one should be compelled to part with his property, unless for the public good, and in consideration of just compensation previously made. But is it absolutely the fact, as M. Troplong thinks it to be, that the state, by these provisions, only reserved to itself the rights attached to political requisition? But did the state by those provisions shelter property from the public power as well as from the usurpation of private persons? This is the weak side of the civil code. Its authors laid down principles, all of whose consequences they had not drawn. While declaring property inviolable, they failed to shield it from sequestration by government, or from confiscation.

—The emperor Napoleon said to the council of state, on Sept. 18, 1809: "Property is inviolable. Napoleon himself, with the numerous armies at his disposal, can not take away a single farm. For to violate the right of property in one man is to violate it in all men." Admirable words, to which his acts did not correspond.

—III. *origin, character and progress of Property*. Why is it that the great majority of philosophers and jurisconsults have succeeded so ill in defining property? How does it happen that the origin and nature of an institution which holds so high a place in social order, have been revealed to us with any degree of clearness, only since the end of the last century? How is it that the highest intellects, when brought to bear on this study, have too often evolved only such theories as the humblest of landowners could not reconcile with his every-day practice? It is because the phenomenon which they studied and described has more than once changed character. Property has shared in the general progress of civilization; it has, at the same time, followed a law of development of its own. It has advanced as liberty, as industry and as the arts have done, in the world; it has passed through different and successive stages, each corresponding to a different theory.

—The distinction of mine and thine is as old as the human race. From the time that man became aware of his personality, he sought to extend it to things. He appropriated the land and what it produced, animals and their increase, the fruit of his energy and the works of his fellow-men. Property exists among pastoral peoples as well as among those nations which have reached the highest point of agricultural

wealth and of industry; but it exists among them under different conditions. The occupation of land was annual before it became lifelong, and it was lifelong, in the person of the tenant, before it became hereditary and in some sort perpetual. It belonged to the tribe before it belonged to the family, and it was the common domain of the family before it took an individual character. Poets, who were the first historians, attest this gradual transformation.

—The marked distinction between the ancient and the modern world is, that formerly property was too often acquired by conquest, while now its essential basis is labor. Not only in antiquity and in the middle ages did individuals, as well as peoples, enrich themselves by usurpation, but free men disdained industry, and the earth was tilled by slaves. Armed force, which was the surest title to the possession of land, procured also the instruments of production. How was it possible to sound the nature or take in the full horizon of property at a time when the conqueror arrogated to himself the right, at one time of selling the conquered like beasts of burden, and at another of making serfs of them; when men were treated as though they were goods and chattels; when labor passed first through the ordeal of slavery, and then through that of serfdom, before it became the honor of free men and the wealth of nations?

—This is not all. Property, in undergoing a progressive development similar to that of liberty, has extended and increased, and has, so to speak, invaded space. When civilization begins, what man possesses is very trifling: a few herds, some rude implements, a spot of land which produces corn in the middle of a desert waste; as yet he has scarcely appropriated any natural agents. Agricultural peoples, which succeed the pastoral tribes, soon increase ten-fold and a hundred-fold the property which now, little by little, becomes connected with the surface of the earth. But it remains only for nations skilled in industry and commerce to bring property to its highest development. When the land becomes, in some sort, individualized, and each portion falls into the hands of an owner who makes it productive with his capital and by the sweat of his brow, those who find themselves left out in this partition of the land are not, on that account, excluded from property. Capital has its origin in accumulation. Personal property is grafted on landed property. Treasures accessible to all are formed, of which each can have a share, and which he can increase by his labor. A parcel of land which in Algeria is worth perhaps \$2, and in the western states of America about \$5, sells readily in western Europe for from \$100 to \$1,000. In spite of the high price which improved agriculture speedily gives to rural property, there is no exaggeration in saying that to-day the personal property of England and France far exceeds the value embodied in the land.

—It may be added, that, as civilization advances, each citizen witnesses the increase and extension of the common property which he enjoys equally with all other citizens of the state. Roads, canals, railways, schools, and other public establishments are incomparably more numerous and better administered to-day than they were half a century ago. What would it be, if we were to compare the sum of enjoyments and capacities which society put at the disposal of its members in the republics of Greece and Rome and those enjoyed by them in our day? The humblest of our laborers would not like to find himself exposed to the misery or the humiliations which awaited the proletarian of ancient days in the agora or the forum. It is, then, rightly that M. Thiers,

calling to mind that property is a universal fact, affirms, at the same time, that it is a *growing* fact.

—Let us listen to Thiers, portraying the origin and the growth of property in historic times: "Among all peoples, however rude they may be, we found property, at first as a fact, and afterward as an idea, an idea more or less clear according to the degree of civilization attained, but invariably settled. Thus the savage hunter has at least his bow, his arrows and the game which he has killed. The nomad, who is a shepherd, at least owns his tents and his flocks. He has not yet admitted property in land, because he has not yet thought of applying his labor to it. But the Arab who has raised numerous flocks, is satisfied that he is the proprietor of the land, and exchanges its products against the wheat which another Arab, settled on the land, has produced elsewhere. He measures exactly the value of the object which he gives, by that of the object which is given him; he knows that he is the proprietor of the one before the barter, and of the other after it. Immovable property does not yet exist for him. Sometimes only he is seen, during two or three months of the year, to establish himself on land which belongs to no one, to plow it, to sow it with seed, to reap the harvest, and then to wander off to other places. \* \* The duration of his property is in proportion to his labor. Little by little, however, the nomad becomes settled and turns agriculturist, for it is an instinct in man to wish to have a place of his own, a home. \* \* He ends by choosing a tract of land, by dividing it into patrimonies, on which each family establishes itself, and works and cultivates it for itself and its posterity. As man can not allow his heart to wander among all the members of the tribe, and as he longs for a wife of his own, children whom he may love, care for and protect, in whom his hopes, his fears, his very life, may be centred, so he has need of his own parcel of land, which he may cultivate, plant, beautify according to his tastes, fence in, and which he hopes to transmit to his descendants, green with trees which have grown not for him, but for them. Then to the personal property of the nomad, succeeds the landed property of an agricultural people; this second property grows, and with it come laws, complicated, it is true, which time makes more just and more provident, but the principle of which it does not change. Property, at first the result of instinct, becomes a social agreement, for I protect your property that you may protect mine. As man advances, he becomes more attached to what he owns; in a word, more a proprietor. In a barbarous state he is scarcely proprietor at all; civilized, he is one intensely. It has been said that the idea of property was weakening in the world. That is an error of fact. Far from growing weaker, it is being regulated, defined and strengthened. It ceases, for instance, to be applied to what is not capable of being possessed, that is, to man, and from that time slavery is at an end. This is an advance in ideas of justice, but not a weakening of the idea of property. \* \* Among the ancients the land was the property of the republic; in Asia it is that of a despot; in the middle ages it belonged to lords paramount. With the progress of the ideas of liberty, where man's freedom was accomplished, the liberty of his chattels and possessions was secured; he himself is declared to be the owner of his lands, independently of the republic, the despot, or the lord paramount. From that moment confiscation is abolished. The day the use of his faculties was restored to him, property became more individualized; it became more *proper* to the individual, more property than it was.

—There is another observation to be made, and one more directly within the domain of political economy. It is, that the more property increases, is firmly established, respected, the more society prospers. "All travelers," says M. Thiers, "have been struck by the state of languor, of misery, and of rapacious usury, of countries in which property is not sufficiently well guaranteed. Go to the east, where despotism claims to be the only property owner, or, which is the same thing, return to the middle ages, and you will see everywhere the same thing: the land neglected, because it is the readiest prey to the avidity of tyranny, and left to the hands of slaves, who are not free to chose their own career; commerce preferred, because it could more readily escape exaction; in commerce, gold, silver and jewels in request, being the valuables most readily hidden; all capital seeking conversion into these values, and when it actually seeks employment concentrating itself in the hands of a proscribed class, who, making a pretense of poverty, lived in houses wretched on the outside, gorgeous internally, opposing an invincible resistance to the barbarian master who would tear from them the secret of their treasures, and solacing themselves by making him pay more dearly for the money, thus, by usury, revenging themselves for his tyranny."

—Such are the roots of property to be found in history. As far as the right of property is concerned, it may be said that the universality of the fact is sufficient to establish it. Were property something accidental in human society, were the institution established only among an insular people, and were it an exception to the general custom, it might be called upon to produce its title deeds; but it stands to reason that men must have the right to do as they have done at all times, and in every inhabited place. Universal consent is an infallible sign of the necessity for, and consequently of the legality of, an institution.

—But the right can be proved independently of the historic reason. "Man," says M. Thiers, "has a first property in his person and his faculties; he has a second, less intimately connected with his being, but not less sacred, in the product of his faculties, which includes all that are called worldly possessions, and which society is in the highest degree interested in guaranteeing to him, for without this guarantee there would be no labor, without labor no civilization, not even necessaries, but, instead, destitution, brigandage and barbarism." This definition is neither sufficiently absolute nor complete. M. Thiers seems to place the foundation of property in labor alone. Undoubtedly it is its most legitimate source, but it is not the only one, nor, in point of date, is it the first. At the commencement of social life, man appropriated the soil by occupation, before he made it his own by the work of his arms. Everywhere wresting the ground from man or from beast, the taking possession of it preceded its cultivation. The land belonged to a tribe collectively before it was distributed among its different members. This is what the school calls the right of the first occupant, a right which is explained by the very fact of possession being taken without hindrance, and by the power to defend, to protect, and consequently to appropriate, the land occupied.

—Side by side with the men who acquired their possessions by occupancy or by labor, there are nations and individuals who usurped what they possess by violence and by fraud. Laws, and public forces at the service of the laws, justify that usurpation wherever their power extends, and commends both obedience and respect. But it happens, and history furnishes many examples of it, that the property thus wrongfully

acquired is peaceably handed down from generation to generation, gives rise to an infinite number of contracts, and becomes the basis of fortunes. After all these *faits accomplis*, ought the origin of landed estates to be sought for with a view to securing their condemnation? Or, rather, does not the interest of society demand that the subsequent transactions be legitimized, and their origin wiped out? This state of affairs has given rise to the system of prescription, which is the real safeguard of property. "No transaction would be possible," says M. Thiers, "no exchange could be made, if it were not settled that after a certain time the person who holds anything holds it lawfully, and may transfer it. Imagine what would be the condition of society, what acquisition would be certain, if it were allowed to go back to the twelfth or thirteenth century, and dispute possession with the holder of a piece of property, by proving that a feudal lord had taken it from his vassal and given it to a favorite, or to one of his men-at-arms, who sold it to a member of the guild of merchants, who, in turn, transmitted it, through many hands, to a long line of owners more or less respectable. It is very right that there should be a term fixed, after which what is, simply because it is, should be declared lawful and held as good. Were this not so, what a scene the world would present."

—It must be said, however, that conquest and usurpation are not constant and exclusive facts, although it might be supposed they were, when we see Assyrians, Persians, Greeks, Romans, and, finally, the northern barbarians, each in turn dispossessing the other, and ruling the world by force of arms. Violence did not mark the beginning of all property. M. Thiers, after having stated, in contradiction to the well-understood and well-interpreted testimony of history, that "all society presented in the beginning this phenomenon of occupation more or less violent," admirably explains how it is that, the greater part of landed property had its origin in labor. (*De la Propriété*, by M. Thiers, vol. i., ch. 10.)

—Property draws after it, as a consequence, inequality of conditions in the social order, and this inequality in condition is itself only the reflection of the differences which nature has established among men. All men have not the same muscular strength, nor the same degree of intelligence, nor an equal aptitude for or application to work. By the very fact that there are some who are stronger, cleverer, and, it must be said, happier than others, there are some also who tread with a quicker and surer foot the way to wealth. Property does not aggravate these irregularities in nature, but it marks them in durable characters, and gives them a body. In the beginning the best farmer possesses most. What interest could society have in interfering with his better farming? The most skillful and robust cultivator of the soil, while enriching his family, adds to the general sum of products, and therefore enriches society also. Equality of condition, the equal partition of the land, and equality of wages, are three forms of the same idea, which amounts to saying that the stronger ought not to produce more than the weaker, and that the thought of the enlightened man ought to sink to the level of that of the ignorant man; this would be to limit production, to repress intelligence, and to stifle literature, science and art in their very germ.

—The right of possession includes, as a natural consequence, the right of disposing of the things possessed by you, of transmitting them to others, either for a consideration, or as a free gift; of exchanging, selling, or giving them away during life or by

testamentary disposition, and of leaving them as an inheritance. Property implies the right of inheritance. Man is so constituted that he wishes to outlive himself. The care he feels for his self-preservation extends to his family; he would work much less for himself were he not, in working for himself, working for family. Property reduced to a usufructuary interest would be of but half its value to individuals, and of but half its value to society.

—This thought is expressed in pages which I prefer to borrow rather than attempt to adapt: "A man, if he had but himself to think of, would stop short in his career. As soon as he had provided for his old age, would you, through fear of encouraging idleness in the son, force the father himself into idleness? But does it follow, that, by permitting the hereditary transmission of property, the son must necessarily be an idler, consuming in sloth and debauchery the fortune left him by his father? Firstly, we would ask, what does the property which is to support the idleness of the son represent, after all? It represents previous work done by the father; and by hindering the father from working in order to compel the son to work for himself, all that is gained is that the son must do what the father has not done. There will have been no increase in the amount of work done. In the system, on the contrary, in which the right of inheritance is recognized, to the unlimited labor of the father is added the unlimited labor of the son; for it is untrue that the son remains idle because the father has left him a more or less considerable amount of property. To begin with, it is rare for a father to leave his son the means of doing nothing. It is only in cases of great wealth that this happens. But usually, in most professions, the father, in leaving the son his inheritance, only procures for him a better start in his career. He has only pushed him a little further, a little higher: he has given him the chance of working to greater advantage; of being a farmer, when he himself was only a farm servant; of fitting out ten ships, when he could fit out but one; of being a banker on a large scale, when he was one only on a small one: or of changing his position in life; of rising from one to another; of becoming a lawyer, a doctor, or a barrister; of being a Cicero or a Pitt, when he himself was a simple gentleman, like Cicero's father, or a cornet of a regiment, like Pitt's."

—Thus, the right of inheritance is necessary to property, as property is to social order; it is that right which, by permitting the accumulation of wealth, creates capital and makes labor productive. The laws of all free and industrious peoples sanction it; but it is so indispensable to the development of families and the progress of societies, that were it not the invincible consequence of human nature and of the social state, that, in a word, if it did not exist, it would be necessary to invent it.

—IV. *Objections which have been raised against the Principle of Property.* The objections which have been taken to the principle of property are taken sometimes to the right, sometimes to the fact itself. The great opponent of property, M. Proudhon, is forced to recognize, that, as the possession of property has become general among all classes, it has approached the ideal of justice. But this more general possession of property, inseparably connected with the advance of civilization, does not disarm M. Proudhon's hostility, he contests the principle of property itself. Property, according to him, does not exist as a natural right; it is founded neither on occupation nor on labor. "Since every man," says this author, "has the right to occupy from the simple fact that

he exists, and that to continue in existence he can not dispense with a material of exploitation and of labor; and since, on the other hand, the number of occupants varies incessantly, owing to births and deaths, it follows that the quantity of matter which each worker may claim, is variable like the number of occupants; that occupation is always subordinate to population; and finally, that, possession never being able rightfully to remain constant, it is, as a fact, impossible that it should become the basis of property."

—To dispose of this paradox, all that is needed is to refute the point from which it starts. The prerogatives of the individual and of the species do not embrace a natural right to occupation any more than they do a natural right to labor. Undoubtedly, in the midst of a vacant space, the man who first occupies a field or a meadow, incloses it in bounds, and appropriates it, becomes its lawful possessor; but it is not by virtue of a right of possession inherent in every man, but because the ground previously belonged to no one, and because, in leaving his impress on that ground, he is not interfering with any previous right.—"A man," says M. Proudhon, "who was forbidden to travel over the highways, to rest in the fields, to take shelter in caves, to light a fire, pick the wild berries, to gather herbs and boil them in a piece of baked earth—such a man could not live. Thus the earth, like water, air and light, is a first necessity which each ought to be able to use freely, without injury to the enjoyment of them by another. Why, then, is the earth appropriated?" This thesis might have its good side in a condition of savagery. M. Proudhon's theory might succeed among a nation of hunters. But in an industrious and civilized community, it is but a late and faded echo of the declamations of J. J. Rousseau. Men nowadays do not live on wild berries or on herbs gathered in the fields; they are no longer reduced to live in caves, or to prepare coarse food in earthen vessels. Civilization has bestowed on them possessions which far more than compensate for any supposed natural rights to gather wild fruit, to hunt or to fish; and the humblest workingman of the nineteenth century is certainly better lodged, better clothed and better fed than the typical man of M. Proudhon could be, with all his right to common possession of the land.

—After having asserted that occupancy could not serve as a basis for property, M. Proudhon equally denies the title of labor. Charles Comte had said: "A piece of ground of fixed dimensions is only able to produce sufficient food for the consumption of one man for one day: if the owner by his labor can make it produce enough for two days, he doubles its value. This new value is his work, his creation; it is not taken away from any one; it is his property." M. Proudhon answers: "I maintain that the possessor is paid for his trouble and his industry by the double return, but that he acquires no right in the soil. I admit that the laborer may make the product of his labor his own, but I do not understand how property in the product carries with it property in the soil, or in matter. Does the fisherman who can catch more fish, on the same coast, than his companions, become, because of his skill, proprietor of the waters in which he fishes? Was a hunter's skill ever looked upon as conferring on him a right of property in the game of a whole canton? The cases are precisely similar: the diligent husband-man finds in a harvest, abundant and of better quality, the recompense of his toil; if he has made improvements on the soil, he has the right to a preference as possessor of it; never, under any consideration, can he be allowed to allege his skill as a farmer as a title to property in the soil he tills. To transform

possession into property, there is more needed than labor, otherwise man would cease to be a proprietor as soon as he ceased to be a laborer: now, what constitutes property, is, according to the law, immemorial and uncontested possession, that is, prescription; labor is only the visible sign, the material act, by which occupation is manifested".

—As sources of property, occupation and labor are the complements of each other. Possession would certainly be far from lasting, if cultivation did not follow to sanction it, by revealing and bringing into play the productive forces of the soil; and as for labor, it does not necessarily imply property, since a farmer who has spent a large amount of capital in the improvement of the land he leases, while he can demand compensation for that capital, does not therefore acquire a right of property in the domain. This much is true, and can be said without exaggeration. But to suppose that the possessor who has cultivated a piece of land, and who, by so doing, has improved the land and increased the capital which that land represents, to suppose that he has no rights beyond the fruit of the year, is a glaring error. To whom would this improved land belong? Would any one bestow capital on it, give it a new value, just that this value might become the prize of the first comer? If this were so, no one would work.

—M. Proudhon admits that the husbandman who has improved land "has the right to a preference in possession." Here, then, is another case, and the case presents itself often, in which property, to use the language of Proudhon's book, ceases to be robbery. There is no doubt that the proprietor has no need to work to preserve his right: but work adds to the titles of property, and makes them still more honorable. Now, the possessor who cultivates, even if he does not add to the value of the land, would very soon grow tired of his passion for work, if he were only allowed to receive from it the produce of one harvest. Agriculture is the offspring of permanency in property, and without the guarantees which the law attaches to possession, agriculture would make no progress. M. Proudhon has only to look at what happens to the best of land when in the hands of nomadic tribes, among whom the land is only scratched to secure the meagre harvest of the year.

—But, it will be said, the land thus conceded in perpetuity is, little by little, sequestered, invaded; and the last comers are likely to see both hemispheres entirely filled up by the heirs of the first who occupied the land, or of those who wrested it, by violence or by fraud, from its original owners. Even if all this were so, the misfortune does not seem to us a very great one. Land, thanks to the progress of industry, is not the only source of wealth. The man who does not own a farm may buy a house, start a factory, or have an interest in some scheme for transportation. Property, supposing there were not enough for all in the form of land, would show itself abundant under new forms. Previous appropriation of the soil, instead of robbing future races, really tends to enrich them.

—Very high intellects refuse to admit this supposed confiscation of the soil to the detriment of the latest comers. M. Thiers gives us considerations on this point which are decisive. I shall try to epitomize them here. "Some engineers have thought that there was coal enough in the bowels of the earth to last indefinitely, while others have thought, that, at the rate at which industry was advancing, there was not enough for a

hundred years. Should we, then, abstain from using it, lest there should be none for our posterity? \* \* The society which should abolish property in land for fear of the earth's whole surface being invaded, would be every whit as absurd. Let us make our minds easy on that score. European nations have not yet cultivated, some the quarter, others the tenth part, of their territories; and of the entire globe not the thousandth part is occupied. Great nations have run their course hitherto, without having brought under cultivation more than a very small part of their dominions. Nations have passed through youth, maturity and old age; they have had time to lose their characteristics, their genius, their institutions, all that they lived by, without having, we will not say, completed, but even much advanced, the cultivation of their territory. After all, space is nothing. Often, on the widest extent of land, men find it hard to live; and often, on the other hand, they live in plenty on the narrowest strip of ground. An acre of land in England or in Flanders supports a hundred times more inhabitants than an acre in the sands of Poland or of Russia. Man carries with him fertility; wherever he appears the grass grows and corn springs up. He brings with him his cattle, and wherever he settles he spreads around him a fertilizing soil. If, then, a day could be imagined when every corner of the globe should be inhabited, man would obtain from the same superficies ten times, a hundred times, nay a thousand times, more than he obtains to-day. What need be despaired of when the sands of Holland are transformed into fertile ground by man? Were he cramped for room, the sands of the Sahara, of the Arabian desert, of the desert of Cobi, would be covered by the fruitfulness which follows him; he would lay out in terraces the sides of the Atlas, of the Himalayas, of the Cordilleras, and cultivation would climb the steepest summits of the globe, and would only stop where, from the elevation, all vegetation ceases. This surface of the globe, invaded as is said, will not fail future generations, and, meanwhile, does not fail those of the present: for everywhere land is offered to men; it is offered them in Russia, on the banks of the Borysthenes, the Don and the Volga; in America, on the banks of the Mississippi, the Orinoco, and the Amazon; in France, on the coast of Africa, once the granary of the Roman empire. But emigrants do not always accept, and when they do, if nothing be added to the gift of the land, they go to their death on those distant shores. Why? Because it is not surface which is wanting, but surface covered with constructions, plantations, inclosures, the works of appropriation. Now, all these things exist only where former generations have been at the pains to put everything in such a position that the labor of the new comers may be immediately productive."

—It is plain, then, that the earth, in spite of the extent of property, is not going to fail man. It is property well established, fenced around with guarantees, and become hereditary, which makes the land habitable and productive. Let us add, that under this régime the lot of the cultivator or tiller of the soil improves more rapidly than that of the owner. Property is in a special way a benefit to labor. (Compare COMMUNISM, MONOPOLY, LAND, SOCIALISM, etc.) [55](#)

## PROPERTY

PROPERTY, Literary. Under the heading of "Copyright" (see vol. i., p.642, Mr. Macleod has given a comprehensive summary of the growth of the conception of literary property, and a specification of the enactments in Great Britain under which its status has been defined and regulated. He has also made reference to the copyright acts of some of the other states of Europe, as they stood twenty years ago. We here propose to supplement Mr. Macleod's statistics with such later data as can now be obtained, to include the specification (not to be found in Mr. Macleod's article) of the copyright acts of the United States, and also to present some of the questions that have arisen concerning literary property between nations, and to describe the conventions in force or under consideration for international copyright.

—During the past twenty years, there has been a very considerable increase in the extent of international literary exchanges, and a fuller recognition, at least in Europe, of the propriety and necessity of bringing these under the control of international law. Americans also are beginning to appreciate how largely the intellectual development of their nation must be affected by all that influences the development of the national literature, and to recognize the extent to which such development must depend upon the inducements extended to literary producers, as well as upon the character of the competition with which these producers have to contend.

—Literary property is defined by Drone as "the exclusive right of the owner to possess, use and dispose of intellectual productions", and copyright, as "the exclusive right of the owner to multiply and to dispose of copies of an intellectual production".

—The English statute (5 8 6 Victoria) defines copyright to mean "the sole and exclusive liberty of printing or otherwise multiplying copies of any subject to which the word is herein applied."

—The American statute (U. S. Rev. Stat., sec.4952) speaks of copyright in a book as "the sole liberty of printing, reprinting, publishing, \* \* and vending the same".

—The French constitutional convention adopted, in January, 1791, a report prepared by Chopelin, which declares that: *La plus sacré, la plus inattaquable, et, si je puis parler ainsi, les plus personnelle ds toutes les propriétés, est l'ouvrage, fruit de las pensés d'un écrivain.* And in the decree rendered by the convention, July 10, 1793, the preamble (written by Lakanal) declares that *de toutes les propriétés, lamoins susceptible de contestation, c'est, sans contrédit, celle des productions du génis: et si quelque chose peut étonner, c'est qu'il ait fallu reconnaitre cette propriété assurer son libre exercice par uns loi positive; c'est qu'une aussi grande revolution que la notre ail été nécessaire pour nous ramener sur ce point, comme sur lout d'autres, aux simples éléments de la justice la plus commune.*

—The act relating to copyright, adopted by the Reichstag of Germany, in April, 1871, declares that *Das Recht, ein Schriftwerk auf, mechanischem Wegs zu verviel faltigen, steht dem Urheber desselben ausschliesstich zu.*

—Coppinger defines copyright as "the sole and exclusive right of multiplying copies of an original work or composition," and says that the right of an author "to the productions of his mental exertions, may be classed among the species of property acquired by occupancy; being founded on labor and invention."

—Francis Lieber says (in an address delivered April 6, 1868), "The main roots of all property whatsoever are appropriation and production. \* \* Property \* \* precedes government. If a man appropriates what belongs to no one (for instance, the trunk of a tree), and if he produces a new thing (for instance, a canoe) out of that tree, this product is verily his own, \* \* and any one who in turn attempts to appropriate it without the process of exchange, is an intruder, a robber. \* \* The whole right of property \* \* rests on appropriation and production: and I appeal to the intuitive conviction of every thinking man to say whether a literary work, such as Baker's description of his toilsome journeys, or Goethe's Faust, is not a *production* in the fullest sense of the world, even more so than a barrel of herrings, which have been appropriated in the North sea, and pickled and barreled by the fishermen; and whether any one has a right to meddle with this property by production, any more than you or I with the barrel of herrings."

—Drone says: "There can be no property in a production of the mind unless it is expressed in a definite form of words. But the property is not in the words alone; it is in the intellectual creation, which language is merely a means of expressing and communicating." It is evident that copyright is in its nature akin to patent right, which also represents the legal recognition of the existence of property in an idea or a group of ideas or the form of expression of an idea.

—International patent rights have, however, been recognized and carried into effect more generally than have copyrights. The patentee of an improved toothpick would be able to secure today a wider recognition of his right than has been accorded to the author of "Uncle Tom's Cabin" or of "Adam Bede."

—Almost the sole exception to this consensus of civilized opinion on the status of literary property is presented by Henry C. Carey. He took the position that "Ideas are the common property of mankind. Facts are everybody's facts. Words are free to all men. \* \* Examine Macaulay's 'History of England,' and you will find that the body is composed of what is common property." Of Prescott, Bancroft and Webster he says: "They did nothing but reproduce ideas that were common property." Of Scott and Irving, "They made no contribution to knowledge." ("Letters on Copyright," Phila., 1854.) Therefore, the author of a work has no right of property in the book he has made. He took the common stock and worked it over: and one man has just as good a right to it as another. If the author is allowed to be the *owner* of his works, the public are deprived of their rights. Property in books is robbery. But this is simply a partial or specific application of the well-known formula of Proudhon: "Property is robbery," a theory which it is not necessary to discuss in this paper.

—The conception of literary property was known to the ancients. A recompense of some sort to the author was regarded as a natural right, and any one contravening it as little better than a robber. Klostermann says: "The first germs of a recognition of a property in thought are to be found in the agreements which authors entered into with the booksellers for the multiplication and sale of copies of their works, and in the custom to treat as unlawful any infringement upon the bookseller's right in a work which had been so transferred to him. The booksellers among the Romans succeeded, through the use of slave labor, in producing duplicates of their manuscripts at so low a cost, that the use and productions, centuries later, of the first printing presses, were hardly cheaper." Martial records, in one of his epigrams, that the edition of his "Xenii" could be bought from the bookseller Tryphon for four sesterces, the equivalent of about twelve and a half cents. He grumbles at this price as being too high, and claims that the bookseller would have been able to get a profit from a charge of half that amount. This poet appears to have had not less than four publishers in charge of the sale of his works, one of whom was a freedman of the second Lucensia. The latter issued a special pocket edition of the "Epigrams." The poet prepared the advertisements for the booksellers, putting these in the form of epigrams, but not neglecting to specify the form and price of each book, as well as the place where it was offered for sale.<sup>56</sup> Horace refers to the brothers Sosius as his publishers, but complains that while his works brought gold to them, for their author they earned only fame in distant lands and with posterity. <sup>57</sup> Terence sold his "Eunuch us" to the Ædiles, and his "Hecyra" to the player Roscius; while Juvenal reports that Statius would have starved if he had not succeeded in selling to the actor Paris his tragedy of Agave. "Such sales," says Coppinger, "were considered as founded, "were considered as founded upon natural justice. No man could possibly have a right to make a profit by the sale of the works of another without the author's consent. It would be converting to his own emolument the fruits of another's labor."

—It is apparent from these and from similar references, that under the Roman empire authors were in the habit of transferring to booksellers for such consideration as they could obtain, the right to duplicate and to sell their works, and that, under the trade usages, they were protected in so doing. There was no imperial act covering such transfers; and it does not appear that in any division of the Roman law was there provision for the exclusive right in the "copy" of literary material.

—It is nevertheless the case that the Roman jurists interested themselves in the question of immaterial property, but it was apparently rather as a theoretical speculation than as a study in practical law. Some of the earlier discussions as to the nature of property in ideas appear to have turned upon the question as to whether such property should take precedence over that in the material which happened to be made use of for the expression of the ideas. The disciples of Proculus maintained that the occupation of alien material so as to make of it a new thing, gave a property right to him who had so reworked or reshaped it; while the school of Sabinus insisted that the ownership in the material must carry with it the title to whatever was produced upon the material. Justinian, following the opinion of Gaius, took a middle ground, pointing out that the decision must be influenced by the possibility of restoring the material to its original form, and more particularly by the question as to whether the material, or that which had been produced upon it, was the more essential. This opinion of Gaius

appears to have had reference to the ownership of a certain table upon which a picture had been painted, and the decision was in favor of the artist. This decision contains an unmistakable recognition of immaterial property, not, to be sure, in the sense of a right to exclusive reproduction, but in the particular application, that, while material property depends upon the substance, immaterial property, that is to say, property in ideas, depends upon the form.

—For the centuries following the destruction of the Roman empire, during which literary undertakings were confined almost entirely to the monasteries, the Roman usage, under which authors could dispose of their works to booksellers, and the latter could be secured control of the property purchases, was entirely forgotten. No limitation was placed on the duplication of works of literature. According to Wächter (*Das Verlugerecht*, 1857), it was even the case that by a statute of the university of Paris, issued in 1228, the Parisian booksellers (who were in large part dependent upon the university) were enjoined to extend, as far as practicable, the duplication of works of a certain class. The business of bookseller at that time consisted as much in the renting out for reading and copying of authentic manuscript versions as in the sale of manuscript copies. In the University of Paris, as well as in that of Bologna, a statute specified the least number of copies, usually 120, of a manuscript that a bookseller must keep in stock, and the prices for loaning manuscripts were also fixed by statute. The difficulty and expense attending the reproduction of manuscripts was in every case considerable (much greater than in the early days of the Roman empire) and when, therefore, an author desired to secure a wide circulation for his work, he came to regard the reproduction of copies, not as a reserved right and source of income, but as a service to himself, which he was very ready to facilitate and even to compensate.

—Throughout the middle ages, whatever immaterial property in the realms of science, art or technics, obtained recognition and protection, was held in ownership, not by individuals, but by churches, monasteries or universities. Before the invention of printing, the writers of the middle ages were fortunate if, without a ruinous expenditure, they could succeed in getting their productions before the public. The printing press brought with it the possibility of a compensation for literary labor. Very speedily, however, the unrestricted rivalry of printers brought into existence competing and unauthorized editions, which diminished the prospects of profit, or entailed loss for the authors, editors and printers of the original issue and thus discouraged further similar undertakings.

—As there was no general enactment under which the difficulty could be met, protection for the authors and their representatives was sought through special "privileges," obtained for separate works as issued. The earliest privilege of the kind was, according to Putter (*Beiträge zum deutschen Staats-und Fürstenrecht*), that conceded by the republic of Venice, Jan. 3, 1491, to the jurist Peter of Ravenna, securing to him and to the publishers selected by him, the exclusive right for the printing and sale of his work "Phœnix." No term of years appears to have been named in this "privilege." It appears, however, that most of the early Italian enactments in regard to literature were framed, not so much with reference to the protection of authors, as for the purpose of inducing printers (acting also as publishers) to undertake certain literary enterprises which were believed to be of importance to the community.

—The republic of Venice, the dukes of Florence, and Leo X. and other popes, conceded at different times to certain printers the exclusive privilege of printing, for specified terms, rarely apparently exceeding fourteen years, editions of certain classic authors. At this time, when the business of the production and the distribution of books was in its infancy, such undertakings must have been attended with exceptional risk, and have called for no little enlightened enterprise on the part of the printers. It is fair to assume that the princes conceding these privileges were not interested in securing profits for the printers, but had in mind simply the encouragement, for the benefit of the community, of literary ventures on the part of the editors and printers.

—After Italy, it is in France that we find the next formal recognition, on the part of the government, of the rights of property in literature. From the reign of Louis XII. to the beginning of the sixteenth century, it became usage for the publisher (at that time identical with the printer) before undertaking the publication of a work, to obtain from the king an authorization, or letters patent, the term of which appears to have varied according to the nature of the work and the mood of the monarch or of the advising ministers. At the close of nearly all of the volumes issued previous to the revolution, will be found printed: *Les Lettres du Roi*, addressed, *A nos ames at feaux conscillers, les gens lenons nos cours de Parlement \* \* et autres nos justiciers, et qui font defenses á tous libraires et imprimeurs et autres personnes de quelque qualité et condition qu'elles soient, d'introduire aucun impression étrangère* (that is to say, any unauthorized reprint) *dans aueun lieu de notre obeissance*.

—These letters were in the first place obtained, as in Italy, for the protection of special editions of the classics, but very speedily the native literature increased in importance, and the list of original works came to outnumber that of the reprints of ancient authors. The rights specified in the letters were in the first place nearly always vested in the printers, but it is evident, that, the longer the terms of the royal concessions, the larger the remuneration that could be looked for from the work, and the greater the price that the printer would be in a position to pay to author or writer. It is also to be noted that the terms granted to original French works were usually longer than those for the new editions of the classics or of reprints of devotional works.

—According to Lowndes, the penalties for infringing copyright were, until the revolution, heavier in France than anywhere else in Europe. It was argued that such infringement constituted a worse crime than the stealing of goods from the house of a neighbor, for in the latter case some negligence might possibly be imputed to the owner, while in the former it was stealing what had been confided to the public honor.

—The status of literary property was further recognized and defined by the so-called *Ordonnances de Moulines* of Henry II., in 1556, the declaration of Charles IX., in 1571, and the letters patent of Henry III., in 1576, but the character of the methods of granting and defending copyrights was not changed in any material respects.

—By the decree of the national assembly of Aug.4, 1789, all the privileges afforded to authors and owners of literary property by the various royal edicts were repealed.

In July, 1793, the first general copyright act was passed, under which, protection was conceded to the author for his life, and to his heirs and assigns for ten years thereafter.

—The imperial act of 1810 extended the term to twenty years after the author's death, for widow or children, the term remaining at ten years if the heirs were further removed. In 1872 the act now (1883) in force was passed. Under this the term was extended to fifty years from the death of the author. The provisions of the act were also extended to the colonies. Foreigners and Frenchmen enjoy the right equally, and no restriction is made as to the authors being residents at the time the copyright is taken out. It is, further, not necessary that the first publication of the work should be made in France. In case the work be first published abroad, French copyright may subsequently be secured by depositing two copies at the ministry of the interior in Paris, or with the secretary of the prefecture in the departments. The provisions of the statute affecting foreigners may be modified by any convention concluded between France and a foreign country.

—The earliest German enactment in regard to literary property was the "privilege" accorded in Nuremberg, in 1501, to poet Conrad Celtes, for the works of the poet Hroswista (Helena von Rossow, a nun of the Benedictine cloister of Gardersheim). As this author had been dead for 600 years, the privilege was evidently not issued for her protection, but must rather have been based upon the idea of encouraging Celtes in a praiseworthy (and probably unremunerative) undertaking. Between the years 1510 and 1514 we find record of "privileges" issued by the emperor Maximilian in favor of the sermons of Geiler of Kaisersberg, and the writings of Schottius, Stabius and others. In 1534 Lutehr's translation of the Bible was issued in Wittenberg under the protection of the "privileges" of the elector of Saxony.

—Penalties for piratical reprints were sometimes specified in the special "privileges" but from 1660 we find certain general acts under which privileged works could obtain protection, and their owners could secure against reprinters uniform penalties. Decrees of this class were issued by the city of Frankfort in 1657, 1660 and 1775, by Nuremberg in 1623, by the electorate of Saxony in 1661, and by the imperial government in 1646. There were also enactments in Hanover in 1778, and in Austria in 1795. All of the above specified acts expressly permitted the reprinting of "foreign" works, that is, of works issued outside of the domain covered by the enactment. Piratical reprinting between the different German states increased, therefore, with the growth of the literature, and although the injury and injustice caused by it were recognized, and measures for its suppression were promised by the emperors Leopold II. and Francis II. (1790 and 1792), nothing in this direction could be accomplished by the unwieldy imperial machinery.

—In 1794 legislation was inaugurated in the Prussian parliament, which was accepted by the other states of Germany (excepting Wurtemberg and Mecklenburg), under which all German authors and foreign authors whose works were represented by publishers taking part in the book fairs in Frankfort and Leipzig, were protected throughout the states of Germany against unauthorized reprints.

—According to Klostermann these enactments were only in small part effective, and it was not until forty years later, that, under the later acts of the new German confederacy, German authors were able to secure throughout Germany a satisfactory protection. It is nevertheless, the case that to those who framed the Berlin enactment of 1794 must be given the credit of the first steps toward the practical recognition of international copyright.

—The copyright statute now in force in Germany, including Elsass and Lothringen, dates from 1871. The term is for the life of the author and for thirty years thereafter. The copyright register for the empire is kept at Leipzig, The protection of the law is afforded to the works of citizens, whether published inside or outside of the empire, and also to works of aliens, if these are published by a firm doing business within the empire.

—In Italy literary copyright rests upon the statute of 1865. The term is for the life of the author and for forty years after his death, or for eighty years from the publication of the work. After the expiration of the first forty years, however, or after the death of the author, in case this does not take place until more than forty years have elapsed since the publication, the work is open to publication by any one who will pay to the author of the copyright a royalty of 5 per cent, of the published price. It is necessary to deposit two copies of the work, together with a declaration in duplicate, at the prefecture of the province. No distinction is made between citizens and aliens, and the provisions of the law are applicable to the authors of works first published in any foreign country, between which and Italy there is no copyright treaty.

—In Austria the term of literary copyright is for thirty years after the author's death, and the other provisions of the act in force are similar to those of the German statute.

—In Holland and Belgium, copyright, formerly perpetual, is now limited to the life of the author and twenty years thereafter.

—In Denmark, copyright, formerly perpetual, is now limited to thirty years from the date of publication.

—In Sweden, copyright was also, until recently, perpetual. By the act of 1877, however, it now endures for the life of the author and for fifty years thereafter. The provisions of the law are made applicable to the works of foreign authors only on conditions of reciprocity.

—In Spain, copyright rests on the act of 1878, and endures during the life of the author and for eighty years thereafter. If the right be assigned by the author, and the author leave no heirs, it belongs to the assignees for eighty years from the author's death. In the case, however, of heirs being left by the author, the assignment holds good for but twenty-five years, after which the ownership reverts to the heirs for the remaining fifty-five years of the term. Owners of foreign works will retain their rights in Spain, provided they adhere to the law of their own country. The copyright registry is kept at the ministry of the interior, and to perfect the registry a deposit of three copies of the work is required. The Spanish government is authorized to conclude

copyright treaties with foreign countries on the condition of complete reciprocity between the contracting parties. Under such an arrangement any author or his representative who has legally secured copyright in the one country would be, without further formalities, entitled to enjoy it in the other.

—In Russia, copyright endures for the life of the author and for fifty years thereafter.

—In Greece the term is fifteen years from publication.

—In Japan the law of copyright dates from 1874. Manuscript must be examined by the department of the interior, and if found free from disloyal opinions or any matter calculated to injure public morals, a certificate of protection is promptly issued. Three copies of the work must be deposited in the department, and the fees amount to the value of six more copies.

—In China, notwithstanding the large body of national literature, no laws have been enacted for the protection of literary property.

—In Great Britain the act of 1842, now (1883) in force, provides as follows: Copyright in a book endures for forty-two years from the date of publication, or for the author's life, and for seven years after, whichever of these two terms may be the longer. The first publication of the work must be in Great Britain. The copy can be taken out by any author or owner who is a British citizen, or by an alien who may at the time of the first publication be within the British dominions (in any portion of the British empire). The work must be registered in the records of the stationers' company, and five copies must be delivered to certain institutions specified. A bill is now, however, before parliament, framed mainly upon the recommendations of the copyright commission of 1878, which provides that the term of copyright for books shall be fifty years; that in the case of British subjects copyright extends to all the British dominions; that aliens, wherever resident, shall be entitled to British copyright on registering their work in that part of the British dominions where it was first published.

—The history of the status of literary property in England prior to 1863, is given in detail in the article of Mr. Macleod (vol. i., p. 642). It is in England that the nature and basis of copyright have received the most thorough consideration, and the English opinions (although representing very wide differences among themselves) have been the most important contributions to the discussion of the subject. It is sufficient to note here that the first record of the recognition of property in literature appears in 1558 (that is, half a century later than in France or Germany) when the earliest entry of titles was made on the register of the company of stationers in London. As early as 1534, however, Henry VIII, granted to the university of Cambridge the exclusive right of printing certain books in which the crown claimed a prerogative. Afterward, patents *cum privilegio* were granted to individuals. Prior to 1710 there was no legislation creating literary property or confining ownership, nor any abridging its perpetuity or restricting its enjoyment. It was understood, therefore, to owe its existence to common law, and this conclusion, arrived at by the weightiest authorities, remained practically unquestioned until 1774. For the provisions of the act of 1710(8

Anne), the details of the cases of *Miller vs. Taylor* (1769), and *Donaldson vs. Becket* (1774), the discussions concerning these cases, with the opinions of Lord Mansfield, Lord Camden and Justice Yates, and also for the debate attending the framing of the act of 1842, with the arguments of Talfourd, Lord Campbell, Justice Coleridge, Lord Macanlay and Thomas Hood, the reader is referred to Mr. Macleod's paper.

—In the United States the first act in regard to copyright was passed in Connecticut in January, 1783. This was followed by the Massachusetts act of March, 1783, that of Virginia in 1785, and New York and New Jersey in 1786. These acts were due more particularly to the efforts of Noah Webster, and their first service was the protection of his famous "Speller." Webster journeyed from state capital to state capital to urge upon governors and legislatures the immediate necessity of copyright laws, and under his persistency measures had also been promised and in part framed in Rhode Island, Pennsylvania, Delaware, Maryland and South Carolina. The necessity for state laws on the subject was, however, obviated by the United States statute of 1790. In creating a public and legislative opinion which made such a law possible, Webster's writings and personal influence were all important.

—Previous to the adoption of the federal constitution, in 1787, a general copyright law was not within the province of the central government, and in order to encourage the states in the framing of copyright legislation, a resolution, proposed by Madison, was adopted in congress, in May, 1783, recommending to the states the adoption of laws securing copyright for a term of not less than fourteen years. The state acts passed prior to this resolution had conceded a term of twenty-one years. The act of 1790 provided for the shorter time suggested by Madison. The act of 1831 extended the fourteen years to twenty-eight, with privilege to the author, his widow or children, of renewal for fourteen years more. The act of 1834 provided that all deeds for the transfer or assignment of copyright should be recorded in the office in which the original entry had been made. In 1846 the act establishing the Smithsonian Institution required that one copy of the work copyrighted should be delivered to that institution, and one copy to the library of congress. This provision was repealed in 1859, by a statute which transferred to the department of the interior the custody of the publications and records. In 1865 the copies were again ordered to be delivered to the library of congress. In 1861 an act was passed, providing that cases of copyright could, without regard to the amount involved, be appealed to the supreme court.

—The act now in force in the United States, is that of July, 1870, (See Rev. Stat., secs. 4948-4971). This provides that the business of copyrights shall be under charge of the librarian of congress; that copyrights may be secured by any citizen of the United States or resident therein; that the term of copyright shall be twenty-eight years, with the privilege of renewal for the further term of fourteen years, by the author if he be still living and continues to be a citizen or a resident, or by his widow or children if he be dead; that two copies of the work shall be deposited in the library of congress; that the work must first be published in the United States, and that the original jurisdiction of all suits under the copyright laws shall rest with the United States circuit courts.

—Under the present interpretation of the courts in both the United States and Europe, copyright in published works exists only by virtue of the statutes defining (or establishing) it, while in works that have not been published, such as compositions prepared exclusively for dramatic representation, the copyright obtains through the common law. Copyright by statute is of necessity limited to the term of years specified in the enactment, while copyright at common law has been held to be perpetual. The leading English decisions have before been referred to. The United States decision, which still serves as a precedent on the point of the statutory limitation of copyright, is that of the United States supreme court in 1834, in the case of *Wheaton vs. Peters*. This decision involved the purport of the United States law of 1790, and the determination of the same question that had been decided by the house of lords in 1774, viz., whether copyright in a published work existed by the common law, and, if so, whether it had been taken away by statute. The court held that the law had been settled in England, the act of 8 Anne having taken away any right previously existing at common law; that there was no common law of the United States; and that the copyright statute of 1790 did not affirm a right already in existence, but created one. Justices Thompson and Baldwin, in opposing the decision of the four justices concurring in the decision, took the ground that the common law of England did prevail in the United States, and that copyright at common law had been fully recognized, and that, even if it were admitted that such copyright had been abrogated in England by the statute of Anne, such statute had of course no effect either in the colonies or in the United States. "These considerations," says Drone, "deprive *Wheaton vs. Peters* of much of its weight as an authority." In 1880, in the case of *Putnam vs. Pollard*; it was claimed by the plaintiff that the decision in *Wheaton vs. Peters* could in any case only make a precedent for Pennsylvania; that the English common law obtained in the state of New York, and could not have been affected by the statute of Anne: but the New York supreme court decided that *Wheaton vs. Peters* constituted a valid precedent.

—*What may be the Subject of Copyright.* In order to acquire a copyright in a work, it is necessary that it should be original. The originality can, however, consist in the form or arrangement as well as in the substance. Corrections and additions to an old work, not the property of the compiler, can also secure copyright. The copyright of private letters forming literary compositions, is in the composer and not in the receiver. (*Oliver vs. Oliver*, *Percival vs. Phipps et al.*, *Story's Com.*)

—The English statute, 5 and 6 Vict., defines "book" "to mean and include every volume, part or division of a volume, pamphlet, sheet of letterpress, sheet of music, map, chart or plan separately published." The right of property in lectures, whether written or oral, is now confirmed by statute, the most important English decision on the point being that of *Abernethy vs. Hutchinson*, and American precedents being *Bartlett vs. Crittenden*, *Keene vs. Kimball*, and *Putnam vs. Meyer*: Copyright can be secured for original arrangements of common material, or novel presentations of familiar facts. In *Putnam vs. Meyer* the New York supreme court held that certain tabular lists of anatomical names, arranged in a peculiar and arbitrary manner for the purpose of facilitating the work of memorizing, were entitled to protection.

—Abridgments and abstracts, which can be called genuine and just, are also entitled to copy right. (*Lawrence vs. Dana*, *Gray vs. Russell et al.*) According to English precedent, copyright can not exist in a work of libelous, immoral, obscene or irreligious tendency. There is no record in the United States of a case in which the question of copyright in irreligious books has been considered. Drone points out that the uniform construction of the law relating to blasphemy is evidence of the large freedom of inquiry and discussion allowed in religious matters. On this point the opinion of Justice Cooley (*People vs. Ruggles*, 8 Johns. Rep., N. Y.) is worth citing. "It does not follow because blasphemy is punishable as a crime, that therefore one is not at liberty to dispute and argue against the truth of the Christian religion, or of any accepted dogma. Its 'divine origin and truth' are not so far admitted in the law as to preclude their being controverted. To forbid discussions on this subject, except by the various sects of believers, would be to abridge the liberty of speech and of the press on a point which, with many, would be regarded as the most important of all." In quoting a similar opinion of Justice Story, Drone concludes that "there appears to be no good reason why valid copyright will not rest in a publication in which are denied any or all of the doctrines of the Bible; provided to motives and manner of the author be such as not to warrant the finding of a case of blasphemy or immorality."

—Several of the questions concerning the status and the defense of literary property in this country are only now beginning to come into discussion. The literature of the country is still so young that as yet but a small portion of it has survived the statute term of copyright. From the present time, however, as the terms of works which have established a position as classics, begin in part or in whole to expire, we can look forward to a larger number of issues and of suits connected with alleged infringements of copyright.

—The case of *Putnam vs. Pollard*, decided in the New York supreme court in 1881, covered some points that appear to have not before received consideration. The defendants had reprinted some fragmentary and unrevised portions of the works of Washington Irving, on which the copyright had expired, and offered these for sale under the designation of "Irving's Works." The plaintiff had for a number of years used this title to describe the authorized, complete and revised writings of this author in the shape in which he had finally prepared them for posterity. The plaintiff sought to enjoin the sale, under the above title, of the fragmentary work, on the several grounds that it misled the public, caused injury to the literary reputation of Irving, and interfered with the property rights of Irving's heirs. The courts decided, however, that as long as the volumes in question contained nothing but material which had actually been written by Irving, it was not unlawful to designate them as "Irving's Works," even though the writings should not be in complete or in their final form; and the injunction was denied. The question involved was, it will be noted, one of trade-mark, and the decision took the ground that an author's name, combined with the term "works," does not constitute a trade-mark. Under this ruling, it might be proper to add to the title pages of volumes of "fragments" sold as "works," the caution "Caveat emptor."

—The four theories which have resulted from this discussion of a century, are thus summarized by Drone: 1. That intellectual productions constitute a species of property

founded in natural law, recognized by the common law, and neither lost by publication nor taken away by legislation; 2. That an author has, by common law, an exclusive right to control his works before, and not after, publication; 3. That this right is not lost by publication, but has been destroyed by statute; 4. That copyright is a monopoly of limited duration, created and wholly regulated by the legislature, and that an author has, therefore, no other title to his published works than that given by statute.

—The first country to take action in regard to international copyright was Prussia, which, in 1836, passed an act conceding the protection of the Prussian statute to the writers of every country which should grant reciprocity. In 1837 a copyright convention was concluded between the different members of the German confederation.

—This was followed by the English act of 1838, 1 and 2 Vict., c. 59, amended and extended by 15 Vict., c. 12. This act provided that her majesty might, by order in council, grant the privilege of copyright to authors of books, etc., first published in any foreign country to be named in such order, provided always that "due protection had been secured by the foreign power so named in such order in council, for the benefit of parties interested in works first published in the British dominions."

—Different provisions may be made in the arrangements with different countries. Under the general copyright act, no right or property is recognized in any book, etc., not first published in her majesty's dominions. Hence, British as well as foreign authors first publishing abroad, have no protection in Great Britain unless a convention has been framed, under the international copyright act, between Great Britain and the country in which the publication is made. It may be noted here, that the condition of "first publication" which obtains in the statutes of nearly all countries, has been held to be complied with by a *simultaneous* publication in two or more countries.

—Under this international copyright act, Great Britain has entered into copyright conventions with the following countries: with Saxony, in 1846; France, in 1851; Prussia, in 1855; states of Germany comprised in the German empire: Anhalt, in 1853; Brunswick, in 1849; Hamburg, in 1853; Hanover, in 1847; Oldenburg, in 1847; Hesse-Darmstadt, in 1862; Thuringian Union, in 1847. (It is not clear what effect the absorption of these states into the empire may have had upon their several copyright treaties.) With Spain, in 1857 (temporarily renewed in 1880); Belgium, in 1855; and Sardinia, in 1862 (confirmed in 1867 by the kingdom of Italy).

—The conventions with the several German states contain essentially identical provisions, which are as follows: "The author of any book to whom the laws of either state (English or German) give copyright, shall be entitled to exercise that right in the other of such states, for the same term to which an author of a similar work would be entitled if it were first published in such other state. The authors of each state shall enjoy in the other the same protection against piracy and unauthorized republication, and shall have the same remedies before courts of justice, as the law affords to the domestic authors. Translators are protected against a piracy of their translation, but

acquire no exclusive right to translate a work except in the following case: The author who notifies on the title page of his book his intention of reserving the right of translation, will, during five years from the first publication of the book, be entitled to protection, in the treaty state, from the publication of any translation not authorized by him. In order, however, to secure this protection, the author must, within three months of the first publication of his book, register the title and deposit a copy in the proper office in the treaty state; part of the authorized translation must appear within a year, and the whole of it within three years of the deposit and registration of the original; and the translation must itself be duly registered and deposited. When a work is issued in parts, each part shall be treated as a separate book; but notice of the reservation of the right of translation need be printed only on the first page. The importation into either of the two states of unauthorized copies of works protected by the convention, is forbidden. A certified copy of the entry in the register of either state shall *prima facie* confer an exclusive right of republication within such state.

—The provisions of the existing conventions between England and France, Spain, Belgium and Italy, are essentially identical with those of the German treaty. The continental book, on the title page of which has been duly printed the announcement of the reservation of the right of translation, must be duly registered at stationers' hall, London. The English work must be registered for France at the *bureau de la librairie* of the ministry of the interior, in Paris, and for Spain and Belgium at the corresponding, offices in Madrid and Brussels.

—The provisions of the treaty between Spain and France, which is based upon the Spanish copyright act of 1878, have, in the main, been followed in the conventions between Spain and Italy, Spain and Portugal, France and Italy, etc. They are as follows: 1. Complete reciprocity between the contracting parties; 2. Treatment of each nation by the other as the most favored nation; 3. Any author of his representative who has legally secured copyright in the one country, to enjoy it forthwith in the other, without further formalities; 4. The prohibition in each country of the printing, selling, importation or exportation of works in the language of the other country, without the consent of the owners of the copyright therein.

—The copyright treaty between France and Germany, as framed in 1883, is a step in advance in many ways. By article ten, authors of the two countries are spared all formalities of registration, and the appearance of the writer's name on the title page is to be considered sufficient proof of his rights, unless the contrary is proved. In the case of anonymous or pseudonymous works the publisher will be regarded as the author's representative. The knotty point of the right of translation has been solved by a compromise. The necessity to print a reserve of the right of translation on the book is abolished, as is the registration of translations. The author is to retain his right of translation for ten years, instead of the five hitherto allowed. When a work is issued in parts, the ten years to be counted from the issue of the last part. Books and acting plays are put on the same footing; and the treaty will apply to works already published.

—An international literacy association was organized some years ago, with Victor Hugo as its first president, and has been of service in calling attention to defects in

existing enactments and conventions for the protection of property in literature. It has recently called special attention to the exceptional position occupied by the United States toward the literature of other countries.

—Between no two countries has the exchange of literary productions been so considerable or so important as between Great Britain and the United States. The interests of authors, of readers, of publishers, of national literature and of national morality, have alike demanded that the exchange should be placed under international regulation, and that this extensive use by the public of each country of the literature of the other should be conditioned upon and adequate acknowledgment of the rights of the producers of such literature.

—It is a disgrace that the two great English-speaking people, claiming to stand among the most enlightened of the community of nations, should be practically the only members of such community which have failed to arrive at an agreement in this all-important international issue; and it is mortifying for an American to be obliged to admit that the responsibility for such failure must, in the main, rest with the United States.

—The reproduction of British literature in this country has, during the past century, been much more considerable than that of American literature in Great Britain, and the direct loss to the English authors, through the want of an assured and legalized remuneration from the American editions of their works, has therefore been greater than the corresponding direct loss to American authors. For this and for other reasons, the suggestions and propositions for an international arrangement have been more frequent and more pressing on the part of England. And although it is certainly true, that from an early date the rightfulness and desirability of an international copyright have been maintained in this country, not only by authors, but by leading publishers and many others who have given thought and labor to the matter, it is nevertheless the case that the views of these advocates of a measure have not as yet been successful in securing the legislation required to change the national policy. This policy still persistently refuses to recognize the rights of any alien writers, and, through such refusal, continues to inflict a grievous and indefensible wrong, not only upon such alien writers, but also upon the authors and the literature of our own country.

—The history of the efforts made in this country to secure international copyright is not a long one. The attempts have been few, and have been lacking in organization and in unanimity of opinion, and they have for the most part been made with but little apparent expectation of any immediate success. Those interested seem to have nearly always felt that popular opinion was, on the whole, against them, and that progress could be hoped for only through the slow process of building up by education and discussion a more enlightened public understanding.

—In 1838, after the passing of the first international copyright act in Great Britain, Lord Palmerston invited the American government to co-operate in establishing a copyright convention between the two countries. In the year previous, Henry Clay, as chairman of the joint library committee, had reported to the senate very strongly in favor of such a convention, taking the ground that the author's right of property in his

work is similar to that of the inventor in his patent. This is a logical position for a protectionist, interested in the rights of labor, to have taken, and the advocates of the so-called protective system, who call themselves the followers of Henry Clay, but who are to-day opposed to any full recognition of authors' rights, would do well to bear in mind this opinion of their ablest leader.

—No action was taken in regard to Mr. Clay's report or Lord Palmerston's proposal. In 1840 Mr. G. P. Putnam issued in pamphlet form "An Argument in behalf of International Copyright," the first publication on this subject in the United States of which we find record. It was prepared by himself and Dr. Francis Lieber. In 1843 Mr. Putnam obtained the signatures of ninety-seven publishers, printers and binders to a petition he had prepared, which was duly presented to congress. It took the broad ground that the absence of an international copyright was "alike injurious to the business of publishing and to the best interests of the people at large." A memorial, originating in Philadelphia, was presented the same year, in opposition to this petition, setting forth, among other considerations, that an international copyright would prevent the adaptation of English books to American wants.

—In the report made by Mr. Baldwin to congress twenty-five years later, he remarks that "the mutilation and reconstruction of American books to suit English wants are common to a shameless extent."

—In 1853 the question of a copyright convention with Great Britain was again under discussion, the measure being favored by Mr. Everett, at that time secretary of state. A treaty was negotiated by him, in conjunction with Mr. John F. Crampton, minister in London, which provided simply that all authors, artists, composers, etc., who were entitled to copyright in one country, should be entitled to it in the other on the same terms and for the same length of time. The treaty was reported favorably from the convention on foreign relations, but was laid upon the table in the committee of the whole. While this measure was under discussion, five of the leading publishing houses in New York addressed a letter to Mr. Everett, in which, while favoring a convention, they advised: 1st, that the foreign author must be required to register the title of his work in the United States before its publication abroad; 2d, that the work, to secure protection, must be issued in the United States within thirty days of its publication abroad; and 3d, that the reprint must be wholly manufactured in the United States.

—In 1853 Henry C. Carey published his "Letters on international copyright," in which he took the ground that the facts and ideas in a literary production are the common property of society, and that property in copyright is indefensible.

—In 1858 a bill was introduced into the house of representatives by Mr. Morris, of Pennsylvania, providing for international copyright on the basis of an entire remanufacture of the foreign work, and its reissue by an American publisher within thirty days of its publication abroad. This bill does not appear to have received any consideration.

—In March, 1868, a circular letter, headed "Justice to Authors and Artists," was issued by a committee composed of George P. Putnam, S. Irenæus Prime, Henry Ivison, James Parton and Egbert Hazard, calling together a meeting for the consideration of the subject of international copyright. The meeting was held on the 9th of April, Mr. Bryant presiding, and a society was organized under the title of the "Copyright Association for the Protection and Advancement of Literature and Art," of which Mr. Bryant was made president, and E. C. Stedman secretary. The primary object of the association was stated to be "to promote the enactment of a just and suitable international copyright law for the benefit of authors and artists in all parts of the world." A memorial had been prepared by the above-mentioned committee to be presented to congress, which requested congress to give its early attention to the passage of a bill, "to secure in all parts of the world the right of authors," but which made no recommendations as to the details of any measure. Of the 153 signatures attached to this memorial, 101 were those of authors and 19 of publishers.

—In the fall of 1868 Mr. J. D. Baldwin, member of the house from Massachusetts, reported a bill, the provisions of which had in the main received the approval of the copyright association, which provided that a foreign work could secure a copyright in this country, provided it was wholly manufactured here and should be issued for sale by a publisher who was an American citizen. The bill was recommitted to the joint committee on the library, and no action was taken upon it. Mr. Baldwin was of opinion that an important cause for the shelving of the measure without debate was the impeachment of President Johnson, which was at that time absorbing the attention of congress and the country. No general expression of opinion, was, therefore, elicited upon the question from either congress or the public, and even up to this date (June, 1883), the question has never reached such a state as to enable an expression of public opinion to be fairly arrived at. In 1871 Mr. Cox, of New York, introduced a bill which was practically identical with Mr. Baldwin's measure, and which was also recommitted to the library committee.

—In 1870 a copyright convention was proposed by Lord Clarendon, which called forth some discussion, but concerning which no action was taken on the part of the American government until 1872.

—In 1872 the new library committee called upon the authors, publishers and others interested to assist in framing a bill. At a meeting of the publishers held in New York, a majority of the firms present were in favor of the provision of Mr. Cox's bill. The report was, however, dissented from by a large minority, on the ground that the bill was drawn in the interests of the publishers rather than that of the public; that the prohibition of the use of foreign stereotypes and electrotypes of illustrations was an economic absurdity, and that an English publishing house could in any case, through an American partner, retain control of the American market. During the same week a bill was drafted by C. A. Bristed, representing more particularly the views of the authors in the copyright association, which provided simply that all rights secured to citizens of the United States by existing copyright laws be hereby secured to the citizens and subjects of every country the government of which secures reciprocal rights to the citizens of the United States. A few weeks later, at a meeting of

publishers and others held in Philadelphia, resolutions were adopted (which will be referred to later) opposing any measure of international copyright.

—These four reports were submitted to the library committee, together with one or two individual suggestions, of which the most noteworthy were those of Harper & Bros., and of Mr. J. P. Morton, a bookseller of Louisville. Messrs. Harper, in a letter presented by their counsel, took the broad ground that "any measure of international copyright was objectionable because it would add to the price of books, and thus interfere with the education of the people." It is to be remarked, in regard to this consideration, that it is equally forcible against any copyright whatever. As Thomas Hood says: "Cheap *bread* is as desirable and necessary as cheap books, but one does not on that ground appropriate the farmer's wheat stack." Mr. Morton was in favor of an arrangement that should give to any dealer the privilege of reprinting a foreign work provided he would contract to pay to the author or his representative 10 per cent, of the wholesale price. This suggestion was afterward incorporated in what was known as the Sherman bill. In view of the wide diversity of the plans and suggestions presented to this committee, there was certainly some ground for the statement made in his report by the chairman, senator Lot. M. Morrill, that "there was no unanimity of opinion among those interested in the measure." He maintained further, in acceptance of the positions taken by the Philadelphians, "that an international copyright was not called for by reasons of general equity or of constitutional law; that the adoption of any plan which had been proposed would be of very doubtful advantage to American authors, and would not only be an unquestionable and permanent injury to the interests engaged in the manufacture of books, but a hindrance to the diffusion of knowledge among the people, and to the cause of American education."

—The commission appointed by the British government in 1876 to make inquiry in regard to the laws and regulations relating to home, colonial and international copyright, made reference in the following terms to the present relations of British authors with this country: "It has been suggested to us that this country would be justified in taking steps of a retaliating character with a view of enforcing, incidentally, that protection from the United States which we accord to them. This might be done by withdrawing from the Americans the privilege of copyright on first publication in this country. We have, however, come to the conclusion, that, on the highest public grounds of policy and expediency, it is advisable that our laws should be based on correct principles, without respect to the opinions or the policy of other nations. We admit the propriety of protecting copyright, and it appears to us that the principle of copyright, if admitted, is of universal application. We therefore recommend that this country should pursue the policy of recognizing the rights of authors, irrespective of nationality." Here is a claim for a far-seeing, statesman-like policy, and based upon principles of wide equity, and planned for the permanent advantage of literature in England and throughout the world.

—It is mortifying for Americans, possessed of any sensitiveness not only for their national honor but for their national reputation for common sense, to see quoted abroad as "the American view of the copyright question" such utterances as the resolutions adopted in the meeting previously referred to, held in Philadelphia in January 1872. The meeting was presided over by Henry Carey Baird, and may be

considered as having represented the opinions of the Pennsylvania protectionists, opinions which, while not, as I believe, shared by the majority of our community, do still succeed in shaping the economic policy of the nation. The resolutions are as follows: 1. That thought, unless expressed, is the property of the thinker; when given to the world, it is, as light, free to all. 2. As property it can only demand the protection of the municipal law of the country to which the thinker is subject. 3. The author of any country, by becoming a citizen of this, and assuming and performing the duties thereof, can have the same protection that an American author has. 4. The trading of privileges to foreign authors for privileges to be granted to Americans is not just, because the interests of others than themselves may be sacrificed thereby. 5. Because the good of the whole people and the safety of republican institutions demand that books shall not be made costly for the multitude by giving the power to foreign authors to fix their price here as well as abroad.

—The first proposition is certainly a pretty safe one, as thought, until expressed, can hardly incur any serious risk of being, appropriated.

—The second proposition, while admitting for a literary creation its claim to be classed as property, denies to it the rights which are held to pertain to all property in which the owner's title is absolute. The property which would, if it still existed, most nearly approximate to such a definition as above given, is that in slaves. Twenty-five years ago the title to an African chattel who was worth in Charleston say \$1,000, became valueless if said chattel succeeded in slipping across to Bermuda. It is this ephemeral kind of ownership, limited by accidental political boundaries, that the Philadelphia protectionists are willing to concede to the creation of a man's mind, the productions into which have been absorbed the gray matter of his brain, and possibly the best of his life.

—In regard to the third proposition, it may be said that the protection accorded to American authors is, according to their testimony, most unremunerative and unsatisfactory; and it is difficult to understand why a European author, who had before him, under international conventions, the markets of his native country and of all the civilized world, excepting belated America, should be expected to give up these for the poor half loaf accorded to his American brother.

—The fourth proposition strikes one as rather a remarkable protest to come from Philadelphia. Here are a number of American producers (of literature) who ask for a very moderate amount of protection (if that is the proper term to apply to a mere recognition of property rights) for their productions; but the Philadelphians, filled with an unwonted zeal for the welfare of the community at large, say: "No; this won't do; prices would be higher, and *consumers* would suffer." The last proposition appears to show that this want of practical sympathy with the producers of literature is not due to any lack of interest in the public enlightenment. It may well, however, be doubted whether education as a whole, including the important branch of ethics, is advanced by permitting our citizens to appropriate, without compensation, the labor of others, while through such appropriation they are also assisting to deprive our own authors of a portion of their rightful earnings. But apart from that, the proposition, as stated, proves too much. It is fatal to all copyright and to all patent right. If the good

of the community and the safety of republican institutions demand, that, in order to make books cheap, the claim to a compensation for the authors must be denied, why should we continue to pay copyrights to Lowell and Whittier, or to the families of Longfellow and Irving? The so-called owners of these copyrights actually have it in their power, in co-operation with their publishers, to "fix the prices" of their books in this market. This monopoly must indeed be pernicious and dangerous when it arouses Pennsylvania to come to the rescue of oppressed and impoverished consumers against the exactions of greedy producers, and to raise the cry of "free books for free men."

—Early in 1880 a draft of an international copyright treaty was prepared, which received the support of nearly all the publishers, including Messrs. Harper, who had found reasons since 1872 to modify their views, and of some authors. The latter, together with the publishing firms which had previously been most active in behalf of a measure, gave their assent to this, not because they thought its provisions on the whole wise or desirable, but because the middle ground that it took between an author's bill, without any restrictions, and the extreme "manufacturing view" of the Philadelphians, seemed most likely to secure the general support required; and it was believed, that if a copyright could once be inaugurated, it ought not to prove difficult to amend it in the direction of greater liberty and greater simplicity.

—The proposed treaty provided that copyright should be accorded reciprocally to English and American works, the foreign editions of which should be issued not later than three months after the first publication: the entries for copyright should, however, by means of title pages, be made simultaneously in the home and the foreign offices of registry, and the several conditions applicable to the national copyright enactments should be duly complied with. It was further provided, in order to secure the protection of the American copyrights, that the foreign work must be printed and bound in this country, the privilege being accorded of importing stereotype plates and electroypes of the illustrations. It is to be noted, that this last clause indicates an advance in liberality of opinion since the suggestions of 1872 and of earlier dates, in nearly all of which it was insisted that the foreign work must be entirely remanufactured in this country. The authors and publishers who gave their signatures, under protest, to the petition in behalf of this treaty, objected principally to the brief term allowed for the preparation and issue of the reprinted editions. Many of the authors believed that there should be no limit of time, while some of the leading publishing houses insisted that the limit ought to be twelve months, and should in no case exceed six months. Attention was especially called to the fact that such a limitation as three months, while a disadvantage to all authors whose reputations were not sufficiently assured to enable them to make advance agreements for their works, would be especially detrimental to American writers, whose books were rarely undertaken by English or continental reprinters until they had secured a satisfactory home reputation. Chas. Scribner, Henry Holt & Co. and Roberts Bros. united with G. P. Putnam's Sons in a protest against what seemed to them the unwise and illiberal restrictions of the proposed measure. These firms did not, however, think best to withhold their signatures from the petition in behalf of the treaty, being of opinion, that even if it might not prove practicable to amend this before it was put into effect, amendments could as a later date be introduced, and that in any case, even a very

faulty treaty would be an advance over the present unsatisfactory and iniquitous state of things.

—In July, 1880, the American members of the international copyright committee, which had been appointed by the association for the reform of the law of nations, addressed to Mr. Evarts, secretary of state, a memorial in behalf of a treaty practically identical with the measure above specified, with the exception of specifying no limit of time for the issue of the reprint.

—In September, 1880, Mr. Lowell, at that time minister in London, submitted to Earl Granville the draft of a treaty based upon the suggestions of American publishers. Lord Granville advised Mr. Lowell, in March, 1881, that the British government would be interested in completing such treaty, but that an extension of the term for republication from three months to six would be considered essential, while a term of twelve months was thought to be much more equitable.

—In March, 1881, the international literary association adopted the report of a committee appointed to examine the provisions of the proposed treaty between the United States and England. In this report the two countries were congratulated at the prospect of an agreement so important to the authors of each, and the United States was especially congratulated upon the first steps being taken to remove from the nation the opprobrium of being the only people from whom authors could not secure just treatment. The provisions of the treaty calling for remanufacture, and the brief term allowed for the preparation of the reprint, were, however, sharply criticised. In the spring of 1881, Sir Edward Thornton, the British minister in Washington, received instructions from London to proceed to the consideration of the treaty, provided the term for reprint could be extended. President Garfield had taken a strong interest in the matter, an interest which Mr. Blaine was understood to share, and it was expected that the treaty would be submitted to the senate in the fall of 1881. The death of Garfield and the change in the state department appear to have checked the progress of the business, and there has since, to the date of this writing (June, 1888), been no evidence of any interest in it on the part of the present administration.

—It appears as if further consideration for the treaty can be secured only on the strength of a popular demand, based on a correct understanding of the rights and just requirements of authors, American and foreign, and on an intelligent appreciation of the unworthy position toward the question at present occupied by the United States, which alone among civilized nations has failed to give full recognition to literature as property.

—This brief historical sketch of the various national and international enactments relating to copyrights, indicates also the lines along which were developed the ideas relating to authors rights. The conception of property in literary ideas is of necessity closely bound up with the conception of property in material things. In tracing through successive centuries the history of this last, we find a continued development in its range and scope corresponding to the development in civilization itself, of which so large a factor is the recognition of human rights and reciprocal human duties.

—It would be beyond the scope of this paper to go into the history of the property idea. It is sufficient to point out, that what a man owned appears in the first place to have been that which he had "occupied", and could defend with his own strong arm. Later, it became what his tribe could defend for him. With the organization of tribes into nations, that which a man had occupied, shaped, or created, was recognized as his throughout the territory of his nation.

—The idea of protection by national law was widened into an imperial conception by the Roman control of the Roman world. With the shattering of the empire, the former local views of property rights (or, at least, of property possibilities) again obtained, and were only gradually widened and extended by the growth, through commerce, of international relations, a growth much retarded by feudal claims and feudal strifes. The robberbarons of the Rhine, by their crushing extortions from traders, did what was in their power to stifle commerce, and unwittingly laid the foundations of the so-called protective system; and later, the little trading communities, still hampered by the baronial standard, built up at their gates barriers against the admission of various products from the outer world, the free purchase of which by their own citizens would, as they imagined, in some manner work to their impoverishment. Barons and traders were alike fighting against the international idea of property, under which that which a man has created, or legitimately occupied, is his own, and he is free to exchange it, that is, entitled to be protected in the free exchange of it, throughout the civilized world, for any other commodities or products. A man's ownership of a thing can not be called complete if it is to be hampered with restrictions as to the place where, or the objects for which, he can exchange it.

—To that extent the idea of international copyright is bound up with the idea of free trade. They both claim a higher and wider recognition for the rights of property, taking the position, that what a man has created by his own labor is his own, to do what he will with, subject only to his proportionate contribution to the cost of carrying on the organization of the community under the protection of which his labor has been accomplished, and to the single limitation that the results of his labor shall not be used to the detriment of his fellow-men. The opponents of free trade would limit the right of the producer to exchange his products, saying, as to certain commodities, that he shall not be permitted to receive them at all, and, as to others, that he must give of his own product, in addition to the open market equivalent of the article desired, an additional quantity as a bonus to some of his favored fellow-citizens. The opponents of international copyright assert that the producers of literary works shall be at liberty to sell them only within certain political boundaries. The necessary deduction from such a position is, that the extent of an author's remuneration is made to depend, not upon the number of readers whom he had benefited, but upon the extent of the political boundaries of the country in which he happened to be a resident.

—If the recognition of the fact that aliens and citizens of foreign states (the "barbarians" of the Greeks and Romans) possessed rights deserving of respect, had depended solely upon the development of international ethics and humanitarian principles, its growth would have been still slower than has been the case. That growth has, however, been powerfully furthered by utilitarian teachings. When men came to understand that their own welfare was not hampered, but furthered, by the

prosperity of their neighbors, reciprocity took the place of reprisals, and commercial exchanges succeeded Chinese walls.

—The same result, in Europe at least, followed the understanding of the fact, that the development of national literature, and the adequate compensation of national authors is largely dependent upon the proper recognition of the property rights of foreign authors: this understanding, added to the widening conceptions of human rights, irrespective of boundaries, and the increasing assent to the claim that the producer is entitled to compensation proportioned to the extent of the service rendered by his production, and to the number of his fellow-men benefited by this, have secured international copyright arrangements on the part of all countries where literature exists, excepting only the great republic, which is founded on the "rights of men".

—The question of the proper duration of literary property has called forth a long series of discussions and arguments, the more important of which are referred to in Mr. Macleod's paper in this work. Authors have almost from the beginning taken the position that literary property is the highest kind of property in existence; that no right or title to a thing can be so perfect as that which is created by a man's own labor and invention; that the exclusive right of a man to his literary productions and to the use of them for his own profit is as entire and perfect as the faculties employed and labor bestowed are entirely and perfectly his own. "If this claim be accepted," says Noah Webster, "it is difficult to understand on what logical principle a legislature or court can determine that an author enjoys only a *temporary property* in his own productions. If a man's right to his own *property in writing* is as perfect as to the productions of his farm or his shop, how can the former be abridged or limited, while the latter is held without limitations? Why do the productions of manual labor reach higher in the scale of rights of property than the productions of the intellect?"

—It is the case, however, that notwithstanding the logic of this position, no nation to-day accords copyright for more than a limited term, of which the longest is eighty years. In the only countries in which the experiment of perpetual copyright has been attempted, Holland, Belgium, Sweden and Denmark, a return was speedily made to protection for a term of years. There appears to have been always apprehension on the part of the public and the governments lest an indefinite copyright might result in the accumulation in the hands of traders of "literary monopolies," under which extortionate prices would be demanded from successive generations for the highest and most necessary productions of national literature. It is hardly practicable to estimate how well founded such apprehensions may be, as no opportunities have as yet existed for the development of such monopolies. It seems probable that accumulations of literary property would, as in the case of other property, be so far regulated by the laws of supply and demand as not to become detrimental to the interests of the community. If a popular demand existed or could be created for an article, it would doubtless be produced and supplied at the lowest price that would secure the widest popular sale. If the article was suited but for a limited demand, the price, to remunerate the producer and owner, would be proportionately higher. A further consideration obtains in connection with literary property which has also influenced the framing of copyright enactments. The possibility exists that the descendants of an author who have become by inheritance the owners of his

copyrights, might, for one cause or another, desire to withdraw the works from circulation. A case could even occur in which parties desiring to suppress works might possess themselves of the copyrights for this purpose. The heirs of Calvin, if converted to Romanism, would very naturally have desired to suppress the circulation of the "Institutes"; and the history of literature affords, of course, hundreds of instances in which there would have been sufficient motive for the suppressing, by any means which the nature of copyrights might render possible, works that had been once given to the world. It will, doubtless, be admitted, that, in this class of cases, the development of literature and freedom of thought would alike demand the exercise of the authority of the government on behalf of the community, to insure the continued existence of works in which the community possessed any continued interest.

—The efforts in this country in behalf of international copyright have been always more or less hampered by the question being confused with that of a protective tariff. The strongest opposition to a copyright measure has uniformly come from protectionists.

—Richard Grant White said, in 1868: "The refusal of copyright in the United States to British authors is, in fact, though not always so avowed, a part of the American protective system. With free trade, we shall have a just international copyright".

—It would be difficult, however, for protectionists to show logical grounds for their position. American authors are manufacturers who are simply asking, first, that they shall not be undersold in their home market by goods imported from abroad on which no (ownership) duty has been paid, which have been simply "appropriated"; secondly, that the government for such of their own goods as are enjoyed by foreigners. These are claims with which a protectionist who is interested in developing American industry ought certainly to be in sympathy. The contingency that troubles him, however, is the possibility, that, if the English author is given the right to sell his books in this country, the copies sold may be, to a greater or less extent, manufactured in England, and the business of making these copies may be lost to American printers, binders and paper men. He is much more concerned for the protection of the makers of the *material casing* of the book than for that of the author who created its essential substance.

—It is evidently to the advantage of the consumer, upon whose interest the previously-referred-to Philadelphia resolutions lay so much stress, that the labor of preparing the editions of his books be economized as much as possible. The principal portion of the cost of a first edition of a book is the setting of the type, together with, if the work is illustrated, the designing and engraving of the illustrations. If this first cost of stereotyping and engraving can be divided among several editions, say one for Great Britain, one for the United States, and one for Canada and the other colonies, it is evident that the proportion to be charged to each copy printed is less, and that the selling price per copy can be smaller, than would be the case if this first cost had got to be repeated in full for each market. It is, then, to the advantage of the consumer, that, whatever copyright arrangement be made, nothing shall stand in the way of foreign stereotypes and illustrations being duplicated for use here whenever the

foreign edition is in such shape as to render this duplicating an advantage and a saving in cost.

—The few protectionists who have expressed themselves in favor of an international copyright measure, and some others who have fears as to our publishing interest being able to hold its own against any open competition, insist upon the condition that foreign works to obtain copyright must be wholly remanufactured and republished in this country. We have shown how such a condition would, in the majority of cases, be contrary to the interests of the American consumer, while the British author is naturally opposed to it because, in increasing materially the outlay to be incurred by the American publisher in the production of his edition, it proportionately diminishes the profits, or prospects of profits, from which is calculated the remuneration that can be paid to the author.

—The suggestion, previously referred to, of permitting the foreign book to be reprinted by all dealers who would contract to pay the author a specified royalty, has, at first sight, something specious and plausible about it. It seems to be in harmony with the principles of freedom of trade, in which we are believers. It is, however, directly opposed to those principles. First, it impairs the freedom of contract, preventing the producer from making such arrangements for supplying the public as seem best to him; and secondly, it undertakes, by paternal legislation, to fix the remuneration that shall be given to the producer of his work, and to limit the prices at which this work shall be furnished to the consumer. There is no more equity in the government's undertaking this limitation of the producer and protection of the consumer in the case of *books*, than there would be in that of bread or beef. Further, such an arrangement would be of benefit to neither the author, the public, nor the publishers, and would, we believe, make of international copyright, and of any copyright, a confusing and futile absurdity.

—A British author could hardly obtain much satisfaction from an arrangement, which, while preventing him from placing his American business in the hands of a publishing house selected by himself, and of whose responsibility he could assure himself, would throw open the use of his property to any dealers who might scramble for it. He could exercise no control over the style, the shape, or the accuracy of his American editions; could have no trustworthy information as to the number of copies the various editions contained; and if he were tenacious as to the collection of the royalties to which he was entitled, he would be able in many cases to enforce his claims only through innumerable law suits, and would find the expenses of the collection exceed the receipts.

—The benefit to the public would be no more apparent. Any gain in the cheapness of the editions produced would be more than offset by their unsatisfactoriness; they would, in the majority of cases, be untrustworthy as to accuracy or completeness, and be hastily and flimsily manufactured. A great many enterprises, also, desirable in themselves, and that would be of service to the public, no publisher could, under such an arrangement, afford to undertake at all, as, if they proved successful, unscrupulous neighbors would, through rival editions, reap the benefit of his judgment and his advertising. In fact, the business of reprinting would fall largely into the hands of

irresponsible parties, from whom no copyright could be collected. The arguments against a measure of this kind are, in short, the arguments in favor of international copyright. A very conclusive statement of the case against the equity or desirability from any point of view of such an arrangement in regard to home copyright, was made before the British commission, in 1877, by Herbert Spencer.

—The recommendation had been made, for the sake of securing cheap books for the people, that the law should give to all dealers the privilege of printing an author's books, and should fix a copyright to be paid to the author that should secure him a "fair profit for his work." Mr. Spencer objected: 1st. That this would be a direct interference with the laws of trade, under which the author had the right to make his own bargains. 2d. No legislature was competent to determine what was a "fair rate of profit" for an author. 3d. No average royalty could be determined which could give a fair recompense for the different amounts and kinds of labor given to the production of different classes of books. 4th. If the legislature has the right to fix the profits of the author, it has an equal right to determine that of his associate in the publication, the publisher; and if of the publisher, then also of the printer, binder and paper maker, who all have an interest in the undertaking. Such a right of control would apply with equal force to manufacturers of other articles of importance to the community, and would not be in accordance with the present theories of the proper functions of the government. 5th. If books are to be cheapened by such a measure, it must be at the expense of some portions of the profits now going to the authors and publishers; the assumption is, that book producers and distributors do not understand their business, but require to be instructed by the state how to carry it on, and that the publishing business alone needs to have its returns regulated by law. 6th. The prices of the best books would in many cases, instead of being lessened, be higher than at present, because the publishers would require some insurance against the risk of rival editions, and because they would make their first editions smaller, and the first cost would have to be divided among a less number of copies. Such reductions of prices as would be made would be on the flimsier and more popular literature, and even on this could not be lasting. 7th. For the enterprises of the most lasting importance to the public, requiring considerable investment of time and capital the publishers require to be assured of returns from the largest market possible, and without such security enterprises of this character could not be undertaken at all. 8th. Open competition of this kind would, in the end, result in crushing out the smaller publishers, and in concentrating the business in the hands of a few houses whose purses had been long enough to carry them through the long and unprofitable contests that would certainly be the first effect of such legislation.

—All the considerations adduced by Mr. Spencer have, of course, equal force with reference to open international publishing, while they may also be included among the arguments in behalf of international copyright.

—It is due to American publishers to explain that, in the absence of an international copyright, there has grown up among them a custom of making payments to foreign authors, which has become, especially during the last twenty-five years, a matter of very considerable importance. Some of the English authors who testified before the British commission stated that the payments from the United States for their books

exceeded their receipts in Great Britain. These payments secure, of course, to the American publisher no title of any kind to the books. In some cases they obtain for him the use of advance sheets, by means of which he is able to get his edition printed a week or two in advance of any unauthorized edition that might be prepared. In many cases, however, payments have been made some time after the publication of the works, and when there was no longer even the slight advantage of "advance sheets" to be gained from them.

—While the authorization of the English author can convey no title or means of defense against the interference of rival editions, the leading publishing houses have, with very inconsiderable exceptions, respected each other's arrangements with foreign authors, and the editions announced as published "by arrangement with the author," and on which payments in lieu of copyright have been duly made, have not been, as a rule, interfered with. This understanding among the publishers goes by the name of "the courtesy of the trade." I think it is safe to say that it is to-day the exception for an English work of any value to be published by any reputable house without a fair, and often a very liberal, recognition being made of the rights (in equity) of the author. In view of the considerable amount of harsh language that has been expended in England upon our American publishing houses, and the opinion prevailing in England that the wrong in reprinting is entirely one-sided, it is in order here to make the claim which can, I believe, be fully substantiated, that, in respect to the recognition of the rights of authors unprotected by law, their record has in fact, during the past twenty-five years, been better than that of their English brethren. English publishers have become fully aroused to the fact that American literary material has value and availability, and each year a larger amount of this material has had the honor of being introduced to the English public. According to the statistics of 1878 10 per cent of the works issued in England in that year were American reprints. The acknowledgments, however, of any rights on the part of American authors have been few and far between, and the payments but inconsiderable in amount. The leading English houses would doubtless very much prefer to follow the American practice of paying for their reprinted material, but they have not succeeded in establishing any general understanding similar to our American "courtesy of the trade" and books that have been paid for by one house are, in a large number of cases, promptly reissued in cheaper rival editions by other houses. It is very evident, that, in the face of open and unscrupulous competition, continued or considerable payments to authors are difficult to provide for; and the more credit is due to those firms who have, in the face of this difficulty, kept a good record with their American authors.

—One of the not least important results to be looked for from international copyright is a more effective co-operation in their work on the part of the publishers of the two great English-speaking nations. They will find their interest and profit in working together; and the very great extension that may be expected in the custom of a joint investment in the production of books for both-markets, will bring a very material saving in the first cost, a saving in the advantage of which authors, publishers and public will alike share.

—It seems probable that the "courtesy of the trade" which has made possible the present relations between American publishers and foreign authors, is not going to

retain its effectiveness. Within the last few years certain "libraries" and "series" have sprung into existence, which present in cheaply-printed pamphlet form some of the best recent English fiction. The publishers of these series reap the advantages of the literary judgment and foreign connections of the older publishing houses, and, taking possession of material that has been carefully selected and liberally paid for, are able to offer it to the public at prices which are certainly low as compared with those of bound books that have paid copyright, but are doubtless high enough for literature that is so cheaply obtained and so cheaply printed. These enterprises have been carried on by concerns which have not heretofore dealt in standard fictions, and which are not prepared to respect the international arrangements or trade courtesies of the older houses.

—To one of the "cheap series" the above remarks do not apply. The "Franklin Square Library" is published by a house which makes a practice of paying for its English literary material, and which lays great stress upon "the courtesy of the trade." It is generally understood that this series was planned, not so much as a publishing investment, as for purposes of self-defense, and that it would in all probability not be continued after the necessity for self-defense had passed by. A good many of its numbers include works for which the usual English payments have been made, and it seems probable, that, in this shape, books so paid for can not secure a remunerative sale. It seems safe to conclude, therefore, that their publication is not, in the literal sense of the term, a *business* investment, and that the undertaking was not planned to be permanent.

—A very considerable business in cheap reprints has also sprung up in Canada, from which point are circulated throughout the western states cheap editions of English works, for the "advance sheets" and "American market" of which United States publishers have paid liberal prices. Some enterprising Canadian dealers have also taken advantage of the present confusion between the United States postal and customs regulations to build up a trade by supplying through the mails reprints of *American copyright works*, in editions which, being flimsily printed and free of charge for copyright, can be sold at very moderate prices indeed.

—It is very evident, that, in the face of competition of this kind, the payments by American publishers to foreign writers of fiction must be materially diminished. These pamphlet series have, however, done a most important service in pointing out the absurdity of the present condition of literary property, and in emphasizing the need of an international copyright law. In connection with the change in the conditions of book manufacturing before alluded to, they may be credited as having influenced a material modification of opinion on the part of certain publishers who have in years past opposed an international copyrights as either inexpedient or unnecessary, but who are now quoted as ready to give their support to any practicable and equitable measure that may be proposed.

—We may, I trust, be able, at no very distant period, to look back upon, as exploded fallacies of an antiquated barbarism, the two beliefs, that the material prosperity of a community can be assured by surrounding it with Chinese walls of restriction to prevent it from purchasing in exchange for its own products its neighbor's goods, and

that its moral and mental development can be furthered by the free exercise of the  
privilege of appropriating its neighbor's books.

## PROPORTIONAL REPRESENTATION

PROPORTIONAL REPRESENTATION. Democracy has as its basis the right of the individual to be represented in the government of his country. This right has been distorted into the alleged right of a majority of men to be so represented, and to deny a like power to all others. Three causes have led to this: first, the fact, that all government rests at last upon superior physical force, and that in every civilized country a majority of its men is a stronger force than all the rest of the community; second, the belief that legislative bodies would find it too difficult to do even the little done now if the minority of the voters was fully represented (the common phrase of a "working majority" condenses this idea); and, third, the practical impossibility of representing all minorities, with the illogical deduction of the uselessness of representing any.

—The first cause would justify the seizure of a country and the overthrow of its institutions by any one who could persuade one more than half of its adult males to join him. The second is due to the existence in legislatures of a foolish partisan spirit, based on a desire to use public positions as party plunder, and to the non-existence of reasonable rules of procedure. Civil service reform will destroy absurd partisanship. Experience will create a proper procedure. It would be difficult, if not impossible, to represent all minorities. If 1,000,000 voters elect 100 representatives, one voter whose views differ wholly from those of all the rest, can not well be represented. But nearly all minorities can be represented, and should be, unless government of the people by the people is wrong.

—A crude form of minority representation often prevails, for a time, when a legislature is composed of two chambers. Whenever there is a liberal ministry in England and the house of lords dares to use its constitutional rights, this is true. The senate of the United States has not infrequently occupied the same position, notably in 1876, and again in 1883. Such a condition of affairs is often a good one in checking hasty legislation and insuring that public opinion, rather than public passion, shall be reflected in the statutes. But it is politically wrong. For it gives the minority more than proportional representation. It gives it a veto on the measures of the majority. Such a power, persistently used, would lead to revolution in any free country.

—A few figures may serve to show the injustice of the existing methods of election in the United States and in Great Britain.

—In the latter, two men have sat in the same house of commons, one of whom received 18,292 votes, and the other 69; ten successful candidates have polled 159,650 votes, while ten other successful ones polled 1,873, and ten defeated ones, 83,117; ten millions of the English people have elected 302 members, when twelve millions returned 187; of the lucky ten millions, 1,850,000 sent 81 members, and 3,008,000 sent 22; and 952,000 persons have returned 120 members, while 7,500,000 returned 96.

—In the United States, about 8,000,000 men voted, in 1882, for candidates for the forty-eighth congress. More than 3,500,000 of them, nearly 44 per cent, of the whole, voted for unsuccessful candidates, and therefore have no representation in the present congress. That is, the American system of majority representation practically disfranchised forty-four out of every hundred men to whom American laws gave the franchise. If we take the votes cast for Grant and Greeley in November, 1872, and divide each by the number of congressmen elected by the party in question, we find that a successful republican candidate required, on an average, 18,076 votes, while a liberal, to insure success, had to get 30,474. That is, majority representation made one republican vote worth one and three-fourths liberal votes. In 1866, when the fortieth congress was elected, one republican vote equaled two and one-fourth democratic votes. In 1872 the administration party received 55.93 per cent of the popular vote; the opposition, 44.07 per cent. But the respective strengths of the two parties in congress were 68.15 and 31.85 per cent. That is, majority representation added nearly forty-four per cent, to the just congressional power of the majority. In 1880 it took 29,500 votes to elect a republican congressman, and 33,500 to give him a democratic colleague. In 1882 the successful democrat, got, on an average, less than 21,000 votes, while the successful republican had to poll more than 28,000. Of the 8,000,000 persons who voted in 1882, 1,792,000 elected 163 members of Congress, a majority of the whole body. If these 163 vote together on any question (which is merely improbable, not impossible), they can carry it, though they represent less than one-fourth of the voters who took part in the election, and less than one-fifth of the voters in the country. A minority of less than one-fourth would then rule the nation, and perhaps dictate its policy for a term of years. To prevent the possibility of minority rule, minority representation must be granted.

—The ideal sought by all systems of proportional representation is this: Every vote cast at the polls for a candidate for membership in a law-making assembly should count in every vote taken in that assembly, whether or not the particular person voted for is elected. Seven methods of reform in representation have been suggested. These are, the proxy, the limited, the cumulative and the double vote, the free list or registered ballot, the Andræ (or Hare) system, and totality representation. The limited, the cumulative and the Andræ plans have been tried on a large scale.

—The proxy vote regards every vote for a legislative candidate as an informal power of attorney, and authorizes him, *if* elected, to cast as many votes as were cast for him. The fatal objection lies in the "if." If a candidate is not elected, his supporters have no representation whatever. This plan merely makes the power of local majorities greater than it is now, and so offers a standing reward for the fraudulent increase of such majorities.

—The limited vote applies only to elections in which three or more places are to be filled. Some English boroughs choose members of parliament in this fashion. Every elector can cast as many votes as there are vacancies, less one. If three men are to be chosen, he can vote for two; if four, three. But he can not give more than one vote to one man. This plan fails to give representation to any but a very large minority. Suppose 100,000 electors, and three places to be filled. A minority of 39,997 can elect no body, for the majority of 60,003 can cast 120,006 votes, which, divided among

three candidates, will give each 40,002. In case of an accidental vacancy, under this system, a direct majority vote must decide the succession.

—The cumulative vote gives every elector as many votes as there are places to be filled and allows him to concentrate or scatter them as he will. This plan also recognizes the rights only of large minorities. It is not proportional. Let the number of vacancies equal  $x$ . A minority of less than  $(1/x+1) + 1$  loses all representation. If there are 100,000 electors and three vacancies, 25,001 electors can secure one member (which is more than their share), but any less number must go unrepresented. Again, a very large minority does not get enough representation. If the 100,000 electors stand 50,001 to 49,999, the minority can get but one member, provided their opponents concentrate on two. The cumulative vote usually involves a great waste. In the first election of the London school board, conducted on this plan, the leading candidate received nearly 50,000 votes, while her colleagues were elected by from 8,000 to 13,000, and 50,000 were wholly lost. This system also makes no provision for the filling of accidental vacancies. Under the last constitution of the state of Illinois, adopted in 1870, the members of the lower house of the state legislature are chosen in this way, three from each district. This has been moderately successful. Parties have been better balanced in the legislature, and some better men have been sent there from the country districts. In the cities and towns, however, the most marked result has been to make king caucus more of a monarch than ever. A premium is put on the bargaining of party managers at the cost of party voters. By limiting the number of candidates on each side, the managers practically run a joint ticket, a proceeding which is rarely conducive to the public welfare. A similar provision in the same constitution in regard to the election of the officers of private corporations seems to have had no results.

—The double vote requires two elections. The first tests the relative strength of the several parties, and so determines how many representatives each shall have. If, with a legislature of 100 members, 600,000 persons vote the liberal ticket and 400,000 the conservative, the liberals become entitled to sixty members, and their opponents to forty. At a supplemental election each party selects its representatives. The double vote involves a waste of time, trouble and money, but it solves to a certain extent the problem of filling an accidental vacancy, and is worth more attention than other systems far better known.

—The free list or registered ballot scheme, provides that a certain number of citizens can make nominations by registering a list of names, the number of which shall not exceed the number of places to be filled. At the ensuing election only the lists thus registered can be voted for. The number of votes needed to elect is found by dividing the whole number of votes by the number of vacancies. If there are 100,000 voters, and ten places to be filled, the quota is 10,000. Suppose four tickets to be nominated, which receive respectively 35,000, 30,000, 27,400, and 7,600 votes. As the first has three times the quota, the first three men on it are elected. The second ticket also has three men elected, and the third two. The largest two remainders are those for the fourth and the third ticket, 7,600 and 7,400. The first nominee on the fourth ticket and the third on the third are therefore chosen. There is a waste of votes here. The men elected on the four tickets represent, respectively, 11,666, 10,000, 9,133 and 7,600

voters. Since 7,600 ballots suffice to elect a candidate, 24,000 ballots, nearly one-fourth of the whole, have been wasted. Again, in the event of the death, resignation or expulsion of a legislator, and a consequent special election, the free list can not be used.

—The Andræ system of proportional representation is commonly known in Great Britain and America as the Hare system, but Mr. Andræ introduced the practice of it in Denmark two years before Mr. Hare called attention to the theory of it in England. Under this system the quota of votes needed to elect a candidate is found as it is under the free list. Every elector puts as many names as he pleases on his ballot, numbered one, two, etc. As the ballots are taken from the box, each is credited to the name which is first upon it. If the electoral quota has already been cast for this first name, the ballot is credited to the second name upon it, and so on till all the full quotas have been ascertained. The largest fractions of quotas then elect, as under the free list system. This plan is somewhat complex, but not unduly so. It reduces the waste of votes almost to a minimum, except in the case of a special election or of an unusual number of candidates. The gravest objection to it is, that in transferring votes the real wishes of very many electors may be wholly ignored; chance may conquer choice. Suppose 100,00 electors, and two men to be elected; A is everybody's first choice; B and C each stand second on 50,000 papers. It makes a great difference which 50,000 ballots are counted for A. Chance or cunning, not choice, will elect B or C, as the case may be. Again, suppose B to stand second on 74,500 papers, and C on 25,500. If all the ballots counted for A have B as second choice, B's remaining 24,500 votes are eclipsed by C's 25,500, and C is elected, although B's real majority over him is 49,000.

—The formula of totality representation is this: after every general election of a law-making assembly, let the aggregate number of votes cast by each party be ascertained; divide this by the number of representatives elected by the party in question; the quotient will be the number of votes which each of those representatives is entitled to cast.

—Suppose that of 8,000,000 voters, who choose a congress of 300 members, 4,500,000 belong to one party and 3,500,000 to the other. It is quite possible that the congress thus chosen would stand 200 to 100. This estimate gives the majority less proportional weight than it has had in several congressional elections. While the parties in the nation were as nine to seven, they would be in the house as two to one. The legal majority in the latter would be 100; the equitable, 38. But apply the plan here proposed. Each of the majority has  $(4,500,000 \div 200) = 22,500$  votes; each of minority has  $(3,500,000 \div 100) = 35,000$  votes. The end sought is attained. The strength of each party in the house is a precise index to its strength in the nation. There is not an unrepresented man in the country.

—Under totality representation, an independent legislator would cast the number of votes he received. The ballots thrown for the man he defeated would be credited to that man's party. If an independent candidate were defeated his supporters' votes could be credited to other independents or go to swell the sum total of one of the two great parties. His constituents could express their wishes in this respect on their ballots.

—Fraud would be diminished by diminishing its usefulness. If we take our hypothetical figures of 8,000,000 voters, divided into two parties of 4,500,000 and 3,500,000, represented by 200 and 100 members of congress respectively, 50,000 fraudulent votes in favor of the majority would doubtless ensure the return of ten more members. The party in power would then have 210 to the opposition's 90. But under this system the administration would have a voting strength of 4,550,000 to its opponents' 3,500,000. In the first case, the fraud would increase the party majority by 20 per cent.; in the second case, by 5 per cent.

—At first the process of recording the votes of the legislature might be a trifle slow, but after two or three days' experience under the appointment which would follow each general election, a clerk could reckon the result of a doubtful vote about as quickly as if it were taken by yeas and nays.

—The totality representation system would make every vote cast at the polls at an election of a law-making assembly count in every vote taken in that assembly, whether or not the particular person voted for was elected. It would bring many habitual absentees to the polls, by giving every vote its proper weight, and would thus maintain a healthy public interest in politics. Its introduction would involve no sweeping changes, either in electoral districts or in modes of election. The ignorant citizen could vote as before, without being perplexed by new methods. All the necessary calculations would be made for him after the election. The system would stop "gerrymandering" by making it useless. A vote, wherever cast, would count. Finally, totality representation would allow an accidental vacancy to be filled at once, without depriving the minority in the particular district of its due representation. The new figures from this district would be substituted for the old ones in the aggregate vote of each party; each aggregate would be divided as before; and the quotient would be the number of votes which each representative of the party in question would be entitled to cast.

## PROTECTION.

PROTECTION. RESTRICTIONS UPON FREEDOM OF EXCHANGE. I. *Fiscal Duties or Duties for Revenue only.* Notwithstanding the evident advantages of freedom of exchange, it has been restricted by two kinds of measures, fiscal and prohibitory ones. We shall first consider the former.

—It is easy to conceive how exchanges came to be restricted with a view to the wants of the treasury. As soon as avenues of communication began to be opened and exchanges to multiply governments began to perceive that it was both possible and profitable to tax articles which found a market through the new ways. At first the tax was a simple toll for meeting the expense of maintaining the roads worn by the transportation of merchandise: soon it served also to reimburse the treasury for other public services, among which may be counted the security afforded those making the exchanges. But, in imposing a tax of this kind, the end in view was not the restriction of trade, it was simply to procure as much money as possible for the treasury, and this fiscal end could not be attained without trade being hampered thereby.

—Unfortunately, a good financial course was rarely adopted. In the middle ages, for example, every country was divided up into a multitude of little seignories or chatellanies, whose proprietors arrogated to themselves the right of taxing the exchanges within their territorial limits. These artificial obstacles, being interposed in addition to the natural obstacle of distance, resulted in such an interception of the exchanges as prevented the extension of trade. Consequently, the industries, being confined to the chatellany or the commune for a market, long remained in an undeveloped state. As the means of production could not be developed, wealth and civilization made no progress, save on the seacoasts and along the great rivers, where fewer obstacles impeded free circulation.

—Later, the feudal system having disappeared, the number of tolls was diminished, and there was at the same time augmented security of communication. The sphere of the exchanges at once became enlarged, a better division of labor became possible, and public wealth developed as if by enchantment. The establishment of the uniform tariff of Colbert in France, and the abolition of internal customs duties by the constituent assembly, contributed greatly to these results.

—In our day the octroi and excise duties, river tolls, tonnage duties, etc., in Europe, which directly affect the circulation of supplies, have a purely fiscal character. Until better means have been found for providing for the public expenses, or until the offices for which the tax furnishes the salaries are by degrees relegated to the domain of private industry, it will be difficult to find a substitute for these taxes. It is only to be regretted that they have become so numerous and are so exorbitant; for, by their excess, they hinder the growth of trade, retard progress in the division of labor, and consequently prevent, in no small degree, an increase of revenue to the treasury.

—Notwithstanding the hindrance to the development of trade, resulting from the establishment of fiscal taxes, the principle of these taxes can not be assailed. If they restrict the sphere of the exchanges, it is inevitable; but their object is not to restrict.

—II. *Protective or Prohibitory Duties. Their character and effects.* Protective or prohibitory duties have an entirely different character. These are established with direct view to limiting the sphere of exchange. They restrict in order to restrict. The governments which have persistently imposed them, apparently with the idea that the organization and development of the exchanges could not be safely left to the rule of Providence, have interposed "to regulate the matter." We shall see whether these organizers of the exchanges were well inspired. But let us first ascertain what are the defenses of the protective system.

—Considered as a whole, the protective or prohibitory system includes two kinds of impediments, viz., prohibitions or protective duties on the importation of merchandise, and prohibitions on its export. It includes also premiums awarded to the exporters or importers of certain classes of supplies. Finally, it has served as a basis for the colonial system, as well as for tariff agreements or commercial treaties.

—Prohibitions or protective duties imposed on imported merchandise, have for their object to favor the development of certain branches of national production at the expense of the same industries in foreign countries.

—Prohibitions against exporting are sometimes imposed in order to keep certain supplies, essential to the industries or to national consumption, at a low price, or to restrict foreign industries or foreign consumption.

—Premiums on export are pecuniary encouragement awarded to certain branches of national industry at the expense of other branches. Sometimes their object is to hasten the development of an industry deemed necessary, or to counteract the protective duties imposed by foreign countries. Sometimes, again, they are imposed simply as a remedy for a sudden panic. The *drawbacks* are premiums to reimburse the exporter of a manufactured product, for the tax paid on the raw materials imported. Premiums on importation are ordinarily of a transient character, in past times they were sometimes employed in cases of dearth, for example, to encourage the importation of food supplies.

—Customs agreements and commercial treaties are partial and temporary breaches of prohibitory tariffs, in favor of certain nations with which it is desired to maintain especially friendly relations.

—Prohibitions or protective taxes on importation constitute the principle weapon of the system. To obtain a clear idea of the manner in which they operate, let us take an example. Suppose the nation A annually furnishes the nation B a thousand tons of spun cotton. Why does B buy this cotton of A instead of spinning it itself? Because the manufactories of A are so situated and organized as to produce spun cotton in better quality and at lower price than manufactories in B could possibly do: because the nation A is more advantageously situated in respect to the conditions for the

manufacture of cotton. If it were not so, cotton would be manufactured in B as well as in A. But here a statesman of B persuades himself that it would be useful to "ravish" this industry from the foreigner, and that the importation of cotton thread should be interdicted. Suppose this statesman can prevent the people of B from receiving the thousand tons of cotton which had been annually furnished them by A, as is possible if the frontier is easy to guard, and is provided with a sufficient number of proved and well-paid officers. Suppose he also promotes the erection of a certain number of mills in B for spinning cotton. Can he place these spinning mills under conditions of production as favorable as those of the mills of A? Can he cause cotton to be spun as well and as economically as in A? No; for he is not master of the natural conditions of cotton production: these he can not change. All he can do, is to prevent cotton which has been spun at low cost from entering B. There his power stops. The nation B now ceases to be "invaded" (this is the consecrated term of the prohibitionist's vocabulary) by the thousand tons of spun cotton from A. It makes its own cotton; but this cotton costs more than that of A, and is of a poorer quality; and less of it is consequently consumed. Before prohibition, the consumption of B took a thousand tons of spun cotton; after prohibition, it no longer takes more than six or seven tenths of this quantity; whence results a diminution, by this difference, in the total production of cotton. Suppose, now, that the nation A imitates the course of B, and prohibits, for example, the importation of spun flax, which it formerly received in exchange for its supplies of cotton. Flax will begin to be spun in A; but as it will be spun at greater cost than in B, and not so well, the total production of linen will in turn be diminished. Less will be produced by both nations, though with as great or greater expenditure of effort than before; and one country will not be as well provided with linen, and the other with cotton.

—At the time when this mischievous policy became the law in international relations, and every nation was trying to "ravish" manufactures from foreigners, a very spirited pamphlet was published in England, under the title "Monkey Economists." A vignette representing a barrack of monkeys served as a frontispiece. Half a dozen monkeys, placed in separate compartments, were coming to receive their regular allowance; but, instead of each one peaceably consuming the portion allotted him by his keeper, these animals were each maliciously attempting to "ravish" the portions of their neighbors, without perceiving that the latter were engaged in the same operation. Thus every one exerted himself to the utmost to obtain by stealth that which could have been easily found directly before him; and the common fund of subsistence was diminished by all that was wasted or lost in the scramble.

—Exactly such has been the conduct of governments which have adopted the errors of the prohibitory system. They have neglected the wealth which Providence bestowed upon them, to purloin that which had been allotted to their neighbors. They have, by their mischievous jealousy, rendered production more difficult and less abundant: they have retarded the growth of prosperity among the people. A statesman who imposes a prohibitory or protective duty, acts precisely the reverse of an inventor who discovers a new process for rendering production more economical and more perfect: he invents a way to render production more expensive and not so good: he invents a process which compels people to forsake fertile lands and productive mines,

to cultivate bad lands and work poor mines. He is the reverse of an inventor: he is the agent of barbarism, as an inventor is the agent of civilization.

—This becomes still more evident when we examine the influence of the prohibitory régime on progress in the industries. Division of labor is the chief element of a low-priced market; the more labor is divided, the more the expense of production is reduced, and the more, consequently, prices are reduced. The demonstrations of Adam Smith on this point have become classical. But on what conditions can labor become more and more subdivided? On condition that it can find a continually widening market. "As it is the power of exchanging," said Adam Smith ("Wealth of Nations," book i., chap. iii.), "that gives occasion to the division of labor, so the extent of this division must always be limited by the extent of that power, or, in other words, by the extent of market. \* \* It is impossible that there should be such a trade as that of a nailer in the remote and inland parts of the highlands of Scotland. Such a workman at the rate of a thousand nails a day, and three hundred working days in a year, will make three hundred thousand nails in a year. But in such a situation, it would be impossible to dispose of one thousand, that is, of one day's work, in a year." Division of labor, then, can be extended only as the market is increased. Hence everything that narrows the market must inevitably retard division of labor and industrial progress. Now, by systematically taking away from the most favored industries a part of their market, the prohibitory system compels manufacturers to reduce their scale of production, and to divide labor less. In cotton manufacture, for example, it would oblige the spinners to spin coarse and fine numbers at the same time, instead of confining themselves to a few numbers or to one alone. Thus production would become more costly and less perfect. It is true, however, that if prohibition contracts the business of the established firms, it gives rise to new ones. But what is the situation of these? Placed, relatively to their rivals, in unfavorable condition of production, they can not create a sale for their products outside of their own country. Now, this market is limited. An effort is made, it is true, to remedy its insufficiency by establishing premiums on exports, which will permit the protected industries to compete in the markets of their rivals. But, this proceeding being extremely costly and manifestly unjust, it can be employed only to a limited degree. On the one side, then, the industry situated under favorable natural conditions is injured; and on the other, establishments which prohibition has made to spring up artificially, find themselves so situated that they can not extend their market without imposing the most onerous sacrifices on the nation. Thus the artificial breaking up of the markets, occasioned by the prohibitory régime, has everywhere retarded division of labor, diminished progress in the industries, and at the same time perpetuated high prices.

—This is not all. High prices are not the only evil which the prohibitory régime has perpetuated, if not engendered. To this evil may be added another not less disastrous, viz., instability. The industries which prohibition makes spring up under unfavorable economic conditions, are continually exposed to fatal lesions. Let the prohibitory duty which permits their existence become lowered, or surveillance be less guarded on the frontiers, and they will infallibly be deprived of a part of their trade. They then suffer all the disasters which are consequent on industrial panics, and their very existence is compromised. They resemble those hot-house plants which perish as soon as one ceases to supply them with the fuel necessary to maintain their artificial existence.

The condition of the national industries is no longer secure. They have nothing to fear, it is true, for their home market, for they are so situated as to defy foreign competition; but the markets they have been able to create abroad are essentially precarious. At any moment prohibition may take from them these markets, on which their existence in part depends. The prohibitory régime, then, causes production to be accompanied by risk, and this inevitably has a disastrous effect on the growth of industries as well as on the condition of the workman.

—Prohibitory taxes on exports are generally less important than others, but their effects are no more salutary. When recourse has been had to them, it has usually been in order to prevent or to restrict the exportation of articles of subsistence and certain raw materials essential to the industries of a country. Let us see how they operate. Two cases may occur: 1st, where the production of the article whose export is interfered with, is limited by nature; 2d, where it may be indefinitely increased. In the former case, which is the more rare, prohibition acts at first simply as a tax levied upon certain producers for the benefit of certain consumers. Suppose, for example, the French government should prohibit the export of the choicest French wines. What would result? It is not probable that a smaller quantity of these would be produced; but the producers, obliged henceforth to offer their whole vintage of these choice wines in the home market, would no longer derive as much profit from them. They would suffer for the benefit of a certain class of French consumers. Such would be the near effect of the imposition of the prohibitory duty. But the consumers would have to suffer in their turn. The best wines being taxed for the benefit of home consumers, the production of fine wines would be discouraged. No attempt would be made to improve the inferior wines, lest they should also be taxed. The home consumers would obtain, it is true, the best wines at a lower price; but they would have to renounce the advantages they might have received from an improvement in the inferior wines. The final result of it all would be that they would be more poorly provided with fine wines, and would have to pay more for them.

—In the second case, *i.e.*, where production may be indefinitely increased, prohibition on export would be at once followed by diminished production of the prohibited article. If the latter were, for example, wheat or any other article of food, or silk, flax, or raw hemp, the production of these articles would be gradually reduced until it was proportioned to the market. Prices would doubtless fall greatly in the meantime; but they would again rise. In fact, the diminished market would compel producers to restrict their operations; and those who produced on a small scale, no longer being able to divide their labor so efficiently, would eventually be driven from the market, because production would have become more costly to them. The remaining producers then having the monopoly, might raise prices so that the consumer would in the end suffer from a measure originally intended for his benefit. But if the object of the prohibition is to deprive a rival industry of its necessary material, this selfish measure will result in encouraging the production of a similar article abroad. Thus England, by putting a high export duty on coal, contributed to the development of mineral production in Belgium.

—To sum up, then, high prices on the one hand, and instability on the other, result from the prohibitory régime; the high prices arising from the bad conditions of

production in which this régime places the industries, and the obstacle in interposes to division of labor, when it does not cause a monopoly; and the instability resulting from modifications in the tariffs, which continually produce panics in the markets.

—III. *Causes which have led to the establishment of the Protective or Prohibitory Régime.* It must seem astonishing that a system so clearly disastrous to the people, so opposed to progress in wealth and civilization, could have become established. Its origin must be principally attributed to certain circumstances inherent in the condition of barbarism and war in the midst of which it arose. Nations, which had been from their commencement hostile to each other, and almost continually at war, could not exchange their products in any permanent or regular manner. Each was obliged to provide for itself most of the articles of its consumption. War then acted as an artificial obstacle added to the natural obstacle of distances. When peace succeeded war, this artificial obstacle disappeared. Unfortunately, its removal was only accidental and temporary: a new war soon arose, when the obstacle reappeared at once. Let us endeavor to obtain an idea of the precise effect which sudden changes of this sort might have on the state of production. Suppose two nations, C and D, the first supplying the second with woolen goods while receiving in exchange silk goods. A war arises, and exchanges are immediately interrupted. The consumers of D can no longer receive the woolen goods which the producers of C had been accustomed to furnish them. The consumers of C are deprived, in their turn, of the silk goods they were having from D. Meanwhile, the demand continues, on the one side for wool goods, on the other for silk. This, then, is what will probably happen. The manufacturers of woolen goods in C, whom the war has deprived of their market, will begin to produce silks, and the manufacturers of silks in D will set about producing woolen goods. Each nation will thus succeed in obtaining as before the war, the goods it needs. To be sure, the conditions will be less favorable. The silks which C will manufacture will probably be dearer and not so good as those with which it provided itself in D. The wool goods which D will make will probably be inferior to those it procured in C; but, on both sides, it will be found more advantageous to employ the capital and the labor whose market the war has cut off, than to leave them idle; on both sides, also, people will prefer to pay a higher price for the goods they need, than to do without them. The war, as we see, compels a change of place of certain industries, to their injury. It ruins the most vigorous branches of production, those which had been able to create an outside market, to substitute for them artificial industries which only the interruption of international communication can make subsist. But peace comes in time: and the protection which the war gave C in the manufacture of silks, and D in the manufacture of woolen goods, at once vanishes. It is evident that these war industries must succumb, unless an equivalent obstacle is substituted for the war, in order to protect them. If the condition of the world is such that the peace can be lasting, it will most assuredly be better to let them succumb, and thus permit production, to resume its natural place; but if war is the natural condition of communities, if peace intervenes only as a short truce, perhaps it will be preferable to renounce relations whose precarious existence is a continual occasion of disastrous perturbations. Prohibition will then appear as a veritable insurance premium granted the industries to which war has given rise, and whose maintenance it was rendered necessary.

—Thus, for example, the prohibitory system became considerably extended in Europe and America at the close of the continental war. During the war the general interruption of communication had led to the establishment of a certain number of industries under bad economic conditions. When the war ceased, the manufacturers loudly demanded that the impediment of prohibition be substituted for that of war, to protect them. Governments hastened to defer to their demand. This was unquestionably a great mistake; for, at a time when peace has become the normal condition of communities, prohibition is no longer anything but a costly anachronism. In this new situation it costs less to suffer the perturbations which a temporary war may cause in international relations, than to pay a heavy war premium for twenty or thirty years to avoid them. However, one can conceive how the prohibitory régime should have come to prevail to a certain degree at the close of a war which convulsed the world for a quarter of a century, and made communities retrograde toward barbarism. On the other hand, it is more difficult to comprehend how this was régime could have been extended and made worse, as it was, long after peace had become established. This is connected with certain effects of prohibition, of which it is important to take account.

—We have spoken above of a statesman who should establish prohibitions or protective duties as the reverse of an inventor. Let us pursue the comparison, and we shall discover the motives which have contributed to extend and make more burdensome the prohibitory régime in time of peace. Suppose that an inventor discovers a process which permits a saving of 10 per cent, in the cost of production of a certain article: by lowering the price of that article 5 per cent, he will obtain an advantage over his competitors, and realize besides a good profit. This profit is the difference between the saving effected and the amount by which the price has been lowered, and constitutes the remuneration for the invention. Now, what takes place when a prohibitory duty is imposed? An artificial deficit is immediately produced in the market, and this deficit brings about an increase in the price. A certain article which was procured at an average price of twenty cents, for example, can no longer be obtained under thirty cents. This is an artificial enhancement by one-half, and is caused by the rupture of communication between the foreign producers and the home consumers. Suppose the prohibited article could be produced in the country at an average price of twenty-two cents: capital would be invested in that new industry; for it would receive, besides the ordinary profits of other branches of production, an extraordinary premium equal to eight cents. This premium would result from the difference between the price at which the article can be produced in the country, and the artificial price which prohibition has created. It is then manifest that if the profits of invention are based on the lowering of prices, those of prohibition are based in just the same way on their enhancement.

—But is the extraordinary premium arising from prohibition lasting? Must not the profits in the protected industries finally fall to the level of those in other branches of production, as a result of home competition? That will depend on the nature of the protected industry. If the industry is one whose essential elements are not limited in the country, the premium will have only a temporary character; for new manufactories will be established with a view of obtaining the premium as long as it shall continue. Home competition will then lower prices so much as to destroy the premium.

Sometimes even the increase of the protected industry will not stop at its necessary limit, and prices will suddenly fall below the expenses of production. The result will be a panic, which will swallow up a good part of the profits from the premium which enhanced prices. Prices will afterward rise again; but the protected industry will have ceased to realize profits greater than those of other branches of production. Its *patent* will have expired, to use an apt phrase of Mr. Huskisson. It will be otherwise if the protected industry is not capable of unlimited extension; if it is, for example, grain culture in a country where land adapted to raising wheat is scarce, or the production of coal, iron, or lead, in countries where mineral deposits are rare. In such cases, the enhanced price may be obtained for any length of time. If prohibition has increased the price from twenty to thirty, the supply will be sufficiently small not only to maintain this price, but even to increase it gradually with the increase of population and public wealth. Then the holders of natural protected monopolies, such as land or mines, will see their profits increase every year; they will continually grow rich without having to take the least trouble.

—But, whether the premium which enhances prices be lasting or temporary, the allurements of that premium is sufficient, and more than sufficient, to multiply prohibitions. What more tempting, in fact? While money is so difficult to win under the abominable law of competition, here is a process discovered, by the aid of which one can grow rich by turning over his hand. Who would not hasten to use and to abuse so marvelous a process? Who would not manage to work the machine to manufacture premiums, until the exhaustion of the material? To be sure, these premiums can be obtained only at the cost of the ruin or impoverishment of others; they constitute a manifest spoliation, a veritable brigandage. But does one stop for such slight considerations when a fortune is in question? Besides, is not this spoliation legal? Is not this brigandage consecrated by the practice of all civilized nations? Is it not universally admitted that one may confiscate, by means of a simple statute, the trade of a foreign industry, and impose on the "protected nation" an extra tax to enhance the price, payable into the hands of the beneficiaries of the confiscated trade?

—Meanwhile, theorists are taking it into their head to denounce so unjust and disastrous a violation of property rights. They demand liberty of the exchanges, invoking justice and urging the interests of the masses. But there is no embarrassment in replying to these theorists. In the first place, they are accused of propounding a theory; and, in the eyes of many people, the accusation is enough to condemn them. Then, search is made in the old arsenal of popular errors and favorite prejudices, for all sorts of redoubtable weapons which people use to crush so pernicious a theory. By the same reasoning that caused inventors in former times to be persecuted and derided, the promoters of freedom of the exchanges are treated as dangerous dreamers, while the supporters of the prohibitory régime are considered as benefactors of humanity.

—The list is long of the sophisms which have been employed to disguise the true motives for the raising of custom house barriers since the establishment of a general peace. Often, it is true, these sophisms were employed in good faith by persons who thought, that, by enriching themselves by means of the international depredations of prohibition, they were contributing to the greatness and prosperity of their native land.

Almost always, too, ignorance of sound economic nations has been so general, that the act of profiting by premiums which raised prices while establishing an industry contrary to nature, was considered, even by the victims of prohibition, as a work of patriotic devotion. We do not intend to take up all the sophisms which have been forged to justify prohibition and glorify the prohibitionists. This would be an endless task. We shall confine ourselves to a review of those most frequently employed.

—IV. *Review of the Sophisms of Protectionists.* 1. *That a nation should not allow itself to become dependent on foreign countries, especially for articles of prime necessity.* This argument was the most important of those which were brought forward by English prohibitionists against the free traders who advocated the repeal of the corn laws. "Is it not," they said, "renouncing our political independence, to put ourselves under the necessity of having recourse to foreigners for the means of subsistence? Would not a nation from which its enemies cut off supplies be obliged to surrender at discretion?" But what more chimerical than such an apprehension? When two nations effect exchanges, is not the dependence which results from them mutual? If England depends for the means of subsistence on Russia, France and the United States, do not these three countries in their turn depend upon England for their supplies of iron, coal, cotton goods, wool fabrics, etc.? Besides, even if England should become embroiled with most of the nations which supply her with grain, could she not, for a small advance in price, supply the deficit from other nations? Did not the gigantic folly of the continental blockade demonstrate the impossibility of commercially isolating a powerful nation? And as to a small nation, do not the commercial relations which such a nation establishes abroad furnish it with new guarantees of independence, by attaching to its cause all the interests which it has been able to conjoin to its own?

—One of the most brilliant orators of the anti-corn law league in England, Mr. W. J. Fox, shows up with marvelous skill the superannuated character of the argument for independence of foreigners, in the following celebrated passage: "Independence of foreigners," he says, "is the favorite theme of the aristocracy. But surely the squire is not consistent when he exclaims against foreign supplies. Let us examine his life. A *French* cook dresses his dinner, and a *Swiss* valet dresses him for his dinner. The lady whom he hands from the drawing room, is adorned with pearls which never grew within the shell of a *British* oyster, and the feathers which nod in her plume belonged to no barnyard fowl. The viands of his table come from *Belgium*, his wines from the *Rhine* or the *Rhone*. His eyes are delighted with flowers from *South America*, and his nose with a leaf from *North America*. His horse is *Arabian*, and his favorite dog of the *St. Bernard* breed. His gallery is enriched with *Flemish* paintings and *Greek* statues. Does he seek diversion? He goes to hear *Italian* singers, singing *German* music, all followed by a *French* ballet. Does he rise to judicial honors? The ermine which decorates his shoulders was never before on the back of a *British* beast. His mind even is a picnic of exotic contributions. His philosophy and poetry come from *Greece* and *Rome*, his geometry from *Alexandria*, his arithmetic from *Arabia*, and his religion from *Palestine*. His infant teeth were pressed on coral from the *Indian ocean*; and when he dies, sculptured marble from the quarries of *Carrara* will adorn his tomb! And this is the man who says, 'Let us be independent of foreigners!'"

—2. *That a nation should avoid large purchases from foreign countries, in order to prevent an exhaustion of its stock of money.* Here we see the old sophism of *balance of trade*. This sophism, formerly on every one's lips, is now much less employed, English protectionists, in particular, seeming ashamed of using it. That an argument, formerly so general, should have become thus discredited, is due to several causes: in the first place, to the deadly war the economists have waged against the doctrine of *balance of trade*; then, to the decrease in the relative importance of importations and exportations of money in transactions between people of different nations; finally, to experience, which successively demonstrated that the suppression of custom house barriers between the different provinces of France, between England and Ireland, and between the states of the Zollverein, was followed by none of the monetary disasters predicted by the advocates of the mercantile theory. However, the prejudice has not disappeared; and so long as the laws of monetary circulation are not commonly understood, it will be possible to stir up the masses against freedom of exchange, by alarming them with the phantom of an exhaustion of the supply of money. (See BALANCE OF TRADE.)

—3. *That it is necessary to have protective duties, as a compensation for the taxes imposed on home industries.* If the English protectionists made little use of the sophism about the exhaustion of money, they made, on the other hand, abundant use of that on *compensatory duties*. "The English farmers," they said, "bear taxes more numerous and more severe than those of Russian farmers. Is it not just to make compensation for the difference, by a protective duty? Is it not just to equalize the conditions of home production with those of the foreign?" Now, in the first place, do these differences in the figures of the taxes always signify what they seem to signify? It was certainly true that the English farmers did pay more taxes than their Russian competitors. But did they not also enjoy more complete security and freedom? Were they not better protected against spoliation and despotism? and was not this greater liberty and security fully an equivalent for the greater taxes they had to pay? In the second place, can protection really compensate for the burdens which excessive taxation imposes on production? Protect home agriculture in a country like England, under the pretext that it is more encumbered by taxes than its rivals, and you will doubtless provide a compensation to farmers, by permitting them to increase the price of their products. But upon whom will fall the burden from which you have relieved them? Upon all the other branches of production, which will pay more dearly for their raw materials and the means of subsistence for their workmen. What is gained on one side is lost on another. Unless a way can be found by which a tax which enters the treasury can be paid by nobody, compensatory duties can not relieve production. Now, if they can neither destroy nor diminish the evil necessarily connected with the existence of every tax, of what use is it to change the place of the evil?

—4. *That home labor must be protected, to prevent the number of employments diminishing in consequence of foreign competition, and thus to guarantee the means of subsistence to the workmen.* This sophism is worthy of notice, because it gives prohibition the attractive appearance of philanthropy. If landholders and manufacturers loudly demand prohibitory legislation, it is not to realize extraordinary profits at the expense of their rivals; O no! it is only to secure work and good wages for the workmen of their country; it is to keep the laboring classes from the sad results

of unlimited competition, etc., etc. But if such were the only aim of the prohibitionists, would they confine themselves to interdicting products from abroad? Would they not prohibit, above all, the importation of foreign workmen who come into competition with their own? Do we, however, observe that they abstain from employing foreign workmen, even at the times when they most energetically plead the necessity of protecting "home labor"? No: they have no scruples of this sort. There is a striking contradiction between their argument and their conduct. (See EMIGRATION.) Now, is it true that the prohibitory system increases the number of places in which men can be employed, in the country? Let us see. We have observed that prohibitions have just the opposite effect on prices from that produced by new machines; that by inducing certain industries to put themselves in bad economic conditions, and by impeding progress in division of labor, they bring about increase of prices, while new machines cause reduced prices. Now, do machines diminish the number of men employed in production? Does not experience, on the contrary, attest that their final result has been to increase it, by the general increase of consumption? Are there not to-day, for instance, more men employed in the cotton industry, than there were before the steam engine and the mule jenny had transformed that industry? A man who should propose to break the spinning machines and the looms of to-day, to replace them by the spinning wheel and the hand loom, in order to give more chances for employing workmen, would justly be deemed insane. But if new machines result at last in an increase in the number of persons employed, must not prohibition diminish the number? If we took at the interests of the working classes, in what respect are the errors of the prohibitionists better than those of the destroyers of machines?

—By making the cost greater, the prohibitory system diminishes consumption, and consequently production, and the number of opportunities for employment. This is how it protects home labor. But does it not, at least, tend to give it more stability? Does it not afford security to the work man against industrial panics, as the prohibitionists affirm? or is the contrary the case? We have already seen that the prohibitory system, by putting industries at the mercy of the changing opinions of legislators, has introduced a constant condition of instability in all branches of production: we have seen that tariff changes are likely to engender industrial panics. Must not the dreadful crises which have so painfully affected the subsistence of workmen, be attributed to the incessant perturbations which the prohibitory system has occasioned in the markets? The history of modern industry gives us strange lessons on this subject. One may read on its every page of the cruel evils which this system for "protecting national labor" has brought upon the laboring classes. (See PAUPERISM.)

—5. *That nationality should be made the basis of the system of exchanges.* This argument was the basis of Dr. List's national system of political economy. But in studying the history of the formation of states, and examining into the elements which constitute them, one readily perceives that nationality can not serve as a basis to a system of exchanges. States have been formed, for the most part, by conquest, and enlarged either by royal alliances, by wars, or by diplomacy. No economic consideration has controlled their formation. When the map of Europe was made over at the congress of Vienna, for example, did any one consult the interests of the

industries and the commerce of the peoples whose nationality they were changing? Did any one ask whether the situation of the Rhine provinces and of the other countries which were then separated from the French empire, rendered that separation advantageous or injurious to the countries concerned? No: the question was not even mooted. Political considerations and diplomatic intrigues alone decided the new configuration of the states. Why should an attempt be made to establish a national system of exchanges based on pretended economic necessities, in states whose formation was controlled by no economic views, states of which the chances of war and of alliances alone decided the boundaries? Is it not the height of absurdity to transform these boundaries, which the hazard of events has alone determined, and which it may enlarge or contract to-morrow, into rational limits of the exchanges? Is not an economic system founded on a political basis and politically modifiable, a monstrosity which good sense objects?

—6. *If the protective system did not exist, it would perhaps be well not to invent it; but to attempt to destroy it to-day would be to pronounce a death sentence on a multitude of industries, to occasion ruinous displacements of capital and of labor, etc., etc.* We have pointed out above the striking analogy between the setting up of a new machine and the suppression of a prohibition. The result of each is to substitute a good market for a high-priced one, and abundance for penury. But all progress, from whatever source, is accompanied by some disturbance. Must we renounce a permanent advantage, to avoid this transient disturbance? Must we give up new machines, new methods, new ideas, under pretense that they disturb the old machines, the old methods, the old ideas? Shall we immobilize humanity, to prevent some change of employments? Let us hear Dr. Bowring on this subject, in his speech at the congress of economists, at Bruxelles, in 1847, where he admirably refuted this paralytic objection: "The displacement of capital," he said, "the displacement of capital! Why, it is a sign of progress. Has not the plow displaced the spade? What became of the copyists after the invention of printing? \* \* We formerly had thousands of little boats on the Thames: what has become of them, now that the Thames is furrowed by hundreds of steamboats? But are not the interests of the workman himself subserved by so rapid and economical means of transportation? The first time I ever went to London I had to pay four shillings to go from one part of the city to the other: to-day I make the same trip for six pence; and if you ask how this has been brought about, I answer: by the displacement of labor and capital. This displacement may be found everywhere. I was born in a town which figures in the commercial history of my country. I have seen there, at Exeter, an entire industry, the woollen industry, abandoned. I have seen, in the port of that city, ships from all countries, and have heard my ancestors speak of their relations with most distant lands. But so soon as steam was introduced into manufactories, fuel being dear in that part of the country, the industry removed to where it was cheap. Well, capital was displaced; but the population has nevertheless increased. When I left Exeter the population was 25,000 inhabitants; now it is 40,000. The workmen have taken up other employments. But what has displaced labor? What has displaced capital? What has displaced industries? What has put them on a false basis? What has built upon sand? Prohibition. What, we ask, is to found the industries on a rock which can not be moved?"

—But do the displacements which the substitution of free exchanges for prohibition may occasion, occur on so large a scale as has been attributed to them? Would the advent of free trade become the signal for the ruin of a multitude of industries? Would one see entire countries deserted for others, as the prohibition pessimists affirm? Observation and experience agree in contradicting these gloomy predictions. The London exposition convinced the most prejudiced minds that the great industries of the various countries of Europe were in a nearly equal state of advancement, and that no people possessed a decidedly marked superiority over their rivals. "The crystal palace," says Michel Chevalier, in his interesting letters on the London exposition, "is a good place to prove this similarity, this fraternity, this equality of the industries of the principal nations of western civilization. It is manifest there, it forces itself upon our attention. When I go from the English department to the French, thence to that occupied by the Zollverein, or to the Swiss, or the Belgian, or the Dutch, I find articles of nearly equal merit, which give evidence of nearly the same aptitude and experience, and at nearly the same prices. This is more especially manifest in regard to England and France, especially if we take the trouble to complete our exhibit at London by recalling the articles we had in Marigny Square in 1849, of which the abused producers refused to send specimens to London. In thus speaking of equality, I do not mean that the productions of the principal nations are identical, on the contrary, they are diverse, they have their peculiar stamp. They reveal special industrial aptitudes, a distinct originality, but they manifest a nearly equal degree of advancement. If one is surpassed in one kind of articles, it is first in another, perhaps similar and equally difficult: and we can not doubt, that, with a little incentive, each nation could equal the one which excels it in any particular product. If prime materials were equally cheap everywhere (and they would be if the legislators of certain countries would abolish the wholly artificial causes of high prices which it has pleased them to multiply), the expense at which the manufactured articles could be produced would be nearly the same, and the several countries would have markets about equally low priced."

—A well-known French manufacturer, Jean Dolfus, corroborated the statements of Chevalier, and showed how the prohibitory régime had resulted in preventing the cotton industry in France from adopting improvements in machinery. "We do not," he says, "keep pace with England in industrial progress. Ten years ago they commenced there to substitute machines which twist the thread on the pirn without the aid of a workman for the old spinning machines: today, for certain numbers, no other machines exist. All have been obliged to adopt the improvement. With us, on the contrary, people still make money while using very antiquated machines; and the sum appropriated to compensate for the annual depreciations, at least in the spinning of cotton, is scarcely necessary, for it is not generally employed to improve the machines. Why have not the improvements adopted in England become necessary in France? Because all remain in the old way, and continue to make spun goods that could be manufactured at much less expense, by a little additional outlay. My house has a spinning mill of 25,000 spindles, 20,000 of which are for calico: it could, by replacing its looms, a part of which are nearly forty years old, spin a kilogramme twenty centimes cheaper than it does to-day: but home competition is not sufficient to compel them to do it. Is not this conclusive? Who pays the twenty centimes? The consumer, the country. The committee for the protection of national labor did not

think it best to change our looms, because many spinners might thus be thrown out of employment. But can we with impunity resist progress thus? On this principle we should return to the spinning wheel, and regret all the mechanical progress realized for the last fifty years. If spinning can be done more economically, consumption will increase; more cotton goods will be sold, more machines will be constructed, and more labor will be needed." (See the corroborative testimony of D. A. Wells, when a special tariff commissioner of the United States government, showing how the protective tariff has operated in the United States to keep in use inferior machines long since discarded in England.

—E. J. L.)

—Thus, in the view of manufacturers themselves, the prohibitory régime retards production. Let this régime be abolished, and every industry which is located under favourable natural conditions will inevitably become considerably extended. It will doubtless then be necessary to exercise more intelligence, activity and energy, in order to preserve and increase one's trade; for freedom of exchange is not so easy a couch as prohibition. Every industry would be at once obliged to employ every new improvement to keep up with its rivals. But would not humanity as a whole profit by the great impulse production would have received? Would not people be more abundantly provided with all things, and their minds kept active by necessity, become more accessible to light? Necessity is a powerful incentive to progress, and the chief result of freedom of exchange will be to render progress more and more necessary. Look for example, at British agriculture. How many times the prohibitionists had predicted that it could not endure the competition of the United States, Poland and Russia! How many times they had depicted its fields devastated, its laborers ruined and dispersed by the storm of free trade, and old England, deprived of this main-stay of her power, disappearing from the list of nations! Well, the corn laws have been abolished, free trade is enthroned, and what has become of British agriculture? Has it sunk in the storm? Has its capital been destroyed, and its fields submerged by the "deluge of foreign grain"? Have proprietors and farmers carried into effect their threat to emigrate to America, abandoning their fields to the thorn and the briar? No. Scarcely had the corn laws been repealed, when the agriculturists, redoubling their efforts, made improvement the order of the day on every hand. The old instruments and the old methods were abandoned; and agriculture, so long given over to routine, took rank among the most progressive industries. Thus transformed under the strong pressure of foreign competition, it now laughs at the phantom which formerly gave it apprehension. And this was an industry which was to be infallibly ruined by free trade!

—Observing, then, as Chevalier and Blanqui did at the universal exposition at London, the condition of the industries of the civilized world, and investigating carefully the results already obtained by tariff reforms, one becomes convinced that the ruinous displacements of production, the destruction of protected industries, and so many other calamities, which, according to the prohibitionists, were inevitably to accompany the advent of liberty of the exchanges, were vain phantoms. One also acquires the conviction, that the adoption of free trade would strengthen and develop industries, instead of compromising and ruining them.

—Here we terminate our review of the sophisms of the prohibitionists, although the subject is far from exhausted. But these unsound arguments have been refuted by all the economists in succession since Adam Smith and Turgot. An especially lively and satirical refutation of them will be found in Bastiat's *Sophismes Economiques*, to which we refer our readers.

—V. *Conclusion*. Freedom of exchanges tends to produce a cheaper market and to favor stability. Should it become permanently established, the industries, having no restriction as to market, would have all the development of which they are capable. At the same time they would acquire a maximum of stability, by ceasing to be based on a precarious foundation. To the high prices and instability inherent in the artificial régime, would succeed a return to the order instituted by Providence. Now, is it chimerical to count on progress so beneficent? Is free trade an economic ideal which we are interdicted from attaining? Is it a pure utopia, a humanitarian dream, as the defenders of prohibition affirm? Observe the signs of the times, and then reply. Is not one of the most absorbing interests of our time, the improvement of means of intercommunication? Are not all civilized nations multiplying railroads, electric telegraphs, and other means of intercourse? Are not steam and electricity having a constantly increasing effect in diminishing the natural obstacle of distance? Now, what is the economic result of all this? It is to extend the sphere of the exchanges. Railroads, steamboats, electric telegraphs, are powerful instruments in destroying distance, to the profit of the exchanges from city to city, and from people to people. But lo! while nations are imposing on themselves gigantic sacrifices to multiply the ways which facilitate the exchanges, they are, on the other hand, maintaining the prohibitory system, which interrupts them! They would stimulate exchange with one hand, and cut it off with the other! Such a flagrant contradiction must eventually impress all minds. Either steam locomotion and the electric telegraph must be abandoned, or else the prohibitory system must fall; for the simultaneous existence of these agents of civilization and of this relic of barbarism is absurd. But there is small likelihood that steam locomotion and the electric telegraph will be abandoned. The prohibitory régime, however, has received severe blows. Governments have finally perceived that prohibitory duties brought them nothing, and that it would be an excellent operation to substitute for them revenue taxes. Sir Robert Peel took this position as the starting point of his financial policy, and the budget of Great Britain, whose accounts showed a continual deficit before the reforms of Peel, afterward presented a regular surplus revenue. A similar reform in the United States gave like results in 1851. Under reduced tariff duties, exports doubled, and the revenue was increased \$50,000,000. Financial necessities thus combine with economic necessities and the progressive tendencies of our age, to put an end to the prohibitory régime. Prohibitions may be compared to the chains which were used in the middle ages to bar the streets. In our day they are a vestige of a system of defense which the progress of civilization has rendered useless and superannuated. Before long, we trust, the frontiers will cease to be barred, as the streets have ceased to be so: and, despite those utopists whose ideal is in the past, liberty will at last become the law in human affairs.

## PROTECTION IN THE UNITED STATES.

PROTECTION IN THE UNITED STATES. UNITED STATES TARIFF. Imposition of duties on imports from foreign countries for the encouragement, promotion and defense of native industry. The fundamental principle which justifies this practice, and makes it needful, is found in the fact that protection, in the broadest acceptance of the term, is not only the sole function of government, but the primal object sought in establishing its authority. Although God has constituted man a social being, so that the race is everywhere and always in communities, yet man's nature is such that his emotions, which centre upon himself, are very much stronger than his sympathies, which go out toward his fellow-creatures; in other words, "he feels more intensely what affects him directly than what affects him indirectly through others." In all the elements of reality and importance his own pains, aches, troubles, plans, desires, appear to his mind far superior to those of other people. Consequently, every person has a higher regard for what he conceives to be his own safety, or his own welfare or his own happiness, than he has for the safety, welfare and happiness of others, and, when these come in opposition, is ready to sacrifice the interests of others to his own. Out of this constitution of man's nature arises in society a universal tendency to strife between individuals, leading, unless prevented, to wrongs, oppressions and crimes of every sort. Restraint thus becomes indispensable for the preservation and for the advancement of society. That restraint invariably takes the form of government, which is found, of some description, wherever there is a community, either civilized, barbarous or savage. The sole purpose of instituting government is, therefore, to obtain and secure *protection*. All the functions of government, legislative, judicial, executive, and whatever, in all their branches and acts, resolve themselves into this—to *protect* the rights of person and property. Moreover, the human race is divided into nations, and these are as different, in their conditions, resources, interests, capacities, motives, as individuals are, with equal tendency to clash, and to encroachment one upon another. For instance, England has for her object to manufacture for the world, to monopolize the bulk of reproductive power, to keep all lands, especially her own colonies, in a state of industrial infancy and vassalage, by political management as well as by the superiority of her capital, by her cheap labor, by her skill, and by her navy and her mercantile marine. Her policy is to have other countries compete in her home market for the sale of their raw materials to the end that she may be enabled to fix the prices of what she buys; and to have other countries compete in her home market for the purchase of her finished products, to the end that she may be enabled to fix the prices of what she sells, thus becoming mistress of the globe. These aims require that England shall be aggressive and overmastering; hence her trade system first looks outwardly, and hinges largely upon external circumstances. On the contrary, the United States has for its object to bring into harmonious proportion and development, within its own boundaries, the four great branches of industry—agriculture, manufacturing, commerce and transportation—without which national life can not attain to the highest degree of excellence, because the history of growing civilization is a history of a long, tedious, painful progress from a condition in which occupations are few to a condition in which they are many. Our republic has for its object, further, to be free, independent,

powerful, but to let every other country enjoy its freedom, independence and power, in its own way; hence our trade system first looks inwardly, and hinges largely upon internal circumstances. These extremes in method of aggrandizement involve all the intermediary differences which distinguish the commercial policy of other nations. Now, the same constitution of man's nature which leads to conflict between individuals in society, leads also to conflict between political communities under different governments, and renders it needful to defend the industrial interests of each against aggression and encroachment from all the others. The United States, as a distinct aggregate of persons, possessing common government, common laws, institutions and interests, common history and destiny, constituting one body politic, free and independent, can provide common defense and security of the rights, property and lives of its citizens, only by following the dictates of self-protection, in order to create the greatest amount of common welfare within, and the greatest amount of safety against danger from without. Just as it would be foolish in congress to refuse to have an army, or a navy, or forts, or a military academy, on the plea that mankind would be foolish in congress to refuse to have protective duties on imports, on the plea, that, in a perfect but entirely imaginary state of the human race, foreign free trade would be beneficial to all. It is not the aim of protection to supply the wants and regulate the exchanges of supposititious communities, purified from the vices, villainies, propensities and ills which vex ordinary humanity; purged of mercenary tradesman, gainful arts and counterfeit honesty; freed of greediness in getting and tenacity in keeping, whether it be wealth or authority; devoid of withering competition, down-trodden laborers, and hunger-pinched wretchedness; but, on the contrary, to provide man with what he requires while he continues in society as it is, recognizing the facts, that individual selfishness predominates over individual benevolence; that the strong, unless restrained, will not respect the rights of the weak; that he who plants a sugar estate, dykes a rice plantation, sows a field, erects a factory, or constructs, a ship, needs the firm basis of the laws and institutions of his country to depend upon, as much as he who builds a house needs a solid foundation; that the great elementary object of organizing government, and of conducting legislation under its constitution or form, is to shield property, foster useful industry, and promote the general welfare; and that nations often may and do have interests as antagonistic as those of persons, making it necessary to provide for the defense of each against the cupidity, over-reaching or encroachment of the rest, manifested either in positive ways or through indirection.

—PRINCIPLES AND FACTS. 1. *Freedom within, but restraint without, the American rule.*

—Every analogy of nature supports the policy of free exchange between the inhabitants of a country, while it is denied between that and other countries. For instance, there is free exchange between the different members of the human body; and it would be the extreme of folly, for it would be death, to protect the kidneys, or the lungs from the blood, or the stomach from the liver; yet, it is highly proper and beneficial to protect all these organs, by suitable clothing, from aggressive, injurious outside influences, and to protect that human body, as a united whole, against encroachment from some other human body. So it is with the body politic. Free exchange between its various parts is essential to its healthy development, and even to

its existence; but protection is needed against aggression and encroachment from foreign bodies politic. This internal free trade rests upon the broad foundation of a community of reciprocities or equalities. Whatever there may be of clash between home interests is minimized, and is subject to control by internal forces. There is one contiguous territory, one national language, one central government, one patriotic allegiance, one kind of political institutions, one code of laws, one set of civil obligations, one habit of manners and customs, one standard of societary excellence, one tendency of public opinion. United under one flag, associated under one general authority, and combined into one organism, the people have rights, duties, privileges, benefits, advantages, prospects, interests, which can not be safely shared with any other people. This homogeneous condition is what makes free trade both permissible and beneficent within the borders of each distinct nationality, as, for instance, between the several parts of United States. It is the lack of a concurrent homogeneousness outside of those boundaries which causes *foreign* free trade to be dangerous. Producers and traders in other countries are not subject to our laws, nor amenable to the processes of our courts, nor obligated to serve upon our juries, nor liable to be drafted into our armies, nor bound to contribute to our internal taxes, nor answerable for non-performance of any of the duties of American citizenship. They are total aliens to our national commonwealth. To permit them to sell their merchandise in our home markets, free of all tariff charge, free of all local burdens, free of all allegiance to our government, would be to exalt perfect strangers above the heads of its own patriotic people in privilege. The foreigner, abiding in a distant land, and often hostile at heart to our free institutions, has no right to ask to be placed on a dead level of commercial benefits with our citizens, who have a round of local burdens incident to those institutions—burdens from which he is exempt. It has cost a vast amount of sacrifice, an immense aggregate of exertion, and an incalculable investment of capital, on the part of our population, through a number of generations, to transform a perfect wilderness into the most opulent and the most desirable of the world's markets. Why should the total alien, without any participation in developing our resources, without sharing in the support of our government, without a personal stake in the welfare of our Union, be allowed to be an exceptionally favored beneficiary of all that toil and effort? There is no way in which he can be compelled to compensate our nationality for the high privilege of admission to our domestic markets except through duties on imports. Only by the imposition of such charges, made adequate to the purpose, can the unequal conditions of competition be equalized between the alien and the citizen, meeting as rivals in trade upon our soil.

—2. *Difference between European and American Protection.* The utmost freedom compatible with liberty regulated by law presides over the internal affairs of the United States. Not only to commodities, but also to land, to political franchises, to education, to religion, to speech, and to whatever else, is applied this principle of equal unrestraint. Here, then, is found in completest operation the great natural law of all organized existence, which requires free exchange within, while demanding protection against without. Defensive duties on imports are thus enabled to promote the welfare of the whole community. It is not so in Europe, where restriction, of one kind or another, represses local freedom, as the *octroi* charges in France, the land monopoly in England, the autocratic method in Russia, and, generally, the grudging limitation of suffrage. Consequently, it is European capitalists, not European laborers,

who reap the solid benefits of protective duties. In this country, the laborer is the chief beneficiary. This is the fundamental difference between tariff protection in Europe and in the United States.

—3. *Need of diversified industry.* The civilization of every community is necessarily graduated by its individual and collective power to command the services of nature; the degree to which industry is diversified among any people affords the surest test of their ability to call the governing forces of matter to their aid; variety in the pursuits of society is not a condition which originates spontaneously the moment there is room for it, and to the extent that surrounding circumstances will permit, but results either from the pressure of population upon the means of subsistence, or from the stimulus of artificial encouragement. To complete the development of man's power over the forces of matter, no single kind of labor will suffice, either agricultural, mechanic, scientific, or manufacturing. Cultivation of the ground subdues the earth only as regards its vegetative properties, and its highest excellence depends upon assistance rendered by the whole circle of the sciences and the arts. Use of the principles involved in the lever, the wheel and axle, the pulley, the inclined plane, the wedge and the screw, while pre-eminently the conquest of mind over matter, commands the services of only one section of the material forces. Delving for ores merely develops for subsequent operations certain products which nature has gratuitously provided in her stupendous laboratory. Systematizing knowledge, although highly promotive of utilitarian results, does little more than set up finger-boards to point out to workers the paths they must follow in accomplishing their task of converting the properties of natural objects into useful and obedient servants. Manufacturing is limited to the arts of reproduction—to changing the condition, shape, arrangement, combination, uses and values of metallic particles, vegetable fibres, and other raw materials. A widespread association of these integral elements of national development is requisite to advance any people to a high position among political communities of modern times. Diversified industry thus lies at the base of all normal progress. The more intelligent, skilled, experienced, productive, prosperous it is, the better for the inhabitants and for the state, and higher and nobler will be the attendant civilization. Hence the interests of labor and of the laborer should be the chief concern of statesmanship; for whatever shackles, cripples, undermines or prostrates them is retrogressive in tendency and force, and strongly detrimental to society. Upon the place in the governmental structure assigned to the industrial element depends the value of the resulting civil and political institutions. In the work of bringing the forces of matter under the control of man, diversified pursuits march hand in hand, evermore co-operating to produce and hasten the same general attainment. Acting, together, they assault nature in her strongholds, and wrest from her possession her most treasured secrets, and explanation of her most occult processes. At every step of this concerted movement, knowledge acquires some new insight into the laws which govern the material world, resulting in augmented ability to use them for practical ends. Thus, so long as science maintained that earth, air, fire and water were elementary substance, it was impossible to find out that the rusting of metals, the formation of acids, the burning of inflammable bodies, the breathing of animals, and the growth of plants by night, involve the same operation: or that the diamond embodies, under dissimilar conditions, the same substance as charcoal or graphite; or that water is composed of two gases, one of which is the great feeder of combustion.

What amazing accomplishments have arisen from, and what grand possibilities are presented by, the chemical demonstration that the chief constituents of all organic matter are carbon, oxygen, nitrogen and hydrogen, three of which are gaseous. So long as the nature of electrical phenomena was a sealed book, the invention of the magnetic telegraph was impracticable. What mighty utilitarian results and civilizing influences have grown out of this conquest of mind over matter, bringing two continents, although three thousand miles apart, into instant communication. How meagre would be the accomplishments of bleachers and dyers, were it not for the discoveries of chemistry. How could carpenters and masons safely and correctly estimate the strength of timbers, of walls, of arches, but for the investigations which have been made in mechanical philosophy? How would it be possible for workers in metals to produce the wonderful results they do, were it not for the accumulated knowledge about the nature of those substances, and about their relations to both heat and other metals, and the airs and liquids with which they come in contact? The improvements of the steam engine by Watt resulted from the most learned inquiry into mathematical, mechanical and chemical truths. Indeed, although a man be neither artisan nor farmer, but only one who has a pot to boil, he is indebted to inventive genius, and to discovered principles which govern matter, for power to cook his morsel better, and to both vary and improve his dish. The art of good and cheap cookery—an art never found separate from a high state of civilization—embodies the application of natural laws, which neither would have been brought to light nor devoted to practical purposes by a community of hunters, or of shepherds, or of farmers. Among such peoples little exists to stimulate observation and arouse inquiry as regards the secret workings of nature. But diversified industry is everywhere seen to be the faithful parent of utilitarian investigations, philosophical experiments, scientific discoveries, mechanical development, inventive ingenuity, and serviceable improvements. Its peculiar province is to enlarge the sphere of mental activity, creating a demand for, and calling into exercise, the latent powers of intellect; to make men more expert, skillful and useful in the various kinds of work by which they are to earn their daily bread; and to supply those cogent instrumentalities by which they are enabled to make it go far, and taste well, when earned. Agriculture, science, invention, mining, manufactures, the mechanic arts, transportation, commerce, esthetics, therefore, all are factors in the solution of one stupendous problem—the universal emancipation of mankind from the thralldom of nature. Whatever reinforces one, reinforces all; whatever is detrimental to one, is detrimental to all.

—4. *Correlation of industries and human faculties.* The protective principle, when established in full operation, secures a diversity of employments suited to the diversified inclinations and aptitudes of the people. Every body politic, like every human body, is necessitated, by virtue of its existence and nature, as a separate and distinct organism, to seek first and preferentially its own safety, welfare, happiness, development, strength and excellence. These qualities, however, are nationally manifested largely or scantily according as they exist largely or scantily in the individuals who compose the nation. God has so constituted society that there must ever be among its members wide differences of natural force talent, appetency and will, unlike capacities, aptitudes, capabilities, endowments, preferences, longings; wholly dissimilar powers of body and of mind. This great diversity in human faculties requires an equally great diversity in human occupations. He who makes a very

indifferent farmer, might excel as a machinist. He who is considered a failure as a carpenter, might achieve reputation as a musician. He who is a bungler as a shoemaker, might win applause and wealth as an actor. He who fails as a merchant, might succeed as an inventor. A sailor, a locksmith, a bank clerk and a dancer could not exchange functions. Each person is specially qualified for some one pursuit in life, and less suited for all the rest. If he can not acquire that pursuit and devote to it his labors, there must be a waste of his highest endowment. Its usefulness is lost to the community in which he resides, and to the nation of which he is a unit. When this sort of waste is so general as to embrace a considerable part of the population, the national power must be very far less than it would be with full exercise of the idle adaptabilities. Hence the imperative need of such a policy of government as will insure the diversity of occupations requisite to employ the diversity of capacities.

—An invincible objection to a system of free trade between this and other countries is, that it would operate with increasing tendency to minimize the number of distinct vocations among our people, and thereby dwarf our national vigor and importance through waste of human aptitudes. In a community where agriculture is the sole occupation, there is very little opportunity to develop and employ the mind in the direction of its best faculties. Although a man might be pre-eminently fitted by nature to be a chemist, and although a knowledge of chemistry is essential to a scientific cultivation of the soil, what means or incentive to that end exists in a rural region, where everybody's chief talk is about the crops and the weather? What likelihood is there, in a purely agricultural country, that many of the rising generation will choose, in preference to the calling of the father, to become architects, bookbinders, confectioners, foundrymen, gunsmiths, jewelers, miners, printers, weavers, and so on through the whole round of skilled employments? Certainly there is nothing in the every-day life and surroundings of such a community to call forth the latent capacity for any of these vocations which may exist in the minds of its members. Under such circumstances thousands may continue, to the end of their days, without once suspecting that they possess faculties which need only to be properly cultivated to give them eminence and usefulness in some trade or profession of which they have, perhaps, never even heard the name. Only where industry is greatly diversified can there be a fields of opportunity sufficiently comprehensive to permit a man's own instincts to choose the pursuit which most enlists inclination, gives it functional exercise, and engages its steady perseverance. Then production, whether mental or material, is largest in quantity and highest in quality, because then each particular endowment is occupied with its appropriate work, and available for its utmost contribution to the aggregate result. Individual and national wealth augments very rapidly when such conditions exist in a country, and its government is rendered powerful and efficient by the symmetrical arrangement and advantageous application of the capacities of its citizens. All this is promoted by the atmosphere of intellectual freedom in which the people live, where there is suitable employment for physical strength, for manual skill and dexterity, for inventive genius, for the active and the sedentary, for childhood as well as youth and mature age, nay, even for decrepitude. A people so situated develop the better part of their natures, grow intelligent and exceedingly enterprising, enjoy the maximum of general prosperity, soon understand and respect one another's rights, and become imbued with intense patriotism.

—In the United States, where the recognized and approved standard of comfort among the masses requires an expenditure beyond the reach of the earnings of the masses in any other country, diversity of industry could neither be created nor maintained under a system of foreign free trade. The consequent invasion of manufactures from Europe, displacing our own, would be as destructive to our varied arts as the invasion of the Goths and Vandals was to the Roman empire. Hence protection, in the form of defensive duties on imports, is necessary to secure to our people those industrial conditions which are the most potent of all the auxiliaries of civilization, and without which its fullest development can not be achieved.

—5. *The rights of labor.* Labor is the greatest part of the capital of every country, because all wealth proceeds originally from production, and all production proceeds from labor. Even the earth, with its prodigious resources, and man himself, are the products of labor—of God's labor—furnishing the basis of all production by the human race. No one can apply his hand or point his finger to an object regarded as capital which is not the result of labor. Whatever exists anywhere under the name of property is the representative of previous labor. So, too, of things not commodities. Government and laws; civil, social and religious institutions; the entire and comprehensive forms and values of human society, are all, severally and collectively, the outcome of human labor. In brief, whatever is has been produced: Production is the sole function of labor, either bodily or mental. But labor's productiveness is dependent upon its ability to find instant and appropriate exercise for labor's function. This moment's power to produce must be utilized this moment. Yesterday's power to produce, unless employed yesterday, must remain forever inoperative. Opportunity to use its potential energies thus becomes absolutely necessary to enable labor to be efficient and copious in production. To the extent that opportunity is absent or neglected, production must be prevented, and to the same extent supply be less for consumption and accumulation. Whatever promotes the activity of labor stimulates, therefore, the growth of individual and national wealth; and whatever slackens that activity regards that growth. The inevitable inference is, that government owes to society the obligation of shaping legislation so as to secure to labor every practicable advantage for the exercise of its productive capacity. Labor thus constitutes the creative force of all betterments which are essential to communities of man. Upon it depend even life, liberty and happiness. Because the multitudinous interests of society are to labor what the superstructure is to the foundation, labor has the first and highest right to full protection. As, in the present stage of civilization the bulk of labor is unable to produce with profit unless its services are hired, its needed protection consists in what will insure *steady employment and fair wages.*

—But these essentials can not be made safe to labor in the United States when it is undefended against excessive competition from foreign countries. This is why: It has been estimated, after careful inquiries, that, on an average, about four-fifths of the cost value of manufactured articles consists of labor alone. Perhaps the problem is too complex to permit the ascertainment of the exact proportion, and the answer which would be correct at one date might not fit the conditions at a subsequent date; but it is unquestionable that the ratio must be very large. To illustrate the case, take a steel rail. There is labor in the ore, labor in the coal or coke, labor in the limestone, labor in the transportation requisite to bring these elements together at the furnace, labor in the pig

iron, labor in the spiegeleisen, and labor in the finished rail, besides the labor which originally produced the capital invested in the several mines, invested in the furnaces, invested in the railroads or shipping, and invested in the rollingmill grounds, buildings, machinery and patents. This aggregate of labor value in the final product can leave only a small fraction of the whole to represent the raw materials of the manufacture, gratuitously furnished by nature. Since human labor thus contributes the bulk of the commercial value of commodities, it is clear that the selling price must be determined generally by the rate of pay for labor's services. If this rate be so unfairly low as to amount to only subsistence wages, then evidently the products of labor so paid will be able to undersell the products of labor paid comfort wages, except when the latter possess countervailing advantages, such as more and better labor-saving machinery, or more operative processes. Now, it is known that wages in Great Britain are about one-half, and on the continent of Europe about one-third, on the average, of what are paid in the United States. If the products of such scantily paid labor should come, without let or hindrance, into this country, they would necessarily be able to undersell the products of our highly paid labor, doing great wrong and distressful injury to our industrious and patriotic people, who need to be secured against this encroachment upon their rights and the consequent damage. Protection to our labor, to be adequate, must therefore have respect to the difference in the joint cost, price or value of money and labor in the United States and in the countries with which we trade. In no other way than by defensive duties on imports can this difference be offset. The very object of a protective tariff is to equalize between this and foreign nations existing inequalities in the cost of production and in the power of competition. These paramount considerations render such a tariff both justifiable and necessary. To illustrate this position, take a single interest. Iron and steel, with their various forms of reproduction, being admitted, let us suppose, free of duties, or under entry charges low enough to avoid protection, our home producers would be unable, generally speaking, to carry on their business except at a loss, and, sooner or later, would be compelled to succumb before an outrivaling competition, reinforced by the whole strength of our national legislation. In that case, what would become of the numerous laborers who had found remunerative employment in those various industries? What would become of the miners, and of the miners' children; of the furnacemen, and of the furnacemen's children; of the forgemen, and of the forgemen's children; of the moulders, and of the moulders' children; of the rolling-mill hands, and of the machinists, and of the engineers, and of the mechanics; of the men engaged in the allied and dependent arts and trades; in brief, of the entire body of persons who can earn a comfortable livelihood because coal and ores are mined, furnaces in blast, foundries in operation, iron-works busy, machine-shops crowded with orders, rolling-mills run to their fullest capacity, and factories prosperous? On withdrawing the protection of our tariff laws from our domestic industries in general, what would become of the multitude of men and women who work in brass, copper, lead, zinc, tin, nickel, stone, glass, wood, leather, silk, paper, cotton, wool, and other materials? What would become of the local development created and continued in existence by their labors? What would become of the vast amount of capital invested in those diversified pursuits? What would become of the immense aggregate of machinery and of buildings provided at enormous expense to carry on special operations which would have to cease? What would become of the traders and the transporters who thrived on the patronage which so much production had afforded? Who but the

government, remiss in its obligation to protect the rights of labor and of property, would have to be held responsible for the widespread and heavy decline in the prices of real estate which would necessarily ensue upon such a comprehensive and fundamental alteration in the condition of affairs? Where else would the blame have to be laid for the increased local taxation for state, county and municipal purposes, which would have to be levied upon other property to make up the deficiency caused by such prodigious derangement and fall of prices, and by such an enervating decrease of the productive forces? Finally, what substantial or permanent gain would there be to show for all this demolition of home resources, this prostration of manufacturing industry, this invasion of the rights of labor, this sacrifice of assured prosperity to satisfy a visionary experiment, this paralysis of vital interests, this inauguration of wholesale suffering among those who live by wages?

—It is asserted that the multitude of skilled laborers thus thrust out of employment could find work and pay in more productive occupations, in those which could exist without the aid of a tariff on imports. But the skill of these laborers—forming the valuable capital acquired by them through years of persevering training, fitting them to perform certain services better and more profitably than any other service—would cease to be available as an element in reckoning the rate of wages, and would lose its money value in any different vocation. Every employer needs that his employes shall have both aptitude and knowledge, not the lack of these qualifications; and the highest capacity will be able to obtain the most pay. A druggist will not add one cent to a clerk's salary because he is an excellent machinist, nor a farmer esteem it a pecuniary advantage to hire a man who is a first-class puddler, nor the captain of a vessel feel called upon to give more compensation to a sailor who is a competent filemaker. On the contrary, the inexperience of each applicant for employment in some occupation with which he is unfamiliar, instantly operates to lower the value of his services, and to diminish the amount he can earn. Perhaps he can become a manual day laborer, of whom mechanical skill is not required; but the ranks of that useful class are always full, and, if he adds himself to them, it will tend to break down the wages of them all. Perhaps he can become a farm hand; but there is already a surplus of labor in agriculture, so much so that corn is frequently used for fuel in some parts of the rural west. When a multitude of men are forced by adverse circumstances, out of employment in the trades for which they were trained, they can find new employment only by being absorbed into other occupations; and they can be so absorbed only by reducing the wages in the occupations to which their labor is transferred. Thus the aggregate capital represented in the skill of labor suffers a ruinous depreciation, which is felt, not merely by the laborer himself, but, through the partial or total loss of his earning and purchasing powers, by all with whom he had been accustomed to deal, extending its injurious influences throughout an almost unimaginable complexity of relations. During the years which followed the panic of 1873, the tramp nuisance signally illustrated the effect of driving labor out of its legitimate channels of occupation. Society is obligated, therefore, as well from what it owes to labor, as from a regard to its own best interests, and to all of its interests, to *secure* to labor those opportunities for steady employment, and those advantages of fair wages, which are indispensable to its welfare, and which will promote its greatest prosperity. This is the only protection which labor asks, and is what it has a right to demand from government.

—6. *Cheap production through sacrifice of labor.* There is only one way in which defensive duties on imports could be discontinued without bringing ruin upon our diversified industries. If our labor would promptly consent to resign itself to unfairly low, or subsistence, or *slavery* wages, such as are doled out of European labor, foreign competition could be overmastered and our establishments could survive. Here the chief elements of mere subsistence are already far cheaper than they are in Europe, and, under a system of scaling prices down to conformity with pittance pay to labor, even food would become much cheaper than it is, while clothing, household utensils, furniture, tenement rents, and nearly all other requirements of the simplest living, would be reduced in cost much below the average in any of the manufacturing countries of the old world. This unparalleled cheapness would enable our subsistence wages to be put at a less rate than they are in any part of Europe. Then we could produce manufactures cheaper than any foreign competitor whatever. But the purchasing power of the masses of our people would be correspondingly low, while their productive power would be largely in advance of their consumption. This would force our producers, as it does the British, to look abroad for markets to take off the surplus, or else a considerable part of production would have to cease, with the result of thrusting a multitude of laborers out of employment and into pauperism, to be supported by public charity or to starve. Under such circumstances we would become exporters of immense quantities and values of finished products, and would be deeply, even vitally, interested in the abolition of hostile tariffs everywhere, as Great Britain is now. Further than that, with the advantage possessed by us in our superior cheapness, as regards both productive cost and selling price, we could and would wrest from Great Britain, not only her foreign markets, but even her home market, and ruin her manufacturing industries, as she now seeks to ruin ours that she may secure a monopoly control of *our* market, and thus take off much of *her* surplus. It would be our selfish interest, as it is hers, to crush out competition wherever encountered throughout the world, and to destroy all the rising arts of reproduction set on foot by other nations. Nor could we be prevented from accomplishing this result, unless those nations should adopt defensive tariffs on imports, efficiently framed and adequately enforced, as we have done. Thus it would be *possible* for us, therefore, to beat Great Britain at her own game of overmastering cheapness. But what, worth having, would we *gain* by such a radical change of our present condition? Nothing whatever. Instead, the aggregate *loss* would be enormous and awful. We would, to begin with, treat man as made for trade, not trade as made for man. Our laborers, deprived of justly high, or comfort, or *freedom* wages, would quickly sink in the scale of civilization. Within a few generations they would cease to be intelligent, and become ignorant, debased, superstitious, servile, and unfit to be trusted with the ballot. No longer having chances to improve their condition, or to arise above it, they would lose their present incentives to self-respect, to courage, to ambition, to enterprise, to hope. The spirit of man falls with his wages—declines as declines the reward of his industry, toil and care. Crush the latter, and *he* is crushed. Take away from labor in the United States the elevated, important and commanding position which it now occupies, and let its wages and its situation sink to the European level, then its descent would drag down the edifice of republican institutions and of human freedom. These can not long exist where the rights of labor are not respected. Would general cheapness in the prices of commodities be any compensation for this tremendous sacrifice of all we hold dear and sacred as the results of American liberty?

—7. *Cheap production through defense of labor.* Protection attains to cheapness of money price in a rational and beneficent way. Under that system the American mechanic, educated, well paid, well clothed, well housed, is not consumed by those large cares, nor deadened by those cruel privations, which beset the life of his European competitor, who rarely has either leisure, inclination or incentive to study out improvements in the processes by which he earns his daily bread. Here, however, the workman, surrounded by a multitude of different industries, is always in the path of intelligently perceiving what is wanting or what is amiss in the old methods, and has a better chance, as well as a stronger inducement, to make the needed progress, whether in machinery, in fabrics or in operations. Without protection, our widely differentiated industry could not exist; without such diversity, there would be lacking, not only the accurate knowledge of details which is requisite to suggest a higher excellence in productive instrumentalities, but also the hope of reward essential to spur the mind to experimental effort. An improved plow is not expected from sailors, who are ignorant of agriculture; an improved ship is not expected from farmers, who have no practical acquaintance with the ocean. If Whitney had not seen cotton growing, and learned both the difficulties and the cost of separating the seed, it is probable that he would not have invented the cotton gin. If the spinning of cotton had not been carried on in England at all, during Arkwright's life, it is altogether unlikely that he would have invented the spinning frame. Our successful inventors have generally been poor men, whose daily experience at their work has shown them some defect in its processes, or suggested some more useful mode of reaching its results. In this manner the drudgery of human hands is gradually transferred to muscles of iron and steel, one machine doing the work of several or many men, with constantly decreasing cost of its production. These automatic appliances rise in the scale of excellence until a correspondingly high degree of excellence, which means intelligence, in the labor, is indispensable. Then, as prices of manufactures decline, the rate of wages advances. Cheapness of commodities thus brought about is allied with the progress of civilization; but the cheapness caused temporarily in an importing country by foreign free trade both victimizes and debases the people whom it promises to bless.

—8. *Poverty and weakness of a purely agricultural country.* Supposing nearly the whole body of our population occupied in cultivating the soil to obtain a livelihood, a home market for any considerable share of the surplus of the crops would be a simple impossibility. The grower of cotton, of tobacco, of rice, of wheat, of corn, of hemp, or of flax, has neither need nor desire to purchase a like product; he is always and everywhere a seller, not a buyer, of the commodity. If his surplus can not find sale in his own neighborhood, it must be sent to a distant place for that purpose; and if customers or consumers can not be found nearer than Liverpool, his crops must cross the ocean in search of a market, involving the greatest amount and distance of transportation, and the largest demand for the always expensive services of the middleman, with the least profit to the producer. Thus dependent upon very far-off markets, the agriculturist must conform his crops to the arbitrary and inexorable requirements of those markets. He is forced to raise only such things as can with certainty be sold regularly there; and he must do so without knowing beforehand whether large or small quantities of his produce will be needed for export, or whether the prices he will receive after harvest will be high or low. Uncertainty, instability and

risk, in an extraordinary degree, must be the inseparable companions of his toil, and the constant perils of its reward. An agriculture so situated and conducted, being necessarily devoid of rotation of crops, leads to exhaustion of the soil, and to the appropriation of other land, in its turn to be exhausted. As the farmer advances in this butchery and spoliation of the earth's surface, he leaves behind him an impoverished region, incapable of sustaining a population. Such a plunder of the fertilizing and vegetative elements of the ground unavoidably tends to poverty; hence agricultural nations, with scarcely any manufacturing industry, are always *poor* nations. Ireland's present condition offers a fair illustration of the invariable result. A like doom would await the United States under foreign free trade, or under even "a tariff for revenue *only*", if either should be continued to the bitter end. The effects upon mining, transportation, inventive genius, architecture, education, literature, and the power of combination and association, would all be equally repressive and disastrous. There would be enormous and frightful losses, for which no possible cheapness of the money prices of commodities could compensate our people. Further, a poor nation is necessarily a weak nation. What if war should come upon us after we had reached our impoverished condition as an agricultural country? We might be unable to maintain the national independence of the United States against a war of invasion. Under just such a policy, Turkey has been slowly crumbling away before continual encroachment, until she is upon the perilous edge of a final catastrophe which will blot her name from the list of self-governed states. History abounds with similar warnings, which nothing except the blind confidence of ignorance or the audacious insanity of folly would refuse to heed. All the voices of experience combine to teach that the only path of safety, and the only road to prosperity, lies through protection to home labor by means of defensive duties on imports.

—9. *Effect of separating producer from consumer.* When farmer and miller are within easy reach of each other, they divide between them, on some equitable plan, all the flour made; but when a considerable distance is interposed between the two, a third party, the transporter, must be employed, who takes a share of the grain, or the money price of that share, to compensate him for his services in conveying the grain to the miller; and again, a share of the flour, or the equivalent of that share, to pay him for his time and trouble in carrying the flour to the farmer, leaving less to be divided between the man who grows the grain and the man who converts it into flour. Ultimately, however, the miller might grind the transporter's share of the grain, taking therefrom his customary toll, and thus might secure for himself the same proportion of the whole quantity as if the transporter had not intervened; but the farmer must, in any event, suffer a positive and permanent loss. It is true, the farmer makes a gain by obtaining the conversion of his grain into flour; but between his gain and that of the miller and the transporter, theirs not being complicated with a sacrifice, there is a large inequality of profitable result. Let this inequality be extended to a great variety and number of the farmer's exchanges, covering the most of his purchases, then his impoverishment would be merely a question of time, or else his power of accumulation would be so seriously crippled as to prevent any considerable or rapid improvement of his condition. Extending this idea, let us suppose A, a country in the western hemisphere, and Z, a country in the eastern hemisphere; and that A exchanges its raw products of the soil for Z's finished products of the loom, the forge and the workshop. This would be the exchange of commodities which free traders declare to

be commerce. It clearly belongs to the kind, however, which would call largely for the services of the transporter and his allied middlemen. It would require the investment of a vast amount of capital in steamships, sailing vessels, railroads, canals, and other machinery of the carrying trade. A and Z would severally have to pay the cost of conveying their commodities to the distant market. Much the heavier part of this expense would fall upon producers in A. Their raw products of the soil being bulky, these would necessarily occupy large space in the holds of the ships, and being of small money value proportioned to their size, it would require a considerable percentage of that value to liquidate the freight charges. On the contrary, much the lighter part of the expense would fall upon producers in Z, whose finished products of mechanical labor would fill small space relatively, and being of large money value in little compass, only a trifling percentage of such value would be needed to pay for transportation. A cargo of wheat exported from A to Z would involve payments of pretty much the same amount of freight charge as a cargo of cloth exported from Z to A; yet the cargo of cloth would purchase many cargoes of wheat. Producers in A would have to give so considerable a part of the money value of their products to the transporter, to compensate him for taking them to market, as to leave very scanty margin for a profitable return; and the more inland the producers were, the greater would they be sufferers in this respect; for, in addition to the cost of ocean carriage, they would have that of getting their products to the seaboard. Moreover, this mode of commerce would embody the folly of taking food and the crude materials of manufacture, in unending series, immense distances to supply the wants of the loom, the forge and the workshop, instead of bringing the loom, the forge and the workshop, once for all, where they could reproductively consume the food and the crude materials of manufacture, thus saving forever all the expenses of a double transportation. Still further, under such a system of exchanges, the inhabitants of A would be compelled to devote themselves to the growth of such staples as the inhabitants of Z would purchase, thereby enforcing a uniformity of crops, and depriving the people of the power to make exchanges among themselves, except to a very limited extent. This condition would also involve a dispersion of population, accompanied with feeble capacity for combined effort in the construction of roads and the building of bridges, and in providing other means to diminish the burdensome tax of transportation. A large increase of the export of the raw products of the soil from A might indicate, therefore, not an increase of individual and national prosperity, but a diminished ability to exchange commodities at home, causing an expansion of the foreign at the expense of the domestic commerce. It thus appears that there may be an exchange of commodities between different countries in which all the real gain is on one side and all the actual loss on the other; or, in other words, wherein all the aggrandizing tendencies combine with Z, and all the depreciating tendencies assault A.

—10. *Effect of bringing producer and consumer together.* Middlemen, whether carrier, broker, agent, or trader, add nothing to either quantity or quality of commodities passing through their hands; yet the pay for their services, including their accumulation of wealth as well as their maintenance, must come out of producers or consumers. Wool will make as much cloth in the United States as in England. If, however, the wool is taken to England to be converted into cloth, and the cloth is brought back to be converted into clothing, then all the intermediaries

required to make the changes in place will obtain a portion of the values created, and all the other parties involved will receive less by the amount thus deducted. When the manufacturer is transferred to the side of the wool grower, these intervening charges, expenses, losses, are thrust out and entirely saved. The exchanges become direct, with the minimum of friction, risk, delay and obstacle. Transactions are between principals, not through agents. No organized waste of time separates the moment of completed production from the moment of commenced consumption, resulting in a sluggishness of societary movement. As exchanges between parties distant from each other are always fewer than between parties near together, and as frequency and rapidity of exchanges are far preferable to their rarity and tardiness, commerce is rendered capable of conferring its utmost benefits. Protection's task is to place producer and consumer side by side, making them such correlatives in human industry as they are in nature's operations. The rock collects the elements of change from the surrounding affinities, not from the far-off ledge or particles. The plant draws its sustenance from the soil in which it is rooted, and from the neighboring air, sunshine and showers, not from the remote field, and from the distant atmosphere, light and rain. The cow, endowed with the power of locomotion, browses in the vicinity of her home, not in the valleys or upon the plains a score of miles away. Such is the mode of procedure in all nature, animate or inanimate, below man. He alone has ever voluntarily pursued a different course; he alone by distance has separated production from consumption, thereby establishing impediments between the two, and injuriously affecting his own welfare. Considering that iron, copper, lead, coal, limestone, marble, manganese, porcelain clay, salt, and many other minerals, are profusely imbedded in our soil, and that these substances are essential to the development of the human race, by what legerdemain of logic is it to be shown that this close proximity of supply to demand is not an indication, almost imperatorial in its emphasis, that demand should seek its supply on the spot? It will hardly be maintained that the boundless presence of these resources has been a matter of pure chance rather than of deliberate design. If by design, then what can be the meaning of that design, unless it be that man, obeying the divine mandate to "be fruitful and multiply, and replenish the earth, and subdue it," should find the means of satisfying his needs wherever he might settle? Protection runs parallel with this broad purpose, in a double sense; for it not only incites our people to utilize the resources which impregnate their own soil, but erects a barrier against those who would entice our people to neglect the resources under their own feet, in order to develop and use the resources which lie under the feet of other men, in other and distant countries.

—11. *Competition increased by protection.* Adequately defensive duties on imports, while minimizing the destructive manifestations of foreign rivalry, secure the maximum amount of wholesome competition; for, if the tariff be too much reduced, foreign competition, flooding in according to its own pleasure, will prostrate and ruin the native establishments, whereupon all the competition left will consist of that between foreigners for possession of our market; but, if the tariff barrier be raised to the protective point, domestic industry will revive, and competition will be increased by that between our home producers, and by that between our home producers and the foreign producers, thus insuring a threefold competition, moving in legitimate channels, and acting with a maximum of combined force to reduce prices to

consumers. Protections, therefore, does not foster (as is alleged) but antagonizes monopoly.

—12. *Protection to either foreigner or native is unavoidable.* To abolish protection to home industry, would be to take sides, in the most positive and damaging manner, with foreign capital against domestic labor. The inevitable operation of the repeal would be to give the fullest practicable force and effect to the advantages which foreign manufacturers possess over our own, by removing the barrier which stands between our producers and the destructive competition of alien producers. Foreign interests and native interests are set before congress as objects of choice, and congress is asked to choose the former in preference to the latter: the benefit and welfare of other countries rather than the benefit and welfare of this country. What can a scheme be, which takes away from domestic producers, to whom it naturally belongs, the possession of the home market, in order to bestow it as a free gift upon foreign producers, except a scheme which withdraws protection from a class at home to confer it upon a class abroad? To repeal the laws which punish crime, is to protect criminals; and to legislate out of existence the protection which guards and sustains American industry, is to transfer the protection to European industry. A tariff too low for home protection thus becomes a law to protect transatlantic manufacturers against the rivalry of our manufacturers in the latter's domestic market. The issue between the protectionists and the free traders, when reduced to its seminal principle, dwindles to simply this, whether we shall protect our own labor and capital or those of other nations. Doing the latter may be symbolized as dismantling our forts, leveling our breastworks, and disarming our troops, in the face of an invading enemy, leaving him at his leisure to reap all the fruits of unopposed conquest. The pretense that the government is to be, or can be, indifferent in the struggle for the mastery between our own arts and industry and the antagonist arts and industry of other lands, is as preposterous as to pretend that the government is to be indifferent in the case of hostilities between this and any foreign power. No revenue law was ever yet enacted, in any country, which did not, in some way, directly or remotely, affect the rights and interests of labor for better or for worse. There is no neutral ground upon which legislation can stand in respect to material development; the inevitable influence of statutory provisions, especially of those regarding taxation, must be, as common sense and all experience teach, to make or mar, to help or harm, to reinforce or antagonize, industry. Insomuch as the productive elements of society find careful and increasing protection in the general course of legislation, national, state and municipal, what just reason exists why any person should advocate the idea of leaving those fundamental elements of prosperity to take care of themselves when the government comes to levy duties on imports? Why should they be left out of favorable consideration at that exact point, and nowhere else? What is there about the arts of reproduction which should make them an exception to the general rule of protection? Some imports are advantageous; some are not, as immoral books or licentious pictures. To discourage the mischievous class of articles, and to promote the beneficial class, is to discriminate between different kinds of trade, that is, different kinds of production. This regard to the public welfare is, as it would be, the ruling motive of our tariff system.—13 *The national constitution expressly authorizes protection.* Andrew Jackson said, in his second message to congress, Dec. 7, 1830: "The power to impose duties on imports originally belonged to the several states. The right to adjust those

duties with a view to the encouragement of domestic branches of industry is so completely identical with that power, that it is difficult to suppose the existence of the one without the other. The states have delegated their whole authority over imports to the general government, without limitation or restriction, saving the very inconsiderable reservation relating to their inspection laws. This authority having thus entirely passed from the states, the right to exercise it for the purpose of protection does not exist in them; and consequently, if it be not possessed by the general government, it must be extinct. Our political system would thus present the anomaly of a people stripped of the right to foster their own industry, and to counteract the most selfish and destructive policy which might be adopted by foreign nations. This surely can not be the case: this indispensable power, thus surrendered by the states, must be within the scope of the authority on the subject expressly delegated to congress. In this conclusion I am confirmed as well by the opinions of Presidents Washington, Jefferson, Madison and Monroe, who have each repeatedly recommended the exercise of this right under the constitution, as by the uniform practice of congress, the continued acquiescence of the states, and the general understanding of the people." The constitution specifies that "the congress shall have power to lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and general welfare of the United States"; "to regulate commerce with foreign nations"; and "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this constitution in the government of the United States, or in any department or officer thereof." These clauses vest in congress almost unlimited power of taxation. As regards imports, save the exception involving state inspection laws, and, besides, the requirement of uniformity in duties, the senate and house possess the same supreme authority over the whole subject as was possessed by the several states before it was surrendered by them into the exclusive hands of the general government. When they parted with their undoubted and unquestionable right, each for itself, and lodged it in the national constitution, they endowed the new organism with all powers and functions in the premises which they could themselves have exercised individually. Had the transfer to congress, by the states, of control over the subject been of a modified or restricted character, the evidences of such a fact assuredly would have appeared in conclusive form in the articles of union. The words in which the qualified authority was delegated would have been specific and positive, and the limits of its extent would have been defined with rigid exactness, leaving no room for ambiguity or misapprehension. The very absence of confinement within bounds justifies the logical sequence that none was intended; for certainly a restraint so important would not have been left to implication or construction. Evidence to the same effect is to be found in the debates on the constitution, which took place in the several state conventions called to ratify or reject the proposed change of government, for there the belief was generally entertained that the grant of power over national taxation was peremptory and supreme. Indeed, the surrender by the states appeared to some minds so excessive and impolitic that they presented it as a serious argument against ratification. All were deeply anxious for a system which would avoid the inefficacy of a mere confederacy, such as they already had, but they felt a dread of passing into the opposite extreme of a monarchical consolidation. Those conflicting wishes and fears led to protracted, intense, exhaustive scrutiny of reasons for and against every important suggestion of change. Never before were political institutions

adopted with so much deliberative assent, with such thorough adjustment in the relations of the various parts, or with so complete an understanding of the nature of the work. Reciprocal protection against contingencies of foreign interference and encroachment was the foundation of the new governmental structure, and it would be grossly illogical to suppose that the protection of domestic industry, so intimately connected with the prosperity of the state, was purposely, negligently or ignorantly excluded from the plan. Congress, therefore, having entire control over duties on imports, and this control being coupled with the power and obligation of providing for the common defense and general welfare, without any reference whatever to a revenue standard, the conclusion is irresistible that both those who framed and those who ordained the constitution granted in it full authority to legislate for the protection of native industry by creating tariff barriers. The phrases "to regulate commerce" and "regulation of commerce," which occur in that instrument, were not accidentally chosen, or used in any vague, loose or indefinite acceptance, but had been constant formulas of expression in the long controversy between the colonies and the mother country, from the time of the stamp act onward, and had acquired, by repeated discussion, and by legal and parliamentary usage, a fixed and precise meaning. Our revolutionary forefathers, people and statesmen alike, also Englishmen, regarded these phrases as synonymous with what we now term protection. When, consequently, in 1787, the federal convention selected these phrases to express the power over commerce granted to the new government, in what other than this familiar and customary sense could such modes of speech have been employed? James Madison, Daniel Webster, Rufus Choate, and others of our great men, have declared, in the most deliberate, specific, positive manner, that the language in the constitution was intended to convey the very authority in question; an authority to be exercised, not held in abeyance. So, too, was the grant interpreted by the first congress, which contained fourteen of those who had been members of the federal convention, its president, George Washington, having been elected chief magistrate of the United States, and another delegate, Alexander Hamilton, appointed secretary of the treasury. It is not logically supposable that these patriots were either ignorant of the design of their own work, or capable of a plain, palpable, direct infraction of the organic law; yet the one or the other horn of this dilemma must be occupied by those who deny the constitutional power and obligation of protection; for the first tariff act, approved July 4, 1789, declared, in so many words, that one of its purposes, one of its objects, one of its inducing motives, was "the encouragement and protection of manufactures." Next year, when still higher duties were imposed, the same avowal was renewed. The only legitimate conclusion from all these circumstances is, that power to protect home industry was put in the constitution in pursuance of a set design to put it there. Before the Union was formed, the people demanded the insertion of that power; the people expected to find that power in the instrument; the convention conferred that power in words familiar to the people from childhood as expressing that power; the people adopted the constitution believing that power was in it; and the very first congress, at its first session, in its first act of general legislation, proceeded to exercise that power in express terms, with avowed intent to give it practical shape. These are historical facts, which it would be folly to dispute: hence the only sort of a tariff on imports which conforms to both the letter and the spirit of the fundamental law is a protective tariff.

—SOME PRACTICAL RESULTS. The general result of the protective system is to develop and cheapen production until its superabundance flushes over into the channels of foreign commerce. To accomplish this outcome the protection must be adequate, stable, prolonged. Alternate changes from this system to its opposite, as has been the case in the history of the United States, arrest the movement, more or less, according as the abandonment of the defensive principle is partial or complete. Only a very few articles have been both fully and steadily protected. In those instances the tendency to ultimate exportation has been most operative and conspicuous. The universal law which governs exports is that nothing, except coin and bullion, or bonds and stocks, tends to go abroad until there is a surplus of domestic production above domestic consumption. There is no incentive to export any commodity whatever until the home demand is satisfied, and an excess remains to seek a foreign market. Hard times may diminish the home demand; still nothing will be exported save what would surfeit that demand, be it languid or active. Brazil exports coffee, and China exports tea, because each country has more than enough of its special product for the satisfaction of its own wants. For this reason Great Britain exports iron and steel, cottons, woollens, linens, tin plate, and other manufactures. For this reason France exports silks, wines and beet sugar; the United States, breadstuffs, provisions, raw cotton and tobacco; Australia, wool; Cuba, can sugar; and so on to the end of the list. It is plain, therefore, that we can arrive at the point of exportation only by so developing the home production that there shall be something in excess of the domestic supply. Without protection, either natural, as in the case of newspapers, or artificial, as in the mass of cases, such an expansion of productive capacity can not take place. This is the teaching of experience no less than of theory, from 1840 to 1864 we did not export a dollar's worth of our own woollen manufactures. The beginning of export has been reached under our system of protective duties. This initiatory export, with its increase, clearly evidences a highly developed woollen industry, and growing surplus above our own wants of the grade and kind of fabrics exported. Under a steadily fostering tariff, a gradual yet accelerated progress is originated, by which establishments multiply, production enlarges, rivalry intensifies, prices diminish, superfluity arises, exportation commences. Such legislation is essential, therefore, to create that fullness of home supply which must always precede any tendency to seek a foreign outlet.

—*The cotton crop of the United States tariff-protected into existence and export.* In 1789, when congress first imposed duties on imports, all the cotton manufactured in the American mills came from other countries, principally from the West Indies. Only an insignificant quantity of the staple, locally consumed in the household industry of those days, was grown in the south; so little, indeed, that one of the representatives in congress from South Carolina declared that the production of cotton was *contemplated* in his state and in Georgia, and, "if good seed could be procured," he hoped it might succeed. Edward Everett, in a public address delivered in October, 1831, said: "In 1794, when Mr Jay negotiated the treaty with Great Britain, it does not seem to have been known to that distinguished statesman that cotton was raised for exportation in the United States; and he accordingly admitted it among the articles not to be exported from the United States in American bottoms. Even as late as 1796, I find in the journals of congress, that a petition from the proprietors of a cotton mill on the Brandywine, who prayed for the repeal of the duty on the raw material, and the

increase of that on cotton goods, was rejected by the committee of commerce and manufactures, on the grounds that the existing duty afforded sufficient protection, and that 'to repeal the duty on raw cotton imported would be to damp the growth of cotton in our own country.'" Hence, the duty of three cents per pound in the first tariff act was laid, not so much to encourage and protect, as to create the existence of the staple in this country as a regular and an important crop. That duty (except during the war of 1812 and a while afterward, when all the permanent duties were doubled) was continued unchanged from July 31, 1789, to Dec. 1, 1846, or a consecutive period of fifty-seven and one-third years, whereupon it was abolished as having ceased to have either protective or revenue force. In the fiscal year 1848, the first complete one after the removal of the duty, we exported, according to the commerce and navigation report of the United States for that year, 7,724,148 pounds of sea-island, and 806,550,283 pounds of other raw cotton, together valued at \$61,998,294; and imported 317,742 pounds, valued at \$6,814, of which we re-exported 51,001 pounds, valued at \$4,727. Since then we have enormously increased the crop, and annually have found a foreign market for all we could spare. In this case, protection, steadily and amply applied, accomplished far more than was hoped for at first, and was instrumental in creating, developing, and establishing an agricultural industry of wonderful and most wide-reaching importance.

—*Axes protected to exportation.* The manufacture of axes and other edge tools was commenced at Hartford, Conn., in 1826, by the brothers Collins, who were the first to supply the markets of this country with cast steel axes, ready ground for use. Until then such implements had always been imported. By the tariff of 1828 a protective duty of 35 per cent. was levied upon imported axes. Under this protection the Collins company introduced labor-saving machinery, much of which was invented, patented and constructed by themselves. Ultimately their axes altogether superseded the foreign article, on account of superior quality and greater cheapness. In 1836 foreign and home-made axes were selling side by side, in the American market, at \$15 to \$16 per dozen, at which time foreign producers, finding they could make no money at those rates, and that our establishments could not be broken down, withdrew from the competition, abandoning the entire market to our own manufacturers. Then, other domestic makers having meanwhile entered the field, home rivalry and improved methods continued the decline of prices. Axes were selling, in 1838, at \$13 to \$15.25 per dozen; in 1839, at the same; in 1840, at \$13 to \$14; in 1841, at \$12 to \$14; in 1842, at \$11 to \$14; in 1843, at \$11 to \$12; in 1844, at \$11 to \$11.50; in 1845, at \$10.50 to \$11; in 1846, at \$10 to \$11; in 1847, at \$9.50 to \$10.50; in 1848, at \$8 to \$10; and in 1849, at \$8 to \$10. These quotations are copied from the finance report of the United States for 1849, and they show a constant decline of prices, even after the pressure of foreign competition had been entirely withdrawn. Now, we are exporters of axes, and are wresting from the English one market after another. Said the "Sheffield (Eng.) Telegraph," as far back as 1874: "The steel of an American axe is so superior to that of an imported axe that no pioneer who understands his business will ever carry any other with him into the wilds." Similar testimony might be given by the page. A recent letter from an Australian to an English house, published for the information of the trade, says, "It is perfectly useless to try to oust American axes from the market, unless the competing article is at least as good in all points of view, and lower in price as well." The same letter further says, "The Anglo-American axes

are invoiced at 54s. per dozen, while the best American (the 'Hartford') are put on board at 48s. 9d. for the same average weights. Furthermore, the casing on English axes costs 4s. to 5s. per dozen: on the American, *nil*. It is, therefore, plain that the trade must go to America, unless a very large reduction in the price of the English goods can be made." Thus has long-continued protection placed American axes at the head for quality of material, style of finish, and cheapness of price, with surplus at home and growing exportation. Similar illustrations may be drawn from locks, scissors, watches, fire arms, shovels, hay forks, agricultural machinery, tools, saws, and many other articles. The necessary corollary is, that protection, adequate in extent and sufficiently prolonged, will lead to equal results as regards the great mass of our manufactures.

—MOST FREQUENT OBJECTIONS ANSWERED. 1. *The import duty is added to the price of the home-made article.* This is the corner-stone of the argument against protection. On it is built the charge, as variously formulated, that prices are enhanced to consumers for the benefit of the domestic manufactures; that taxes are levied to serve as bounties paid to privilege; that the many are plundered to enrich the few; that the tariff is a scheme of spoliation. Really, however, there is no greater falsity than the dogma, that, whenever a duty is imposed, the amount of duty is added to the price, not only of the foreign article imported, but also of the similar article manufactured in this country; the fact being that the tariff barrier merely shields and permits the natural price, which varies in different countries, according to the variation of its component elements, just as the natural price of wheat in the United States is made up of cheaper components than the price of wheat in England; and just as the natural price of pig iron in England is made up of cheaper components than the price of pig iron in the United States. Our wheat can undersell English wheat: hence the ruinous effect of our free competition upon English agriculture. On the other hand, English pig iron can undersell our pig iron: hence the ruinous effect of her competition, when not restrained, upon our manufacture. The only way to guard the natural price from destructive encroachment from abroad, is to erect the tariff barrier, behind which healthy competition, skill and invention will co-operate to bring down the articles to the lowest point at which a profit can be made. This is the universal law of domestic prices under a system of protective duties. It explains all the phenomena about which there is so much dispute. For instance, would a duty of \$100 per ton on imported pig iron increase the price of domestic pig iron by that sum? Is there anybody so rash as to insist that there would be such an enhancement? If not, for what reason not, if the duty is always added to the price of the home-made article? This is one of the predicaments into which the free-trade dogma forces its votaries; but the law of prices above stated does not encounter any difficulty whatever. The explanation under that law would be, that the duty of \$100 per ton would shield and permit the natural price of pig iron in this country, and such price would rise no higher even though the duty should be increased to \$200, to \$500 or to \$1,000, or be reduced to \$10. But if the duty should be cut down to \$3, \$2 or \$1 per ton, or to any other sum too small to shield and permit the natural price, the home price would fall; and if the competing foreign price should be low enough to compel an abatement of all the profit contained in the natural price of the native article, or to cut below productive cost, then the effect would be to stop the domestic manufacture, and hand the market enjoyed by it over into the hands of the foreigners, or else the chief component of productive cost,

which is wages, would have to be so reduced as to give some remuneration to capital. When a tariff duty does not, or could not, exert any influence whatever in sheltering and allowing the natural price, as in the cases of raw cotton, ice and newspapers, its imposition is a work of supererogation; but we can not have healthy and prosperous industries at home unless the natural prices of their products are adequately protected against those aggressions from abroad which possess overmastering power. Persons who denounce tariff protection are therefore compelled to take the untenable position that they are unwilling to permit the existence of natural prices for American products; or, to state the case in another form, are opposed to the continuance of all domestic industries which can be undersold in our market by foreign competition. To go before the people on that basis of appeal for their votes, is very different from going before them to get their support of the proposition, that consumers are taxed by the amount of the duties added to the home prices for the enrichment of our manufactures. Nor is this the whole of the predicament. If the duty is added to the price of the home-made article, then the conclusion is inevitable that the repeal or the decrease of the duty will reduce the home price by the amount of the duty removed; hence, when in the summer of 1879, the American mills were selling steel rails at \$40 per ton, the repeal of the duty of \$28 per ton would have brought the home price down to \$12 per ton, although the English mills could not then sell equal rails at less than \$22 per ton in the English market, and although \$12 would not have nearly paid for the raw materials of manufacture, to say nothing of wages. What value, theoretic or practical, can belong to a dogma which involves absurdity like this as an unavoidable corollary? Nor is this all. Many articles of home production, which are dutied in our tariff, are bought by our consumers as cheap as, or cheaper than, the equivalent articles can be bought in foreign countries. How it is possible, in those cases, to add the duty to the home price? Jaconet sells (May, 1882) wholesale for 6½ cents a yard, and can not be had for less in Manchester. Abroad the price of cod-liver oil is \$1.30 a gallon, the duty is 40 per cent., and the price here is 80 cents a gallon. A long list of such instances might be presented, all flatly contradicting the free trade dogma about the incidence of duties on imports. A theory which allows for no exceptions, yet encounters a multitude of them, must be a huge fallacy. Finally, if the import duties are added to the prices of the home-made articles, and thus, as is alleged, organize robbery by law, how is a revenue tariff without protection to be defended on principle? Such a tariff must levy duties, and these, according to the theory, must constitute robbery to that extent. This must be the position occupied by those who espouse the dogma about prices, unless the extreme view be adopted of excluding from the tariff charge everything, of whatsoever kind, produced in the United States. But then the revenue raised would be wholly inadequate to the needs of the government. Here, consequently, is a very puzzling dilemma, one born of which is robbery, and the other horn a deficit.

—2. *Free speech, free press, free soil, free men! why not free trade?* Because what has come to be styled in the discussions of the day, and in the demands of the antiprotectionists, as "free trade," is the instrument, not of freedom, but of slavery. The adjective "free" does not necessarily dignify, improve, ennoble, purify or sanction anything to which it is applied. Good men and women reprobate the use of liquor in treating on election days, as a vicious and corrupting device to influence voters; yet the intoxicant so used is styled "free liquor." We may, therefore, repeat the formula,

with the following variation: Free speech, free press, free soil, free men! why not free liquor? The answer, as before, is because it is the instrument of slavery, not of freedom. Again: Indiscriminate love, or the love of one man for many women, and of many women for one man, would debauch society; yet this sort of love is advocated by a class of persons who call it "free love." Once more the formula may be varied, thus: Free speech, free press, free soil, free men! why not free love? Because it is the instrument, not of freedom, but of slavery. Trade is not made really free by chaining it to the epithet *free*. Free trade no more emblemizes or establishes freedom than a pure fraud emblemizes or establishes purity. Free men under free trade between nations are put in bondage, losing their freedom by becoming the slaves of trade. If trade is made literally free by coupling the two words, why is there so much talk in England about "onesided free trade" and "fair free trade"? Whatever is truly and properly free can not be onesided, and must be fair; yet these descriptives are employed to designate that very system of free trade which we are asked to copy, and which we are told is so beneficial in itself that England can not afford to surrender it, even although it should be rejected by all other countries. It is a very unsound use of logic to base an argument in favor of an economic policy upon the ambiguity of a word in its different connections. The formula given is only one of those carelessly phrased propositions; one of those fallacies and non-sequiturs, which are continually passed off upon the unthinking as first-class truths; one of those adroit, pungent, sparkling sophisms, making war for the wrong in the name of the right, which are apt to dangerously impress such superficial minds as are unaccustomed to independent thought.

—3. *Every man has a natural right and should be free to spend his own money in his own choice of a market.* Every right has its duty, and the two limit each other. Thus, everybody has a right to love, but that right is restricted by laws, both human and divine. No man has a right to love his neighbor's wife; there duty interposes an impediment, while law erects a barrier and provides a punishment. A man has a right to marry, but not to marry more than one woman, at least in any civilized country. His marrying right is a right with fixed boundaries or restraints, which he can not transgress without doing an injury to society, and subjecting himself to just penalties. A man has a right to choose his religion, but his right is limited by the proviso that his religion shall not be such as to require an invasion of the rights of others, as, for instance, Mormonism, which exists in its polygamous form in defiant violation of law, and needs to be remorselessly crushed out for the good of the community in general. It is the same in regard to spending one's own money. The right to spend is not an absolute right; like other rights it is hedged in by duties or obligations, which measure, determine and restrict its exercise. No one, for illustration, has a right to spend his money in getting somebody else drunk, with a design to unsettle the latter's judgment so as to take advantage of him in sharp bargain-making, or to trick him out of his signature or out of his vote. It is not right to spend one's money in building a dam across a stream, by which water will be backed up over other people's land without their consent. It is wrong to spend one's money in any way which encroaches upon the rights of others. Even the right to life has its limitations. He who commits murder forfeits his right to life. The right to happiness is bounded by the duty of conduct consonant with the attainment of happiness. There are no rights without corresponding obligations; and any argument which treats of the rights as absolute, that is, set free from obligation, is obliged to lead to fallacious conclusions, as in the

case of the proposition that every man has a natural right and should be free to spend his own money in his own choice of a market.

—Rights are of two sorts: natural and conventional. To breathe, to eat, to live, are natural rights. To spend one's money, and the general acts of buying and selling, with the great mass of what are called rights, are conventional, fixed either by statute or constitution, or by custom, which is only another name for the common or unwritten law. Money itself is a conventional creation for the benefit of society by overmastering the intricate difficulties, embarrassing delays and sluggish movements of pure barter—the condition before money was agreed upon as a medium for effecting exchanges. A conventional right is necessarily subject to the regulating terms of the convention or general agreement, whether by law or custom, which created it a right. What is a conventional right in one country may be a conventional wrong in another. In some places a man may spend his money in ways or on objects prohibited in other places. A man may lawfully spend his money in Louisiana for a lottery ticket, but to spend his money in that way in Illinois is to violate a legal provision. It is a false assumption that the right to spend one's money is a natural, not a conventional, right—is a right like that to breathe, to walk, to think, or to live. It is nothing of the kind, but wholly conventional. Whenever a man enters a community, and becomes one of its integral units, he must submit himself to the conventional rights which he finds in operation there. He can not set up his individual judgment, however wise and superior he may consider himself, as the determiner of his measure of acquiescence in those rights; he must submit until he can bring over enough of the other judgments to his style of thinking to precipitate the desired change in the conventional rights.

—The argument for a protective tariff rests upon the experience that the spending of one's own money for foreign goods, when it dooms laborers at home to idleness, and leaves our own good raw materials, unused, and our own natural resources to remain undeveloped, is detrimental to the mass of the people. No one has a right to spend his money in such a way as to injure the community in which he lives. Every time this country has had a tariff which encouraged the importation of manufactures from other countries, the result has been disastrous to our domestic industry. Wages have gone down, many thousands of men have been thrown out of employment, and the activities of production have been reduced to slaggishness and embarrassment. Exactly the contrary have been the circumstances under every tariff enacted with the effect of protecting American labor and capital against encroachment from foreign aggression. Are we to be told that men have a natural right to spend their own money in their own choice of a market, despite the fact that such spending may inflict adversity upon the nation, impoverish its resources, deplete its revenue, weaken its political power, impair its credit, and perhaps render it unable to successfully wage a defensive war for the preservation of its existence? The policy of a protective tariff is vindicated by the prosperity, strength, vigor and safety which it confers upon the country.

—4. *Protection is the reign of selfishness, and it antagonizes the brotherhood of man.* The Bible says: "But if any provide not for his own, and especially for those of his own house, he hath denied the faith, and is worse than an infidel." Thus we are taught

that the duty to selfhood precedes and outranks the duty to brotherhood. Every man's mind must be itself educated; every man's character must be itself formed; every man's affections must be themselves cultivated, disciplined, purified; every man's condition must be itself raised, before his mind, character, affections and condition can attain to their utmost usefulness to society, not only at large, but especially at home, where the circumstances of daily intercourse multiply his obligations and preferentially employ his duty. Communities are not elevated pecuniarily, mentally, morally, or religiously, by a process which involves the whole mass as a single entity, but through individual action, the advance realized by each integral unit contributing its share to raise the general average, and every retrograde movement of any one of the units detracting from and lowering that average. In every man there must be a large development of internal power before there can be a large development of external power. No more than an individual can a nation exert great strength outwardly until such strength exists inwardly. Every person, every city, every country, every state, every people, must look first to its own welfare, to its own improvement, to its own benefit. This is the great law of universal progress. Whenever it is violated it deranges the conditions of normal advancement. Even Christianity was for the Jew first, then for the Gentile. The gospel was preached to all the world, but the beginning was at Jerusalem. God has wrought the law of selfhood into every fibre of man's constitution, but selfhood and selfishness are distinct, not identical, the latter being the perversion of the former, bearing toward it the same relation that lust bears toward love. It is beyond controversy, because the testimony of all experience in all ages and countries is, that man's individual feelings are stronger than his sympathetic emotions; hence the maxim that "self-preservation is the first law of nature." To breathe is not more natural than to love first and preferentially one's self, one's own wife, one's own children, one's own kindred, one's own country. If this were not so, what would become of self-improvement, of family, and of patriotism? The assertion of selfhood is inseparable from human nature. It is the gift of God, and therefore must be beneficial in its exercise. Only when it is abused does it degenerate into selfishness, as love in its abnormal and debased manifestations becomes lust. Indeed, were man differently constituted—if he felt another's woes more than his own—this world would be turned into a scene of universal confusion and of still greater suffering. Then everybody, actuated by a self-sacrificing desire to look after the welfare, safety and benefit of others, would vastly neglect to look after his own welfare, safety and benefit. The very sentiment which would seek to render assistance would prompt its refusal by the intended recipient; for the unconquerable tendency would be to give, not to receive, and, in receiving rather than conferring, that tendency would be antagonized. Society would thus fall into inextricable disorder. Instead of diminishing misery, such a condition would augment it, until the earth became a rack for the incessant torture of human sensibilities, and extinction of the race ended the scene of wretchedness and anguish. It is the wisdom of God that selfhood should be the guide. That has given the situation as it is, with its capacities and opportunities of progress. The argument against the protective system virtually is, that it does not permit the abnegation of self to be substituted for this selfhood. But the sweeping away of that system—the abolition of custom houses and tariffs—would not get rid of this selfhood. It is not in the power of man to dethrone self, nor is it desirable, even could it be accomplished. Selfhood was bestowed by Infinite Wisdom to be exercised, not frustrated or perverted. Protection offers it a fair field for its functional activity. Home

industry outranks foreign industry as home folks outrank strangers. Free trade, instead of fostering and developing selfhood, would degrade and misapply its proper faculties and inclinations, transforming it into aggressive and unrestrained selfishness. Suppose congress should remove all the restrictions on imports, how could that cultivate the spirit of brotherhood? Our manufacturing industries would be partly crippled, partly ruined, partly extinguished. Immense amounts of fixed capital would be irrecoverably sunk. Many ten thousands of our skilled workmen would be thrown out of employment. All this would happen because it has happened aforesaid, when import duties have been reduced below the level of protection; much more, then, would it happen if those duties should be removed altogether. Unrestrained foreign competition, remorseless as monopoly, would be let loose upon this country. How could such circumstances induce a wider, deeper, fuller application of the doctrine of the brotherhood of man? Whatever strengthens the appeal to the instinct of self-preservation weakens the incentives to sympathetic action. In a shipwreck the spirit of brotherhood is generally trampled ruthlessly under foot in the wild scramble for individual safety. When, at the cry of fire, panic seizes upon an audience, the spirit of brotherhood vanishes on the instant, and an intense struggle of each for self takes possession of the scene. These examples illustrate the principle. To abolish the tariff, to tear down the custom houses, or to withdraw protection from the import duties, and thus to bring risk, loss, danger, fear, grief, hunger, misery, to the homes of a multitude of our people, would not yield the fruits of brotherhood, but those of selfishness. All the circumstances which centre the emotions upon self would be reinforced at the expense of the sympathetic feelings. As a scheme to promote brotherhood, free trade would be not only idle and nugatory, but in its operative forces the very reverse of what would be intended. Labor at home would be wronged, depressed, victimized; and, as whatever harms labor anywhere tends to harm it everywhere, even European labor would be ultimately harmed by the reflex influence from the harmed condition in this country. It is protection, not free trade, that cultivates and strengthens the brotherhood of man.

—5. *Industry will thrive best when it is let alone.* This dictum became American free trade doctrine in the days of Robert J. Walker, who said, in his annual report for 1845, as secretary of the treasury: "*Let them alone* is all that is required of man; let all international exchanges of products move as freely in their orbits as the heavenly bodies in their spheres, and their order and harmony will be as perfect, and their results as beneficial, as in every movement under the laws of nature when undisturbed by the errors and interference of man." This argument from analogy is supremely fallacious, because the assumed analogy is not legitimate, but forced. Human beings can not, even if they would exercise any influence or control whatever over the motions of planets and suns; but God has commanded man to vanquish the forces of nature, so far as these appertain to our own globe; a command found in the words, "Be fruitful and multiply, and replenish the earth, *and subdue it*," as addressed to our first parents. From that day to this, interference, persistent interference, with the natural order of things, interference for the purpose of obtaining a complete mastery, has been an imperative law of man's progress to higher and still higher levels of social, political, industrial, moral and even religious excellence. There is no such thing as letting industry alone, without going back to barbarism, to the lowest depths of human degradation, privation and wretchedness. "Strictly speaking," declares Say,

"there is no act of government but what has some influence on production." We know of no writer on political economy, entitled to be considered an authority, who disputes Say's proposition. Accordingly, it is quite obvious, that, in regulating duties on imports, and in all other legislation, the industry of the country will necessarily be affected for the better, or for the worse; it will either be promoted and bettered, or be embarrassed and depressed, whether, in making the laws, we take it into consideration, or disregard it wholly. We can not, then, let it alone without ceasing to make or have any laws. We *must* legislate, and *must* administer the laws, in respect to industry, and so either promote or depress it, or, by ceasing to have laws, relapse into barbarism, and, by so doing, affect industry in the utmost degree possible, that is, annihilate it. The let-us-along dogma is, therefore, saying in other words, shoot at random without taking aim, and you will be sure to hit the mark, or, refuse medical treatment under all circumstances, and people will be kept in the best of health. The declaimers in favor of letting industry alone, raise their absurd cry in the face of the fact that all the positive and useful knowledge we possess, all the accumulations we have realized from the productive forces, whatever of empire we have achieved over material objects, and the whole of the civilization we enjoy, have resulted from *refusing to let things alone*: by interfering with their natural order in the most obtrusive manner; by interrupting and turning aside their spontaneous tendencies; by compelling matter to assume new proportions, to take on predetermined relations, and to exercise unaccustomed functions; by forcing the natural agents to become the obedient servants of man; in other words, *by subduing the earth, in compliance with the divine command*. We dig down into the bowels of the ground, bring coal to the surface, confine it in adaptable receptacles, and compel it to surrender gas, with which we light our cities. The let-alone policy would never do that. Water has a natural tendency to seek a general level, but we refuse to leave it to flow as it will, and pump it up into reservoirs, distribute it through pipes over a wide area, and supply it to the people within their very dwellings. What has the let-alone doctrine to do with such a purpose? For centuries electricity flashed only in the lightning, or illuminated the northern sky with the aurora borealis; but man harnessed this subtle force to ingenious devices of inventive mechanism, and converted it, speeding along lines of telegraph, into the errand boy of commerce. How many years would it take the let-alone plan to accomplish that? We tunnel mountains to provide a passageway for railway trains; we span broad streams with bridges to afford easy and speedy access between the opposite banks: we burrow under rivers to facilitate the movement of people and of vehicles; we lay telegraphic cables across the ocean to secure instant communication between distant continents; we cut a vast canal through the width of an isthmus, thus connecting seas by navigable waters, and obtaining a quick transit for large vessels, by which is effected a saving of months of time and many thousands of miles of transportation; we go up in balloons, and explore the secrets of the upper atmosphere; we send down a cunningly constructed apparatus into the depths of the ocean, map out the altitudes and the depressions of the bottom, and determine the character of its substance; we devise immense telescopes, and lay bare to human vision the mysteries of the heavenly arcana. It is by thus getting the mastery over nature, by literally subduing the earth, not by letting things alone, that the progress of our race has been realized. Our boasts are about our *triumphs over obstacles*, not about our *omissions to do*. Every advancing step of this progress has been signalized by an increased persistency of interference. We refuse to let iron ore alone beneath the surface, where

it has been placed by nature; we dig it out; we mix it with other materials; we melt the mass down; we produce pig iron. Then we refuse to let it alone in that form; we convert it into bar iron. Still we refuse to let it alone; we turn it into steel. Next, we refuse to let the steel alone; we cast it into cannon; we shape it into tools; we use it to armor-plate ships of war; we transform it into watch springs. One act of interference is only a stepping-stone to another act of interference. In like spirit we refuse to let alone anything which human influence can reach from a speck of dust floating in the air to the morals of a community. Actively and incessantly disturbing the customary courses of nature, we develop the sour crab apple into the mellow, delicious fruit of the cultivated orchard; we marry one sort of plant to another, and produce a new variety; we diversify the external appearance of flowers by artificial applications, and make these changes permanent in aftergrowth; we domesticate certain wild animals, and improve their breed. Each successive generation witnesses a considerable increase in the accumulation and aggregate of these interferences, and each in consequence secures the attainment of a higher level of civilization. How, then, can it be said with truth that industry will thrive most when it is least cared for in the tariff laws? Why should it be abandoned at that exact point, but nowhere else? Industry must be protected in the laws which levy duties on imports, no less than in the other laws, if it is expected to augment, to be diversified and to prosper; for it surely can not expand under a policy of indifference, inaction, impotence and folly, such as is involved in the let-alone doctrine.

—6. *Protection has for its essence obstruction, and for its object scarcity.* This allegation is flatly contradicted by experience. In the seventy-one and a half years beginning with 1790 and ending June 30, 1861, our net imports aggregated \$7,488,263,258; in the twenty years ended June 30, 1881, \$9,117,531,264, or over 21<sup>3</sup>/<sub>4</sub> per cent, more of value in about 28 per cent. of the time. Our net imports in 1860, after thirteen years and seven months under the revenue tariff system, amounted to \$335,233,232, or to \$10.66 per capita; but, in 1880, after twenty years and three months under the protective policy, our net imports had increased to \$741,501,725, or to \$14.78 per capita. The idea of obstruction as the essence of protection is signally refuted by these statistics. In the seventy-one and a half years, our domestic exports aggregated \$6,854,339,383; in the twenty years, \$11,091,223,908, or \$4,236,884,525 more in fifty-one and a half fewer years. Our domestic exports amounted to \$373,189,274 in 1860, or to \$11.87 per capita; but, in 1880, they had increased to \$833,294,246, or to \$16.61 per capita; a gain of \$4.74 per capita. As, averaging our domestic exports, each head of population had this additional value to send abroad, and as exports always consist of what the people have in surplus after the satisfaction of their own wants, it is an audacious and foolish crossing of swords with the truth to charge that tariff protection in this country has led to scarcity. There is no escape from the proofs offered by these figures. They show, beyond room for doubt, that net imports and domestic exports augmented faster under the protective than under the revenue system, even distributed and measured per capita, the growth of commerce and trade being far more rapid than the growth of population. Are these evidences that the defensive policy restricts either imports or exports so as to tend to scarcity? Rather, do they not contradict such a theory with all the conclusive authority of positive knowledge? Our short mathematical refutation of the absurd dogma of the free traders is complete. With a prodigality of abundance in plain sight every day, and

in all directions, almost forcing itself upon recognition, it is effrontery to raise the cry of "scarcity," and to stigmatize a system of legislation which is concurrent with such prodigious realizations as the skeleton in the closet-of the nation; as the curse which sits by their firesides; as the following omen of calamities and still greater "scarcity" to come. The marvel is, that a doctrine so preposterous should have found a lodgment in any intelligent mind.

—BIBLIOGRAPHY. The literature of the subject is very copious, mainly in the form of pamphlets. Far the greater part of both the minor publications and the books has now only stray existence in private collections and in the libraries of public institutions. Among the most valuable works to be occasionally procured at the second-hand book stores are *Essays on Political Economy*, by M. Carey, Philadelphia, 1822; *Propositions Concerning Protection and Free Trade*, by Willard Phillips, Boston, 1850; *National System of Political Economy*, by Frederick List, Philadelphia, 1856. The most important treatises not out of print are as follows: *Principles of Social Science*, 3 vols., 8vo, *The Slave Trade, domestic and Foreign, Harmony of Interests, and Unity of Law*, by Henry C. Carey; *American Political Economy*, by Francis Bowen; *A Manual of Political Economy*, by E. Peshine Smith; *The Tariff Question*, by E. B. Bigelow; *Essays designed to elucidate the Science of Political Economy*, by Horace Greeley; *Protection a Boon to Consumers, The Solidarity of the Industries, The Protective Question Abroad, and The Protective Question of Home*, by John L. Hayes; *Protection to Native Industry*, by Sir Edward Sullivan; *Sophisms of Free Trade*, by Sir John Barnard Byles; *Speeches and Letters on Industrial and Financial Questions*, by William D. Kelley; *Speeches on the Tariff Question and on Internal Improvements*, by Andrew Stewart; *Questions of the Day, Economic and Social, and Conversations on the Principal Subjects of Political Economy*, by Dr. William Elder; *Social Science and National Economy, and Political Economy, with Especial Reference to the Industrial History of Nations*, by Robert Ellis Thompson; *How Western Farmers are Benefited by Protection*, by David H. Mason *Outlines of an Industrial Science*, by David Syme; *The Premises of Free Trade Examined, and Reviews of Sundry Free Trade Arguments*, by George Basil Dixwell. A very large amount of valuable information is to be found in Alexander Hamilton's celebrated *Report on Manufactures*, made to congress in 1791, and printed in his collected works; also, in the congressional debates on the tariff from 1789 onward, and in the reports of the house committee on commerce and manufactures, and the committee of ways and means.[58](#)

## PRUSSIA

PRUSSIA. The kingdom of Prussia was composed, before 1866, of many separate pieces of territory. The largest, situated in the east of Germany, comprised the provinces of Prussia, Pomerania, Brandenburg, Posen, Silesia and Saxony; the other, situated in the west, comprised the provinces of Westphalia and of the Rhine. We have embraced in each of these two pieces of territory certain detached domains, but so small in extent that they scarcely deserve mention. The war of 1866 gave to Prussia, with the electorate of Hesse, which was situated between the provinces of the east and the west, as if between the tree and the bark, Schleswig-Holstein, Hanover, Nassau, Frankfort, and some small districts; so that the Prussian state, including Lauenburg and the two principalities of Hohenzollern, now forms a compact whole, with an area of 137,066 English square miles. The area of Prussia in 1740, when Frederick the Great ascended the throne, was 2,160 geographical square miles; 3,539 geographical square miles at his death, in 1786; 5,551 at the death of Frederick William II., in 1797; 5,725 before, and 2,859 after, the peace of Tilsit; and 5,086 after the peace of 1815. Lastly, in 1865, it has an area of 5,104 square miles.

—In 1865, before the several annexations to it, the population of Prussia was about 19,000,000; it has been 10,402,631 in 1816, 12,308,498 in 1825, 13,556,000 in 1834 and 16,181,185 in 1846. The census of 1871 gave the number of inhabitants as 24,693,066.<sup>59</sup> Prussia forms part of the German empire, and its king is the emperor of Germany.

—1. *Constitution* Circumstances, which now belong to history, postponed until 1847 the fulfillment of the promises made by the ordinances of Oct. 27, 1810, May 22, 1815, and Jan. 17, 1820. A part of these promises, however, was fulfilled in 1823 (ordinance of June 5), by the creation of the provincial estates, divided into four orders—princes and lords, knights (equestrian order), towns, country. In 1842 (ordinance of Jan. 21), the provincial committees (*Provinzial-Ausschüsse*) were established; they were to be elected by the estates, and consulted in certain cases by the government. Finally, a decree of Feb. 5, 1847, established a "united diet," composed of the eight provincial representative bodies. This "united diet" (*Vereiniger Landtag*) was convoked April 11, 1847, and generally carried on its deliberations in two *curiæ*, the one composed of princes and lords, and the other of the three other orders. This first session had produced great effects in the country, when the revolution of 1848 broke out. The national assembly, convoked by the royal patent of May 13, 1848, did not succeed in drawing up a constitution. It was dissolved Dec. 5, 1848, and on the same day the king granted a constitution and an electoral law. The two chambers instituted by the new constitution assembled at Berlin, Feb. 26, 1849, recognized in the address to the crown the constitution thus granted, and immediately set about revising it. But the second chamber was dissolved April 27, 1849, and after the promulgation of a new electoral law, dated May 30, 1849, chambers were elected, which assembled Aug. 7, 1849. With the parliament thus reconstituted anew, the revised constitution of Jan. 31, 1850, was deliberated upon; the king and the chambers took the oath to support it, and it was published in the

official collection of the laws and ordinances of the kingdom. It is this fundamental act, modified in some of its parts by subsequent laws, which we have here to analyze taking into account, of course, its subsequent modifications. In case of conflict between them, the constitution of the empire controls the Prussian constitution.

—*Fundamental rights.* All Prussians are equal before the law; the nobles have no privileges. Public offices are accessible to all citizens who fulfill the conditions provided by the laws. Personal liberty is guaranteed; no citizen can be deprived of it except in the cases and according to the forms prescribed by the laws. The domicile is inviolable; domiciliary search, the seizure of papers and letters, can take place only in cases provided by law. No one can be brought under exceptional jurisdiction. Penalties must have been provided for by law (they have no retroactive effect). Property is inviolable; expropriation can not take place except compensation is made. There is no such thing as civil death or confiscation.

—Freedom of worship is guaranteed. The enjoyment of civil and political rights is independent of the religious belief professed by the citizen (law of July 3, 1869). Religious communities or corporations can not be declared civil persons except by a law. Each religious body administers its own affairs and its own property; it freely enjoys its institutions and endowments; the relations of the faithful with their clergy of all grades are not subject to any restriction, only the publication of religious regulations is subjected to the rules imposed on all kinds of publications.

—Every Prussian has the right freely to express his thoughts by words, writing, printing and drawing. Censure is abolished, and no restriction of the liberty of the press can be established, except by a law. Citizens may assemble freely, and are not obliged to obtain an authorization to so assemble, but without arms and in an inclosed place; they may form associations and societies for any object not contrary to the law. The right of individual petition belongs to every Prussian; authorities or corporations alone have the right of collective petition. The secrecy of letters is inviolable; the law determines the exceptions required by criminal procedure and by the circumstances of war. Seigniorial jurisdictions and other privileges connected with the land are suppressed, and can not exist within the limits of the kingdom.

—*The King.* The person of the king is inviolable. All official acts must be countersigned by a minister, who assumes the responsibility of them. The king alone has executive power, appoints and dismisses ministers, causes the laws to be promulgated, and decrees the ordinances (cabinet orders, *kabinatoorder*) necessary for their execution. He is commander-in-chief of the army; he has the right to declare war, and to conclude peace or treaties. Only treaties of commerce, and those which impose a burden upon the state, are subject, in order to be valid, to the approval of parliament. We must add that the king of Prussia has now lost this right, as it is the emperor who declares war. The king has the right of pardon but can not exercise it in favor of a minister, except at the request of the chamber which impeached him. He convokes and prorogues parliament, and dissolves the second chamber. In the latter case the elections must take place within sixty days, and the convocation of parliament within ninety days.

—Succession to the crown is in the order of primogeniture, in the Hohenzollern family, and in the male line only. The king attains his majority at eighteen. He takes the oath of fidelity to the constitution in the presence of both chambers.

—The funds of the *fideicommissum* of the crown continue the proprietor of the annual revenue of 9,649,121 francs. drawn from the revenues of the domains and forests under the law of Jan. 17, 1820, an annual revenue which was increased by the law of April 30, 1859, an annual revenue which has a budget appropriation of 1,875,000 francs a year. The royal palaces, with the furniture and works of art contained in them, as well as the diamonds and all property acquired by purchase or inheritance, belong to the royal family in its own right, and not to the nation.

—Since 1871, the king of Prussia is emperor of Germany; this is not a remunerated office, as there is no *imperial* civil list. The heir apparent alone is entitled his imperial highness; the other princes of the *royal* house have the title of royal highness.

—*The ministers.* The ministers have the right to participate in the proceedings in the two chambers, and must be heard whenever they demand it. But they do not vote, unless they are members of the chamber. They may be impeached by each chamber for a violation of the constitution, malversation in the administration of the public moneys, or for treason. The supreme tribunal, consisting of the united chambers, are the judges in cases of this kind. Although there is a president of the council, the ministers are not jointly responsible; the king may even retain a minister who has been many times in the minority, the constitution not expressly requiring the king to dismiss him. The king, however, has been obliged more than once to yield to the pressure of public opinion.

—Since the creation of the German empire many ministers find themselves serving two masters: the empire (German) and the state (Prussian). The empire has no minister of war, no minister of the navy, no minister of finance, but those of Prussia. But they have no right to take part in the proceedings of the Reichsrath, except by reason of their being members of the Bundesrath. The chancellor covers them with the mantle of his responsibility.

—*The parliament.* The parliament, called the Landtag, shares the legislative power with the king. Financial laws must be presented in the first place to the chamber of deputies; the chamber of lords must approve the budget, or reject it as a whole. It is only to maintain public security or to organize aid in case of calamity, that the ministry can, on its joint responsibility, proclaim regulations having the force of law, while the chambers are not in session; these regulations must contain nothing contrary to the constitution, and must be submitted for the approval of parliament at its next session. Each chamber has, like the king, the initiative in the making of the laws; that is, the right to introduce bills.

—The king convokes parliament every year in ordinary session (in January), and afterward as often as circumstances require it. Each chamber draws up its own rules and governs itself; it appoints its president and secretary. The sessions are public. No decision can be made if a majority of the members is not present. The members of the

two chambers are the representatives of the whole people (and not each of his own district); they vote as their conscience directs, and are not bound by an imperative commission or instructions. They are not bound to give any reason for their vote. No member of the chamber can be prosecuted during the time the chambers are in session, unless he be taken *flagrante delictu* or immediately after. The consent of the chamber is necessary to continue the prosecution.

—*The chamber of lords.* According to the law of May 7, 1853, and the ordinance of Oct. 12, 1854, modified by the ordinances of Nov. 10, 1865, Oct. 26 and Nov. 16, 1867, the chamber of lords is composed as follows: 1. Princes of the blood who have reached their majority, and upon whom the king confers the right to sit in the chamber. 2. Hereditary members, to wit: the heads of the houses of Hohenzollern-Hechingen and Hohenzollern-Sigmaringen; the heads of eighteen houses formerly sovereign; sixty-seven princes, counts and lords appointed by the king; in all, in 1867, eighty-seven hereditary seats. 3. Members appointed for life: a, the titularies of the four great offices of the province of Prussia; b, the persons appointed by the king upon the presentation of the following corporations: the three foundations (*stifter*) admitted in 1847 to make part of the *curia* of the lords, one member for each foundation; the eight colleges (*verbände*, or *unions*) of counts possessing equestrian property, one for each college; the representatives of eleven families of great landholders; the colleges of landholders, whose families, have been established for a long time upon their property, to the number of ninety members; the nine universities, one for each university; the forty-three cities upon which the king has conferred the right of presentation (most of them present the burgomaster, who ceases to be a member of the chamber when he loses or abandons his municipal functions—the burgomasters are elected for from six to twelve years, according to the cities); and the persons whom the king calls on to sit in the chamber of lords in 1867 there were sixty, but the number varies).

—The number of the members of the chamber of lords is not limited. They must be thirty years old. They receive no salary or indemnity of any sort.

—*The chamber of deputies.* The chamber of deputies is composed of 432 members. The election is of two degrees. Every Prussian twenty-four years of age, enjoying civil and political rights, not living on alms, and having lived in the commune for at least six months is a primary elector. The electors of each district are divided, according to the amount of direct taxes they pay, into three classes, so that each class represents one-third of the total amount of the taxes of the district. Each of these divisions, or classes, appoints a third of the electors allowed to the district. There is an elector of the second degree for every 250 inhabitants; and the districts must be combined in such a manner as to include a population corresponding to six electors of the second degree. The total number of the latter is about 73,000. The primary elections, as well as the elections of the second degree (nomination of deputies), are made by public vote; the vote of each elector is officially recorded. An absolute majority of votes is necessary to make an election valid. In the hall in which the elections take place, there can be no discussion nor any decision made. The elections for the Reichstag are direct and secret.

—All Prussians thirty years of age, enjoying civil rights, and who have lived in Prussia at least a year (if naturalized) are eligible to the chamber of deputies. The deputies are elected for three years. They receive mileage and compensation during their stay at the seat of government. The deputies to the Reichstag receive no indemnity (gratuitous service being the counterpoise to universal suffrage and universal eligibility). Frequently the same person is both a deputy to the Prussian parliament and a deputy to the German parliament, in which case he is paid in one capacity and serves gratuitously in the other.

—II. *Administrative Organization.* The administrative organization of Prussia is considered in many respects a model; it is very centralized, and yet self-government has a large part in it. The administration proper is represented by the ministers, who direct the central administrations; by the superior presidents in the provinces; by the governments (whose organization we shall explain further on) of the *Regierungs-Bezirke*, governmental districts or governments, corresponding to the French departments; by the directors of the districts, called *Landsräthe*, equivalent to the French sub-prefects, but intrusted with much greater power; finally, in a certain measure, by the bailiffs (*amtmanns*) and the burgomasters, also by the *Schulze*, or administrators of the commons (*Gemeinde-Vorsteher*), corresponding to the French mayors. Self-government resides in the provincial estates, corresponding, to a certain extent, to the councils general of the French departments, but embracing the province; also in the district, the canton and the commune, but not in the department (governmental district).

—The treatises on German administrative law and the royal almanacs still speak of the council of state, and tell how it is composed (princes, ministers, certain high functionaries, etc.). But as the constitution of 1850 confides no functions to it, it scarcely functions at all. The king can convoke it and ask its advice, but this advice does not bind the ministers; it has no peculiar privilege or prerogative. The first council of state dates from 1604; its modern reorganization dates from March 20, 1817, when, in the absence of a national representation, it was invested with the preparation of laws. The year 1848 abolished it, but it was re-established by royal ordinance, July 4, 1854.

—We must also speak of the "Secret cabinet" (*das geheime Cabinet*), of which mention is often made in the journals. Before 1808 this cabinet had an influence which annulled that of the ministers. In 1810, under Chancellor Hardenberg, the powers of the cabinet were diminished; after 1822 the cabinet recovered all its influence, which the constitution of 1850 lessened, but did not succeed in destroying completely. At bottom it is only a secretaryship of the king, a committee of secretaries, whose members are functionaries of a high rank, and who prepare the work for the king.

—*Administration.* The ministers, as we have said, are at the head of the administration; their number is at present nine: of justice, war, the navy, finances, of foreign affairs, the interior, worship and instruction, commerce and industry (including public works), and agriculture. There is, besides, a minister of the king's household, but he does not form a part of the council of ministers, or rather, he is not

a political minister or, as they say in Prussia, a "minister of state." Various services are directly subordinate to the ministry of state (council of ministers), such as the official journal, the archives, printing, various others, and notably the commission of examination for future functionaries. To be a functionary it is necessary to have studied three years at the university, to have passed a period of instruction and preparation for the public service, and to undergo a new examination, called the *state examination*, before the commission. The candidate then obtains the title of assessor, which confers the right of being employed and compensated, but some time elapses before a place with the title of councilor can be had. The functionaries of lower grade and simple employés are likewise obliged to pass an examination, but naturally the requirements here are not so great.

—As to the internal organization of the public services, some are organized into bureaus, that is, they have a chief, a sole functionary, and employés; but most of these services have councils or committees, in which the president often has a great preponderance, but in which each councilor has his powers (*decernat*) clearly defined.

—At the head of each of the eleven provinces (Prussia, Brandenburg, Posen, Pomerania, Silesia, Saxony, Westphalia, the Rhine, Schleswig-Holstein, Hanover, Hesse-Nassau) is placed a superior president (*Oberpräsident*) as an organ of the government, and whose powers are rather political than administrative. In case of urgency he can take any step which the circumstances demand; but ordinarily he has to do chiefly with the relations with the provincial estates, of which we shall speak further on, the affairs which concern many governments (district governments, departments, called sometimes, but wrongly, regencies), the surveillance of the provincial authorities depending on the various ministries; he is, besides, first president of the government which administers the district (*Bezirk*) in which he resides.

—Each province is divided into several governmental districts (*Regierungs-Bezirk*); for the six of Hanover, the name of *Landrosties* has been preserved; their total number is thirty-five or thirty-six, if Berlin is counted as a government district. The Hohenzollern country stands apart. These governments, which correspond to the French prefectures, are composed of a certain number of functionaries, each charged with a service for which he is responsible: these functionaries form a council (often divided into two or three parts), which meets several times a week; its decisions are signed by the president of the council and the directors of the divisions. The three divisions are: 1. interior (police, communal affairs); 2. worship and instruction; 3, finances. These are collective administrations (German *Collegial*). The powers of the governments differ little from those of the French prefecturers. It should be remarked, however, that the *council of schools*, which forms a part of the government (Regierung) and renders useless the academy inspector, the council of construction, and others, fulfills the duties of certain functionaries of the French departments, such as engineer-in-chief, director of direct taxes, and those of the chiefs of division and of the bureau of prefectures.

—The *circle* (*kreis*) corresponds to the French arrondissement, and the representative of the administration is called the *Landrath* (literally, country councilor)

corresponding to the French *sous-préfet*. However, it would be more exact to call him, the *mayor of the arrondissement*, for he is appointed by the king from a list of candidates presented by the estates of the circle (*conseil d'arrondissement*); he must be a landed proprietor; he represents the circle vis-a-vis of the government and the government vis-a-vis of the circle. He is, however, paid from the funds of the state.

—The bailiffs of the cantons should also be considered as having part in the administration, because they are appointed by the superior president, and have administrative powers; the burgomasters, or mayors, who are appointed by the king, upon the presentation of the municipal council, should perhaps be ranked here also; but practice is not always conformable to the rigorous classifications of abstract science. We shall now describe the organs of self-government in Prussia, remarking that the most important of these is the *Landtag* (the parliament), of which we have already treated above. And first of the provincial organs, of those of the circles and communes.

—*Self-government.* The organs of self-government in Prussia are: 1, the provincial estates; 2, the communal diets (*Communal-Landtag*); 3, the districts; 4, the cantons, or bailiwicks; 5, the communes. The administrative organization has not the character of symmetry and unity that it has in France; it preserves the traditional peculiarities of the provinces and localities, so that it is difficult to give an exposition of it in broad outline.

—The provincial estates were created by the law of June 5, 1823. In each of the eight provinces then existing, a diet was established, made up of the lords on whom the king had conferred an individual (*viril*) vote, of the deputies of the great landed proprietors or of the possessors of equestrian property, of the deputies of the cities, and of the deputies of the country. The number of members varies in the different provinces; but everywhere the cities and the country have the majority. The provincial diets meet every two years; they sit in the chief town of their respective provinces. The government submits to them such laws of general interest as it deems proper, and most of the laws of local interest. The diet elects its president, who bears the title of *Marschall*, and the government is represented by a commissioner. These powers were extended after 1866, in consequence of the annexations which took place at the time. The old electorate of Hesse was put in possession of the treasury of the ex-electoral, whose revenues amounted to 300,000 thalers; the diet of the province of Hanover received in 1868 a grant of 500,000 thalers a year, and the old duchy of Nassau an income of 142,000 thalers and a capital of 46,380 thalers, provided by the funds formerly belonging to Nassau; finally, the law of April 30, 1873, gave to the old provinces, as well as to Schleswig-Holstein and to the city of Frankfort, a grant provided for in the budget of the state, amounting altogether to the sum of two millions. Various acts have extended the powers of the provincial diet, which has the right to acquire and to manage all provincial property; it is specially charged with public assistance in so far as it is incumbent upon the state (asylums for the insane, for deaf mutes, subsidies to poor communes, etc.); it superintends the construction and maintenance of highways and roads, and can, if needs be, levy additional taxes for this purpose. It is the organ of the province.

—The "communal diets" are representative assemblies for territories less than a province; in this only do they differ from the provincial estates. Thus Hesse, Nassau and Frankfort together form a province, but each of these territories has its communal diet (the word communal is not synonymous here with municipal, but means *of common interest*). Brandenburg is divided into several *Landschaften*; it is detached from other provinces. This division of territory is based on historical souvenirs.

—The pivot of the system of self-government is the *arrondissement*. The *Landrath* (sub-perfect), who represents the government, and who is charged with the administration proper, presides over the council, or better, the *diet* of the *arrondissement*. This diet is composed of at least twenty-five members, but most frequently of thirty; the number depends on the number of the population. Election takes place by estates or orders, that is, the cities, the large landed proprietors and the rural communes, constitute so many electoral colleges (*Wahloerbände*), and each college appoints its representatives. The great landed proprietors and the rural communes elect each the same number of representatives. The vote of the representatives of the country is divided by the deputies of the cities, who are almost everywhere smaller in number. The *arrondissement* diets or councils have extensive powers; they administer the *arrondissement*, which is charged with the powers or prestations incumbent, in France, in part upon the department and in part upon the commune, and which are too numerous to be enumerated here. Of course, a certain number of the decisions of the district council must be confirmed by the superior authority.

—Below, and in certain respects it must be said *in*, the *arrondissement*, is the canton, or bailiwick (*Amtsbezirk*). The bailiwick has existed for a long time in the provinces of Hanover and Westphalia (and, if we are not mistaken, in Nassau). It was established, in 1873, in the provinces of Brandenburg, Prussia, Pomerania, Silesia, Saxony and Posen. A royal ordinance of 1867 (Sept. 22) had continued the provosts who existed in Schleswig-Holstein. The bailiffs, provosts or heads of the canton are a sort of cantonal mayor, presented by the diet of the district, and appointed by the president of the province. They are paid from the funds of the bailiwick, and their powers have to do with the police, which is exercised in the name of the king, with the maintenance of means of communication, and, in general, with the execution of the laws and of the administrative regulations. They are aided by a council, in which each commune is represented.

—As to its municipal organization, Prussian legislation distinguishes between the cities and communes which constitute an *arrondissement* themselves, cities which form part of an *arrondissement*, and the rural communes; moreover, the municipal laws differ according to province. There are nine legislative groups, and in each group a distinction is made between the city municipalities and the rural municipalities: 1, the six provinces of the east; 2, a certain part of Pomerania; 3, Westphalia; 4, the Rhenish province; 5, Schleswig-Holstein; 6, Hanover; 7, Hesse; 8, Nassau; 9, Frankfort. Perhaps there are also peculiarities in the old landgraviate of Hesse, in the Bavarian communes annexed in 1866, Prussia professing a greater regard for tradition than for uniformity. We may add, that, everywhere, the autonomy of the cities is greater than that of the rural communes.

—The administration of cities is regulated in the six eastern provinces, not including the government of Stralsund (Pomerania), by the organic law (*Stadte-Ordnung*) of May 30, 1853; in Stralsund by the law of May 31, 1853; in Westphalia, by the organic law of March 19, 1856; in the Rhenish province, by the organic law of May 15, 1856. These laws apply only to the cities of more than 2,500 inhabitants. They have some principles in common, and notably the following: the city commune forms a corporation, which freely administers its own affairs by the organ of an executive committee called the town magistracy, assisted by a city of municipal council (*Stadivsrordneton-Vertammlung*). In the Rhenish province a burgomaster (mayor) and two or three deputies take the place of the magistracy. The magistracy is always composed of a burgomaster, as president, and several councilors, some of whom, as well as the burgomaster, receive a compensation. They are elected by the municipal council, but in cities of 10,000 inhabitants and more, their election must be confirmed by the king; in the others, by the governments. The burgomaster and the paid councilors are elected for twelve years, the others for six years. The number of the members of the municipal council is in proportion to the size of the city; they are appointed by the municipal electors, divided into three classes each of which chooses a third of the members of the council, one-half of whom must be landed proprietors. The term of office is six years, but the council is renewed one-third every two years.

—Every Prussian twenty-four years of age, who has lived in the city for at least a year, punctually and fully paid his taxes, who has a house within the territory of the commune, or carries on an industry of a certain importance, and is inscribed for at least fifteen francs upon the register of the class taxes or the revenue register, is a burgher, and has the right to vote at municipal elections.

—The powers of the magistrate and of the municipal council somewhat resemble those of the mayor and municipal council in France. The surveillance of the state is exercised, in the large cities, by the governments, and in the small, by the *Landraths*. Both may annul illegal municipal decisions, those which involve an exceeding of power, or which cause prejudice to the state; they may also, if they see fit, insert in the budgets the obligatory expenses which the municipal council has refused to insert in them. A municipal council can be dissolved by royal ordinance, but in this case another council must be elected within six months. The approval of the superior authority is necessary: 1, to validate the alienation of urban real estate, or of objects having a particular historical artistic or scientific interests; 2, to contract a loan; 3, to levy communal taxes; 4, to change the mode of the enjoyment of a communal right.

—The ordinance of Sept. 22, 1867, for Hanover, and that of March 25, 1867, for Frankfort, differ in some details from the preceding.

—We now come to the rural communes. In the six eastern provinces, to which the law of 1873, concerning the arrondissements, of which we have given a brief analysis, applies, the rural communes consist, on the one hand, of villages, and in part of great landed properties. In 1872 these six provinces included 25,446 communes, 14,152 landed estates enjoying municipal rights, and 82 localities which did not form part of any municipality; in all, 39,680 communes and localities. Most of the communes are small, as the following figures show: Rural communes with less than 100 individuals,

5,305; with from 100 to 500 15,676; with from 500 to 1,000, 3,498. Landed estates with less than 100 individuals, 7,682; with from 100 to 500, 6,260; with from 500 to 1,000, 186. Localities with less than 100 individuals, 78; with from 100 to 500, 4; with from 500 to 1,000, 186. The rest of the communes and landed estates have more than 1,000 inhabitants.

—The rural communes are administered by a head called the *schulze* (mayor), assisted by two deputies or aldermen; they are elected by the inhabitants of the commune, and confirmed by the *Landrath* on the recommendation of the bailiff. The *schulze* may have a salary allowed him from the municipal funds. He administers the affairs of the commune. convokes the communal assembly, directs its deliberations, and executes the decrees. He must aid the bailiff in the exercise of police duties, and provide the proper means in case of urgent necessity; he is, according to the expression of the law, the local authority.

—In the landed estates which constitute a commune, the proprietor represents the local authority. He exercises authority in person, or by a substitute approved by the *Landrath*. On the other hand, he is liable for all the expenses which are incumbent on a commune.

—In the province of Westphalia, baillwicks have been established composed of many rural communes. Each commune preserves its own particular interests: it is administered by a chief, assisted by landed proprietors paying a certain amount of taxes (the amount required is rather large) whose decisions must be approved by the bailiff, often by the superior authority, in order to be valid. The bailiff, as well as the chief of the commune, exercises his functions gratuitously. The bailiff is appointed by the king, upon the presentation of the *Landrath*, from among the inhabitants of the district; if there is no person in the neighbourhood capable of properly exercising this function, a paid bailiff not belonging to the locality may be appointed.

—In the Rhenish Province there are paid burgomasters at the head of the cantons, which form large communes, having their municipal council, without prejudice to the individuality of each village, which has its chief, and the inhabitants of which assemble to deliberate upon their particular interests. The burgomasters are assisted by a council. III. *Finances*. The good administration of the finances of Prussia is proverbial. During many centuries it had princes who took care of its pennies; the immediate successor of Frederick the Great, Frederick William II., alone, made a break in the series. Fortunately, his reign was short (1786-97), and his son, Frederick William III., devoted himself to paying off the debts, by practicing the strictest economy for many years. The oldest accounts preserved are on the civil list of Joachim Frederick for the year 1606. This prince had only 40,000 thalers revenue, which did not prevent him from undertaking the construction of a canal. Under George William the domain revenues of the elector reached, in 1622, 211,527 thalers, but in consequence of the devastations of war they fell (account of 1638) to 23,440 thalers. On the accession of the great elector (1640) the whole of the revenues of the state were valued at 400,000 thalers; on his death (1688) the receipts were valued at 2,500,000 thalers. His son, Frederick III., who became in 1701 the first king of Prussia, under the title of Frederick I., brought the revenues up to 4,000,000 thalers.

He died in 1713. Frederick William I. (1713-40) reached the sum of 6,917,192 thalers (he introduced various taxes), and the amount in the *treasury* was 8,700,000 thalers. Frederick the Great (1740-86) had, in the last year of his reign, 20,000,000 thalers revenue, and at his death, the *treasury*, despite the wars and public works which he had undertaken, was found to contain 55,000,000 thalers. This money Frederick William II. set himself to work to dissipate; he reduced certain taxes, so that Frederick William III. (who died in 1840) had, in 1797, a revenue of only 20,499,383 thalers. We know the vicissitudes through which the Prussian monarchy passed, during the period which terminated with the year 1815. In 1821 the receipts rose again to 50,000,000 thalers net (costs of collection deducted); in 1844, to 57,677,194 thalers net, and 74,981,330 thalers gross. From this year (1844) onward, the budget gave the gross product of the taxes, but in the case of the postoffice and other revenues, only the net revenue of the postoffice was inserted. In 1854 it exceeded 100,000,000 the account balancing at 107,990,069 thalers; in 1866, the last year preceding the increase of territory, it was 168,929,873 thalers. The annexations brought the figures up to 210,620,043 thalers (budget of 1867), of which 168,929,873 were for the old provinces, 22,589,700 for Hanover, 5,749,000 for the electorate of Hesse, 4,882,303 for Nassau, and 7,671,303 for Schleswig-Holstein; the rest for the small additions to the frontiers. From 1868 to 1873 we have the following figures: 1868, 159,757,064 thalers; 1869, 167,536,494; 1870, 168,251,372; 1871, 172,918,937; 1872, 197,059,940; and 1873, 206,802,643 thalers.

—When, from 210,000,000 in 1867, the total of the budget fell suddenly, in 1868, to 159,000,000, it was because the establishment of the *Norddeutsche Bund*, which became in 1871 the German empire, has exacted a great alteration, a part of the revenues and expenses of the kingdom of Prussia being transferred to the confederation. The total of the Prussian revenues thus transferred to the federal German budget was (budget of 1868) 62,173,346 thalers in receipts (customs and indirect taxes, sugar, brandy, 29,616,401; salt, 9,547,737; postoffice, 15,783,899; telegraphs, 1,594,275, etc., etc.), and 100,254,789 thalers in expenses (salt, 2,866,344; postoffice, 13,945,500; telegraphs, 1,737,230; army, 72,994,740; navy, 8,428,975; consulates, 102,000; civil pensions, 180,000). These changes are due to the fact that the German empire has charge of the foreign affairs, of the army, of the navy, and of the postoffice and telegraphs, and that its own revenues consist of customs duties, duties on salt, the postoffice, and some sources less productive; finally, that the federated states have to cover the deficit by a matriculate contingent, an obligation which is incumbent also upon Prussia. The following is the Prussian budget, as it has been presented since 1868; we shall analyze that of 1878, passed March 24, 1873 (a little later than usual):

GROSS RECEIPTS, IN THALERS.

Receipts collected by the ministry of finance:

Domains (9,475,100) and forests (14,540,000), the trust fund of the crown (2,573,099) subtracted... 21,442,001

Product of the redemption of rents and sale of domains... 830,000

Direct taxes:

Land tax... 13,055,000

House tax... 4,867,000

Tax upon incomes of more than 1,000 thalers... 7,000,000

Tax upon incomes of less than 1,000 thalers... 13,264,000

Industrial tax (patents)... 5,402,000

Railway dues... 2,343,000

Miscellaneous... 125,000

46,056,000

Indirect taxes:

1. Imperial taxes:

Customs 19,577,900, of which there were turned into the treasury of the empire 17,759,900, leaving for the Prussian treasury (the equivalent of its expenses)... 1,818,000

Sugar (gross 10,475,380), remains to Prussia... 419,000

Salt (gross 6,058,250), remains to Prussia... 36,390

Tobacco (gross 120,020), remains to Prussia... 18,000

Brandy (gross 12,840,910), remains to Prussia... 1,926,140

Beer (gross 2,876,640), remains to Prussia... 431,500

Total imperial taxes... 4,649,080

2. Taxes collected for Prussia alone:

Tax on the grinding of corn... 1,750,000

Slaughter-house tax... 2,526,400

Stamps (the taxes were reduced in 1872)... 10,000,000

Prussia's share in the German stamps... 265,240

Tolls on roads... 1,525,880

Tolls on bridges and canals... 600,000

Miscellaneous... 678,450

Total taxes collected for Prussia alone... 17,345,970

Total indirect taxes... 21,995,000

Lottery... 1,340,300

Naval commercial institution (*See handlung*)... 2,500,000

Bank of Prussia... 2,002,000

The mint... 344,000

Printing of the state... 328,000

General administration of the finances (the principal items of which are revenue of the old treasury, 5,250,000; excess of the receipts 1871, 9,273,920)... 20,169,630

Total of the collections of the ministry of finance...	117,006,951
Receipts collected by the ministry of commerce (of which the principal items are mines, manufactories, salt works, 29,958,548; state railways, 46,265,100)...	76,835,823
Collections of the ministry:	
Of state (sale of the bulletin of the laws)...	41,750
Of justice (costs, fines, etc.)...	14,005,000
Of the interior (work in the prisons, collections of the ordinances of the authorities, etc.)...	931,879
Of agriculture (product of the schools, of the stud, etc.)...	1,055,480
Of worship, instruction and public health...	166,284
Total receipts...	210,048,767

—*Domains and forests.* The state is proprietor of 1,148 farms of rural domains, comprising a productive surface of 354,819 hectares, not including a quantity of small properties or parts of properties, the area of which is not known, but which, to judge from the provinces from which we have returns, must surpass in extent 200,000 hectares, and yield about 4,000,000 francs of farm rents, and besides a sum of 10,000,000 francs of perpetual rents, due by cultivators for lands which were formerly abandoned to them. There are, besides, about 3,000,000 hectares of state forests. With the exception of a revenue of 9,649,121 francs, drawn from the whole of the domains in favor of the crown, these latter were declared, in 1820, the property of the state, and pledged at the same time as a mortgage to its creditors. What remains of the revenues of the domains and forests, after the payment of the income of the crown, is devoted to the payment of the interest of the public debt. The rural domains are farmed out by *adjudication*, ordinarily for eighteen years, and produce a farm rent, the amount of which rises with the price of commodities. In 1849 an average obtained was 1 thaler 5 sgr. 7 pf. per *morgen*, or 17 fr. 76 c. per hectare; in 1856, 20 fr. 40 c.; in 1869, 34 fr. 56 c. From 1869 to 1873 the average was still higher. The rents fixed upon the portions of land, and which we have qualified as perpetual, must, however, be discharged by amortizement in forty or fifty-six years; they are also redeemable, entirely or in part, at the choice of the debtors. The amount of these redemptions may be estimated at 3,000,000 francs a year. The expenses of administration and other expenses absorb about 15 per cent, of the gross revenue of the domains, and about 47 per cent. of the product of the forests. The expenses of the administration of the forests are so high, because they include the expenses of cultivation, of the cutting and transporting of the wood to the markets.

—*Direct taxes.* The land tax is levied in the different provinces in accordance with old traditions. It thus weighs very unequally upon immovable property. To effect an equalization of the burden, the laws of May 21, 1861, prescribed a new assessment upon general principles, applied everywhere in the same manner. This distribution of the burden was finished at the ascribed time, but it operated only in the old provinces. The tax is levied upon the net product of immovable property. Landed estates not built on, in these provinces, yield the treasury a sum of 10,000,000 thalers, or

37,500,000 francs; by adding to this the product of real estate built on, which is 7,000,000 francs, the land tax rose in 1865 from 38,000,000 to 45,000,000 francs.

—The tax upon classified income and the class taxes (law of May 1, 1851) are personal taxes levied upon the income. For this purpose tax payers are divided, according to their incomes, into several classes, the amount of income for each class being fixed by law. The classification is made by commissions of tax payers appointed by the communal authorities, so that, in fact, the tax payers classify themselves. The tax upon classified revenue is paid only by persons with an income of more than 1,000 thalers a year, while the class tax is due from all tax payers who do not live in cities subject to the tax on the grinding of corn and the tax on the slaughtering of animals (tax on flour and meat). There is in Prussia an income tax, but this tax has a different name, according as the tax payer has more or less than 1,000 thalers income. The rate of the tax also differs; it is about 2 per cent, for the class tax, and 3 per cent, for the tax on classified income. The term *class* has the following signification: instead of demanding so much percent of income, a poll tax is demanded, graduated according to the wealth of the tax payer; tax payers are, therefore, grouped into classes, according to the amount of their income (for example, 1,000 to 1,100, 1,100 to 1,200, etc.), and poll taxes are demanded proportionate to the income. The result is, that for 1,150 thalers income, as much is required as for 1,101 or 1,199.

—The industrial or license tax (law of May 30, 1820) is levied upon the exercise of the industrial and commercial professions. The different localities are, for this purpose, divided into four categories, of which the first three embrace the cities of a certain importance, while the fourth comprises all the other communes. The first three categories are determined by the number of the population; the localities belonging to the fourth category are joined together in unions corresponding to the circle (*kreis*). The license is always a distributed tax. The contingent is fixed in a lump for a city or circle; it is then divided among those engaged in industry according to the importance of their business.

—The tax upon railways (law of May 30, 1853) is levied upon their net proceeds. The tariff is all follows: when the income from shares is 4 per cent. net or less, the tax is one-fortieth of the income; when the dividend exceeds 4 per cent., the tax is one-twenty-fourth for the excess between 4 and 5 per cent., one-tenth for what exceeds 5 per cent, and up to 6 per cent., and two-tenths for the part of the dividend which exceeds 6 per cent.

—The land, class and patent taxes are collected by collectors, who receive allowances for collection, while the tax upon classified incomes is collected by the pay offices of the circle (the receivers of finances), and the tax upon railways by the provincial pay-offices of the government (receivers general).

—*Indirect taxes.* The customs duties, the tax upon salt, brandy, malt, native sugar and tobacco, coming with the jurisdiction of the empire, we have nothing to do with here. We shall speak here only of taxes purely Prussian.

—The stamp duties (law and tariff of March 7, 1822, modified in 1869 and 1873) are in part fixed and in part proportional. To the first are subject all instruments submitted for registration, or which are presented to the public authority, such as passports, playing cards, periodicals, so long as stamps had to be affixed to them; to them latter, unilateral instruments concerning objects of a value of at least 187 fr. 50c., as well as inheritances, judicial acts, etc.

—To the taxes on the grinding of corn and slaughtering of animals (law of May 30, 1820) are subject eighty-three cities (the number is diminishing) of a certain importance, designated by the law of May 1, 1854, and exempted, for this reason, from the class tax, but not from the tax on classified income. It is a tax on consumption collected at the gates of the cities, and levied upon flour and meat, whatever may be the form under which these commodities enter the city. The tariff is 5 francs per 100 kilogrammes of wheat, 1 fr. 25 c. per 100 kilogrammes of other cereals, and 7 fr. 50 c. per 100 kilogrammes of meat. The tax upon meat may be replaced by a tax per head upon the cattle which enter the cities. A third of the tax upon the grinding of corn is given to the respective municipal funds. The share of the state amounts to a total sum of 12,000,000 francs. A great number of these cities have also been authorized by the state to add additional taxes to these.

—The tax upon the cultivation of the vine (law of Sept. 25, 1820) is not important. Wine is subject to a duty of from 90 c. to 4 fr. 38 c. (according to the quality) per *eimer* (70 litres) of wine produced. It is charged to the producer, and is, so to speak, a supplementary land tax; it is therefore wrong to include it among indirect taxes.

—The tolls of roads and bridges have been strongly attacked for some time, but they do not lack defenders.

—*Other resources of the department of finance.* We group under this designation the lottery, the bank, the naval commercial institution, the mint, and the general administration of the finances. The first three, established by Frederick the Great, have undergone many changes since.

—The lottery (law of May 28, 1810, and regulation of May 1, 1841) is divided into four classes; it is renewed twice a year, so that there are eight drawings in the year. The number of chances in each lottery, at 195 francs a chance, is 95,000, and the number of prizes, 34,000. The state collects from this gain 15 5-6 per cent.; and besides 2 per cent. is accorded to the collectors charged with the sale of the tickets and the payment of the prizes.

—The naval commercial institution (*See handlung*), instituted in 1772 to encourage maritime commerce (law of Jan. 17, 1820), is but an institution of credit and of commerce, intended principally to effect the purchase of salt abroad, and to take charge of certain public affairs which require commercial operations. This institution has been often and many times justly attacked; some demand more publicity, while others do not wish a banking house carrying on business with the funds of the state. The *Seehandlung* having many times controlled the issue of laws, it has been said that it made a profit at the expense of the state. Bergins, author of a "Treatise of Finances",

echoes this singular reproach (pp. 388. 389). Would people have preferred to see a banker making this profit? For, what the *Seehandlung* gains, the state receives; and in this case it performs the office of a public service, as if it were a section of the ministry of finance. We do not wish to defend the *Seehandlung*; we are only trying to do justice to the value of an argument. Let us add, that the *Seehandlung* turns only a fixed sum into the treasury of the state, and figures only in the receipts, and not in the expenditures. Certain deputies have demanded that the *Seehandlung* should turn in, every year, the whole of its gains, instead of increasing its capital by the surplus; but it would be perhaps better to abolish that institution than to enfeeble it.

—The gross proceeds of the mint, from the coinage, are an item in the receipts, and are absorbed by the expenses of manufacture and administration.

—*Collections of the department of commerce, of industry and of public works.* These comprise the mines, manufactories and salt works, the state railways and the royal manufactory of porcelain. The mines, manufactories and salt works of the state are so numerous and so important that their gross product amounted, in 1873, to: mines, 20,309,680 thalers; manufactories, 6,702,950; and salt works, 1,674,660. There are also various products which reached a total of 1,200,000 thalers; in all, about thirty millions; but about 80 per cent, was absorbed for the expenses of exploitation and administration. The state collects, besides, a tax of 6 per cent. on the gross product of the mines of individuals (law of May 12, 1854), which has been for a series of years about 2,000,000 thalers. The manufacture of porcelain is a right of the state.

—In the railway system of Prussia the following distinction must be made: 1. the railways of the state; 2. the lines which have been subsidized by the state, which, besides, assumed certain obligations, 3, the lines to which the state guarantees a minimum of interest; 4, the lines acquired by the annexation of Hanover and other territory; however, the budgets confine themselves to an enumeration of the lines, indicating separately the proceeds of each of them. The net product of the railways, augmented by a sum of about 5,000,000 francs, is applied to the payment of the interest and the liquidation of the public debt contracted for the construction and acquisition of railways.

—*Collections of the other ministerial departments.* The collections of the ministry of the justice are the most considerable. They consist of the costs of trials and of judicial acts, and reach a figure large enough almost to cover the expenses of the administration of justice. The receipts of the department of agriculture are made up from redemption of servitudes and of other real estate burdens (consolidation of estates), and of the revenues of the public studs; they cover, except about 2,500,000 francs, the expenses of the ministry. The receipts of the department of the interior comprise fines, taxes on passports, and the products of workhouses and houses of correction.

—*Expenditure of the state.* The expenditures of the state are divided into *ordinary* and *extraordinary*, or, to use the Prussian phraseology, into permanent and accidental (*einmalige*). The following is the table of the expenditures of 1873, corresponding to the table of receipts given above:

ORDINARY EXPENSES.

A. Cost of collection and exploitation.		Thalers.
Ministry of finance...		19,451,025
	To wit:	
Domains...	2,136,750	
Forests...	7,562,000	
Direct taxes...	2,351,000	
Indirect taxes...	6,883,500	
Lottery...	24,875	
Mint...	278,200	
State printing...	214,700	
Ministry of commerce...		53,456,068
Manufacture of porcelain...	148,000	
Mines...	14,805,423	
Manufactories...	6,243,004	
Salt works...	1,155,730	
Other industries...	656,096	
Total...	23,008,253	
Railways...	30,447,815	
Ministry of state...		48,870
Total costs...		72,955,463
B. Complements to the civil list...		1,500,000
Public debt (comprising therein 11,939,134) for the debt of the railways...		25,828,800
Expenses of the chambers...		307,800
Ministry of state...		547,611
Ministry of foreign affairs...		135,600
Ministry of finance...		31,566,005
Ministry of commerce (of industry and public works)...		11,508,981
Ministry of justice...		19,459,530
Ministry of the interior...		9,766,396
Ministry of agriculture...		2,796,043
Ministry of worship, education and health...		10,022,017
Extraordinary expenses, divided among the different ministries...		23,450,239
Grand total...		209,844,485

The absence of the ministries of war and of the navy, in the above table, will be noticed: this is because their services depend now upon the empire, and figure in the latter's budget. The council of Prussian ministers includes, however, the ministers who direct these services.

—The dotation of the crown includes the deduction from the product of domains and forests already mentioned, and which amounts to 2,573,099 thalers with the premium

upon gold. This deduction was decreed to the civil list, when the king abandoned the domains of the crown to the state, as a hypothecation in favor of the creditors of the state (law of Dec. 17, 1808, law of 1810, and law of Jan. 17, 1820). This civil list was increased 500,000 thalers by the law of April 30, 1859, and by that of Jan. 27, 1868, by a million, so that the whole of the dotation of the royal crown is 4,073,099 thalers, or 12,219,297 marks, in the new German money.

—We speak, a little further on, of the public debt. The extraordinary expenditures are applied chiefly to public works of all kinds, to improvements, to the redemption of servitudes with which the domains and forests of the state are charged, to the improvement or extension of useful institutions, etc.

—*Public debt.* The events of the first fifteen years of this century imposed upon Prussia a rather heavy debt; it amounted in 1820, when peace allowed liquidation to be begun, and regulation to be undertaken, to 206,733,171 thalers bearing interest, and 11,242,347 thalers of paper money. A sinking fund was created; economy reigned in the administration, and in 1848 the debt was reduced to 122,942,765 thalers. The events of the times, on the one hand, and the construction of numerous railroads, on the other, increased the debt, in 1858, to 225,776,838 thalers, and in 1867 to 270,661,195. At the end of 1868, after the addition of the debts of the annexed provinces, the figures were as follows (the railway debt being included in the total debt):

PROVINCES.	Total Debt.	Railway Debt.
	Thalers.	Thalers.
The old territories .....	357,857,422	134,703,812
Hanover .....	22,146,050	16,868,730
The electorate of Hesse .....	15,406,500	15,207,600
Nassau .....	20,340,628	16,532,286
Hesse-Homburg .....	131,429	.....
Schleswig-Holstein .....	877,092	.....
<b>Total .....</b>	<b>416,259,121</b>	<b>183,312,428</b>

To this must be added 18,250,000 thalers of debt not bearing interest, or of paper money. We have seen above that this debt was 11,242,347 in 1820; it remained at that figure till 1850. At that time an issue of 9,600,000 thalers was made, which brought the circulation up to 20,842,347 thalers. In 1851 ten millions more were issued, but in 1856 the circulation was reduced five millions, and in 1857 ten millions more, and it remained 15,842,347 thalers until 1867.

—The debt of 1868 required an expenditure of 25,704,930 thalers, of which 10,002,486 was for the railway debt. The sinking fund in these twenty-five millions comprised the amount of 8,178,433 thalers. As the construction of railroads continued, and as, with every loan, the dotation of the sinking fund was increased; and

as, besides, the interest of the redeemed debts continued for ten years to increase this fund, the burden was found rather heavy, or, as was also said, the amortizement was too rapid. Perhaps this state of things would have continued, but, the year 1869 showing a deficit, the minister of finance decided to propose a bill for the *consolidation* of the debt. This bill, a little modified, became a law Dec. 19, 1869 ("Prussian Official Journal," of Dec. 24). To understand this law, we must keep in mind that all the Prussian debt, which was composed of 115 different titles, was subject to obligatory amortizement. There were annually redeemed at the Bourse, as far as the funds intended for that purpose would allow, the funds (or rather, the capitals) the market price of which was below par. As for other titles, they were drawn by lot as obligations (the coupons were numbered and payable to the bearer). The consolidation consisted in the exchange of nineteen kinds of titles, twelve at 4½ per cent., and seven at 4 per cent., for new titles at 4½ per cent., the obligatory amortizement of which was suspended till 1885, and is to be optional with the state after that date. That is to say, until 1885 the titles of the consolidated debt can be redeemed only at the Bourse, at the market price of the day, and only by means of the budget surplus which is especially intended for that purpose. From Jan. 1, 1885, the government may resume the amortizement by means of drawing by lot and at par. To attract the holders of titles at 4 per cent. a premium of 1 per cent. was offered them. The operation was applied to a sum total of 223,436,175 thalers, which became reduced to 217,551,000 thalers, since 800 thalers of capital at 4½ per cent. were given in exchange for 900 thalers at 4 per cent. The rest of the debt was maintained under the former system. The operation, by reducing the liquidation funds from 8,666,140 to 5,243,285 thalers, set free for other purposes the sum of 3,422,855 thalers. The consolidation, which transformed the capital debt into an interest debt, was so successful, that, disposing of the great surplus of receipts, six million thalers for 1870 and more than nine million thalers for 1871, and the 4½ having passed par, the minister of finance could ask of the chambers the authority to resume, as far as this remainder was concerned, the former mode of amortizement.

—We shall now sum up the situation of the debt on Jan. 1, 1872, according to the report of the commission of surveillance, established by the law of Feb. 24, 1850:

<i>Debt bearing interest.</i>	Thalers.
Debt of Prussia, before 1866...	354,793,184
Debt of the states annexed in 1866...	61,164,001
Total...	415,957,185
From these figures must be deducted the amount proceeding (except 9,286,200 thalers) from railway loans, the proceeds of which cover the interest and liquidation of the capital employed	196,858,145
Left to the charge of the state...	219,099,040
<i>Debt not bearing interest.</i>	
Paper money ( <i>Cassenscheine</i> )...	18,250,000

—In 1873 Prussia contracted a loan of 120 millions of thalers for the construction of new railroads.[60](#)

—IV. *Army and Navy*. Whatever may be the interest which is attached to the organization of the Prussian army, we can only relate its history from the accession of King Frederick William III. In the first year of his reign, in 1797, he laid down in a law, the principle of obligatory personal military service; but this law contained at the same time such a great number of exemptions and privileges, that the service was exclusively confined to the lower classes. The misfortunes which Prussia suffered in 1806 were the cause of great modifications in its internal organization. It was necessary to supply the material strength which it had lost by the creation of new moral strength, so that the reform extended to all public services. Napoleon, having restricted the effective force of the Prussian army in active service to 42,000 men, certain illustrious generals, like Scharnhorst and Gneissenu, and an eminent statesman, the baron von Stein, consulted as to the means of giving to Prussia the power and authority which she had enjoyed before the war of 1806. To accomplish this aim, it was necessary to increase, as much as possible, without awakening suspicions, the number of soldiers, and to thus prepare to be ready at the first signal given by circumstances. The royal ordinance of Aug. 6, 1808, established a system, according to the terms of which the regiments in active service should discharge from time to time a certain number of well-drilled soldiers, and replace them by as many more, whom they should instruct, and discharge again at the end of a given time, to receive an equal number of new recruits. In this way, little by little, a drilled reserve was formed, amounting to a total of 150,000 men. In 1811 *dépôts* of instruction, so-called, were organized, whose real purpose was to increase the number of active officers, in view of an imminent war. These preparation allowed, in 1813, an army of 200,000 men of troops of the line to be placed in the field, and the provinces organized an auxiliary army, composed of able-bodied men who had not served, called the *landwehr*, and which the provinces equipped and armed at their own expense.

—The *landwehr*, springing almost spontaneously from the patriotic ardor of the people, was pro-claimed the fundamental principle of the future military organization of Prussia. On Feb. 9, 1813, the king abolished all exemption from conscription, and, Sept. 3, 1814, a royal ordinance established the new organization of the army as follows. The land force comprised: 1, the active army; 2, the first *ban* of the *landwehr*; 3, the second *ban* of the *landwehr*; 4, the *arrière-ban*, or *landsturm*. The active army is the practical military school of the nation; it comprises: 1, individuals who wish to embrace a military career and to pass the examinations for ensign and officer; 2, those who present themselves voluntarily to satisfy the law; 3, able-bodied-young men, aged from twenty to twenty-five years, without exception. (There are, however, some cases of exemption.) The length of service is three years under the flag; then the soldier, sent to his home on renewable leave of absence, passes into the reserve, of which he forms a part for two years. The first *ban* of the *landwehr*, destined to maintain the standing army, comprise the soldiers who leave the reserve after having completed their five years of service; they form a part of it for seven years, and are obliged to present themselves at the musters and at the periodical exercises in their cantons. The second *ban*, who are charged with going to the defense of fortified places, are likewise subjected to a service of seven years, but are not bound to take part in the cantonal exercises, they are only reviewed from time to time by the military authority of the district. The *arrière ban*, finally, are simply a home guard.

Thus was the army constituted by the law of Sept. 3, 1814. A supplementary law, published April 21, 1815, assigned to each division of the landwehr its territorial circumscription, and regulated its division into (three) battalions, and its general administration.

—Such was the primitive organization of the Prussian army. Later, it was resolved to place the landwehr in a more intimate connection with the line, by forming bridges composed of a regiment of the line and a regiment of landwehr. The line and the landwehr had the same equipment, the same armament, and officers of the line were detached to serve in the ranks of the landwehr, and *vice versa*. But this fusion, instead of creating a strong and rational whole, produced a system which was in contradiction with the spirit of modern times and with the exigencies of practice. The line would often be despoiled, at a decisive moment, of its best officers and under officers, and besides be obliged to share its supplies with the landwehr. In assembling the latter, the country was suddenly deprived of a great number of workmen; the mechanic, the workman, and the cultivator of the land, were snatched from their customary occupations. Becoming soldiers again after an absence from the corps of from three to six years, these men formed a body of troops to whom the experience which arms of precision and modern tactics demand, was lacking.

—These military arguments found their corollary in reasons of equity and of public economy. "Personal conscription," that is to say, the obligation of *every* Prussian to serve in the regular army, could never be applied in all its rigor, and had become an illusion altogether. Just as in 1848, when the population of the kingdom amounted to 11,000,000, the annual contingent remained fixed at 40,000 men at a time when the census gave a population of 18,500,000; it was afterward raised to 63,000 men. A drawing of lots, introduced in 1820, liberated annually almost 74 per cent. of the male population: a very considerable advantage, if we remember that those to whom fortune had not been favorable (about 26 per cent.) were subjected to nineteen years' service, while also remaining subject to all civil charges. Cramped in their movements by the obligation to join the army, they could only with hesitancy enter upon certain careers, and could, consequently, contribute only in a measure relatively restricted to the increase of the nation's fortune. On the other hand, the support of the families, whose heads were called to active service, was charged to the cantons and communes, which involved them in debt in an almost insupportable manner. Finally, the division of the army into eight corps, corresponding to the eight provinces of the kingdom, might have had as an effect the distribution in an unequal manner, and therefore unjust, of the burdens of all kinds which a partial mobilization of the army imposes on a country. In such cases, the province had to furnish all that it could in men, in horses, in provisions, while the others were freed from all payments, and scarcely perceived the agitation which reigned among their fellow-citizens. Such a military system could no longer be maintained. It was necessary to change the very long duration of service of a limited number of the inhabitants to a shorter service supported by a larger part of the population. In other words, it was necessary to increase the annual contingent, and to diminish the obligations of the landwehr, of which the year 1859 had shown the weak side.

—In this year, the king of Prussia, while maintaining the officers and under officers of the infantry, and of some regiments of cavalry of the landwehr, sent back the oldest classes to their homes, and ordered a supplementary levy. In 1860 the government finished the new organization; it at the same time presented to the chambers a bill, which the ministry withdraw at the end of the session without its having been discussed. The principal features of that bill may be summed up as follows: Every Prussian owes military service from the age of seventeen. The land force comprises the standing army and the landwehr. The navy is composed of the permanent navy and of the naval militia. The permanent army and navy are always bound to be ready to enter on a campaign. The obligatory time of active service on land and sea is fixed at eight years. Of these eight years, the soldiers of the cavalry pass the first four years in the regular army, those of the other branches and of the navy the first three years, and those in the train of the army the first six months. The rest of the time they are on renewable leave of absence. The landwehr and the maritime militia are intended to sustain the army and navy. After the eight years of service are ended, the men enter the landwehr or the naval militia; one figures upon the lists of these for eleven years, but in no case beyond one's thirty-ninth year, and he can be called to active service only in time of war. Young men, fulfilling certain conditions of capacity, who enlist voluntarily and equip themselves at their own expense, serve for one year only, after which they pass to the landwehr. This provision was sustained by the law proposed in 1860, and which was adopted despite the chamber. As for the present organization, it will be found in the article GERMAN EMPIRE, the Prussian army and the German army being now subject to the same law.

—*Navy* (see GERMAN EMPIRE).

—*V. Judicial Organization.* Offenses against police regulations are judged by police tribunals, composed of a single judge, who can inflict a penalty as high as six weeks' imprisonment and 187 francs 50 centimes fine; misdemeanors are within the jurisdiction of the correctional tribunal, composed of three judges; crimes are tried by a jury.

—The left bank of the Rhine and some localities of the right bank have preserved the French civil legislation, while almost all the rest of the monarchy is subjected to the Prussian code. From this, differences in the judicial organization of the various provinces result. These differences may be thus summed up: 1. While the jurisdiction of the Rhenish tribunals is restricted to the cognizance of litigated cases, and while extra-judicial acts, such as wills, etc., are reserved to ministerial officers, notaries, sheriffs, etc., these acts are placed among the prerogatives of a special chamber of the tribunals, which unites with the judicial chamber only to judge important cases. 2. The Rhenish tribunals can pronounce judgment only in case the matter in controversy has been brought before them by the parties to the suit or by the public ministry; the other Prussian tribunals can act officially and without the matter in controversy being so brought before them. 3. While in the Rhenish districts the public ministry extends its surveillance over the whole of the administration of justice, including the ministerial, their jurisdiction is limited, in the rest of Prussia, to affairs pending before to tribunal and to matrimonial affairs. 4. In the Rhenish province the execution of judgments is made by the agency of a sheriff; elsewhere in Prussia, directly by the tribunals.

—A distinction is drawn between the ordinary tribunals and special tribunals. The former are tribunals of the first resort; there are forty-six in the province of Prussia, twenty-nine in Brandenburg, twenty in Pomerania, fifty-three in Silesia, twenty-six in Posen, thirty-one in Saxony, twenty-nine in Westphalia, nine in the Rhenish province, etc. The jurisdiction of most of these tribunals comprises a circle (district, or arrondissement), the others are established in cities of more than 50,000 inhabitants. Moreover, the tribunals of the Rhenish province extend their jurisdiction over about a whole governmental district. But the judicial jurisdictions do not always correspond with the administrative division of the country. The tribunals of the first resort form twenty-six jurisdictions of courts of appeal, from which the Rhenish province, which has only two resorts (like France), can appeal to Berlin, where the supreme court sits, forming a third, for the rest of the kingdom. In the Rhenish province there are 125 justices of the peace. It is the supreme tribunal which settles the conflicts of jurisdiction which may arise between the tribunals; the conflicts between the tribunals and the administration are regulated by the tribunal of conflicts, composed of the president of the council of ministers, of some councilors of the supreme tribunal, and of some functionaries of the administration.

—The special tribunals are: the tribunals of commerce, the judges of which are elected by the chief merchants, and the *conseils de prud'hommes* elected by employers and workmen; the university tribunals, which extend their jurisdiction over students, and which can inflict a penalty as high as four weeks' incarceration; the customs or fiscal tribunals; the military tribunals (courts-martial); finally, the tribunals charged with the regulation of compensation due for the purchase of servitudes.

—To be a judge, it is necessary to have studied law for three years, to have passed a first examination, then to go through a stage of trial, and pass a second examination both theoretical and practical. Conditions of capacity less rigorous are imposed upon prothonotaries and ministerial officers. The latter are appointed by the ministers; the presidents appoint the inferior agents. The judges are appointed by the king; they are irremovable, or at least, their salary can not be taken away from them, except in case of crime or misdemeanor. Each tribunal has its posts more or less well endowed; a person begins with the lowest salary, and rises, by seniority and in proportion as vacancies occur, to a higher salary.

—VI. *Church and state*. The liberty of Christian religions has been established in Prussia since the last century. Frederick the Great wished *every one to work out his salvation in his own way*. The code of 1794 recognized this principle in a solemn manner, and the constitution of 1850 confirmed it, and even applied it in a broader way by extending it to Israelities. This act expressly permits the establishment of reunions for the exercise of worship in common. These reunions (or parishes) from the time they are established, possess the rights of a recognized private society, but acquire the rights of a corporation only by a law. Each religion administers its institutions as it wishes.

—The 24,500,000 inhabitants of Prussia were in 1874 about thus divided among the principal religions: Protestants, 16,000,000; Catholics, 8,000,000; Israelites, 320,000. The rest are divided among many less numerous sects. The Catholics form the

majority of the population in the Rhenish province, in Posen and in Silesia; in the other provinces the Protestants are the more numerous.[61](#)

—The king is the supreme bishop of the Protestant religion in Prussia. In principle the constitution of 1850 gave worship its independence, but the complete application of the principle of independence was not attained until 1873. It was limited, in 1850, to the separation of internal matters from external matters. The former were confided to a superior evangelical council (*olerkirchenrath*) independent of the minister of worship, that is to say, functioning side by side with him. Within the jurisdiction of the superior council are eight provincial consistories, which operate under its authority, and which are presided over by the superior presidents; they include among their members a general superintendent, who represents the minister of worship. The external matters are administered, as formerly, by the minister of worship and by the governments of the districts (the prefects). In matters of a mixed nature the ecclesiastical and the administrative authorities deliberate in common.

—The internal matters include dogma, the liturgy, discipline, the synods, and theological instruction. The candidates for the evangelical ministry must have studied theology for three years in the a university; they must pass an examination, and are appointed by the *patron* (the state or the possessor of the seignior), or elected by the parish. The provincial consistories and the superior evangelical council are appointed by the king.

—The external affairs consist in the surveillance over the property, the establishments and the institutions of the various churches, in the exercise of the patronate of the state, which confers upon it besides a direct influence over the administration of these establishments, over the appointment of the administrators of the church lands, and over all that relates to the material interests of the parishes.

—The internal organization of the Protestant, or Evangelical, religion, promised by the constitution, has its foundation in the communal and synodal regulation of Sept. 10, 1873, which established *councils of ancients*, and district and provincial synods, as well as a general synod. These regulations enter into all possible details, even to prescribing that they shall commence their meeting with a prayer.

—The Catholic religion is much more independent of the state than the evangelical religion. There is not even a concordat. The bull *De salute animarum*, dated July 16, 1821, and accepted by royal ordinance of Aug. 23, 1821, is not a treaty, although it was preceded by negotiations. It settles the boundaries of the diocess, it regulates what relates to the *election* of archbishops and bishops by the chapters of the cathedrals (with papal approval), and treats of the endowment of the sees, by right of indemnity for the secularization of the property of the church effected in 1810. The state had reserved its rights, and notably that of acting as intermediary in the relations between the bishops and the holy see. In 1840 the state abandoned this right. Article sixteen of the constitution of 1850 abolished it, and allowed the bishops to correspond directly with their superior.

—The bishops enjoyed in Prussia very extended rights, and the government favored them in a very special manner. But, although the reason is not very clear, a conflict arose between them and the government in 1870, after the proclamation of the infallibility of the pope, which was about coincident with the Franco-German war. The conflict threatened to become more and more envenomed, the government demanding that the clergy should recognize the supremacy of the state, while the priests, and, above all, the bishops, professed that the orders of the sovereign pontiff took precedence of the laws of the country. To combat the ultramontane spirit without meddling with the internal matters of religion, the government proposed and the chambers passed many laws, of which the following is a very brief analysis.

—*Law of May 11, 1873.* This law applies to Catholic priests as well as to Protestant pastors or ministers; it exacts that every ecclesiastic appointed to a parish shall be German, and that he shall have studied theology regularly, either in a university or in a higher ecclesiastical seminary furnishing an equivalent instrument, and whose plan of studies shall have been approved by the minister. Before entering the seminary, or being enrolled in the university, the pupil has to pass an examination to prove that he has made his humanities. The professors of a small or of a large seminary, although priests, must show their capacity by an examination. In case of transgression, the state can refuse the subsidies or endowments. The ecclesiastical superiors (bishops, for example), before proceeding to an appointment, must present (make known the name of) the candidate to the superior president of the province, and wait thirty days; if there is no objection, the appointment may be made. Objection may be taken: 1, if the candidate has not passed through the required course of study; 2, if he has committed any crime or misdemeanor; and 3, if his previous conduct authorizes the government to think that he will not submit to the laws of the country. The nominations made contrary to these provisions are null and void; the state can keep back the salary of bishops (the German text says only, "of those who appoint"), and inflict fines upon them, as high as 1,000 thalers, if they have the places vacant. The above provisions have no retroactive effect, only a delay of a certain time is fixed for foreign priests to be naturalized.

—*Law of May 12, 1873.* This law regulates what concerns the discipline of the various Christian churches. No disciplinary punishment can be inflicted, except by a German authority. It may consist of fines, of imprisonment (detention in a house of *demeritants*), or even of recall; but when it exceeds a maximum fixed by law, it must be approved by the superior authority, to whom a written decision giving the reasons therefor must be submitted. An appeal may be taken, in certain cases mentioned, to a superior ecclesiastical tribunal, whose members, to the number of eleven, are irremovable.

—*Law of May 13, 1873.* This law applies equally "to all churches and all religions," and forbids the publication of internal disciplinary measures (excommunication, etc.). These measures must not be dishonoring, under penalty of a fine of from 200 to 500 thalers, and of imprisonment for not over a year. There is question here of measures taken against laymen; the disciplinary penalties against ecclesiastics are regulated by the law of May 12, 1873.

—*Law of May 14, 1873.* This tells how one may *leave* a religion (the law does not say *change* a religion; its language is broader), and regulates the civil consequences which may be attached to this change. This law frees also an Israelite landholder from contributing to the expenses of the Christian religion.

—A law of February, 1874, established civil marriage in Prussia, and various decisions recognized as Catholic the ecclesiastics who do not accept the infallibility of the pope. A decree of the superior tribunal (July, 1873) declared that it did not belong to a tribunal to distinguish between dogmas, and to decide which are characteristic; it was sufficient for the "Old Catholics" to declare themselves Catholic, to be considered as such.

—The liberal régime which existed before 1870 in regard to convents and religious bodies caused these institutions to multiply in Prussia, so that certain inconveniences resulted. However, petitions were addressed to the chamber of deputies of Prussia, and the question was thoroughly treated in a report of the eminent professor Gneist, of the university of Berlin (session of 1869, document No. 221). We are obliged to refer to that for the explanation and discussion of principles, limiting ourselves here to giving some statistical information borrowed from that document.

	No. of Stations.	No of Members.	No. of Novices and Lay Brothers.
Religious orders of men.....	63	450	320
Communities of men .....	32	267	65
Religious orders of women ..	41	612	312
Communities of women .....	690	4 497	867
<b>Total.....</b>	<b>826</b>	<b>5,826</b>	<b>1,564</b>

Ample detail will be found in the above mentioned report. By a decision of June 15, 1872, the minister of public instruction excluded, for the future, the members of religious orders from all participation in the instruction in public schools. The order of Jesuits was, moreover, completely banished from Germany by the law of July 4, 1872. For the continuation of this subject see GERMAN EMPIRE.

—The Israelite religion is not subject to any surveillance on the part of the state, which has also not granted it any subsidy. It administers its affairs with perfect freedom. The communities form generally recognized private societies; some, however, have received corporate rights.

—VII. *Public Education.* The importance of education has been recognized for a long time in Prussia, and in the seventeenth century the government took measures to extend its benefits. The code of 1791 declared that schools and universities were public establishments, which could be opened without the authorization of the state

charged with their surveillance. This code was the point of departure for quite a liberal legislation, which the constitution of 1850 developed. "Science and instruction," it said, "are free; education for the young shall be furnished by public schools. Parents can not deprive their children of the decree of instruction which the public primary school is charged with conferring. All persons who can prove before the authorities their morality, their capacity and their knowledge, may teach or open schools. All public or private establishments, whose purpose is instruction, are subject to the surveillance of the state. In establishing public primary schools, the difference of religion must be taken into consideration as much as possible. Religious instruction is given in them under the direction of the churches or religious associations (dissenting parish). The direction of the external interests of the public primary schools, in which instruction must be gratuitous, belongs to the communes, which must also sustain the expenses of their establishment and maintenance. The state intervenes only when the commune is unable to fulfill this duty, and within the limit of the want. A law shall regulate all that concerns public instruction, and, meanwhile, the existing organization will be preserved."

—Such are the principles put forward by the constitution of 1850; the new law promised by the constitution was presented Nov. 2, 1869, but it was not adopted. Till it shall be otherwise arranged, the primary (or elementary) school is placed under the local authority, and its support is in charge of the members of the *school commune*, including all the heads of households, while the *political commune* includes only the inhabitants possessing a property or a revenue sufficient to entitle them to be municipal electors. The heads of households are required to contribute to the support of the school in proportion to their means,<sup>62</sup> not including the school fee due from the parents. The expenses of building a school house are charged to the municipal funds, with subsidies from the lords or proprietors of noble properties, if there are any, and finally of the state.

—But if instruction is not yet entirely gratuitous, despite article twenty-five of the constitution, it has for a long time been obligatory. All children who do not receive at home the prescribed instruction must attend the primary school, under penalty of a fine and even of imprisonment for the parents.

—The number of schools, of teachers and of pupils in Prussia, for the dates mentioned may be gathered from the following table:

	In 1816.	In 1846.	In 1864.
Number of schools.....	22,479	24,746	28,468
Number of instructors.....	25,045	33,332	36,656
Number of pupils to each instructor	51	73	80

According to a table published in 1869 by the *Zeitschrift* of the bureau of statistics, there were, in the primary schools: 12.8 per cent.; in 1825, 13.5 per cent.; in 1828,

14.6 per cent.; in 1831, 15.2 per cent. of the male population. It remained the same in 1861; in 1864 we find 16.9 per cent. For the year 1872, Brachelli estimated the number of primary schools at 34,700, and that of scholars at 3,650,000. In 1870 there were in Prussia seventy-six normal schools, fifty-six of which were Protestant and twenty Catholic. Since 1860, eleven normal schools belonging to the former religion, and five belonging to the latter, have been established.

—Secondary instruction is represented by schools of different natures and different degrees. The 204 *gymnasiums* (lyceums) were attended in the winter of 1870-71 by 52,657 pupils, not including the 5,835 pupils of the preparatory schools, which makes one pupil in 468 inhabitants (the elementary classes not included). The thirty-three *progymnasiums* (colleges) had 3,443 pupils, besides 335 pupils of elementary classes. The seventy-six *realschulen* (schools of exact sciences) of the first rank had 20,026 and 2,620 pupils; those of the second rank had 2,950 and 1,002 pupils; the higher city schools, fifty-nine in number, final examination in which entitled the pupil to enter the military service a year earlier than provided by law, were attended by 7,093 pupils, not including 1,818 pupils in the elementary classes; the twenty which did not enjoy this right had 1,317, and seventy-four pupils. The total number of pupils receiving secondary instruction was 89,275 (the elementary classes included); that is, one pupil in 276 inhabitants. These numbers indicate those who remained till the close, but, in reality, the attendance was 99,102 and 15,584; that is, 114,686 pupils, one in 215 inhabitants.

—Superior instruction belongs to the universities of Berlin, Königsberg, Greifswald, Breslau, Halle, Bonn, Göttingen, Kiel, and Marburg. Munster may be added, although three faculties only are represented there. Paderborn and Braunsberg have faculties of Catholic theology (besides those which are annexed to many universities). Berlin, Königsberg and Düsseldorf have academies of the fine arts, and there are, in addition, agricultural academies, military and naval schools, and other institutions which it would be tedious to enumerate. The universities had, in 1873, about 8,000 matriculated students, and 1,600 to 1,800 young men who are simply authorized to follow the courses. In 1873 these universities had 404 professors in ordinary (incumbents), 166 extraordinary professors, and 241 *privat-docenten* (free professors); 50 masters taught the language, etc.

—The surveillance of the state over education is exercised by the minister of public instruction, and the different authorities dependent upon him. Such are the provincial colleges (committees), the district governments (prefects), and the school inspectors. The inspection is generally exercised by the priest or pastor. In consequence of the strife between the state and the church (chiefly, but not entirely, the Catholic church), by the law of March 11, 1872, which accentuates the right of the state to the surveillance of instruction, laymen have been appointed, but they still constitute the minority. In execution of the same law, a royal ordinance of April 18, 1873, made the opening of schools or boarding schools depend upon an administrative authorization. It is not probable that this authorization will be granted to religious congregations. (See ministerial decree of June 15, 1872.)

—The number of professors, students, etc., at the Prussian universities, during 1882-3, was as follows:

UNIVERSITIES.	Teachers.		Students (Summer of 1882-3).					Attendants at Lectures (Summer 1882-3).		Matri- culated Stu- dents (Winter 1882-3.)	
	Total.	Ordina- ry Pro- fessors.	Theology.		Juris- pru- dence.	Medi- cine.	Philos- ophy.	Total.	Non- matri- culated.		
			Evang'l. Catholic

—VIII. *Resources.* Agriculture is very much advanced in Prussia. There is a rivalry between the government, the agricultural associations, and even simple individuals, to forward the progress of agriculture and the raising of stock. Many of the most illustrious German agriculturists, Albert Block, Thaer, Koppe, are Prussians. The flourishing condition of agriculture in Prussia, despite a rather ungrateful soil and a relatively cold climate, is due to various causes; but, among those which have exercised the greatest influence, we must mention the abolition of serfdom in 1807, and the regulation, by the edicts of September, 1811, of the relations between the former lords and their freed serfs. The point was to give to these latter their share of the land, which they had cultivated from father to son, and at the same time take into account the rights of the lords. The division had to be made amicably; and in those cases where there was a disagreement, the peasants, having the hereditary usufruct of an agricultural property, gave up a third to the lord, while the peasants who cultivated on other conditions gave up a half. These provisions could be fulfilled either by actually giving up a half or third of the land, or by preserving that portion, and paying an annual rent in corn or in silver. Special agents were appointed to put these arrangements into execution according to the views of the government ("consolidation of property"). The effects of this agrarian law were then completed by a series of measures, which bore their fruits. We will cite but one proof among many. In 1858 there were 762,157 agriculturists working their own properties, against 33,218 farmers, *métayers* and stewards. To this number must be added 421,544 heads of families, who carried on agriculture as an accessory industry.

—The area of the kingdom is divided as follows, among the different branches of cultivation: arable lands and gardens, 50.1 per cent.; meadows and pastures, 18.3; forests, 23.1; total, 91.5 per cent.; lands not cultivated, 8.5 per cent.

—The territory prior to 1866 (102,000,000 hectares) was divided into 1,099,333 properties, of less than five *morgens* (in all, 2,227,812 *morgens*); 617,420 properties, of five to thirty *morgens* (8,428,751 *morgens*); 391,596, of 30 to 300 *morgens* (35,918,017 *morgens*); 15,079, of 300 to 600 *morgens* (6,048,222 *morgens*); 18,302, of more than 600 *morgens* (41,117,312 *morgens* in all). The *morgen* is equal to 8897 acres. The produce of the land does not appear to be so high as might be supposed from the advanced state of agricultural processes. The average yield of wheat is

estimated at 9 *scheffels* per *morgen*; of rye, at 8.60; of barley, at 10.73; of oats, at 13.25; of buckwheat, at 7.17; of pease, at 6.50; and of colza, at 8.60. The average production is 19 million hectolitres of wheat, 69 of rye, 12 of barley, 55 of oats, and 176 of potatoes.

—The Rhenish province is superior in fertility to all the others. It produces the greatest quantity of wine; out of 500,000 to 600,000 eimers, 450,000 to 550,000 are produced in the Rhenish province. On the other hand, this province is much less rich in live stock; the provinces of Prussia, Pomerania and Posen are the richest in cattle. According to the census of 1873, there were in Prussia 2,274,053 horses, 926 mules, 8,751 asses, 8,600,672 horned cattle, 19,589,624 wool-bearing animals, 4,272,901 hogs, and 1,474,586 goats.

—Prussia is rich in mines. The total value of production was estimated at 59,312,950 thalers in 1867 (the new provinces included); at 62,221,708 thalers in 1868, and at 66,473,517 in 1869. By the aid of 110,168 workmen, 480,690,512 quintals (50 kilogrammes) of coal were extracted in 1869; also 119,551,211 quintals of anthracite (by 14,912 workmen), and considerable quantities of minerals (57,911,389 quintals), of stones, and other mineral materials. The total number of miners was 188,606, having to support 331,476 women and children. In 1869, four kilogrammes of gold and 1,633 kilogrammes of silver were extracted. In 1871 Prussia produced 23,874,263 quintals of unwrought cast iron, 5,689,944 quintals of merchandise in cast iron, 1,840,159 quintals of sheet iron, 157,443 quintals of tin, 1,091,042 quintals of iron wire, 3,664,064 quintals of steel, and a proportionate quantity of bar iron. The importation of unwrought iron, amounted, in the same year, to 11,849,410 quintals, and that of wrought iron to 5,664,747 quintals; the exportation amounted to 4,137,844 quintals of unwrought iron, and to 6,357,001 quintals of wrought iron.

—The production of zinc amounted to more than 1,200,000 quintals of unwrought zinc, to 350,000 quintals of carbonate of zinc, and 350,000 quintals of sheet zinc; that of lead to 365,000 quintals; that of copper to 50,000 quintals. Nickel, arsenic and some other metals in less extent are also found.

—The textile industries are quite important, especially in the western part of the kingdom. There were in 1861, 651,145 spindles of carded wool. 47,153 spindles of combed wool, 398,071 spindles of cotton, 106,508 spindles of flax. The number of looms was in all 190,715, of which 30,392 were for tissues of silk and half silk, 76,993 for tissues of cotton, 42,667 for tissues of flax, 31,880 for tissues of wool or half wool, 2,315 for hosiery, 4,244 for ribbons, and the rest for various things. In these figures are not included 276,266 looms which are in operation only during the intervals between other labors, and principally for domestic wants. These figures (which were the most recent in 1873) have much increased since; and if we take into account the annexations, they may be considered as having doubled.

—Among other important industries we will cite the 254 sugar manufactories, which transform into sugar twenty-five metric quintals of beet root (1873), producing about 8 per cent. of brown sugar; the 8,638 distilleries, which used (1872) 5,800,000 *scheffels* (55 litres) of grain, and more than thirty-one million *scheffels* of potatoes;

the 8,326 breweries, great and small, which produce beer, a part of which is exported. It is proper also to mention the tanneries, paper factories, bushel making, and other like industries.

—Transportation by land in 1873 was facilitated by 13,680 kilometres of railway, and by an excellent net work of highways and roads; the rivers and canals are also numerous and well kept.

—The commerce of Prussia embraces, for exportation, agricultural products (cereals, brandy, wool, etc.), minerals, tissues, and some other merchandise; for importation, above all, colonial commodities, cotton and other materials and objects of luxury. Besides, almost all raw or manufactured products figure upon the tables of commerce. It is not possible, however, to give the amount of exports and imports, nor the total value of the commerce of Prussia, because its territory is confounded with that of the *Zollverein*. (See this word.) We can only know what has entered by the frontiers or the bureaus of Prussia. The institution of the *Zollverein* has been eminently useful to Prussian commerce, as well as to German commerce in general, and a part of its progress is due to it. This progress, very perceptible already, can only increase by the suppression of the last vestiges of the guilds (*zünfte*), by the multiplication of associations of credit, and the advancement of chemistry and mechanics. (Compare GERMAN EMPIRE.)[63](#)

## PUBLIC LANDS OF THE UNITED STATES

PUBLIC LANDS OF THE UNITED STATES. The United States has always been favorably situated as regards land, one of the three important factors in production. There has ever been open to the settler an almost unlimited quantity of rich and uncultivated soil, on which he may locate, and take such part as the law allows at a cost which makes it rather a gift than a purchase. The economic effects of this are too evident to require any extended notice. It has permitted an unexampled growth of population capacity of the soil for the necessary food which is so marked in older countries; it has offered to the inhabitants of the more densely settled countries of Europe an opportunity to improve their condition by emigration, little or no capital other than what is necessary to reach the land being required; it has in this way attracted the labor, skill, and accumulated experience from those countries, and thus applied them to developing the internal resources of this nation, permitting an advance in industry and commerce commensurate with the extension of agriculture; it has, in a measure, regulated the wages of labor, maintaining them at a higher level than they would otherwise have attained, not only by furnishing an abundance of cheap food, but by offering to the workingman an opportunity of increasing his returns should his wages in industry fall below what he might obtain from cultivating the land; it has made the United States the cheapest market for food products, and has brought the European nations to its doors for their supplies, and, finally, it has made us a nation of landowners, and thus not only a strong nation, able to assimilate the vast number of immigrants which annually come to its shores, by giving them a direct interest in the stability and maintenance of its institutions, but also a nation in which a marked distinction of classes is impossible, one man being as good as another, and all possessing equal rights. The laws which govern the transfer and disposition of property have also tended to produce this result, and "free trade in land" is almost absolute. This, for the most part, results in placing the land in the hands of those who intend to cultivate and develop its productiveness, and thus insures a rich return from it.

—From the very beginning, there has been an abundance of cheap and fertile land. The original thirteen states contained 341,752 square miles, or 218,721,280 acres, but the claims recognized in the definitive treaty of peace with Great Britain in 1783 increased the extent of territory to 830,000 square miles, or 531,200,000 acres. Since that time the national domain has been more than quadrupled. In 1803, 1,182,752 square miles, or 756,961,280 acres, were purchased from France, and in 1819 a further tract of 59,268 square miles, or 37,931,520 acres, was purchased from Spain. The annexation of Texas, in 1845, brought 274,356 square miles, or 175,587,840 acres, and in 1850 a purchase from Mexico added about 522,568 square miles, or 334,443,520 acres. In 1850 lands to the extent of 101,767 square miles, or 65,130,880 acres, were bought from Texas; in 1853, 45,535 square miles, or 29,142,400 acres, from Mexico; and in 1867, 577,390 square miles, or 369,529,600 acres, from Russia. Since 1803 the total area of territory, purchased and annexed, is 2,763,636 square miles, or 1,768,727,040 acres. As many of these various transfers contained matters in doubt or in litigation, the results do not exactly agree with the details.

—The greater portion of this land was unoccupied save by Indian tribes, who subsisted chiefly by hunting and fishing, and therefore had left almost untouched the natural fertility of the soil and the rich mineral deposits beneath it. The original settlers who came to these shores took possession by right of discovery, and claimed exclusive title and possession for the governments they represented, a claim which was, according to the ideas then prevailing, good as against all other individuals or governments. But the Indian tribes, which were at the time settled upon the territory, also claimed exclusive possession and occupancy as sovereign and absolute proprietors. This possession was in a measure recognized. "It was deemed a right exclusively belonging to the government in its sovereign capacity to extinguish the Indian title, and to perfect its own dominion over the soil, and dispose of it according to its own good pleasure. \* \* This principle, in the view of the Europeans, created as peculiar relation between themselves and the aboriginal inhabitants. The latter were admitted to possess a present right of occupancy, or use in the soil, which was subordinate to the ultimate dominion of the discoverer. They were admitted to be the rightful occupants of the soil, with a legal as well as just claim to retain possession of it, and to use it according to their own discretion. In a certain sense they were permitted to exercise rights of sovereignty over it. They might sell or transfer it to the sovereign who discovered it, but they were denied the authority to dispose of it to any other persons; and until such a sale or transfer, they were generally permitted to occupy as sovereigns *de facto*. But notwithstanding this occupancy, the European discoverers claimed and exercised the right to grant the soil, while yet in possession of the natives, subject, however, to their right of occupancy and the title so granted was universally admitted to convey a sufficient title in the soil to the grantees in perfect dominion" (1 Story Comment., p. 8.) This principle was adopted by the United States, and its exclusive right to extinguish the Indian title, by purchase or conquest, has never been judicially questioned (Kent); and further, no lands already occupied by Indians have been thrown open to purchase or settlement until the title of the tribes has been duly extinguished.

—The ultimate title to the land resided in the sovereign; and when the colonies revolted, this title became vested in the states. The constitution of New York(1846) recognized this principle: "The people of this state, in their right of sovereignty, are deemed to possess the original and ultimate property in and to all lands within the jurisdiction of the state," and the exercise of the right of eminent domain is based upon it. With lands already settled, and subject to private ownership, the states also came into the possession of unoccupied territory, as yet public property, which had been in very general terms granted to individuals or to associations by royal charters. This public land was ceded by the states to the federal government, and formed the nucleus of the public domain. While the national domain contains about 4,000,000 square miles, the public domain which has been acquired by the government of the United States, to be disposed of under and by the authority of the national government, has amounted to 2,894,235 square miles, or nearly three-fourths of the total area of the country.

—The title to this land became vested in the United States, whether it was obtained by purchase, cession or annexation. The federal constitution provides, that "Congress shall have power to dispose of and make all needful rules and regulations respecting,

the territory or other property belonging to the United States; and nothing in this constitution shall be so construed as to prejudice any claims of the United States, or of any particular state." (Art. IV., § 2.) But is this absolute? Would congress have the power to dispose of the public land in any way that may appear good at that time? In the short sketch of the history of legislation pertaining to the public lands, it will be seen that almost every conceivable method of disposing of them has been adopted, but the United States has never assumed the position of landlord (save as respects mineral lands, an experiment which ended so disastrously to the interests of the government as to be speedily abandoned). It has rather been a trustee, to whose care the management of this important trust was given. The deed of cession entered into between New York and the United States expressly provided that the ceded lands and territory were to be held "to and for the only use and benefit of such of the states as are, or shall become, parties to the articles of confederation." The cession of Virginia was made on the condition that the lands "shall be considered a common fund for the use and benefit of such of the United States as shall become members of the confederation, \* \* and shall be faithfully and *bona fide* disposed of for that purpose, and for no other use or purpose whatever." As regards the purchased lands, they followed the same rule, as they had been paid for out of the national treasury, whose only source of income was from general taxes levied upon the people of the states. The United States was bound to hold and administer these lands as a common fund, and for the use and benefit of all the states, and for no other use or purpose whatever. To waste or misapply this fund, or to divert it from the common benefit for which it was conveyed, would be a violation of the trust.

—The public land is held and disposed of in the expectation that new states will be created. The federal constitution recites that "new states may be admitted by the congress into this Union; but no new state shall be formed or erected within the jurisdiction of any other state, nor any state be formed by the junction of two or more states, or parts of states, without the consent of the legislatures of the states concerned as well as of the congress." In the articles of confederation the eventual establishment of new states within the limits of the Union appears to have been wholly overlooked, although the possible admission of Canada was provide for. Under the constitution the power of congress is absolute, save for the above restrictions. "The power to expand the territory of the United States by the admission of new states is plainly given; and in the construction of this power by all the departments of the government, it has been held to authorize the acquisition of territory not fit for admission at the time, but to be admitted as soon as its population and situation would entitle it to admission. It is acquired to become a state, and not to be held as a colony, and governed by congress with absolute authority; and as the propriety of admitting a new state is committed to the sound discretion of congress, the power to acquire territory for that purpose, to be held by the United States until it is in a suitable condition to become a state upon an equal footing with the other states, must rest upon the same discretion. It is a question for the political department of the government, and not the judicial; and whatever the political department of the government shall recognize as within the limits of the United States, the judicial department is also bound to recognize and to administer in it the laws of the United States, so far as they apply." (Supreme Court U. S., in *Dred Scott vs. Sandford*, 19 How., 393.)

—But land is not valuable without capital and labor to make it productive; though it is one of the important instruments of production, it is not profitable when left to itself. It must be improved and its fertility developed in certain lines by the application of labor or the results of previous labor. At first the public lands were regarded as a source of revenue. "It is now no longer," said the Federalist in 1788, "a point of speculation and hope, that the western territory is a mine of vast wealth to the United States; and although it is not of such a nature as to extricate them from their present distresses, or for some time to come to yield any regular supplies for the public expenses, yet it must hereafter be able, under proper management, both to effect a gradual discharge of the domestic debt, and to furnish for a certain period liberal tributes to the federal treasury." But in time the conservative policy adopted in the first years of the republic was gradually broken down, and the lands ceased to be an object of revenue, and began to be disposed of, chiefly with a view to settlement and cultivation. Originally selling only in townships, congress had disposed of the soil in smaller and smaller portions, until at length it sells in parcels of no more than forty acres. Large grants have been made without compensation to states, corporations and individuals, for all manner of reasons, many of which were of a very questionable character; donations which could not but open the door to abuses, and tempt dishonesty, jobbery and logrolling to secure them. The liberal policy of disposing of the lands has been shamefully abused, and the public lands have ever formed a point of attack from those who profit by the meanest and most corruptible characteristics of the legislator.

—In spite of fraud, the land policy has resulted in making this nation what it is, as its greatness depends upon the products of the soil. There is still an abundance of rich land easy of access and open to the first comer, and the wave of immigration which floods the country proves to how great an extent the privilege is appreciated. Census after census gives evidence of the immense development of the resources of the country; and were it not for a restrictive commercial policy, no nation on the face of the earth could attain the wealth and power that this nation is capable of securing, and no country could afford a better field for enterprises. As it is, this is so now to a great extent, but it is capable of almost indefinite extension. The country is still comparatively sparsely settled, and there is no necessity of offering any special inducements to settlers. The area of settlement, population, and average density of settlement, or number of persons to a square mile, at each decade, are shown in the following table:

YEARS.	Area of Settlement.	Population.	Av. Density of Settlement.
	Square Miles.		
1790 -----	289,985	3,929,214	16.4
1800 -----	806,708	5,808,483	17.4
1810 -----	407,945	7,229,951	17.7
1820 -----	508,717	9,658,459	18.9
1830 -----	632,717	12,866,020	20.3
1840 -----	807,222	17,069,458	21.1
1850 -----	979,249	22,191,576	23.7
1860 -----	1,194,754	31,448,821	26.3
1870 -----	1,272,289	33,558,871	26.3
1880 -----	1,569,570	50,156,788	32.0

—As to the future, I can not do better than to quote from one of our clearest thinkers and writers on political questions. "If you will think clearly, you will see that what we want, for the future is not more people, but more land. If we should receive no further addition of population from Europe, we are now so numerous and so prosperous that our numerical increase will be very rapid. But we shall constantly receive great numbers of European immigrants, and these, who readily adapt themselves to our customs, are a welcome addition, and quickly become a part of us. For their descendants and ours, it would be a great advantage if we could secure still more vacant or sparsely settled territory, provided that these new lands were, by their climate and productions, fitted for settlement by our own people. \* \* Thus, as we want land, and not people, sound policy tells us not to annex territory which has already an independent and tolerably dense population." (Nordhoff's "Politics for Young Americans," 198.) It would be impossible even to guess in what direction further supplies of land must be sought. Cuba and San Domingo have been thought of; and our relations with Mexico are becoming very close, and American enterprise and capital are going there. On the north the rich grain fields of Manitoba and the Red River valley are being occupied, so that there is little prospect of any extension of dominion with a view of securing unoccupied land there.

—More than twelve years before the definitive treaty of peace with Great Britain the question of boundaries had given rise to discord among the states, and it was due to their jealousy that a public domain, as distinguished from the national domain, was formed; the latter, however, including the former. So long as the colonies were subject to Great Britain, and were governed, directly or indirectly, by parliamentary control, the question of boundaries did not assume any great importance, and whatever conflicts did arise were, as a rule, referred in the last resort to the king and parliament for determination, and their decision was acquiesced in. Moreover, such disputes were local in their character, concerning only the colonies between which the dispute existed, while the other colonies remained indifferent spectators to the contest. But when the colonies became independent states, and assumed the control of the lands within their respective boundaries, and when they came into closer political relations

with one another, in which extent of territory and population exerted a great influence in determining the relative importance of the states, then the question of boundaries and extent of royal grants became a burning question; then it was that the congress of the confederation was early forced to take action with a view to settle peaceably what might create feuds and threaten the disruption of the already too loosely connected governments which had succeeded the colonial administrations. Prior to 1781 but six of the original thirteen states, viz., New Hampshire, Rhode Island, New Jersey, Pennsylvania, Maryland and Delaware, had exactly defined boundaries. Within these geographical divisions all right and title to the public domain became vested in the new states, and this held true in the case of those states whose boundaries were not definitely determined. But here a conflict of authority arose over the vast extent of territory in the west. Some of the states, guided by grants that had from time to time been made to court favorites or others, claimed to extend to the Mississippi river; while others claimed to the Pacific ocean. As little was known of the character of the country, the same territory had been covered by more than one grant, and, being claimed under two or more charters of equal validity, no real determination could be reached, because the terms of the charters were irreconcilable, and each state was determined to maintain its claims. The treaty of 1783 declared the national territory to extend from the Atlantic ocean westward to the Mississippi river, and from a line along the great lakes on the north, southward to the 31st parallel and the southern border of Georgia. This area embraced about 830,000 square miles, of which but 341,752 were included in the thirteen original states.

—The movement to secure a cession to the confederation of the western territory, originated among those states which had no claim or title to such territory, and which regarded with a jealous eye their more extensive and more powerful neighbors which claimed to stretch across the continent. And, when the articles of confederation were presented to the various states for ratification, this question formed one of the most difficult to solve. Thus New Jersey ratified the articles only in the belief that the candor and justice of the states would in due time remove as far as possible the inequality in size that then existed. In February, 1779, the legislature of Delaware memorialized congress on the subject, and desired "that a moderate extent of limits should be assigned for such of those states as claim to the Mississippi or South sea; and that the United States in congress assembled should and ought to have the power of fixing their western limits;" and the suggestion was then made that the states should cede to the confederation such claims, to be a common estate for the good of all. And in December, 1778, Maryland instructed her delegates not to agree to the confederation unless an article was added providing for such a limitation of boundaries and the erection of a public domain. Nor did the congress itself refuse to take any action on the question. For by an act of Oct. 30, 1779, the states were requested to "forbear settling or issuing warrants for unappropriated lands, or granting the same during the continuance of the war," a measure that was called out by the opening of land offices, and the granting of lands and bounties by some of the states. The first state to take any decisive action was New York, the legislature of which, in March, 1780, gave to congress the power to limit and restrict her western boundaries, and furthermore, to assume the title to all lands not included within such boundaries, and to use them for the benefit of the states as it (congress) should see fit.

—This resolve of the New York legislature anticipated congress; for it was not until September, 1780, that any action was taken on the various instructions, acts and resolutions that had been sent in; but the report then presented forms an important point in the history of the public domain. Without undertaking to pass upon the merits of the policies as expressed in the instructions or declarations, the committee conceived "that it appears more advisable to press upon those states which can remove the embarrassments respecting the western country, a liberal surrender of a portion of their territorial claims, since they can not be preserved entire without endangering the stability of the general confederacy"; and "earnestly recommended to those states which have claims in the western country, to pass such laws, and give their delegates in congress such powers as may effectually remove the only obstacle to a final ratification of the articles of confederation." This report was sent to the legislature of the several states, and was followed, in October, 1780, by an act providing for the acceptance and care of such unappropriated lands as might be ceded by the states to the confederation, and for the disposition of the same of the common benefit of the United States. These measures resulted in Maryland's ratifying the articles, and in the acceptance by congress of the cession made by New York. The earlier grants made to the confederation were nominally large in extent, but actually very limited, as they were made subject to existing claims and grants under state laws, and to extensive reservations. The government formed under the constitution succeeded to the title of all territory granted to the confederation, and further cessions were made to it, the last being that of Georgia, in 1802. The areas of these sessions, and also the extent of the public domain as it was on April 30, 1803, are shown by the following table:[6465](#) .

STATES.	Sq. Miles.	Acres.
Massachusetts (estimated)*.....	54,000.00	34,560,000
Connecticut (disputed) and western reserve and fire lands (estimated) †.....	40,000.00	25,600,000
New York and Massachusetts cession (actual).....	315.91	202,167
Virginia cession (disputed and undisputed) exclusive of Kentucky and including area of western reserve and fire lands.....	265,562.00	169,959,680
South Carolina cession.....	4,900.00	3,136,000
North Carolina cession, nominal, because the area of Tennessee was almost covered with reservations.....	45,600.00	29,184,000
Georgia cession.....	88,578.00	56,689,920
<b>Total actual state cessions to the United States for public domain</b>	<b>404,955.91</b>	<b>259,171,787</b>

—No further increase of territory occurred until the purchase of Louisiana from France. The question of the right to navigate the Mississippi river had come before the congress of the confederation, and while its importance was recognized, a proposition was made to cede the right to a foreign nation for a pecuniary consideration. Spain at that time owned the Louisiana territory, and it was natural to make the offer to that nation, with a further hope that she would then recognize the revolutionary government of this country. And although such a resolution empowering the representative of the United States in Spain to enter into a negotiation of that character was actually passed by congress, it was never acted upon. A treaty was in 1795 contracted between this country and Spain, by which certain commercial advantages were secured by the former; but difficulties between the two nations were continually arising, and threats of closing the Mississippi to all traffic were made. Spain had, in the meantime, extended her territory so as to include what is now comprised in Florida, Alabama, Mississippi, Louisiana, and a part of Texas and Mexico. In October, 1800, by the secret treaty of San Ildefonso, Spain ceded to France "the colony or province of Louisiana, with the same extent it now has in the hands of Spain, and that it had when France possessed it, and such as it should be after the treaty subsequently entered into between Spain and the other states." the stipulations of the treaty were not carried into effect before 1803. The question of allowing Napoleon to gain such a territory in this country was seriously and with no little anxiety considered in and out of congress. The few years during which the trading privileges had been enjoyed, showed how important, if not essential, it was to secure the free navigation of the Mississippi to American merchants. And holding guard over the mouth of that important channel of internal commerce, it was deemed too great a risk to allow the territory to fall under the dominion of a power with which other questions had almost led to open war. During the years 1798-1800 commercial intercourse between France and the United States was almost wholly suspended, and the treaty of 1800, while settling old questions, gave occasion to new difficulties which hinged upon his very question of the Louisiana cession. Mr. Jefferson early recognized the importance of securing the right to navigate the Mississippi. "There is," he wrote to Mr. Livingston in 1802, "on the globe one single spot the possessor of which is our natural and habitual enemy. It is new Orleans. \* \* It is impossible that France and the United States can continue long friends, when they meet in so irritable a position. \* \* The day that France takes possession of New Orleans fixes the sentence which is to restrain her forever within her low-water mark. It seals the union of two nations, who, in conjunction, can maintain exclusive possession of the ocean. From that moment we must marry ourselves to the British fleet and nation."

—In 1802 the provincial authorities of Louisiana gave notice that the commercial privileges enjoyed under the treaty of 1795 had ceased, and, contrary to the provisions of the treaty, they failed to provide any means by which, even in a modified form, they might be continued. This action of the Spanish authorities naturally aroused great indignation among the inhabitants of the states bordering the Mississippi, and on a remonstrance by congress the privileges were restored. It was not until December, 1802, that the secret treaty of San Ildefonso became known to Jefferson, who at once took steps to secure possession of at least a part of the territory, the plan at first including only New Orleans, the island of New Orleans, and Florida. But Napoleon, who was at that time too busily engaged in his attack upon England to pay much

attention to his schemes of colonization, and was much pressed for money, would sell all or none; and this was finally agreed to, the price named being 60,000,000 livres, together with claims amounting to 20,000,000 livres more. The treaty of cession was signed April 30, and ratified Oct. 19, 1803. Spain at first showed a disposition to oppose the sale, as by the secret treaty the territory was to be first offered to her in case France decided to part with it; but her objections were afterward withdrawn. By an act of congress, March 26, 1804, Louisiana was divided into two territories, one called the territory of Louisiana, which in 1812 became the state of Louisiana, and the other the district of Louisiana.

—Spain now laid claim to what was then known as East and West Florida, under a cession by Great Britain made in 1783; and this territory now became a bone of contention, and continued such till 1819. It would be of little importance to trace the many diplomatic attempts that were made to settle this question, or to trace in detail the various measures that were undertaken both by the national and state governments (notably that of Georgia) to take possession peacefully or by force of arms. Congress even went so far as to occupy and hold the territory in dispute under secret resolutions passed in 1811, but not made known till 1817. In 1817, under pretext of Indian outrages, congress ordered Gen. Jackson to obtain redress, and he construed his orders to mean the acquisition of Florida. His action brought matters to a crisis, and in February, 1819, a treaty of cession was signed, but was not ratified and proclaimed until 1821. The boundaries of the ceded territory were in doubt, owing to difficulties between Mexico and Spain, which prevented the latter from fulfilling her part of the treaty, and they were only determined by a treaty entered into between Mexico and the United States in 1828. The total cost of the Florida cession, in bonds and interest, was \$6,489,768.

—The question of the annexation of Texas was intimately connected with that of the extension of the slave power, and with the rapidly increasing interests of the nation in the Pacific states. Since 1821 the United States of Mexico had been independent of Spanish rule, and in 1826 some American immigrants at Nacogdoches declared Texas independent of Mexico, and in the following year Coahuila and Texas, the northeastern provinces of Mexico, framed a constitution. In the same year Mr. Clay instructed the minister of the United States in Mexico, J. R. Poinsett, to offer \$1,000,000 for Mexico's territory east of the Rio Grande, but Poinsett never carried out his instructions, pleading the danger of irritating Mexico by an offer that was sure to be rejected. Meantime Mexico had abolished slavery in her territory, and thus the slaveholding states found themselves flanked north and south by free states, and the extent of territory from which future slave states could be formed limited. There had been a free movement of migration between the two nations, and many slaveholders had crossed the border with their slaves, and were now met by the abolition of all slavery. The curious plea was then urged that the United States should *reannex* the territory of Texas, and, owing to the very indefinite boundary lines, this plea could be supported. In 1829, a second attempt, made by Van Buren, to purchase all the territory east of the Nueces river, failed, and in the next few years the Mexicans passed laws prohibiting immigration, which had no effect. In 1835, after the failure of Santa Anna to extend his power over Texas, Jackson made a third offer, and wished the boundary line to follow the Rio Grande up to the thirty-seventh parallel, and thence on that

parallel to the Pacific. The defeat of the Mexicans by the Texans brought matters to a head, and in March, 1836, the constitution of Texas was adopted, and annexation to this country regarded as almost inevitable. Although this scheme of annexation was rejected by the senate in 1844 (16 yeas to 35 nays), in 1845 Texas was admitted as a state. It is noteworthy that the United States never owned public lands in Texas itself; the state retained the disposition of her own lands, opened a land office, made grants to railroads, and for other purposes, and had her own settlement laws.

—In the meantime the desirableness of acquiring California and other Pacific states was being agitated. By purchase or cession the United States claimed all of what is now comprised in its present boundaries, save California, Nevada, Utah, Arizona, and the western portions of New Mexico and Colorado, which were still under the rule of Mexico. Russia was making settlements in California, and agents of England and France were preparing to take steps preliminary to annexing the territory to one of their respective nationalities. Great Britain even had a fleet in the Pacific, for the purpose, it was said, of seizing California as an equivalent for the Mexican debt, due to British subjects. Nor was the United States idle. Jackson, as has been seen, attempted to purchase a part, and the expeditions of Wilkes and Fremont created a desire to secure the whole. In 1845 Mr. Buchanan made an offer to purchase, but it was rejected. In 1846 congress declared that "war existed by the act of Mexico," and there is every reason to believe that this war was intended to secure California, as the possession of Texas even to the Rio Grande could have been obtained without it. The war was successful, and in 1848 all the states named were obtained by treaty; and in 1853, by the Gadsden treaty, a further strip of territory to make a more regular boundary between the United States and Mexico, was secured. Both of these cessions became public domain.

—The final acquisition of territory was made in 1867, when Alaska was purchased from Russia at a cost of \$7,200,000. These lands have not as yet been surveyed nor opened to settlement.

—The manner of disposing of these public domains should be noticed. In many cases they were obtained subject to grants made previous to the cession, express stipulations being found in the treaties that such grants should remain good. The public lands proper were received by the United States in trust, to be disposed of for the common benefit of the United States, to be "granted at such time and under such regulations as shall hereafter be agreed upon by the United States in congress assembled, or any nine or more of them." The public domain is thus under the control of congress. Until 1812, the secretary of the treasury acted as the agent in the sale or disposition of the public lands; and when in that year the office of the commissioner of the general land office was created, it remained a bureau of the treasury department, the commissioner being subordinated to the secretary. In 1836 this bureau was reorganized, still, however, remaining a part of the treasury; but in 1846, on the creation of the home or interior department, the bureau of public lands was very properly transferred to and made part of the new executive department. This bureau is charged with the surveying and disposal of the public lands of the United States.

—But as yet all lands are not in the market. Before the land is opened up for settlement it must be surveyed, and since 1876 only certain qualities of lands are surveyed by the government. These lands include: 1, those adapted to agriculture without artificial irrigation; 2, irrigable lands, or such as can be redeemed, and for which there is sufficient accessible water for the reclamation and cultivation of the same, nor otherwise utilized or claimed; 3, timber lands, bearing timber of commercial value; 4, coal lands, containing coal of commercial value; 5, exterior boundary of town sites; and 6, private land claims. As soon as congress authorizes the extension of surveys over a district of country, the commissioner of the general land office directs the district surveyor to see that the work is performed. There are at present (1882) sixteen surveying districts, each in charge of a surveyor general, with a corps of assistants and deputies. All surveys are made in triplicate. The original is temporarily retained in the office of the surveyor, to be ultimately delivered to the state government; the duplicate is sent to the local land office, where it is used in disposing of the land; and the third copy is sent to the commissioner at Washington, for the information of the government.

—The manner of surveying public lands is uniform, and has been so since the committee of congress, of which Mr. Jefferson was the chairman, adopted in 1785 the rectangular system. The committee, in their report, recommended that all public lands should be divided in *hundreds* of ten miles square, each hundred to be subdivided into plots of one mile square, these plots to be numbered from one to one hundred. On motion of Mr. Monroe, the township (*hundred* in the report) was reduced to six miles square; and each subdivision was to be one mile square, thus containing 640 acres. This was the system adopted. In the survey, a base line and meridian line are first determined, and from the base line townships of six miles square are established and numbered, counting north and south. From the surveying meridians, ranges (the subdivisions of the township) one mile square are mapped out and numbered both east and west of the principal meridian. The location of even a part of a section is thus a simple matter; and the purchaser who receives a description of his land as the "Southwest quarter of Section 20, Township 30, north, Range 1 east of the third principal meridian." would have no difficulty to locate his purchase on the survey map, and as some boundary marks are always placed at the intersection of divisional lines, his lot would be easily found. It is the simplicity of this system that has recommended its use, and so well has it served its purpose that little change has been made in it since it was first introduced into use, nearly a century ago. The first principal meridian that was established was the line dividing Ohio and Indiana, having for its base the Ohio river, and being coincident with 84° 51' of longitude west of Greenwich. This line governs all surveys of public lands in Ohio. A meridian line may govern the surveys in more than one state. Thus the sixth principal meridian, which coincides with longitude 97° 22' west from Greenwich, controls the surveys in Kansas, Nebraska, that part of Dakota lying south and west of the Missouri river, Wyoming, and Colorado, excepting the valley of the Rio Grande del Norte, in southwestern Colorado, where the surveys are governed by another meridian line. Since 1785, twenty-four initial points (the intersection of principal bases with surveying meridians) have been used in the public surveys.

—The manner of surveying mineral lands differed in no way from that employed in agricultural and timber lands up to 1866. The lead, copper and other mineral districts of Iowa, Michigan Minnesota, Wisconsin and Missouri, were surveyed under the rectangular system, and when sold the soil carried with it the mineral deposits. In 1866 mineral survey districts were formed, and the extent of ground that could be claimed was limited to not exceeding 200 feet in length for each individual (with one additional claim for discovery), the width of the claim being regulated by local custom. In no case, however, could a location by an association of individuals exceed 3,000 feet. In 1872 the mineral survey districts were discontinued, and surveys are now made by deputies under the surveyor-general of the district. In all cases the claimants bear the expense of the survey, and mining claims may be formed from the public lands, whether surveyed or not.

—Several qualities of lands are noticed in the laws. *Mineral*. Lands valuable for minerals are reserved from sale except as otherwise expressly directed by law. Such lands, whether surveyed or unsurveyed, are open to exploration and purchase by citizens of the United States, or those who have declared their intention to become such. The law covers claims for lands bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposits, and titles to such claims may be secured from the United States under the existing laws at \$5 per acre. No vein or lode claim can exceed a parallelogram 1,500 feet in length by 600 in width, but the size of a claim below this maximum is governed by state laws or the rules of the mining district. No state or territorial law can limit a claim, located since May 10, 1872, to less than 1,500 feet in length by 50 feet in width, unless rendered necessary by existing rights, so that the maximum claim under the United States law is about 20.66 acres, and the minimum 1.72 acres. Costs of survey, etc., are paid by the claimants. Placer locations are sold for \$2.50 per acre, and can not exceed twenty acres for one person; no location by an association can exceed twenty acres for each person. *Coal lands*. The act of March 3, 1873, gave a pre-emption right of 160 acres of coal land to a person, and 320 acres to an association, upon payment of not less than \$10 per acre, where the lands lie more than fifteen miles from a completed railroad, and \$20 per acre where the lands lie within fifteen miles of such a road; and further provided that when any association of not less than four persons have expended \$5,000 in working and improving any mine, located within limits as above, they may make an additional entry of 640 acres at the several limits prices. Lands that are valuable chiefly for *timber and stone*, and are unfit for cultivation, are sold for \$2.50 per acre. Only citizens, or those who have declared their intention of becoming such, can secure the benefits of this law, and no one person or association of persons can enter more than 160 acres of such land. *Saline lands*, or lands on which are situated any known salines or mines, are first offered at public sale to the highest bidder at a price of not less than \$1.25 per acre; and if not then sold are subject to private sale at a price not less than \$1.25 per acre in the same manner as other public lands are sold. *Town site lands*. The laws relating to this subject are very liberal, and not only provide for the entry of land already settled upon for purposes of trade, for the benefit of the citizens of the town, but also provide for the selection and reservation of land, whether surveyed or unsurveyed, for town sites "on the shores of harbors, at the junction of rivers, important portages, or natural or prospective centres of population," in advance of its settlement or of the surrounding country. There are two methods of acquiring a title to town sites: 640

acres may be laid off into lots, and a copy is filed in the office of the recorder of the country in which the town is situated, or in the general land office. The lots (not to exceed 4,200 square feet) are then offered at public sale to the highest bidder at a price not less than \$10 per acre; whatever is not thus disposed of is subject to entry at this minimum price. Or, the United States may grant to the inhabitants of cities and towns, through the corporate authorities of said cities or towns, or the judges of the country courts acting as trustees for the occupants, the privilege of entering lands occupied as town sites at a minimum price of \$1.25 per acre. The quantity of land allowed varies with the number of inhabitants. If more than 100 and less than 200, 320 acres from the maximum; if more than 200 and less than 1,000, 640 acres; if over 1,000, 1,280 acres, and for each additional 1,000 up to 5,000, a further quantity of 320 acres is allowed. *Desert lands*, which are unfit in their existing condition for cultivation, may be entered by any citizen to the extent of 640 acres, on a payment of twenty-five cents per acre, and the filing of a sworn statement that the buyer intends to reclaim the tract within three years from the date of entry by conducting water thereon. If he fulfills this condition he obtains a full title to the land on the further payment of \$1 per acre. All other lands are known as *agricultural lands*, and are taken in tracts of from 40 to 160 acres under the pre-emption, homestead and timber-culture acts, or purchased at public sale or private entry. There are two classes of agricultural lands; the one class, situated within prescribed limits of works of internal improvements, is held at \$2.50 per acre, and is designated as *double minimum*; the other class is *minimum* land, and is sold for \$1.25 per acre. Any person who is the head of a family, a widow or single man over twenty-one years of age, a citizen of the United States or about to become such, who does not own 320 acres of land within the United States, and has not abandoned his land in any state or territory in order to reside upon the public lands, may take advantage of the pre-emption laws. Such a person may, on payment of a fee for registering the claim, occupy for a limited period a tract of not less than 40 nor more than 160 acres of land, with the obligation of paying to the United States at the end of that period \$1.25 per acre, when a patent for the land is given him. Credit of from twelve to thirty-three months is given to the pre-emptor by residence on the land, and it must be shown that the settlement he made for the exclusive use and benefit of the pre-emptor, and not for purpose of sale or speculation. The essence of the homestead law and the amendments is embodied in the conditions of actual settlement, dwelling on and cultivation of the soil embraced in an entry. It gives for a nominal fee, equal to \$34 on the Pacific coast and \$26 in the other states, to a settler—a man or woman over the age of twenty-one years, a citizen of the United States or having declared an intention of becoming such—the right to locate upon 160 acres of unoccupied public land in any of the public land states and territories subject to entry at a United States land office, to live upon the same for a period of five years, and, upon proof of a compliance with the law, to receive a patent therefore free of cost or charge for the land. But to obtain a final title full citizenship is required. Under the timber-culture act a person may enter from 40 to 160 acres of land. One-fourth part of the tract entered must be devoted to timber for eight years; after eight years, on suitable proof that the necessary conditions have been complied with, a patent will be issued. A clause in the homestead act (Rev. Stat., § 2317) also offers a bounty for planting timber. All lands to be sold must be offered at public sale before they may be entered at private sale. (See the Revised Statutes, §§ 2207-2490.)

—*History.* As soon as the cessions of lands had been made by the states, congress took steps to determine the manner of disposing of them, a task that was far from easy. Many of these cessions were burdened with claims which must be passed upon before the lands could be sold. For example: Virginia in her act of cession expressly reserved the right to enter upon the lands in case they should be needed to fulfill the obligations of the state in respect to military bounties. The cession of North Carolina was subject to a great variety of claims, and the act of session contained as many as ten conditions. The result was, that, when the Indian title was extinguished, the North Carolina claims absorbed the greater part of the eligible lands, and what was left was in 1841 given to Tennessee; while that of Georgia was complicated by the famous "Yazoo claims," which proved in the end a very costly experience for the government. Even the lands purchased from foreign powers were not absolutely free. Much of the land (and this holds true of lands ceded by the states) was already occupied by Indians. Could they be ousted by the first comers, and deprived of their holdings without any compensation? By right of discovery and of conquest it was claimed that an absolute title to the land became vested in the crown; but this title was made subject to the Indian right of occupancy, which could be extinguished by the crown alone. The federal government, on acquiring the title to these lands, without looking into the justice of the original claim, recognized this condition, and before even attempting to survey and dispose of such lands, it was purchased the occupancy right of the Indians for a sum greater than the use of the lands is worth to them. The only exceptions to this practice have been where rebellions tribes have been put down, and, as a price of peace, compelled to part with the lands they occupied. In addition to Indian titles, the lands were subject to grants made by the former rulers, and large portions had been successively under the sway of several foreign powers: what is now Michigan, Indiana and Illinois, belonged first to France, and then to England; a part of Mississippi had passed through periods of French, English and Spanish possession; while Louisiana had acknowledged the rule of France and of Spain. To quiet the claims that had arisen under these various governments, congress created eight boards of commissioners, to examine into all claims, reject such as were unfounded or fraudulent, and confirm such as were just; and also to secure in their possessions all the actual settlers who were found on the land when the United States took actual possession, although they had only a right of occupancy. (Gallatin.)

—The early steps to dispose of this public domain were tentative, and it was many years before they led up to a well-considered and efficient system. Under the confederation an ordinance in 1785 directed the secretary of war to draw by lot certain townships in the surveyed portion for bounties to the continental army, and the remainder was to be drawn by lot by the board of treasury in the name of the western states, to be sold by them at public sale at not less than "one dollar per acre, payable in specie, or loan office certificates reduced to specie value according to a scale of depreciation, or certificates of liquidated debts of the United States, including interest, besides the expenses of survey and other charges thereon," which were estimated to be \$36 per township. This measure was a failure, and it was intimated that the states which had any lands of their own to dispose of, took pains to make it inoperative. Meanwhile a new difficulty, unauthorized entries upon the public lands, was to be met, and force was necessary. Gallatin recalls, in his correspondence with Jefferson, that from 1783 to 1786 immigration into the territory north of the Ohio was

encouraged by the peacefulness of the Indians; and that a company was kept going up and down the Ohio from the Pennsylvania line to Cincinnati, burning every cabin, and in some instances laying down or burning the fences. This operation had to be repeated, and he knew of persons "whose cabins were burnt and settlement destroyed three times." (Writings, vol. i., p. 188.) In 1787 the price per acre was reduced to 66  $\frac{2}{3}$  cents per acre, and in the following year, the clauses regulating the drawing of land being repealed, power was given to the board of treasury to move about the United States and sell surveyed lands at pleasure. The low price soon attracted purchasers, and in 1788 a party from New England, under the lead of Rufus Putnam, settled at the mouth of the Muskingum river, while another party, made up chiefly in New Jersey, and among which was John C. Symmes, who had been a delegate to congress, aimed at the acquisition of the territory west of the former grant, and included between the Ohio and the Great and Little Miami rivers. Without waiting, however for congress to act upon their petition, Symmes and his associations began the sale of lands, issued warrants of locations, and even made settlements. Differences arising between Symmes and the board of treasury, no satisfactory arrangement was made until 1792, when, under Hamilton's administration, a patent was issued, in September, 1794, for as much land as had been paid for, amounting to about 310,000 acres, although 1,000,000 acres were called for by the contract. The difficulty of settling this claim arose from the general ignorance respecting the topography of the country; for when the surveys were made, it was seen that no tract of 1,000,000 acres could be included within the bounds named without cutting into former Indian or military reservations. The patent of 1794 was not regarded as final by Symmes, for in 1803 he issued a circular in which he expresses the belief that in the end he would receive the full 1,000,000 acres. On the other hand, congress accepted the patent of 1794 as a full settlement of Symmes' claims, and this involved the latter in difficulties from which he never entirely extricated himself. The fault in this matter appears to have rested entirely with congress. In addition to these two sales of lands, a third tract of 202,187 acres (now included in Erie county, Pa.) was sold to Pennsylvania, and was the last transaction which occurred before the constitution was adopted. These lands were paid for in evidences of the public debt of the United States, and in military land warrants.

—Among the important questions which were presented to the first congress under the constitution was that of the public domain. In the first debate on the subject (May 28, 1789) it was urged that the existing system tended to favor speculators and to discourage actual settlers; the land therefore ought to be sold in quantities to suit the applicants, and not in large quantities only. In this way settlement would be encouraged, and the public income from this source be greater and more certain. On the other hand, it was urged, that, if lands were offered on much more favorable terms, the eastern states would be depopulated. The situation was complicated by other circumstances. Some of the states were in the market with lands. Connecticut was offering her "Western Reserve" lands at forty cents per acre; Virginia advertised her Kentucky, and North Carolina her Tennessee, lands; both Pennsylvania and Georgia were inviting purchasers, while Massachusetts had reduced the price of Maine lands to fifty cents per acre, with the intention of checking western emigration. Moreover, the Spaniards in Illinois were at this time bidding for settlers under even more advantageous terms: lands without charge, exemption from taxation, provision,

and the implements of husbandry. In order to arrive at some determination, congress called upon Hamilton, now at the head of the treasury, to submit a plan, and in July, 1790, he communicated it to the house. Hamilton's report forms an important contribution to the history of the public domain, for many of its features have been retained to the present time. In his estimation, two objects were to be considered: to increase the facility of effecting advantageous sales, and the accommodation of those who were already settled in, or might in the future emigrate to, the western country. The land should be so offered as to accommodate three classes of purchasers "moneyed individual and companies who will buy to sell again; associations of persons who intend to make settlements themselves; single persons or families now resident in the western country, or who may emigrate thither hereafter." He recommended that a general land office should be established at the seat of government, and at least two subordinate offices opened in the western lands, each office to be under the control of three commissioners; that the land should be set apart for sales in townships of ten miles square, after certain reservations had been made for actual settlers, and for the subscribers to the proposed loan in the public debt; that no credit be given for any quantity less than a whole township, nor more than two years' credit be allowed for any greater quantity, and security, "other than the land itself," shall be required of the purchaser to whom credit is given; that the price shall be thirty cents per acre, payable either in specie or in public securities; and finally, that it might be advisable to "vest a considerable latitude of discretion in the commissioners of the general land office." (Hamilton's Works, vol. iii., p. 84.)

—Congress, however, was slow to act, and it was not until 1796 that any decided step in advance was taken. It was then that the rectangular system of surveying lands was in substance adopted, and provision made for the public sale of lands in sections one mile square at a price not less than two dollars per acre. This price was determined upon in order to include all costs of surveying and disposition. It will be of interest to note the valuation of land in some of the original states, as estimated two years after, in 1798:

STATES.	Acres.	Valuation.	Per Acre.
New Hampshire.....	3,749,061	\$ 19,028,108	\$5.07
Pennsylvania.....	11,959,865	72,824,852	6.09
Maryland.....	5,444,272	21,634,004	3.77
Virginia.....	40,458,644	59,976,860	1.48
Sixteen states.....	163,746,686	470,293,263	2 92

(American State Papers, Public Lands, vol. iii., p. 264.)

—Up to the year 1800, when an important changes was made in the land laws, all sales were made from the territory now included in the state of Ohio, and amounted to 1,484,047 acres, realizing 1,201,725.68.

—The act of May, 1800, introduced several new features, and may be said to be the first serious attempt to systematize the manner of disposing of the public lands. Registers, having offices within defined districts, were created, and at each land office there was to be a bonded officer known as the "receiver of public moneys." But the most important modification made, and one that was pregnant with consequences, was that governing the terms of payment. The lands were, as before, to be offered at public vendue, and to be sold at a price not less than two dollars per acre, payment to be made in specie or evidences of the public debt. But only a fourth part of the purchase money was required at the time; the payment of the balance was to be spread over three years, one-fourth of the original purchase money to be paid in each year, with interest at 6 per cent. per annum from the day of sale. A discount of 8 per cent. was allowed for the prepayment of any of the last three installments. In case the full payment was not made within one year after the last installment was due, the lands were to be resold, or were to revert to the United States. The opportunities afforded by this extension of credit were too tempting to be resisted, and a great increase in the sales of land at once occurred. While in 1799 nothing was turned into the treasury from this source, and in 1800 but \$443, in the following three years the receipts were respectively, \$167,726.06, \$188,628.02, and \$165,675; and it is reasonable to suppose that in the larger number of instances full advantage was taken of the credit offered, and that these sums were therefore but the first payment on the purchases. And this conclusion is further supported by the receipts for the years 1804-1806, when the arrears and final installments were falling due, being, in round figures, \$487,500, \$540,200, and \$765,250 respectively. In fact, it was soon evident that the long term of credit allowed, was inducing excessive purchases, and that, in their eagerness to secure lands, purchasers were assuming debts which only a long continuation of the most favorable circumstances would enable them to discharge. For, on lands sold before 1803, amounting to 900,000 acres, and sold under the provisions of the act of 1800, but \$800,000 had been paid, while \$1,100,000 remained due. Nor did the results of the following years tend to prove the wisdom of the credit system, as in 1804 the unpaid balance was \$1,434,212, and in 1805, \$2,094,305, the increase being due both to increase of sales and to an accumulation of arrears. The lands might be forfeited, and put up at public sale, but such attempts were rarely attended with success, and the lands reverted to the government, encumbered by the occupancy of a tenant. Speaking of the increasing indebtedness on account of land purchases, Gallatin said: "Great difficulties may attend the recovery of that debt which is due by nearly 2,000 individuals, and its daily increase may create an interest hostile to the general welfare of the Union." For this reason he recommended a shortening of credit, and also to allow the land to be sold in tracts smaller than quarter sections. Nothing, however, was done with respect to these recommendations, and in 1806 congress still further complicated matters by refusing to receive in payment for purchases of public lands any more certificates or evidences of public debt. The demands for relief now became more urgent, and congress was flooded with petitions, resolutions, legislative enactments and personal applications, all seeking to obtain relief from burdens which a little foresight would have originally prevented. From 1809 to 1824 hardly a year passes without a "relief act" being adopted, by which the operation of the general provisions of the law was suspended or mitigated. Many of these measures were but partial remedies, and only served to complicate matters, while offering little toward a final and satisfactory solution of the problem. It was difficult to see how the situation

could be helped by merely extending the term of credit. If the back interest was remitted for one set of purchasers, others petitioned for a like favor; if an advantage was given to the purchasers in one state, arguments were adduced for extending the same advantage to other states. So that a privilege or relief measure granted to apply to a special, and it may be an exceptional, case, became the basis for demands from other quarters. One of the most common pleas for demanding relief was the expediency of interesting the purchaser in the Union by giving him a full and complete ownership in a portion of the soil, and not weakening his attachment by making him a debtor. "It is believed that a government founded on the general sentiment of the community can not, with safety to itself, hold as debtors the citizens of any considerable portion of the country." But special reasons were not wanting to those who applied for some favor. In 1809 it was the embargo, which "had suspended the foreign trade of the country, ceased that demand for domestic produce, and that exchange of produce for specie, so necessary to produce a general circulation of it, that, while a redundant moneyed capital has accumulated in the commercial towns and cities, its circulation is proportionally diminished in the interior and remote parts of the country." In 1812 it was the war which prevented the payment of debts; and in that year a report was made in congress advocating some favor. "The present system can not be continued, and the laws rigidly executed, without occasioning great injury to the purchasers. Men are seduced by the temptation, which the credit held out to them, to extend their purchases beyond their means of making payments; the unfavourable fluctuations of commerce can not be foreseen; and the pretty general disposition in men to anticipate the most favorable results from the produce of their labor, are the general causes of the failure of purchasers in making payments."

—Yet, in spite of the fact that the buyers of land were during these years so cumbered with debt, attempts were made to induce congress to give even greater opportunities for running into debt. Thus, a petition presented to congress in 1814 recited that there were many thousands of poor, industrious inhabitants and faithful citizens of the United States, suffering for want of a portion of the soil of the country; and from the scarcity of money, and the high price of lands, they were prevented from purchasing; they therefore prayed that every person above the age of eighteen years may be allowed to hold 160 acres of the public lands by virtue of settlement, at the price of 12½ cents per acre, payable within the term of seven years, without interest. Furthermore, during the period between 1817 and 1819, when commerce was prosperous, price of produce high, and speculation, aided by excessive issues of bank notes, was rampant, large purchases of public lands were made under the credit system; and when in the following years the bubble of prosperity had burst, few who had entered into these purchases were able to discharge their obligations. Again was appeal made to congress, and, in addition to granting relief measures, it passed an act in April, 1820, abolishing the credit system, authorizing the selling of land in half quarter sections, or 80-acre lots, and reducing the minimum price of \$1.25 per acre. The credit system was prevalent, and left its traces in Ohio, Indiana, Illinois, Missouri, Alabama, Mississippi, Louisiana and Michigan. Relief acts were, however, still in demand, for the amount of indebtedness had largely increased, being, in December, 1820, \$21,213,350.17. The fluctuations in the prices of commodities, the issues of paper money, Indian hostilities, which required the personal service of land cultivators, and many others such excuses, were, from time to time, urged upon

congress as reasons why relief should be granted. And through the influence of these successive acts, coupled with the repeal of the credit system of purchasing lands, the amount of indebtedness was decreased through payment of arrears and through a relinquishment of the lands. In 1828 the general land office reported that under the relief laws 4,168,941 acres had been relinquished, discharging \$13,778,347.37 of debt; in 1830 this land debt was wholly discharged.

—In the meanwhile, however, a new difficulty was taking form by reason of the dissatisfaction openly expressed by the states with the method of disposing of the lands. The states which had large tracts of public lands, within their limits, and were known as the "land states," as distinguished from the original states, chafed under the apparent injustice of the land laws to themselves, and even threatened to resort to measures of force if relief was not provided for. As all lands, irrespective of their quality and situation, were in the market at the same *minimum* price, it naturally followed that the best lands, those that at that time presented the most promising results to the cultivator at the least expenditure of labor and money, were taken first, and the lands of inferior quality were passed by. It is true, that in many cases these lands were increased in value by the mere accession of population and increase of wealth in the neighborhood. But scattered throughout the land states, and indeed, in almost every section where public lands had existed, there remained tracts which were not at that time worth the minimum price, and which could not have made any return to the cultivator in proportion to the expense necessary to purchase and cultivate them. The result was, these tracts remaining public lands, bore no share of state or local taxation, and were even a source of expense to the state, as were the lowlands of the south, which were subject to an annual inundation. As early as 1824 these complaints became frequent, and Benton introduced into congress a measure for graduating the price of lands that had been in the market for a certain length of time, and for granting pre-emption rights to actual settlers. The introduction and rejection of this measure only served to urge the states to new endeavors. In 1827, Illinois stated, that if the present minimum price be adhered to, "it must be several hundred years before all the soil of the state can be passed out of the hands of the federal government and be subjected to the laws and jurisdiction of the state." "The question is one which, if seriously presented, must involve questions of the highest importance to a state, and of the most intense interest to its citizens—no less than of the deprivation of some of the essential attributes of its sovereignty; the control of the internal concerns and police of a free state by a power other than its own; a prohibition to regulate and improve the settlement of lands within its own limits and acknowledged boundaries, according to its own views of its prosperity and happiness; a deprivation of the collection of revenue from vast bodies of soil within such limits until the general government shall choose to assent thereto by the disposition of the soil—whether the citizens of such states shall be subject to the operation of the laws of the United States, confessedly purely municipal, which have no existence in the older states, and which they along have the right to pass, and to which no other power is competent without the consent of their own legislative powers; whether in reality the compact under which the general government claims these extraordinary powers, is consonant to the rights reserved to the states, respectively, by the constitution of the United States, or have, in any wise, been granted by that instrument, and finally, whether the tenure by which they hold the public lands is valid and binding on the

new states." The legislature of Missouri went even further, and declared, that in persisting in its land policy congress was infringing the compact between the United States and the State; "that the state of Missouri never could have been brought to consent not to tax the lands of the United States while unsold, and not a tax the lands sold until five years thereafter,<sup>66</sup> if it had been understood by the contracting parties that a system was to be pursued which would prevent nine-tenths of those lands from ever becoming the property of persons in whose hands they might be taxed." Indiana declared that "this state, being a sovereign, free and independent state, has the exclusive right to the soil and eminent domain of all the unappropriated lands within her acknowledged boundaries," this right being reserved in the deed of cession of the northwestern territory to the United States, and confirmed and established by the articles of confederacy and the constitution of the United States.

—Another circumstance that led to these complaints by the states was the great desire to effect internal improvements, which had during these years become prevalent. These states were deprived of the right of eminent domain where the public lands were situated, and were further debarred from what might be a very profitable source of revenue; for their revenues were almost wholly derived from a tax upon land. As the population was much scattered by reason of the situation of the best lands, the policy of maintaining a minimum price for all lands was fastened upon as the cause. "The tide of population is thus diverted into a thousand channels, and suffered to roll over immense regions, creating feeble and thinly scattered settlements, and leaving extensive tracts of wilderness behind." (Illinois, 1825.) "In a scattered population public institutions are seldom established; systems of education can not be matured; moral restraints are tardily enforced; laws are feebly executed, and revenue raised with difficulty." "It is the policy of enlightened legislation," said the legislature of Indiana, "to curtail this unlimited range, and by social allurements to reclaim our wandering tribes to the blessings of humanity and refinement." But the climax of absurdity was reached by Mr. Richard Rush, the secretary of the treasury, in his annual report for 1827, in which he makes a plea for further protection to manufactures through the tariff, on the ground that the land laws were protecting agriculture. "It can not be overlooked that the prices at which fertile bodies of land may be bought of the government under this system, operate as a perpetual allurement to their purchase. It must therefore be taken in the light of a bounty, indelibly written in the text of the laws themselves, in favor of agricultural pursuits. Such it is in effect, though not in form. Perhaps no enactment of legislative bounties has ever before operated upon a scale so vast, throughout a series of years, and over the face of an entire nation, to turn population and labor into one particular channel, preferably to all others. \* \* It has served and still serves to draw, in an annual stream, the inhabitants of a majority of the states, including among them at this day a portion, not small, of the western states, into the settlement of fresh lands lying still farther and farther off. \* \* And, as it is the laws that have largely, in effect, throughout a long course of time, superinduced disinclinations to manufacturing labor, by their overpowering calls to rural labor, in the mode of selling off the public domain, the claim of further legal protection to the former kind of labor, at this day, seems to wear an aspect of justice no less than of expediency."

—In December, 1827, the secretary of the treasury reported that, while more than 261,000,000 acres of land lying within the states and territories had become the absolute property of the United States free from Indian claim, since the organization of the government but 19,000,000 had been sold to individuals. At that rate it was estimated that a period of more than five centuries must elapse before the whole of the public domain then under the unrestrained control of congress would become the property of individuals. In 1880 the land commission reported, that, at the present rate of absorption, all the surveyed arable land would be taken within three years.

—Still another cause for agitation on this subject was the rapid decrease in the national debt, to provide for which the lands in a measure stood pledged. As early as 1806, in view of the ultimate payment of the debt, Jefferson had suggested the appropriation of the proceeds of the sales of the lands to works of internal improvement and to the support of education. And between the years 1825 and 1832 many schemes for disposing of the lands by sale or gift were advanced in congress, many of which were very questionable in character. Indeed, in December, 1829, it was stated in the house, that "it seemed as if the four quarters of the Union were striving with one another which should get the most out of these lands. The appetite for them appeared to be insatiable and uncontrollable." Claims that had been rejected at the land offices were readily allowed by congress. During the session of 1827-8 congress actually gave away to states and individuals not less than 2,300,000 acres of choice lands, the donations of internal improvements alone exceeding the sales. In order to check further concessions it was proposed to give the states a direct interest in the income arising from the sales of the public lands. Some states laid claim to the lands themselves. In 1831 Madison expressed himself in forcible terms against a claim "so unfair and unjust, so contrary to the certain and notorious intentions of the parties to the case, and so directly in the teeth of the condition on which the lands were ceded to the Union." No account seems to have been taken of the practical difficulties connected with a donation of lands to the states: the creation of rivals in her own land markets, the difficulty of locating divisions of equal value, and the establishments of as many systems of land sales as there states.

—In December, 1829, a resolution was offered in the senate by Mr. Foot, of Connecticut, that the committee on public lands should inquire into the expediency of limiting the sales of the public lands to those then in the market, and to suspend further surveys. A spirited debate followed, which led up to the famous argument between Webster and Hayne, which involved a general examination of the principles of the constitution. No action was taken. The secretary of the treasury, in his report for 1831, "submitted to the wisdom of congress to decide upon the propriety of disposing of all the public lands, in the aggregate, to those states within those territorial limits they lie, at a fair price, to be settled in such a manner as might be satisfactory to all," and the president raised the question of public lands in his message for 1832. In the meantime the legislatures of six of the new states had memorialized congress in favor of a reduction in the price of lands, and a cession of them to the states in which they were situated, being substantially the proposition of the secretary. The senate instructed the committee on manufactures to report upon these propositions.

—This able document, prepared by Mr. Clay, embodies the debates of the previous years, and clearly states the actual status of the question. For this reason a summary is here given of its arguments. A reduction of price, it asserted, if called for by the public interest, must be required either because the government now demands more than a fair price for the public lands, or because the existing price retards injuriously the settlement of the new states and territories. While it was true that much of the land then offered might not be intrinsically worth the minimum price fixed by law, there was also much that was unquestionably worth more. If the government was intent upon accelerating the sales of the lands, some alteration in the price might be made; but, under the existing regulations the acquisition of a home was placed within the reach of every industrious man; and that the established price was not too high was demonstrated by the rapidity with which the land was taken when offered. In fact, the returns given by the secretary of the treasury proved this assertion by showing that the receipts from lands "had gone beyond all former example." Moreover, if any reduction was made in the price of the lands, the value of land throughout the country, and especially of that in the states which contained, or were nearest to, the public lands, would be affected. There would be danger of offering encouragement to speculation, and lastly, a reduction would affect injuriously the interests of the states, by decreasing the value of the liberal grants of land made to them for various purposes, much of which was still in the market. That large quantities of the public lands remained unsold was due to the fact that immigration, and the progressive increase of population, were not sufficient to absorb all that was offered; and if the quantity thrown upon the market had been quadrupled, the probability is that not much more would have been annually sold than had been actually sold. On the second point, the increase of population in the states where the public lands were situated clearly showed that no fresh impulse to immigration was required. The population of the seven states embracing the public lands had increased by 85 per cent. between 1820 and 1830, that of Illinois alone showing an increase of more than 185 per cent.; whereas the population of the seventeen states which embraced no public lands within their limits had, in the same period, increased but 25 per cent. Furthermore, while the population of the country was increasing at the rate of 3 per cent. a year, the demand for public lands increased at the rate of 23 per cent. per annum. To the complaint made by some of the states, that by reason of the exemption of lands from taxation an undue proportion of the expenses of government was thrown upon the resident population, it was answered, that congress had in many ways made a liberal compensation for this apparent injustice: it had appropriated toward internal improvements 5 per cent. of the net proceeds of all sales of public lands within their limits; that a section of land in each township, or one thirty-sixth portion of the whole of the public lands, had been reserved for purposes of education; and that liberal grants had been made for local and special purposes. Still, the committee would recommend a further grant for internal improvements, to the states having within their boundaries public lands, of 10 per cent. of the net proceeds of land sales, and for a limited time a division of the residue among all the states.

—As to ceding on reasonable terms the public lands to the several states in which they might be situated, it would practically involve a cession of the whole public domain of the United States; for as new states were created, similar cessions must be made to them. This would mean the relinquishment of an aggregate of 1,090,871,753

acres, or, at the minimum price, upward of \$1,400,000,000. "If such a measure could find any justification, it must arise out of some radical and some incurable defect in the construction of the general government properly to administer the public domain. But the existence of any such defect is contradicted by the most successful experience. No branch of the public service has evinced more system, uniformity and wisdom or given more general satisfaction, than that of the administration of the public lands." The states are not more competent than the government to dispose of the lands, for the regulations would lack uniformity, and might lead to contests among themselves. "Each state would be desirous of inviting the greatest number of emigrants, not only for the laudable purpose of populating rapidly its own territories, but with the view to the acquisition of funds to enable it to fulfill its engagements to the general government. Collisions between states would probably arise, and their injurious consequences may be imagined. A spirit of hazardous speculation would be engendered. Various schemes in the new states would be put afloat to sell or divide the public lands. Companies and combinations would be formed in this country, if not in foreign countries, presenting gigantic and tempting but delusive projects; and the history of legislation, in some of the states of the Union, admonishes us that a too ready ear is sometimes given by a majority, in a legislative assembly, to such projects." A decisive objection to such a transfer for a fair equivalent was that it would establish a new and dangerous relation between the general government and the new states, that of creditor and debtor; and would involve much the same consequences, save in higher degree, that existed between the general government and individual debtors under the credit system. The states would not be able to pay for their lands at once, and must incur heavy debts. If the debtor state failed to pay when the debt matured, how could it be forced to pay? War is the last remedy between independent nations, but the relations between the general government and the members of the confederacy excluded all idea of force and war. Nor would the judiciary be efficient. "On what would their process operate? Could the property of innocent citizens residing within the limits of the defaulting states be justly seized by the general government, and held responsible for debts contracted by the states themselves in their sovereign capacity? If a mortgage upon the lands ceded were retained, that mortgage would prevent or retard subsequent sales by the states, and if individuals bought, subject to the incumbrance, a parental government could never resort to the painful measure of disturbing them in their possessions" "Delinquency on the part of the debtor states would be inevitable, and there would be no effectual remedy for the delinquency. They would come again and again to congress, soliciting time and indulgence, until, finding the weight of the debt intolerable, congress, wearied by reiterated applications for relief, would finally resolve to sponge the debt; or, if congress attempted to enforce its payment, another and a worse alternative would be embraced. \* \* Upon full and thorough consideration, the committee have come to the conclusion that it is inexpedient either to reduce the price of the public lands, or to cede them to the new states."

—This report was not, of course, satisfactory to those who desired to distribute freely the land or proceeds among the states, and the bill reported by the committee on manufactures was promptly referred to the committee on public lands, which but for political reasons would have had cognizance of the matter from the first, and a very different report was made. The report of Mr. Clay was declared to be "founded in

error both in its principles and its details;" its recommendations were rejected, and, in place of them, the committee recommended the minimum price of one dollar per acre, such lands as remained in the market more than five years to be sold at fifty cents per acre, and finally, the distribution of 15 per cent of the proceeds among the states. A bill embodying Mr. Clay's recommendations was passed by both houses of congress, but was vetoed by the president, and in such a way as effectually to prevent its being passed over his veto, a sufficient majority in both houses being in favor of the bill. His main objection to it was, that it prevented any reduction in the price of land. In 1835 Mr. Clay again passed his bill through the senate, but it was lost in the house.

—Now occurred one of the most curious episodes connected with the history of the public lands. Owing to a number of causes, the chief of which was the condition of the currency and of banking, an era of speculation and inflation was introduced, and was at its height in 1835. Curiously enough, the public lands became an object of speculation, although the supply was practically unlimited, and the expectation of any marked rise apparently too distant to tempt investment for merely speculative purposes. Furthermore, while the prices of all other commodities were rising, an abundance of lands could be had at the minimum price fixed by law. In 1834 the sales amounted to \$4,800,000; in 1835, to \$14,700,000; and in 1836, to \$24,800,000. During the fourteen months between July, 1835 and October, 1836, the sales were extraordinary. Yet in 1835 neither the president nor the secretary of the treasury appeared to realize that there was on foot any great speculation in the public lands. Jackson appeared to regard the increase as a proof of the prosperity of agriculture, and even hinted at a reduction in the minimum price; while the secretary of the treasury was so little impressed with the real situation that he estimated the probable receipts for 1836 at \$4,000,000, whereas in fact they were more than eight times as large. "The receipts for the lands consisted largely of notes of irresponsible banks. Land speculators organized a 'bank,' got it appointed a deposit bank if they could, issued notes, borrowed them and bought land; the notes were deposited, they borrowed them again, and so on. There was, of course, little specie in the west, on account of the flood of paper money." In congress Benton attempted to pass a bill that nothing but gold or silver should be taken for public lands, but failed. But on July 11, 1836, the president issued the famous "specie circular" which made this requirement.<sup>67</sup> It is not only caused great inconvenience and discontent in the west, but also precipitated a crisis by drawing specie from the eastern banks, already hard pressed by the speculative period, which had then reached its culmination. In February, 1837, Calhoun introduced a measure for ceding the public lands to the new states, but the reason he gave will not bear serious criticism: "to place the senators and representatives from the new states on an equality with those from the old, by withdrawing our local control, and breaking the vassalage under which they are now placed." In the same session a bill for graduation the price of unsold lands passed the senate, but failed to be acted upon in the house. A new factor now appeared. Many of the states had emerged from the period of speculation with heavy debts, which were chiefly held in England. About two hundred millions of dollars were due from states and corporations to creditors in Europe. (Benton.) "These debts were in stocks, much depreciated by the failure, in many instances, to pay the accruing interest; in some instances, failure to provide for the principal. These creditors became uneasy, and wished the federal government to assume their debts. As early as the year 1838 this

wish began to be manifested; in the year 1839 it was openly expressed; in the year 1840 it became a regular question, mixing itself up in our presidential election, and openly engaging the active exertion of foreigners." This was Benton's statement, and it is certain that he made too much of the proposition. In January, 1840, Mr. Grundy, of Tennessee, presented a report on it, which contained the following: "We, therefore, conclude that the application of the moneys arising from the sales of public lands to the payment of said debts, or their distribution among the states for such purposes, is as unjust, inexpedient and unconstitutional as a similar application of any other portion of the public revenue; and, moreover, in direct violation of the terms and spirit of the compacts of the cession." Mr. Webster stated that he did not know of a man in congress who held that the government had any more right to pay the debts of a state than those of a private individual. Some color was given to the charge by the first message of President Tyler. Although repudiating any assumption by the government of the debts of the states, he recommended a distribution among the states of the proceeds of the sales of the public lands; and intimated that such a measure would cause an immediate advance in the price of the state securities. A measure embodying such a distribution, with many other features, such as a gift of 500,000 acres of land to the new states, and pre-emption rights to settlers, was passed in 1841, and spite of the fact that the condition of the national finances was not such as to warrant the loss of the land revenue. A further provision connected it with the tariff. "If, at any time during the existence of this act, duties on imported goods should be raised above the rate of the 20 per centum on the value as provided in the compromise act of 1833, then the distribution of the land revenue should be suspended." In like manner the tariff act passed in the same session provided that if any duty exceeding 20 per centum on the value shall be levied before June 30, 1842, it should not stop the distribution of the land revenue as provided for in the distribution act. Both tariff and distribution acts remained in force less than a year. The progress from relief acts to a distribution of proceeds of the sales of lands was logical, but the principles embodied in these many acts were bad, and undoubtedly strained the constitutional powers of the government. Propositions of a like character are met with in after years, but as they never reached an issue, there is no necessity for special mention. The results of such measures were so clearly pointed out by Jackson, in his eighth annual message, as to warrant its quotation. "All will admit that the simplicity and economy of the state governments mainly depend on the fact that money has to be supplied to support them by the same men, or their agents, who vote it away in appropriations. Hence, when there are extravagant and wasteful appropriations, there must be a corresponding increase in taxes; and the people, becoming awakened, will necessarily scrutinize the character of measures which thus increase their burdens. By the watchful eye of self interest, the agents of the people in the state governments are repressed and kept within the limits of a just economy. But if the necessity of levying the taxes be taken from those who make the appropriations and thrown upon a more distant and less responsible set of public agents, who have power to approach the people by an indirect and stealthy taxation, there is reason to fear that prodigality will soon supersede those characteristics which have thus far made us look with so much pride and confidence to the state governments as the main-stay of our Union and liberties. The state legislatures, instead of studying to restrict their state expenditures to the smallest possible sum, will claim credit for their profusion, and harass the general government for increased supplies. Practically there would soon be but one

taxing power, and that vested in a body of men far removed from the people, in which the farming and mechanic interests would scarcely be represented. The states would gradually lose their purity, as well as their independence; they would not dare to murmur at the proceedings of the general government, lest they should lose their supplies; all would be merged in a practical consolidation, cemented by wide-spread corruption, which would only be eradicated by one of those bloody revolutions which occasionally overthrow the despotic systems of the old world."

—Coupled with propositions for graduating the price of the public lands, for ceding the lands to the states, or distributing the proceeds from sales among the states, were measures for extending the privilege of pre-emption to actual settlers. pre-emption gives a settler the first right or preference to purchase as against those who may wish to purchase and hold for investment or speculation. It is a premium to those who make a permanent settlement on the land with the intention of cultivating it and making a home. "The essential conditions of a pre-emption are actual entry upon, residence in a dwelling, and improvement and cultivation of a tract of land." The right or privilege thus conferred was first exercised in the case of those who had suffered from the Symmes purchase, but between the date of the first pre-emption act and the year 1841 no less than sixteen such acts were passed. In fact, some such measure was necessary in order to prevent injustice to those who had entered upon and cultivated public lands before they had been surveyed and opened to settlement. In its eagerness to secure the best lands the population tended to overpass the surveyed lands and settle in the wilds, and this tendency was greatly aggravated by the speculation in lands in 1835-7, when nearly all the best lands that were in the market were controlled by companies or single proprietors, who had purchased for purposes of speculation. Thus in 1838, "in that part of Wisconsin which lies west of the Mississippi, there are supposed to be from thirty to fifty thousand inhabitants. Over this region congress has extended civil government, established courts of law, and encouraged the building of villages and towns; and yet the land has not been brought into the market for sale, except it may be small quantities for the sites of villages and towns. In other parts of Wisconsin a similar state of things exists, especially on and near the border of Lake Michigan, where numerous settlements have been made and commercial towns erected, some of them already of considerable importance, but where the title to the land still remains in the government. Similar cases exist in Indiana, Illinois and Michigan, and probably also in the southwestern states." (Webster.) To oust these settlers from their holdings appeared to be gross injustice, and yet any favor shown to them would only open the door to future abuses. It was said that pre-emption encouraged squatters, that it enabled a man to settle upon a tract of land and not pay for it until forced to, and that it was a bounty to the speculator and intruder. On the other hand, it was urged that the privilege of pre-emption served to invite the immigration of foreigners, and to encourage the actual settlement and cultivation of the land, and that it was not a bounty, gratuity or donation, but merely a right of previous purchase at a fixed price. Up to the year 1840 the privilege of pre-emption was generally conferred only by special enactments, and such laws, being chiefly of a temporary nature and supplying only to a certain class of settlers who had made entry upon land before the date mentioned in the law, were in fact but relief acts. In 1840 a movement toward a permanent pre-emption law was started, and under the stimulus of the presidential campaign of that year, in which the log cabin—the symbol of frontier life—played an

important part, the act of September 1841, which was supplemented by the act of March 5, 1843, was passed by congress. The right of pre-emption was, however, confined to surveyed lands only. By laws passed in 1853 and 1854 the privilege was extended to unsurveyed lands, thus giving every facility to the speedy settlement of the public domain. It will be well to speak here of the origin and result of thus offering the special privilege pre-empting lands, even if we have to anticipate somewhat. " The pre-emption system arose from the necessities of settlers, and through a series of more than fifty-seven years of experience in attempts to sell or otherwise dispose of the public lands. The early idea of sales for revenue was abandoned, and a plan of disposition for homes was substituted. The pre-emption system was the result of law, experience, executive orders, departmental rulings, and judicial construction. It has been many phased, and was applied by special acts to special localities with peculiar or additional features, but it has always, and to this day contains the germ of actual settlement, under which thousands of homes have been made and lands made productive, yielding a profit in crops to the farmer, and increasing the resources of the nation." (Report of land commission, p. 215.)

—The next important move in respect to the disposing of the public lands was taken in 1850. As early as 1802 a grant of land for public improvements in Ohio had been made to that state, and in later years grants for wagon roads, for internal improvements and for canals, were from time to time allowed. Between 1824 and 1866 more than four millions of acres of land had been given to five states for canal purposes, and all of this but some 700,000 acres was ceded prior to 1853. But a more important agent of transportation—the railroad—was being introduced, and in a few years superseded all other agencies. In 1833 congress authorized the state of Illinois to divert a canal grant and to apply it to the construction of a railroad, but it was not utilized by the state. As showing the small beginning made in these grants, it is interesting to note, that, in a grant made two years later, only thirty feet on each side of the line of the road through the public lands, with use of timber within 300 feet on either side and ten acres at terminus, were given. This was little more than the right of way. In 1836 another grant only a little more liberal was made to a projected southern line. Easements were granted for necessary depots, water stations and workshops, in blocks of not more than five acres on the line of the road, and adjacent, and at least fifteen miles apart. Material for construction (earth, stone or timber) might be taken from the public lands. These early acts, however, received and indeed called for little attention. It was not until 1850 that congress was again called upon to aid in the construction of railroads, but its action was then very different from what it was in 1835-6. The important points of the act of September 1850, which made a grant to Illinois of land to aid the construction of a railroad (the Illinois Central) were as follows: Alternate sections (even numbered) for six sections in width on either side of the road and branches were granted; and if any of this land was already legally occupied the road could in lieu take a like amount of unoccupied land within fifteen miles of the road. This is known as the indemnity practice. The price of lands situated within the grants and retained by the government was raised to \$2.50 per acre (double minimum), the former price being \$1.25 per acre (single minimum). This was to indemnify the government for the lands granted, and was believed to be just on account of the advantage accruing to the purchaser of having the means of reaching the markets with his produce. It was further stipulated that the road was to be a public

highway, to be used by the government free of toll or other charges, and the mails were to be carried at prices to be fixed by congress. The whole expense of construction was defrayed from the proceeds of the land sales, and, in lieu of the charter and franchises received from Illinois, the railroad stipulated to pay to the state from 5 to 7 per cent on its gross receipts. "The state thus far has received, interest alone (the Illinois Central railroad's gross income being a perpetual source of income to the state), more than \$3 per acre. The state debt of Illinois, Sept. 14, 1880, was \$265,000, which will be paid Jan. 1, 1881 from cash now in hand; and thus the state will be free from debt, and the income from this railroad will constitute a fund for state expenses, doing away, to a great extent, with the necessity of taxation for state purposes. The income from this source in 1879 was over \$325,477.38." The total number of acres given under this grant was 2,595,053.

—In 1852 grants for railroads were made to Missouri, and in 1853 to Arkansas. In June, 1854, a cession was made to the territory of Minnesota (an unusual act, as a territory was not a sovereignty), a but it was repealed two months later. In 1856 and 1857 further grants were made, in every case to the states themselves.

—As early as 1845 steps were taken to secure government aid for the construction of a transcontinental road, but little was accomplished till California was admitted into the Union, in 1850. From 1850 till 1862 the debates of Congress contain the record of a large number of bills, resolutions, petitions and report upon this project, and the war department organize and executed a series of surveys from the Mississippi river to the Pacific Ocean in order to determine the most practicable and economical route for a such a road. The political parties took up the subject. In 1856 the democrats, in a national convention at Cincinnati, adopted a resolution asserting that it was the duty of the federal government to exercise all its constitutional power to aid in building the railroad, to the Pacific, and the democratic plat form of 1860 declared that the party stood pledged to aid the construction of the road by such means as were constitutional. The republicans took a like stand. In July, 1862, the Union Pacific railroad, was incorporated by a direct act of congress, and the grant of land was made to the corporation, thus making a complete change in the system. The company was given right of way, allowances for shops, stations, etc., and in aid of construction, every alternate section of public land (odd numbered), unless previously disposed of, reserved or mineral (without indemnity provision), to the extent of five alternate sections per mile on either side of the road. It would take too much space to trace the subsequent legislation on this subject, or even to summarize the results. That more properly belongs to the subject of railroads. From 1850 to 1872 a total of 155,504,994 acres was granted for railroad construction of which more than half was given in the years 1862 and 1864. Willis Drummond, Jr. (in Major Powell's Report in the "Lands of the Arid Region," 1878 (established, that if the lands embraced in limits of grants to railroads to June, 1880, were all available, and if the corporations, state and national, built their roads and complied with the laws, it would require 215,000,000 acres of land to satisfy their requirements, or only 6,000 square miles less than the area of the original thirteen states. This estimate was, however, too large, and the figures we first gave are nearly correct. Many of those grants have lapsed, and by appropriate legislation the land may revert to the United States.

—To go back a little, not content, with a pre-emption law, in 1854 a graduation act was passed to "cheapen the price of lands long in market for the benefit of actual settlers and for adjoining farms." Lands which had been in the market for more than ten years were sold to actual settlers at prices ranging from 12½ cents to \$1 per acre, according to the time they had been offered without being taken. Lands of ten years' standing were appraised at \$1 per acre; of fifteen years, 75 cents; of twenty, 50 cents; and so on. The act was repealed in 1862; but under the law 23,696,419 acres were disposed of.

—About 1852 a homestead law, or the granting of free homes and on the public domain, became a national question, and was pushed by the "free-soil democracy." In the years that elapsed between 1852 and 1862, when a homestead bill was passed, the contest was severe and bitter, and was marked by a good deal of foolish rant on the subject of land ownership. The free-soil democrats in national convention in 1852 inserted the following in their platform: "that the public lands of the United States belong to the people, and should not be sold to individuals, nor granted to corporations, but should be held as a sacred trust for the benefit of the people, and should be granted in limited quantities, free of cost, to landless settlers." In 1859 the contest in congress centred upon a homestead bill which gave heads of families the right to enter free of cost, 160 acres of public lands. The bill passed the house, but failed in the senate. In 1860 a measure passed both houses of congress by which a head of a family might enter upon a quarter section of land, and after the expiration of five years might purchase the same at twenty-five cents per acre. The bill further provided that "all lands lying within the limits of a state, which have been subject to sale at private entry, and which remain unsold after the lapse of thirty years, shall be \* \* ceded to the state in which the same shall be situated." President Buchanan vetoed the measure, on the ground that it was unequal and unjust. In 1862 a homestead bill was passed, and this, with the amendments since adopted, forms the law as it stands to-day. Concerning it, the land commission says: "The present homestead law contains all the beneficial features of the pre-emption act, with the addition suggested by experience and the changed condition of national life. The eighth section of the act contains the substance of the pre-emption act in the matter of purchase. \* \* It contains one feature as broad in its terms and as beneficial in its principle as the domain it covers. It is as follows: 'No land acquired under the provisions of this act shall, in any event, become liable to the satisfaction of any debt or debts contracted prior to the issuing of the patent therefor.' The homestead act is now the approved and preferred method of acquiring title to the public lands. It has stood the test of eighteen years, and was the outgrowth of a system extending through nearly eight years; and now, within the circle of a hundred years since the United States acquired the first of her public lands, the homestead act stands as the concentrated wisdom of legislation for a settlement of the public lands. It protects the government, it fills the states with homes, it builds up communities, and lessens the chances of social and civil disorder by giving ownership of the soil, in small tracts, to the occupants thereof. It was copied from no other nation's system. It was originally and distinctively American, and remains a monument to its originators."

—Such, in brief, has been the history of the public lands in this country. There are a number of other important measures that have been adopted for preserving and

disposing of these lands, such as the land bounties for military and naval service, the 2, 3 and 5 per cent. funds granted to the states out of the proceeds of sales of lands, the Indian and military reservations, scrip lands, timber and timber-culture laws and a flood of donations, public and private; but they need only be mentioned here, as many will be treated in other parts of this work.

—*Statistics.* According to estimates the aggregate area of the public lands of the United States disposed of and remaining of June 30, 1880, was 2,894,235.91 square miles, or, 1,852,310,987 acres. The territory now included within the limits of Tennessee was not disposed of under the direction of the executive department of the general government, and deducting this, the actual public domain is 1,821,700,922 acres. Up to June 30, 1880, there have been surveyed in the land states and territories, 752,557.195 acres of the public domain, and there remain to be surveyed, 1,069,143,727 acres. The surveyed, lands yet undisposed of are estimated at 204,802,711.12 acres, which with the unsurveyed, make a total of 1,273,946,438.12 acres of land still the property of the United States, and subject to disposition; from which must be deducted the grants to railroads and private land claims. Since the passage of the ordinance of 1785 to June 30, 1880, a total net sum of \$200,702,849.11 has been realized by the national government from the sales of lands, fees, etc., as follows:

1787. Sold at New York, 72,974 acres (cash)...	\$117,108.24
1790. Sold at Pittsburgh, 148,446 acres (certificates and land warrants)...	100,427 53
1792. To state of Pennsylvania (certificates of public debt)...	151,640 25
1792. To John Cleves Symmes, 272,540 acres (army warrants)...	189,693.00
1792. To Ohio Co., 892,900 acres (certificates and army warrants)...	642,856.66
Total...	\$1,201,725.68

Total... \$208,059,657.14

From which must be deducted the amounts paid to the states (\$7,356,808.03), making a net total of \$200,702,849.11. The total cost of the public domain, purchases and cessions, surveying and expenses of disposition, extinguishing Indian titles, etc., has been \$302,049,595.96, so that to June 30, 1881, the public domain had cost \$121,346,746.85 more than it had realized. It is estimated that the value of the lands yet to be disposed of is, under existing laws, \$1,159,921,661.

—The land has been in part disposed of as follows:

	Acres
Cash sales, including preemptions, etc., and probably 30,000,000 or more acres accounted for under other acts, and commutation of homesteads...	169,832,364
Donation acts, Florida, Oregon, Washington and New Mexico...	3,084,797
Land bounties, military and naval service...	61,028,430
State selections (act of 1841) for internal improvements...	7,806,334
Salines granted to states...	539,965
Town sites and county seats...	148,916
Railroad land grants patented...	45,650,025
Canal grants...	4,424,073
Military wagon-road grants...	1,301,010
Mineral lands sold since 1868...	148,621
Homesteads (other than commuted)...	55,667,041
Scrip lands...	2,893,011
Coal lands...	10,750
Stone and timber acts, 1878...	20,782
Swamp and overflowed lands to states...	69,206,322
Graduation act, 1854...	25,696,419
Schools, seminaries and agricultural colleges...	78,659,439
Area held under the timber culture act...	9,346,660
Desert land act...	897,160

—AUTHORITIES. *American State Papers*, vols. on Public Lands; Benton's *Abridgment of the Debates of Congress*, and the *Congressional Globe and Record*; the *Reports of the General Land Office*, and later, of the *Secretary of the Interior*; *Works of Hamilton, Webster, Clay, Calhoun and Adams*. The most complete record of legislation respecting public lands is to be found in the *Report of the Land Commission*, Exec. Doc. 47, part 4, H. of R., 46th congress, 3d session. There are also a number of reports on the same subject to be found among the public documents.

## PUBLIC LANDS

PUBLIC LANDS, Office of. This bureau of the interior department at Washington is in charge of an officer styled the commissioner of the general land office, which is his legal title, although he is generally known as commissioner of the public lands. The first official designation of such an office was by act of April 25, 1812, which established it in the department of the treasury; but the duties were greatly enlarged in 1836 (5 Stat. at Large, P. 107), and the commissioner was placed under the immediate direction of the president. The office was placed under the secretary of the interior at the creation of that department in 1849. The duties of the commissioner are to discharge or supervise all executive acts appertaining to the surveying and sale of the public lands of the United States. He is to record and issue all patents for land under the authority of the government, whether on private claims, homestead or timber-culture entry, pre-emption claims, every by land warrants, or congressional grants to states or corporations for education or public improvements. Being thus charged with the care of the entire public domain, the office involves great responsibility and legal knowledge. Besides the commissioner, whose salary is \$4,000, there is a recorder of the general land office, likewise appointed by the president and senate, and three principal clerks (of surveys, of public lands, and on private land claims), besides a secretary to the president to sign land patents under the seal of the office, all of whom are appointed by the president. The general land office employs a total force of 218 clerks, costing \$287,820 in 1882. The commissioner is required to make an annual report to congress, embracing all the statistics of surveys and sales of public lands during the year. These reports make a valuable series of volumes. Extensive maps of the United States, showing the public domain unappropriated, are issued from time to time; also, circulars of information regarding the method of purchase or free entry of any of the public lands, which may be had on application to the commissioner. The commissioner, and all officers and clerks in the general land office, are forbidden by law to purchase or to become interested in the purchase of any of the public lands. All the accounts connected with the public lands are audited in the general land office. The large number of clerks required for the current business of the land office are in the interior department building.

## PUBLIC OPINION

PUBLIC OPINION. The power of public opinion has vastly increased in the civilized world in the last century. Even those who affect to scorn it, can not deny this, and the statesman is compelled to take this new "great power" into consideration. It has become the authority of the uneducated masses as well as the study of philosophers. What, then, is public opinion? Whereon does its power rest? Where are its organs? At what does it aim?

—When a religious impulse takes hold of the masses, as in times of the foundation of new, or the reformation of old, religions, and carries them in a definite direction, we do not call the expression of this common religious sentiment "public opinion"; but we are inclined to characterize the general, though sometimes boisterous, utterance of a popular political desire, as a demand of public opinion. Whence this difference? Public opinion always supposes free judgment, which is possible in political affairs, but unusual in religious emotions. Therefore, without cultivation of the reasoning powers and the capability of judging, there can be no public opinion; it can only thrive in freedom. The ancients knew it well and esteemed it highly. *Vox populi vox Dei.*

—In the middle ages public opinion could make but little progress. Barbarians knew nothing of it, and despotism stifled it. It is neither the opinion of the mighty nor that of a few sages: it is principally the opinion of the great middle classes. In the same proportion as the middle classes give their attention to public affairs and form an opinion on their political interests, the power of public opinion prevails; and the more influential the middle classes become, the more respect public opinion commands. Hence its great significance in the present: for the influence of the middle classes has never been greater in the state than now.

—It is radical exaggeration to declare public opinion infallible, and to ascribe mastery to it as a matter of right. Men with a deep insight into public life and its requirements have never been very numerous, and it is very uncertain whether they can succeed in making their opinion public opinion. The minority of learned men and philosophers seldom agrees with the large majority of the middle classes. The common judgment of the educated classes, even, is almost always superficial. It is impossible for them to know all the particulars and discover all the causes on which the decision of important affairs depends. Public opinion may be disturbed, or may even be artfully misled by the momentary passion of the multitude. A single prominent individual may judge aright where every one about him judges falsely. But, preposterous as such overrating of public opinion may be, the haughty contempt with which many doctrinarians look down upon it, and the vain scorn for it of petty minds, are no less foolish. Even if public opinion is misguided and falls into error, it should not be treated with contempt and sneered at, because it is an intellectual power which has an irresistible influence on the rise and downfall of leading statesmen and on the destiny of nations. It is almost impossible, with the representative constitutions of to-day, that a system opposed to public opinion should long remain dominant. But the value of public opinion has a deeper cause than the external influence it exercises. Do not all political

order and all law, in the last analysis, rest upon the common consciousness of nations? and in this is not the wisdom of the Creator manifest, who has given human nature a moral conscience as well as logical intellectual power, so that it may understandingly and morally discriminate between right and wrong, and decide what is useful or injurious to the public welfare? The public conscience, and particularly public opinion, are chiefly developed in the middle classes, and hence so much importance is to be attached to their judgment, where there is question of the interests of the community, *i.e.*, of the state.—"Public opinion", writes Neibuhr, "is that opinion which arises in minds uncontrolled by personal influence—an influence which might mislead those in power—that opinion which, in spite of the difference in individuals and of the very different conditions or situations in which they are placed, is so unanimously expressed, and not merely repeated by one man after another, that it may be taken as an utterance of universal truth and reason, and even as the voice of God himself". public opinion may be compared to the chorus in ancient tragedy, which, observing the actions and sufferings of the *dramatis personoæ*, gives expression to the emotions and opinions of the common consciousness of all. On the whole, it is equivalent to the verdict of a jury in a case of law.

—Public opinion is formed by innumerable impressions and observations, by deliberations in the various spheres of society. But it is always controlled and determined by the public conscience and the established principles of the nation. It manifests itself in the most varied forms, in free public speech, in the family, in the drawing room and the tavern, in meetings of every kind, and, above all, in the press and the national representations of 'the people. In the latter it becomes even an organic political expression, while otherwise it manifests itself in a more unorganized and changeable manner. It sometimes fluctuates, like life itself, but it is also susceptible of instruction, and often follows the leaders who are competent to communicate ideas to the educated classes and to influence them. Public opinion courts criticism, while it is not unreceptive of enlightenment offered by superior minds. In the same degree that schools and means for the education of the young are provided, the public sense and love of truth and justice increase. Besides, public opinion is subject to the direction of the prevailing spirit of the age, by which it is determined and moved. But, once its judgment has been fixed, determined by the pressure of some general necessity, it becomes a power which crushes all imprudent resistance and which commands attention.

—It is not true, that public opinion *reigns*, since it can neither rule, nor is it desirous of ruling. It leaves the government to those intrusted with it. It is not a creative, but pre-eminently a controlling, power. It is no part of the public authority, but belongs to the national life. Only exceptionally does it change from its passive attitude to an active one, when the course pursued by those administering public affairs is in opposition to it. It is public power, but not a public force.

## PUBLIC POLICY

**PUBLIC POLICY.** This term, in legal acceptance, denotes the principle of government and law which aims at the general welfare, as distinguished from the welfare of particular individuals, and courts of law do not allow their decisions to conflict with this public policy. Our tribunals do not confine their justice to the parties before them. As plaintiff and defendant are represented by counsel, so the people is represented by the court, and it is its duty to protect the interests of the people. A litigant might prove the clearest right to relief, so far as his adversary is concerned, and yet if his right would in any way injure the public, it must be denied. There are three kinds of relief which the court is bound to refuse on public grounds, viz.: first, that which conflicts with positive law, the expressed wish and command of the people, *e.g.*, relief based on a contract to evade the revenue laws by smuggling; second, that which is immoral or *contra bonos mores, i.e.*, which would have an immoral effect on the public, such as a judgment for rent under the lease of a house for disorderly purposes; third, all other relief which can interfere with the public welfare. Each of these three classes of cases may properly be said to be "against public policy", but this expression is usually confined to the last class, and the claims of positive law and public morality are permitted to stand by themselves.

—The third class of cases is somewhat indefinite. The common law always strove to be definite, and sought for exact precedents, Hence a general discretionary power in the court to declare that a contract or will is void as against public policy, would seem to be repugnant to the established rules of law. Such a power has, however, been held to exist, and, as might have been expected, it gained currency in an anomalous way. The general principle, that a condition in a contract which is "against the general good" can not be enforced, was recognized in England at a very early date in Sheppard's "Touchstone". Bracton hints at it (book iii., p. 100), and lord Coke seems to regard as void those conditions which are "repugnant to the state". Still, the law on the subject was not developed and formulated until a much later day, when it became closely associated and even identified with the law of wagers. The English judges had by some mischance decided that wagers could be enforced at law, although in other civilized countries the contrary rule prevailed. They discovered afterward how pernicious the effects of betting were, and how much of the time of the courts was wasted in determining trivial questions, but it was too late to retract. They could not then hold all wagers illegal, but they found some relief in the doctrine of public policy. Whenever they could, they decided that particular wagers were invalid, as against public policy, and they displayed considerable ingenuity in extending the number of such cases. Thus, a wager on the sex of a third person was held void, as it tended to call forth indecent evidence, although such evidence would not be considered an objection in any other case. A bet upon an election was not enforced, as it might have influenced votes, and the public is interested in removing such influence from the polls. In short, any wager upon public matters would have been held bad, because it would have created a dangerous interest in public affairs. So in *Gilbert vs. Sykes*, 16 East, 150, (1812), it appeared that in 1802 Sir Marks Sykes received a hundred guineas from one Gilbert, promising in return to pay Gilbert a guinea a day

until the death of Napoleon Bonaparte, who was then first consul. The wager arose out of a conversation upon the probability of his assassination. Lord Ellenborough, the chief justice, said, "Whenever the tolerating of any species of contract has a tendency to produce a public mischief or inconvenience, such a contract has been held to be void." The court decided that this contract was illegal, as it would naturally create a desire to assassinate a public enemy, contrary to the law of nations. In the case of *Eltham vs. Kingsman*, 1 Barn. 8 Ald., 683, (1818), the rule was carried to an extreme, although the court disposed of the issue on another point. One proprietor of livery carriages at Cheltenham bet watches with another proprietor that a certain Col. Longford would go to the assembly in his "fly by night" (a vehicle) and no other. The court held that the wager was void, because it would tend to subject Longford to great inconvenience by exposing him to the importunities of the proprietors of these vehicles, one of the judges remarking that "any person who has walked through Piccadilly must be sensible that this is no small inconvenience." Finally, those wagers were held bad, 1, which tended to create an improper bias in the mind of a person with relation to some public duty (as in the election case above mentioned), or, 2, which had a tendency to injure third persons or the public. Such wagers were regarded as "against public policy."

—Meanwhile the doctrine of public policy spread through all branches of the law. The courts, after introducing the principle into the law of wagers, soon found that it was applicable to many other subjects of litigation. It has now been definitely settled that any contract or will may be declared void as against public policy, if it be calculated to injure either, 1, the government in its foreign relations, or 2, the government in its domestic relations and the administration of justice, or 3, the public generally by restraining the freedom of individuals. Under the *first* head, viz., of contracts, etc., injurious to the government in its foreign relations, are included those which benefit an enemy or affront a friendly state. Consequently it is held that "as the presumed object of war is as much to cripple the enemy's commerce as to capture his property, a declaration of war imports a prohibition of commercial intercourse and correspondence with the inhabitants of the enemy's country, and that such intercourse is illegal," (*Esposito vs. Bowden*, 7 Ellis 8 Blackb., 763, 779); and a contract between citizens of two countries is annulled by a subsequent war, as it is against public policy to enforce it. "On the principles of the English law, it is not competent to any subject to enter into a contract to do anything which may be detrimental to the interests of his own country." (*Furtado vs. Rogers*, 3 B. 8 P., 191, 198.) The *second* division, viz., of contracts, etc., injurious to the government in its domestic relations and the administration of justice, embraces all agreements contemplating the bribery of public officers, executive, legislative or judicial, or of any person having some public duty to perform, such as voting. The leading English case on the doctrine of public policy is *Egerton vs. Earl Brounlow*, 4 House of Lords Cases, 1, and it has reference to corrupt influence of this kind. The earl of Bridgewater died leaving a will, in which he left a very large estate to a certain legatee on condition that he should obtain the title of duke or marquis of Bridgewater. The house of lords held the condition invalid, as it held out a temptation to the legatee to indulge in bribery in endeavoring to obtain the title. In short, contracts creating an interest at variance with a duty are void. The sale of offices is also against public policy. So is the assignment of salary, not yet due, by a public officer. It is for the interest of the public that he should be able to support

himself while he is in office. and he can not place his future salary out of his power. Again, it is illegal to compound a felony or misdemeanor, viz., to refrain from its prosecution for any consideration. This is against public policy, because it frustrates justice; and, for the same reason, maintenance and champerty, *i.e.*, the impertinent encouragement and assistance of litigation by persons who are not interested, vitiates contracts. Agreements not to bid at judicial sales are void, and, indeed, all auction sales are carefully scrutinized to prevent frauds upon the public. Under the *third* class, viz., of contracts, etc., which are injurious to the public generally, as restraining the freedom of individuals, the most important are contracts made in restraint of trade. A man can not bind himself not to carry on his business. The people at large are interested that he should earn a living for himself and his family, and not become a pauper, and that there should be the freest competition in all trades and professions. The enforcement of contracts, taking away the right of men to pursue their callings, would discourage industry, diminish products, prevent competition, enhance prices, and introduce monopoly. A man may bind himself not to trade within certain limits; *e.g.*, a retiring partner may agree with his copartners not to compete with his firm in a certain town, the seller of a business with the buyer, or a servant with a master who undertakes to teach him the secrets of his art; but these are manifestly wise exceptions, based on peculiar grounds. A father can not abdicate his parental rights. It is the interest of the public that paternal authority should be upheld. An agreement not to marry can not be enforced; nor can an agreement not to marry any one except a certain person: nor a "marriage-brocage contract"; viz., a promise to pay a person a sum of money if he can induce a certain person to marry the promisor. All these contracts interfere with freedom of choice in marriage, and imperil the happiness of that domestic system in which the people has everything at stake. An agreement to use influence with a testator is also against public policy.

—But it is needless to multiply instances. The main point to be remembered is, that the court always protects the interests of the people. Enough examples have been cited to show the nature of that protection in England and America. Our judges are always ready to annul engagements which are "against public policy," but it is probable that the principle will never be extended much further, for, as has been ably said, it is paramount public policy to allow freedom in making contracts, and to enforce them as made. (19 Equity, 462.)

—See *Pollock on Contracts*, 251 et seq.; 1 Story's *Equity Jurisprudence*, § 259, note 1; Hubbard, J., in *Sedgwick vs. Stanton*, 14 *New York Reports*, 289, 291.

## Q

### QUARANTINE

QUARANTINE. *Theory of Quarantine.* Quarantine is a regulation based upon the law of self-preservation, by which persons and things coming from an infected region or place are subjected to a period of detention. Quarantine is either maritime quarantine, or land quarantine (*cordon sanitaire*); the former applicable to water craft, and the latter to all vehicles of transportation on shore or to pedestrians. It is now based upon the principle that all contagious diseases have their origin in a specific, particulate germ or poison, which is capable of being conveyed from place to place. Belief in this theory of contagion is nearly universal, yet the doctrine of the prevention of epidemic diseases by means of quarantine is differently viewed by different nations. Thus, England, for example, by reason of her insular situation, and the length of time required to reach her ports from infected regions, has not heretofore found it necessary to exact the long detention required by most other countries, and the medical profession are divided there, as elsewhere, upon the question whether cleanliness and sanitary measures alone will serve to prevent the introduction of contagious diseases, and their spread from place to place; some holding that if the ports were always perfectly clean and in good hygienic condition, there would then be no need of quarantine; that a clean ship sailing to and from a clean port could in no case communicate the contagion; a proposition which is self-apparent. But every-day experience teaches us that the millennial period has not yet arrived, when all cities and common carriers are clean. Therefore, until hygiene shall become understood by people of all nations, quarantines in one form or another are necessary, according to the physical characteristics of the port, and the presence or absence of epidemic disease.

—The period of detention at a quarantine was formerly, as the name implies, forty days; the time has now been reduced at most quarantines, and, during the absence of epidemics, a simple inspection is all that is practiced or required. But the period of detention varies according to the period of incubation of the disease quarantined against, and the time is usually counted from the date of departure from the last port, or the date of termination of the last case of sickness on board.

—*Practice of quarantine.* A quarantine station usually consists of a hospital for the sick (*lazaretto*), so named from the isolation of St. Lazarus on account of leprosy (*mal de Saint Lazare*); a boat, usually a steam vessel, to carry the boarding officer and remove the sick, if there be any found on board vessels, coming into port; and quarters for the attendants. On arrival of a vessel at the quarantine, she is boarded by an inspecting officer, her bill of health is examined, the crew and passengers mustered, and the vessel itself inspected in every part to determine whether it be clean or foul. At this day the bill of health is not accepted as *prima facie* evidence of the sanitary condition of the vessel, but is only corroborative; even if it be stated thereon that the port from which the vessel last sailed was free from infectious disease, the

inspector trusts to his own inspection of the vessel, and examination of the persons on board and the cargo, to determine whether or not the vessel should be detained in quarantine. If, however, the vessel is last from an infected port, and the period of incubation of the disease has not elapsed, the vessel is detained in quarantine until the expiration of that time, whether there be sickness on board or not. If there be found contagious sickness, the sick are removed to the hospital, the bedding and other articles in their state rooms or berths removed and destroyed, and the place thoroughly fumigated with the fumes of burning sulphur. In case the vessel is discovered to be foul and in an unsanitary condition, whether there is sickness on board or not, the vessel is detained in quarantine for the purpose of cleansing and fumigation, the cargo removed to a warehouse, or to open lighters, the bilge water pumped out, and all parts of the vessel fumigated, and if necessary, painted.

—*Land Quarantine (cordon sanitaire)*. A land quarantine consists in stationing a guard around an infected place to prevent the escape of inhabitants until after suitable detention; and as well to prevent the ingress of unacclimated persons likely to furnish fresh material for the disease. Its success depends entirely upon the vigor and inflexibility with which it is maintained, and failure has always followed laxity of administration. In Russia, in 1879, with other measures, the *cordon sanitaire* was successfully used to prevent the spread of oriental plague; and in Texas, in the United States, the cordon was successfully maintained against yellow fever in 1882 under the direction of the surgeon general of the marine hospital service; and in the same year by the naval authorities at the Pensacola navy yard, to prevent the introduction of the disease from the then infected city of Pensacola, and while this is being written (September, 1883), an epidemic of yellow fever has been prevailing on the naval reservation for upwards of forty days, which has been prevented from spreading from the yard by reason of a *cordon sanitaire* maintained around it.

—*Laws of Quarantine*. The first quarantine regulation in modern times originated with viscount Bernabo of Reggio, in Italy, Jan. 17, 1374. In 1448 the first systematic laws of quarantine were enacted by the Venetian senate, Venice being at the time the greatest commercial seaport in the world. The present English quarantine law is based upon the act of 6 Geo. IV., c. 78, under which act orders in council have been adopted from time to time, promulgating regulations necessary to be observed to meet particular exigencies. The passengers act, 1855 (18 and 19 Vict., c. 119), and the public health act (schedule v., part iii.), contain provisions affecting vessels subject to quarantine. In the United States, quarantine enactments were passed by the colonial legislatures, and since that time, until a very recent period, quarantine laws have been enacted by the several states. The United States passed its first act respecting quarantine, Feb. 23, 1799, which was subsequently codified in the Revised Statutes, sections 4792 to 4800, inclusive. This act was supplemental to the state quarantine laws, and required federal officers to aid and assist in the execution of state or municipal quarantine regulations. April 29, 1878, a national quarantine act was passed, authorizing, in certain contingencies, the establishment of national quarantines, and vesting the execution of the law in the surgeon general of the marine hospital service. The portion of the act directing its execution by this officer was repealed by the act of June 2, 1879, which itself expired by limitation June 2, 1883; and although the body of the act of 1878 is still upon the statute books, no one is

charged with its execution. The appropriation act of March 3, 1883, authorizing an expenditure of \$100,000, to be used in case of threatened or actual epidemic, and for maintaining quarantine at points of danger, conferred upon the president of the United States authority to maintain quarantine. In accordance with the discretionary act named, national maritime quarantines have been maintained on the gulf of Mexico, the south Atlantic coast, and the Chesapeake bay. The expenses of state quarantines have heretofore been maintained by a charge upon the vessel, but a recent decision by the civil district court of Louisiana, F. A. Monroe, judge, holds that such fees are in the nature of a tonnage tax, a tax which the constitution has forbidden states from levying, and that, while the state has power to establish quarantine for the protection of her citizens, she has no constitutional right to collect this fee from vessels engaged in commerce. (Morgan's Louisiana & Texas Railroad & Steamship Co. vs. Board of Health of the State of Louisiana.) If therefore, this decision be sustained by the higher courts, it would appear to be necessary for the government to prevent extortionate fees upon shipping, by taking charge of the maritime or external quarantine for economic reasons; but no such constitutional power has been claimed by any administration, or held by any court, in regard to municipal health regulations.

JOHN B. HAMILTON.

[\[Back to Table of Contents\]](#)

## QUIDS

QUIDS (IN U. S. HISTORY), the name applied to the Randolph faction, in 1805-11. The quarrel in which it originated was really only a Virginia difficulty, a contest as to which of the two Virginia aspirants should be the successor of Jefferson. The politicians of that state had been in open antagonism to Washington, had yielded grudgingly to the overwhelming national strength of Jefferson, and many of them were disposed to nominate Monroe for the presidency in 1808, in order at one blow to satisfy their dislike to Jefferson and to Madison, who was Jefferson's choice for the succession. The ostensible opposition to Madison was grounded on the latter's incapacity, his cowardice, his political heresies in the "Federalist," (see that title), and his general lack of energy. The first breach in the dominant party occurred on the reference of the president's message in December, 1805. That part which related to the unfriendly actions of Spain in Florida was referred in the house to Randolph's committee, as he had been the administration leader, and he reported in flat opposition to the president's views. March 5, 1806, he formally declared war upon the administration as governing congress by "back-stairs influence," by "men who bring messages to this house which govern its decisions, although they do not appear on the journals," and by "the pages of the presidential water-closet." From that time the name "quid," meaning either a *tertium quid*, as distinguished from the two great parties, or a cast-out faction, was given to Randolph and a half-dozen supporters in congress. They opposed the restrictive system (see EMBARGO) and Madison's nomination in 1808 (see CAUCUS, CONGRESSIONAL), and nominated Monroe through a caucus of part of the Virginia legislature. Monroe's entrance into Madison's cabinet, April 2, 1811, ended the existence of the faction.

## R

### RACES OF MANKIND

RACES OF MANKIND. Formerly an article on races would with difficulty have found place in a political encyclopædia, for men had not then come to consider this question as anything more than one of anthropology and natural history, and did not imagine that the differences which they noticed in the different tribes of the great human family could possess as much interest for the historian and the moralist as for the naturalist or the physiologist. It is only in our own day that general ethnology has become an important branch of the historical sciences, and that men have conceived the idea of seeking, in the physical origin of peoples, for the secret of their destinies and an explanation of the results which they have accomplished, or in which they have participated. Until very recently, historians acknowledged in the history of humanity but one sole physical influence, that of climate, and, as is well known, it is to this incontestable influence alone, that Montesquieu attributed the differences of character which are found among peoples, and, as a consequence, the differences of the laws and institutions that govern them. This notion of climate, formerly so important, is to-day reckoned among the secondary causes, and plays only a secondary part, in the explanation of historical phenomena. The theory of races has taken its place completely. There are those who take alarm at this, and pretend that we have merely exchanged one materialistic theory for another more materialistic still; but such alarm is ill-founded, and true spiritualism, on the contrary, achieved an undeniable victory the day that the theory of races replaced that of the influence of climate in historical science; for it then ceased seeking in the external influences of matter alone for the secret of human destiny, and applied itself to the study of man himself for the explanation of man's moral and political life. Fatality, it is true, ever rules in the theory of races as in the theory of climate, but this fatality has at least the merit of being so intimately united to the being which it governs, that it is mingled with the very fact of his existence, and for man to rebel against it would be as if he were to rebel against himself.

—This notion of races is, moreover, moral, and, so to speak, spiritual, in its origin. In fact, it was not the progress of the natural sciences and of physiology that led the philosophers and historians of our time to adopt this theory, which holds that every tribe of the great human family carries within itself its own destiny, but rather the progress of the science of philology. From the modern science of comparative philology is drawn, among other general results, this important conclusion, that all the nations that speak languages which can be traced back to a common source, exhibit analogous faculties and aptitudes, and that, with some shades of difference, they have had the same historical development. It is not, therefore, merely physical characteristics, a yellow, black or white skin, smooth or woolly hair, oblique or horizontal eyes, that constitute race: it is language as well. Now, what is language if it be not the expression of the inner man, the instrument of the moral man? It is therefore the mind, which is thus reached through the medium of language, as well as

the physical conformation of the body, that determines race. In fact, how can we understand that nations having the same physical characteristics should manifest such unequal abilities and such dissimilar instincts, and should follow such contrary ideals of civilization, if, despite their external points of resemblance, their minds were not radically different? The flesh relationship, which seemed so conclusive, was, after all, but superficial. This is especially true of the white or Caucasian race, which philologists have been obliged to divide into two great families: the Indo-Germanic and the Semitic races. Thus this historical theory of races, which has been subjected to so many accusations of materialism, has resulted from the most profound meditation upon language, the noblest of man's attributes. We have just seen, however, that it sought its principle and starting point far beyond physical man, in invisible and moral man.

—Mankind is divided, physically, into three great races, entirely distinct in appearance, color, and even in anatomical structure: the black or Ethiopian race, the yellow or Mongolian race, and the white or Caucasian race. These are the only three pure and simple types of man. All the other races, the red race, the Malayan-Polynesian races, etc., are but varieties and mixtures of these three primitive races. The particular characteristics that distinguish each of these three types are so marked that many of the learned have considered them, not as different modes, so to speak, of the same human type, but as three distinct types, as three patterns of the human form. Here naturally arises the great question of the unity of the human species. Is there but one, or are there several types of humanity? We shall not presume to analyze this question, which belongs more especially to naturalists and physiologists, but we do not hesitate to declare our belief in the unity of the species. The opinion which admits several human types seems at first sight to render a more rational account of the existence of the different races, than the opinion which admits only one; but even after a superficial examination, we perceive that, if it is difficult to explain how the different human races sprung from the same primitive source, it is still more difficult to explain the existence of three primitive types; in other words, it is easier to admit that nature performed her work after one pattern, which she modified according to climate and time, than to admit that she followed three different patterns. In fact, in order to establish the theory which recognizes several human types, we would have to admit that these types are rigorously immutable, that they were settled once and forever at the time of their origin, that they are permanent and essential, that they existed before all mixture of them, and that they will resist all such mixture. But the physics of life and nature do not recognize the scientific rigor and exclusive precision of physics of learned men. Nature is not angular; it waves and floats; and the limits of its provinces are singularly uncertain and difficult to determine. To be sure, it is very easy to distinguish the black race and the yellow race from the white race; but where does the black race end? Where does the yellow race end? These races, so clearly marked, melt at their extremes into, and are confounded with, our own, spite of the fact that they seem so entirely distinct from it. The Berber, the Abyssinian and the Nubian differ from the white race only in the color of their skin; men hesitate to rank them with the black race by the same title as the Kafirs, or the negroes of Congo. The Turks are unquestionably of Mongolian origin; must we, however, continue to class them as belonging to the yellow race, or grant them the right to be numbered among Caucasians?

—Whatever may be the solution of this difficult and perhaps insoluble question of the unity of the human species, this one thing is incontestably true, viz., that history proves the coexistence of these three races upon the earth from the earliest period, and that the oldest legends show them to us contending with one another in that part of the Asiatic continent which is regarded as the cradle of the human race. The primitive population of India, that impure and bestial people which was conquered by the noble race of the Aryas, our ancestors, was of the black race, and very probably of the same blood as the natives of Australia; and the land of Turan, the land of darkness and evil spirits, which the Persian legends oppose to Iran, or the land of light, was occupied by peoples of the Mongolian race. But the three races which we thus see in juxtaposition, so to speak, in the infancy of the world, have singularly separated each from the other, although they have frequently and in numerous cases intermingled, and thus given birth to new peoples. Each of these three races inhabits more especially some one continent, which may be considered as its legitimate country. Africa belongs to the black race; Asia, with the exception of Hindostan, of Persia, Arabia and Armenia, to the Mongolian race; and Europe, entirely to the Caucasian. Each of these continents seems so especially intended for the race which inhabits it, that the other races could not retain their purity in it. Thus, the Africans of the north have received the impress of the black race; the Caucasian peoples of Asia have undergone a greater or less admixture of Mongolian or Finnish blood; and the Caucasian race dissolved and appropriated the foreign races which established themselves upon its own continent, the Hungarians, the Turks, etc.

—But if history shows us the three great human races coexisting from the earliest antiquity, it is far from assigning them the same rank and attributing to them the same importance. All three are possessed of aptitudes for civilization, but these aptitudes, which are rudimentary and purely instinctive in the negro, and strong, but narrow and restricted, in the Mongolian, have an almost infinite power of expansion in the Caucasian. To speak correctly, history belongs to the white race, and to no other. Civilization is its true work, and all the societies, political or other, formed by the men of the other races, are but imperfect, gross or repulsive figures of those which had their origin in the white race. It is through the Caucasian race that man has taken possession of the earth; it is through it that he has broken and every day breaks the net-work of external fatalities with which nature surrounded him. All the different religions of mankind sprung up under the pressure of the force of sympathy of that race; all the literatures of the world were produced by the glow of its imagination; its power of invention seems inexhaustible, and its fertility of combination infinite. Only its labor has been blessed, for only its labor has been truly fruitful. When we take a rapid glance at all that has been accomplished by our race, we experience a feeling similar to that experienced by the traveler, who, from a mountain height, sees spread before his eyes cultivated fields and rich cities, and we feel ourselves taken hold of by veneration and respect.

—We do not experience entirely the same feeling when we survey the aggregate of the works of the Mongolian race. As far as the eye can reach, we behold only immense steppes, cut here and there by gigantic swarms of human beings. We no longer feel veneration and respect, but wonder, fear, and, to some extent, contempt. We feel as though we were in the presence of an enemy, and we fear to see these

swarms scattered, broken and fall upon the rich fields which we contemplated awhile before. The Mongolian race is the great obstacle that opposes the development of real civilization. When we endeavor to discover what benefits it has conferred upon humanity, we are filled with dismay at the conviction we must come to, that it has conferred none, unless it be that it has afforded an asylum to Buddhism, when the latter was driven from India, and that it developed Buddhism within its boundaries. It developed it, but it did not create it. A truly atheistical race, devoid of all noble instincts, it was necessary for a man of the Aryan race to give it the only religion suited to its instincts, and to teach it the only truly efficacious consolation in the miseries of this life, toward which its avaricious, acrid and strong mind is incessantly turned. The part played in history by the Mongolian race has ever been merely accidental, and has always been fatal. The Mongolians have figured as conquerors and devastators, and in this quality have caused some of the greatest movements recorded in the annals of mankind. Their aptitude for civilization is real, but singularly narrow and limited. The Mongolian race believes only in force, and the sabre driven into the ground, which the hordes of Attila adored, is its real god. The most perfect, most moral and most peaceful of the political communities it has produced, the Chinese nation, forms no exception to this general rule, much as it may be believed that it does worship anything but force; it has no idea of the value of human life, of the true dignity of man, or of real law. This innate belief in force, however, gives to the peoples of the Mongolian race eminent political capacity, which renders them singularly formidable, the capacity for domination. Wherever they pass, life dries up and becomes extinct, it is true, but they establish themselves in such places, and last. The societies which they form, though old and decrepit, still maintain themselves with a strength of resistance that is truly extraordinary: but if their civilization lasts a long time, it also attains its limit very rapidly, and never renews itself. The old age of Mongolian states is infinitely longer than their youth or maturity. Their force soon reaches the limit of its expansion, and soon finds its point of equilibrium and rest, which is immobility. This is a perfect résumé of the history of the Mongolian races. They overflow like a furious torrent; but, this moment of destructive expansion once passed, they enter again into the repose of stagnation, and maintain themselves by the bare volume and weight of their population.

—The black race ranks last in the scale of races. This unfortunate race shows us man approaching almost to the brute species. Down to the present time the negro race has produced nothing, has done nothing, for humanity, either for good or evil. So far as any political society is concerned, it is made up of a collection of hostile tribes perpetually warring with one another; its religion consists of ridiculous, infamous or bloody fetichism; and when we have said this, we have told the history of the black race. It is only in our own times that a moral ray has begun to enlighten this African continent, in consequence of the expansion of the Caucasian race on the one hand, and, on the other, of the spread of Islamism, which, though stagnant everywhere else, has cast itself upon Africa, which it is about to civilize by means of the sword and the Koran. The bestial appearance of the negro, his instincts, at once childish and fierce, his ridiculous vanity and superstitious credulity, his virtues, which may be compared to those of the dog and his vices, which resemble only those of the feline species, have at all times excited the horror of the other human races, which have refused almost to allow him the name of man, and which have made the abhorrence which

they feel toward him a reason for denying him all justice, and for pitilessly compelling him to serve the ends of their cupidity. Slavery seemed the natural condition of this miserable race, and servitude the only means of bringing them under the influence of civilization. The negro is not, however, without an aptitude for civilization; but this aptitude seems to be limited to only one faculty, extreme sociability. Bestial or not, the negro, if he is not, as many pretend, capable of great culture, is, however, capable of tenderness, love and devotion; if it is difficult to develop his mind, it is very easy, on the other hand, to develop his heart. His sensibility leaves nothing to be desired, and even surpasses that of the other races. If he is not the white man's equal, he can live with him: he has nothing of the haughty and taciturn manner of those savage races that fly before the face of civilization and pine a way solitary and silent in the society of men of the white race. Far from perishing, he, on the contrary, flourishes in the bosom of Caucasian civilization. This sociability of the negro is a very great moral fact, which pleads loudly in favor of his race, and refutes the opinion which holds that he is incapable of civilization. Whether he is inferior to the other races or not, it is evident that he accommodates himself perfectly to civilization, and finds in it nothing hostile to his instincts.

—The other human races, the red race (the North American Indians), the Malay-Polynesian race, the boreal race (Finlanders, Laplanders, Esquimaux, etc.), may be considered as mixtures of the three great races, or as degenerations of the three primitive types. These races have in general shown themselves singularly barren in a moral sense. They live in the savage state or in an extremely rude state of society; the Mexicans and Peruvians, however, reached a very advanced state of civilization, and different peoples of Finnish and boreal origin have mingled in the civilization of Europe, and become thoroughly amalgamated with it. The boreal race possesses a peculiar characteristic: it is a sort of physiological cross-road, and the peoples that compose it serve as a passage from one race to another. On the one hand, it is related to the Caucasian race, and on the other, to the red race of America; and it reminds us, by the traits of most of the tribes which compose it, of the Mongolian race, of which it is probably a degeneration.

—The Caucasian or white race is divided into two great branches: the Semitic race, and the Indo-European or Japhetic race. All the civilization of modern humanity has come from these two races; to the Semitic race we owe our religious and moral life, our life of conscience; to the Japhetic race we owe our intellectual, political and social life.

—The Semitic race, which is now singularly reduced in numbers, disseminated and mixed by the dispersion of the Jews over the whole surface of the globe, and by the extension of the conquests of Islamism, comprised, in olden times, the Hebrews, the Arabs, the Phœnicians; and the numerous tribes which the Bible mentions as perpetually warring against their neighbors the Israelites, such as the Canaanites, the Amalekites, etc. Despite the exclusive spirit of this race, which endeavored, more than any other, to preserve its purity, and which always considered the nation as the family enlarged, it did not escape the happy fatality of crossing and admixture, and even from the very earliest antiquity, it seems to have received a very strong infusion of Hamitic blood. The tribes of Canaan were but a mixed race, half Hamitic, half

Semitic, and the Hamitic element manifests itself in an unmistakable manner in the civilization of Phœnicia. The Semitic element is also met with, in proportions which it is rather difficult to state exactly, in those first mighty attempts at civilization which ancient history presents to us under the names of Babylon and Nineveh. The Egyptians themselves were also, in all probability, but a mixture of Semitic and Hamitic peoples, and their civilization, which, even to this day, excites our wonder and admiration, was the result of the combined genius of these two great races. No matter what may be said of these admixtures, the true Shemite would not have recognized them, and would not recognize them to-day. For him, the true race of Shem was to be found in Israel, and he admitted but one brother, Ishmael, and even branded that one as a bastard. The Jews and Arabs, therefore, to-day, compose the entire Semitic family; the ancient spirit of exclusion and the ancient prejudice have triumphed, for the fatality of history has brought about the successive disappearance of all these civilizations and all these peoples which the descendants of the patriarchs rejected as impure and tainted with idolatry.

—The moral life of the Semitic race has been at once the most exalted and the simplest known to man. Born under a tent, reared in the desert, and grown up in the habits of nomadic life, it has ever ignored the complicated methods of life of other races. It knows but one sentiment, religious sentiment; but one life, the life of conscience. This simplicity of soul has engendered an extraordinary social simplicity: the ties which bind men to one another among the Semitic races are at once the closest and the freest which the mind can conceive. The Shemite does not know the meaning of the *political state*, he has no idea of a civil power distinct from the religious power, of a society distinct from the family, of rights and duties proceeding from any other source than God. Man has no master above him but God, and on earth he owes obedience only to those to whom he owes his life, and who are subject to the same master as himself. Religion, therefore, is everything in this Semitic society; the fatherland is the temple, the nation is the family, the king is God, the law which punishes crime is the same as that which admonishes the conscience. Theocracy is the natural form of government of such a race; and this it has never abandoned either in the most brilliant or the most perilous moments of its history. The same genius everywhere attends the Shemite, whether he be nomadic or sedentary; whether he live under a tent or in a city, whether he be a shepherd or conqueror, whether he lead a patriarchal life or be the founder of empires. The Hebrew monarchy never was a monarchy after the oriental fashion, and the kings of Israel endeavored in vain to prevail over the power of Jehovah, the ancient master of their people. The Arabian conquest and the establishment of the societies introduced by Islamism wrought no change in the simplicity of the Semitic intellect, and failed to teach it to distinguish between political power and religious power, between the citizen and the believer. The caliphate was the grand expression of this genius, powerless to conceive the idea of a state under any but a theocratic form.

—This synthetic genius of a single shoot, this inability to divide man, enabled the Semitic race to conceive and preserve their religion free from all alteration, which religion became that of the human race. All the feelings of the Semitic race concentrating into one, that one acquired extraordinary depth, elevation and power. The men of the Semitic race not serving two masters, God took entire possession of

them, and while the sojourn in the desert separated them from the brilliant, voluptuous or terrible visions of nature, the vision of their sovereign master was revealed to them in all his majesty and all his grandeur. The Shemite, therefore, was able, for all these reasons, to conceive God as an infinite and all-powerful Being, immutable and eternal, one and perfect, as a pure spirit, master of the world, with which he has no affinity of nature or of substance. This idea, which some of our modern metaphysicians may even consider narrow and arid but which astonishes us by its moral elevation and its abstract grandeur and purity, when we contrast it with the imaginative conceptions and the coarse and deformed symbols of other peoples, impressed the Semitic tribes themselves, just as it has impressed the rest of the Caucasian race, which has finally adopted it as the basis of its faith, and inspired the Shemites with a pride which has always manifested itself in the exclusion of other races, and in a contempt for other religions. They exerted their every power to preserve their religion pure from all idolatry, and they found powerful auxiliaries for the accomplishment of this task in the simplicity of their social state and in their proximity to the desert.

—Nearly all the nations of modern Europe belong to the Japhetic or Indo-Germanic races. This name of Indo-Germanic has been given them by comparative philology, which has established the relationship of nearly all the European nations by the analogy of their different languages with the sacred language of India, the Sanscrit. This analogy once established, the consequence was easily drawn; since the Sanscrit was the common source of the languages of the different peoples of Europe, these peoples must evidently have sprung from a common source, and are all but branches of the race whose language the Sanscrit was. What was this race? and what country did it first inhabit? The most recent researches in ethnology and philology have established the fact that this part of the great Caucasian family from which the Indo-Germanic races have sprung, inhabited that part of Asia which extends from the Caucasus to Bactriana, and was divided into two great tribes, the Aryans and the Iranians. The Aryans are the source of the superior classes of Hindostan, which country they conquered; the Iranians have continued even to the present time almost without admixture in Persia, of which country they still form the chief population. Everything that is of any capital importance to us, in the civilizations of the ancient east, everything that interests our imagination in the history of Asia, everything of oriental origin that has contributed, either directly or indirectly, to our modern life, comes to us from these ancestors of our race. The aristocratic system of caste, Brahmanism, and later on, Buddhism, are the work of men of the Aryan race; the vast undertaking of the military and administrative monarchy of ancient Persia, and the religion of the two principles, are the work of men of the Iranian race.

—The Japhetic race, the most enterprising, the most movable and the most inventive of all the races, seems to have early felt the love of enterprise and adventure. If we would present, under a brief and poetic form, what our imagination perceives confusedly in these remote ages, we must take as symbols of the genius of our ancestors, two characters in the great tragedy of Æschylus, who knew some of the secrets of some of the origins of our race, Prometheus and Io, two victims of ambition, adventure and enterprise. Prometheus admirably symbolizes the boldness of invention of the Japhetic race; and the wild course of Io, goaded by the breeze-fly,

their longing for emigration and travel; and, if the word be not too mean to use in speaking on such a subject, I would freely add, the mania for change of place which seems to have possessed our barbarous ancestors. The same love of conquest which urged on the Aryans in India, impelled, at different times, other tribes of the Japhetic race into Europe, and many successive emigrations, the dates of which are uncertain, landed them upon that continent, until at length they gained entire possession of it. The actual descendants of the peoples who effected these old migrations are divided into innumerable families, but they may be all ranked under five principal heads: the Celtic race, the Germanic race, the Slavic race, the Latin race, and the Greek race.

—None of these races is to-day free from admixture, and in some of them the primitive type and genius of the race have almost entirely disappeared before the frequency and violence of crossings with other races. Thus, the Latin race, the stock from which the Italian nation of to-day has come, has been singularly changed for the worse by the admixture of Greek, German, Ligurian and Gallic blood which it underwent in the course of its long history; in France the Celtic blood has been intermingled with Roman and German blood; in Spain the Iberian, with Gothic and Moorish blood, the Germanic tribes, especially in the extreme limits of the vast country which they inhabit, have received a strong infusion of Slavic blood; and the Slaves, subject to an influx of German and Greek blood, mingled with Mongolian and Ougro-Finnish, can scarcely be said to be any purer than the others, although they are the latest comers among the civilized nations, and their primitive type should, in consequence, be less worn out than that of their sister races, by the fatigues of history and the labor of centuries.

—The oldest in the civilization of the races of Europe, is the Greek or Ionian race, the sons of Javan (Ionians), as the Bible calls them, a race which succeeded, on Hellenic soil, to a race called Pelasgic. Next after the Semitic race, this race has rendered the greatest services to civilization. If humanity owes all its religious development to the Semitic race, it owes all its intellectual development to the Greek race. It truly deserves the name of the chosen race among the Japhetic nations, as did the Jewish people among the descendants of Shem. They are the true sons of Io and Prometheus, and when we see the mighty gifts which their imperishable works still present to our admiration, we are almost inclined to believe that their emigration carried off the cream of the entire youth of the great Japhetic family. It is to them we owe that religion of polytheism, that brilliant invention of poetic and graceful minds, which subdued and humanized the old natural religions, and which, by confounding the mysterious forces of the world with human force, produced that conception of the poetic *ideal* which has since become the true religion of all poets; for this conception holds the same place in literature that the dream of moral perfection does in religion. It was the Greek race that transformed the barbarous industries of primitive times, and developed the fine arts out of the useful trades, just as it had developed the literary ideal from the religion of nature. In all intellectual matters we reap to-day the benefits of Greek civilization; we are indebted to it for our knowledge of the rules of architecture and sculpture; we have received from it our philosophy; and half the literature of modern Europe is but an offshoot of the literature of Greece. Finally, when Christianity appeared in the world, it was Greece that undertook to form its dogmas for it, to construct its metaphysics, and to define its mysteries. Christianity

owes the speculative part of its character to the Greek race, as it owes its political organization to the Roman race. It was the Greek race also that instilled civilization into the barbaric races, against which it defended the Byzantine empire during a thousand years, so that the civilization of the future, as well as that of the past, belongs to Greece; for the Slaves, who threaten Europe with a renewal or making over again, represent the Byzantine civilization, and consequently the Greek mind. Crushed by three centuries of oppression, invaded by barbarism which has incessantly flowed in upon it for fifteen centuries, marred by admixtures of Slavic and Turkish blood, the Greek race of to-day is not what it was; nevertheless, we still recognize in the modern Greeks the traits of the ancient type, and the qualities of the ancient genius of the race, just as we recognize the beauty of a statue, despite the mutilations which it has received, and the distinctness of a likeness, spite of the rust which covers it.

—The Latins, who are the source from which the Italian people sprang, present a most marked contrast to the Greek race, a contrast which must have been peculiarly striking in the beginning, and which is attested by the differences of the civilizations of the Greeks and the Romans. As the Greek race is lively, pliable, made for labor and intelligence, so the Latin race is strong, serious, heavy, made for conquest domination and practical interests. If the Greek race has the appearance of being made up of the youth of the Japhetic race, the Latin race has the appearance of being composed of an emigration of sedate men, who had reached the age of serious interests, and know no other sentiment than ambition, half sacerdotal and half warlike. This twofold character is found in the origin of the Latin race; through Etruria it is sacerdotal, through Rome it is warlike; but neither religion nor glory is its end; with it everything speedily takes a worldly and practical turn. It knows only force and interest; but how well it knows these! It was Rome that created the organization of force called conquest, and that organization of interests called administration. But it did not stop here. Inspired by its rugged and powerful genius, it raised its concrete notions of force and interest to the height of absolute abstractions; it created the metaphysics of force, and called it politics, and the metaphysics of interest, to which it gave the name of jurisprudence. This instinct is so strong that it does not overlook even things which seem most opposed to it, literature and religion. Sacerdotal rather than truly religious, as soon as Christianity was presented to it, it hastened to organize it, and gave to it, in the Catholic church and the papacy, its own political institutions. The essential traits of this profoundly positive genius and of this character made for domination and the enjoyment of earthly goods, are found again in the Italians of the middle ages and of modern times, but with important modifications, brought about by time, the accidents of history and the intermingling of races. The centre of the Latin race was changed during the middle ages, and transferred to Tuscany; the Italian genius gained by this change a flexibility and aptitude for ideality which it did not possess in ancient times, and because of this change, Europe is indebted to Italy more than to any other nation for the revival of arts and letters at the end of the middle ages known as the renaissance.

—The Celtic race, which formerly occupied all of Gaul and Great Britain, and a great part of the territories of Belgium and Helvetia, can not now be found anywhere in a pure state except in Armorica, or French Brittany, in Wales, in Scotland, particularly in the Highlands, in the Shetland and Hebrides islands, and finally, in Ireland. The

domain of this valiant, imaginative, sensitive and adventurous race, once so extensive, is now reduced to this mere remnant of territory. The Celts are the most interesting and unfortunate of all the barbaric races. Their conquerors, exasperated by their stubborn resistance, never spared them, but always pitilessly tracked them, and exterminated them without mercy. This race owes its cruel destiny in part to its very qualities: its extreme sensitiveness often turned into harmful rage, imprudent, hasty hatred, and capricious sallies of contempt, while it on the other hand, easily engendered despair, discouragement and silent melancholy. This sensibility explains why the Celts have never been able, despite their valor, to preserve their independence, and why, after having lost it, they have never been able to cause their masters to bid them welcome, or to make their subjection the starting point of a new destiny. Conquered races have been known to govern their conquerors, like the Greeks, or to use the masters which fate had given them, like the Italians generally; but the Celts have never been capable of such miracles. The Celt does not know how to control his emotions: when victorious, he abandons himself to the proud intoxication of triumph; when vanquished, he falls into a mournful despair, or becomes the prey of a frantic rage which injures only himself and deprives him of all sympathy. To this extreme sensibility is added a fine and charming imagination, which renders him the slave of fancies and of habit, and thus forms a new source of danger. He is slow to accord his esteem or love to political or religious innovations; but once he has given it, it is given for centuries, and he will not abandon anything which he has set his heart on, even when experience has condemned it. Thus he is always behind the general progress of civilization, and figures in history as the champion of lost causes. Of all the barbaric races, the Celts were the last to submit to Christianity, and the difficulty of their conversion seems surprising when we consider the prompt submission of the Germanic races to the new religion. The papacy encountered in them its first adversaries, and, later, its most devoted defenders; the French monarchy was kept constantly at war defending itself against their revolts down to the very outbreak of the revolution of 1789; yet this revolution met with no more irreconcilable enemies than the Vendéans and Bretons; and it is a well-known fact that the obstinate resistance of the Highlanders prolonged the contest entered into in England between the monarchy of the Stuarts and the Protestant dynasty.

—The Celtic race is not the only one which preserves itself pure and unmixed only in certain provinces or portions of territory; the same is true of the Iberian race, which is the basis of the population of Spain and probably of Portugal, and which has continued in its purity only within the narrow confines of the Basque provinces. Are the Iberians an Indo-Germanic or an Ougrian or Finnish race? Opinions are divided, and the question is a doubtful one. Some ethnologists, basing their opinion on the characters of the Basque language, say that the Iberians belong to the Finnish race; others see in them a separate branch of the Celtic race. However this may be, frequent interminglings seem to have occurred at an early period between the Iberians and the Celts, and the mixed race thus produced, the Celtiberians, constitutes, to a great extent the basis of the population of Ireland. In truth, the genius of the Iberian race is very different from that of the Celts; the two races have little more than one trait in common, a fierce valor; but this valor manifested itself among the Iberians from the earliest ages with a gloomy energy and a firmness of resistance entirely unknown to the adventurous and brilliant courage of the Celtic race.

—The mixture of the Latin race with the Celtic and Iberian races produced the nations of central Europe, which are without distinction called Latin nations, notwithstanding the well-defined differences of their inhabitants. France, Spain, Portugal and Italy constitute this class. The basis of the population of Spain has remained Iberian, and that of the population of France, Gallic; the admixture of Roman or Germanic blood has not so changed the characteristics of the two nations as to render them unrecognizable, and it is easy to observe in the soldiers of modern France the descendants of those Galatians who raised their swords aloft when it thundered to hold up the heavens if they should fall, as it is also easy to recognize the descendants of the defenders of Numantia in the defenders of Saragossa. The action of the Latin race upon the two nations has been more moral than physical; it has rendered them capable of discipline, initiated them into a higher civilization, and neutralized and even destroyed the fatality of blood and the obstacles of instinct. Thanks to this initiation, the Celtic genius especially, crushed or impotent everywhere else, developed in France, and gave to the world all that it contained. At once adventurous and fond of routine, utopist and retrograde, violently revolutionary, and conservative to the extreme, the enemy of tradition and the slave of habit, idealistic and skeptical, quick to undertake and easily discouraged, the French clearly manifest all the principal characteristics of the Celtic race. But what a marvelous transformation these characteristics have undergone! The lively sensibility of the Celt has been changed into a spirit of humanity and justice; his love of habit has become a sentiment of patriotism; his lively, pure, moral, elevated imagination, the most moral, most elevated and most truly religious of all the barbaric races, has translated itself into a literature of a noble, moral, abstract, refined and idealistic character, disdaining the pleasures of the flesh and of the blood, and loving the pleasures of the mind, to such a point as to forget their reality. Thus the least carnal of the barbaric races has produced, under the influence of Latin discipline, the most idealistic nation in the world. France is the champion *par excellence* of absolute causes and of moral interests. She has successively given to the world the ideal of all the institutions and the moral theory of all the governments which have appeared, one after another, during the past fifteen hundred years. She has been the champion *par excellence* of the papacy, that moral ideal of the Catholic church; she drew from the feudal system the ideal of chivalry, she conceived the ideal of monarchy, she produced in Calvinism the most absolute and most metaphysical form of reformed Christianity; finally, she conceived, by the French revolution, the ideal of the government of human societies based upon absolute right and abstract reason, and not upon the fatality of circumstances and the contingency of human events. After Greece and Rome, no country has done more for humanity than France.

—The Germanic race is the most powerful, materially, of all the races. It not only occupies all the vast territory known in Europe as Germany, but it embraces also, under the name of the Scandinavian race, Denmark and Sweden and under the name of the Anglo-Saxon race, England, and the United States of North America. It has ever been a remarkable peculiarity of this race, that it has manifested more life at its extremities than at its centre, and, to use the language of its metaphysicians, *realized itself outside itself*. This peculiarity is an essentially distinctive mark of its political, if not of its intellectual and moral, history. If any one desires an expression of the political genius of the Germanic race, he should seek it, not in Germany, but in the

nations which have sprung from it, in the branches which its great trunk has put forth, England and the United States, for instance. The idea of individual liberty, of self-government and the sentiment of self-reliance, which are the most valuable contributions the Germanic race has made to the world, have found their full and entire realization in England and the United States. The material conquest of the globe belongs more to this race than to any other: in the barbaric ages they were the most intrepid conquerors, the best founders of kingdoms, and displayed faculties which distinguished them as rulers and governors; in modern times they make the most active merchants, the most adventurous colonizers the most energetic explorers and pioneers. Moral civilization owes more to other races; material civilization owes as much to none; for no other has done so much in the way of discovery, in the conquest and transformation of our globe. Its profound genius seems to be in contradiction with this political destiny; but upon close consideration, the contradiction disappears. This genius seems to be unreal and mystic; at bottom, it studies only man and nature, and, profoundly practical even in metaphysical revery and speculation, it seeks only to penetrate into hidden realities, to separate real from apparent truth, and to comprehend the inner structure of objects. The end of Germanic speculation is to penetrate the soil of thought to its very tufa in order to explain the brilliant vegetation that appears at its surface. Thus it is that Germany, of all nations, has best explained man to man, has best demonstrated how he thinks, what instinctive methods he employs, what are the unconscious processes of his logic, by what concatenation his visions become facts, his ideas civilizations, his phantoms doctrines; how the conditions of his existence force him to imagine the truth, and, as a consequence, to express himself by symbols. The practice of *self-government*, the conquest of the material world and the revelation of the internal structure of the moral man: such is the magnificent part of the Germanic race in general civilization.

—The Slavic race is the most widely diffused race of modern Europe. It comprises nearly all the peoples subject to the dominion of Austria, with the exception of the Magyars, who belong to the Ougrian race, and of a few Wallachians scattered here and there, especially in Transylvania, who belong to the Danubian principalities, and are the descendants of Latin colonies of the empire established in Dacia; the Dalmatians, the Illyrians, the Serbians, the Croatians, the Czechs, etc.; the peoples of the Turkish empire, known as Greco-Slaves, of Poland and Russia. Although the youngest of the European races, it has not escaped intermixture any more than the others; in Russia there has been an influx of Mongolian and Finnish blood; in Poland, of Sarmatian blood; and in other parts, of Turkish, Greek and Germanic blood. Some peoples, the Cossacks for example, are a mixture of several races. The Slavic race has penetrated very far, and in the middle ages was the warlike and invading race *par excellence*. It required all the strength of Germany to check its inroads; and the history of the German empire for several centuries is merely a history of the resistance of the west to this permanent inundation of the Slaves, who, at the same time that they threatened the young civilization of Latin Europe, overran and destroyed the old civilization of eastern Europe. Prussia, for example, is the product of an inundation of Slaves restrained by Germanic barriers, and the German empire became powerful only after the two great Slavic monarchies of the middle ages, Bohemia and Poland, were conquered or enfeebled. The Slaves are the last comers into history, which they ardently aspire to take full possession of, in order to inscribe their name on its pages

with the names of their elder brothers in civilization. Each of the nations of modern Europe has aspired to political preponderance, and has obtained it for a greater or less length of time. This is now the ambition of the Slaves, who have begun, in Russia, the realization of their mighty dream. The Slavic genius is remarkably mild, social, subtle, imaginative, mystical, and entirely distinct from the genius of the other European races. It is impossible to tell for what benefits civilization will be indebted to this latent genius in *posse*, but we may, however, foresee, that, if the idea of fraternity is to be transformed into institutions and introduced into the political life of nations as those of equality and liberty have been already introduced, humanity will owe this result to the Slavic race, which understands this sentiment more profoundly than any of the other races, just as the Celtic and Latin races best understand equality, and the Saxon race liberty.

—We have now reached the end of this long description of the various races of the human family. What conclusions shall we draw from what we have stated? Shall we admit that these families, irremediably separated by their genius, are condemned by the fatality of their instincts to continue to the end of time in a state of aggression, or that they are destined to be melted into a closer and a closer union? History, which we have just consulted, teaches us that the mixture of the races is a law of humanity, that they do not preserve their purity but in the barbarous state and for a very short time, and that, on the other hand, the moral barriers of their different genius are not more difficult to break through than the physical barriers of blood. The races understand one another, when crossed one with another, and thus discover that the differences which constitute race are but secondary, and that men have the same souls just as they have the same bodies. What difference does it make that the Shemite was the only one that conceived the idea of one God? If all the rest were capable of understanding that great idea, we must conclude that their instincts very closely resemble those of the Shemite. Buddhism clearly bears the impress of the Hindoo mind, and the Mongolian genius is certainly earthly and hard; but we must admit that this genius possessed at least some predisposition that destined it to understand the religion of Buddha; in what, therefore, is the Mongolian race irremediably separated from the race which conceived the religion which it adopted? Christianity is of Hebrew origin, and still the nations of Indo Germanic origin have found it conformable to their nature, since they have embraced it. Chivalry is undoubtedly conformable to the instincts of all nations, since all nations recognized it in the middle ages. Self-government is of Germanic origin; still, we see that to-day all nations have an equal inclination to adopt, practice and love it. There are differences, however, but if we examine them closely, we will find that they exist more especially in the secondary faculties or inferior part of the genius of nations; after all, men are separated only by the evil instincts and vices of their natures. They are all united and understand one another by the superior part of their souls. Thus, this great question of race is reduced to a question of morals; the differences in the genius of different nations are reduced to mere shades; and history proclaims the moral unity of the human race with still greater certainty than science proclaims its unity of flesh and blood.

## RADICALISM

RADICALISM. One may be radical, that is to say, *absolute*, in all opinions, in the monarchical as well as in the republican party; but, as a general thing, the words radicalism and radicals are applied to democratic doctrines more or less advanced, and to their adherents. It has long been said that extremes meet: consequently, they are equally false; the truth lies in the middle. Hence those who claim the designation of *radicals* are to be boldly condemned. They wish *to go to the very end*, being aware or ignorant (either supposition is equally unfavorable to them) that the end is an abyss. We are less severe toward those who are called radicals by their opponents. In that case the question is often only one of degree, of relation; according to the point of view at which one is placed, it will be as correct to consider the latter very backward, as the former very advanced. We should never stop at party names, but seek to penetrate to the foundation of things.

—Radicalism is characterized less by its principles than by the manner of their application. Its political doctrine is that of democracy, and as a general thing liberal men will approve of it. Who would raise the slightest objection against *liberty*, *equality*, *fraternity*, against *national sovereignty*, the *responsibility of power*, *universal suffrage* even? But what are we to understand by liberty? Should it be the universal leveling of all social enjoyments to the level of the lowest classes? Should fraternity encourage idleness and vice? Should national sovereignty or the responsibility of power constitute a permanent insurrection, and take away the right of decision from peaceable majorities to confer it on ambitious, turbulent, audacious minorities? Does universal suffrage admit of absolutely no limit? Thus political formulas lend themselves to more than one interpretation, and radicalism has its own; but it is, above all, the manner of its application which characterizes it. It knows only one method of procedure, which is to make a *tabula rasa*, to clear away the ground in order to raise on it a new structure complete in all its parts. Is it not as unreasonable to wish to break the chain of the ages, as to condemn all the accused in a lump, to declare all diseases incurable, to claim to know, to foresee everything, and even, which has actually happened, to wish to change the nature of things?

—Nature never makes a *tabula rasa*. She does not proceed by fits and starts, but by slow and continuous development, *and society itself is a product of nature*. Can any one deny it? Will any one question that society is composed of men endowed with reason, and often swayed by passion? Does any one think that this reason can be curbed, these passions silenced, by a decree, however solemn the deliberation and promulgation of it may have been? Nothing lasting is established by sudden or extreme measures. First, because such measures clash with received opinions, established interests, opinions and interests which have often their *raison d'etre*, and which have a right to demand consideration. But the principal obstacle to the success of radical measures lies mainly in the complex nature of man. He has necessities, aspirations, multiple duties, often contradictory; you can not fully satisfy some without, to a greater or less extent, injuring others.

—Radicalism is generally wedded to a few principles, sometimes to a single one, to which it refers everything, and which it would wish to adapt to everything. Now, the infinite variety of social facts are neither caused nor explained solely by the principles inscribed upon the banner of a radical party; these facts overflow in every direction, and force alone can compel them to return within their bounds. But radicalism does not draw back before violence. It is as absolute in its doctrines as the despot the most thoroughly imbued with the rights conferred on him by his hereditary power.

—It is by this absolutism, which is always found united to narrowness of views, that radicalism is distinguished from liberalism (which see), with which it has, however, some principles in common. Absolutism prevents all progress, and narrowness of view renders a lasting foundation impossible, for it does not permit all the important circumstances to be taken into account, and produces a certain social blindness, which makes those afflicted by it incapable of serving as guides. Thus, even should the radicals have principles identical with those of the liberals, they would differ from them by their tendency to abstraction, to idealization, they would see the mathematical line, surface or body, where, with the liberals, the real line, surface or body should be seen, with all the qualities and defects given them by nature.

—It is perhaps for all these reasons that Rohmer (see PARTIES, POLITICAL) attributes to radicalism the character of the boy; it has the same capacity as well as the same defects. It is enthusiastic, imaginative, to a certain extent generous, lives in an ideal world, pursuing a single idea, and pursuing it frantically, without regard to the evils caused by the efforts to realize it. Happily, the idea pursued is often a good one, the realization of which, even if somewhat dearly bought, compensates more or less for the ills which it has caused. Only one thing remains to be desired, namely, that the end be not attained with such violence as to go beyond it and give rise to a reaction which shall call everything into question again.

## RAILWAYS

RAILWAYS, History and Political Economy of. Of all the factors that have contributed, during this century, to the growth of wealth, to the increase of material comfort, and to the diffusion of information and knowledge, the railway plays the most prominent part. It has widened the field for the division of employments; it has cheapened production; it has promoted exchange, and has facilitated intercommunication. In its aggregate it represents a larger investment of capital than any other branch of human activity; and the service that it renders and has rendered to society is, both from industrial and commercial points of view, greater than is rendered by any other single service to which men devote their activities.

—Down to a very recent period in his history, man was remitted to water routes mainly for the transportation of goods. Migration of hunters and shepherds could and did take place over land from zone to zone even without roads; but the transportation of heavy goods, such as form the bulk of the consumption of mankind, after the agricultural period had fairly set in, was necessarily committed to the water ways. The lands bordering rivers and shores were therefore the first to be populated by agricultural tribes, which, by establishing communication with other tribes by means of the waterways, started an exchange of products. Primitive commerce thus took its origin along the lines of rivers and the lagoons of coasts, occupied by tribes which were the forerunners of civilization in its developed form.

—History gives us accounts of Assyrian and Persian roads that were at best not more than 200 miles in length, which were built for military purposes mainly. The Greeks made no contribution to the world's great highways; the roads to Olympia and Delphos comparing unfavorably with the roads subsequently built by the Romans. Rome was the first nation that appreciated the advantages of highways; and its great conquests of Gaul, Alemanin and of Britain, were due quite as much to the genius of the Romans for road building as to their prowess and skill in arms. The road made the forest insecure to the barbarian. From the fight in the ambush the road compelled the fight in the open, and gave to the higher civilization an immense advantage over the more primitive arms and the absence of tactical knowledge of less civilized man. The road, therefore, was the means of conquest of the Roman civilization over barbarism in the pre-Christian era.

—In the shape of the railway, the road has become the principal lever in man's conquest over want, distress from the accidents of birth in locality, and the disadvantages arising therefrom. It has diffused civilization, and has distributed the commodities of any one part of the civilized world over every other part, so that wants and satisfactions become substantially equalized throughout the industrial world. Famine and great general distress become impossible; by means of the railway a large degree of well-being has, with but slight modifications, mainly due to man's mistaken legislation, been diffused all over the world.

—The story of the mechanical means by which, in times within the memory of men of middle age, this great revolution was wrought, has been so often told, that it seems almost superfluous to repeat it here; and yet the requirements of the title of this article make it necessary that it should be briefly recounted once more.

—To England the world owes the railway. In the coal districts of the north of England, rails of wood were laid during the last century for the purpose of reducing the friction caused by pulling the coal cart from the workings to the mouth of the pit. About 1767 cast-iron rails were introduced. Stone props, instead of timber, were used by Outram for supporting the ends of the rails; hence the term, still used in England, of *tram* roads. Between 1784 and 1820, Murdock, Trevethick and Gray made experiments in steam engines. The modern railway, however, both by common consent and as the verdict of engineering specialists, owes its origin, as a success in transportation, to George Stephenson, who built engine No. 1 for the Stockton & Darlington railway, which was originally organized as a horse railroad, but which was authorized in 1823 to use steam as a motive force. Stephenson himself acted as the engineer on the opening of the steam railroad line in the autumn of the year 1825. Following this, came the opening of the Manchester & Liverpool railway in 1830, the first engine of which was also built by Stephenson, and which from the outset not only proved the success of the railway in the transporting of persons and goods, but also showed it to be a financial success to its promoters and stockholders in their investment of capital. Within the first year after the opening of the Manchester & Liverpool line, upward of 500,000 passengers were carried.

—That the railway was not introduced without much opposition would almost go without saying. The large interest in the stage coaches had either to be conciliated, bought off, or fought. The canal proprietors, who had just gotten well under way with their canal projects, and were making considerable sums of money out of them, when this formidable rival appeared upon the field, were opposed to the competition of the railway. In the third place, the rich landed proprietor regarded the railway as a devouring monster, which would not only destroy the value of his fields, but which threatened to destroy his game preserves and his beautiful lawns and flower beds, and, with but few exceptions, the rich landed proprietor opposed the railway. But stronger than all these special interests in opposition to the railway, was the conservative spirit of the English people, which found expression in the "British Quarterly Review," in the words, "We should as soon expect the people of Woolwich to suffer themselves to be fired off upon one of Congreve's ricochet rockets, as to trust themselves to the mercy of such a machine going at such a rate."

—London was first connected by rail with the interior of England in 1833, when the through line to Birmingham was completed. From that time forth English railways rapidly developed, so that at the close of 1881 the railway system of the United Kingdom consisted of 18,180 miles in a country of 120,000 square miles in area; representing a total capitalization of £746,000,000, and carrying annually 623,000,000 passengers, with yearly receipts of £64,000,000.

—The success of the Stockton & Darlington experiment produced in the United States a greater effect than it did in England. Before the Liverpool & Manchester line was

built, in 1830, many lines of rail were already projected in the United States, and as early as 1825 what is now the New York Central system was begun to be built under the charter of the Mohawk & Hudson railroad. In 1827 Massachusetts authorized the appointment of a board of commissioners, and caused surveys to be made of the most practicable routes for a railroad from Boston to the Hudson river at or near Albany. Two reports were made by these commissioners in the winter of 1829, giving a survey of the road, accompanied with the recommendation to make the commencement of the railroad on both the routes at the charge of the commonwealth. In 1830 and 1831 the Boston & Worcester railroad and the Boston & Providence railroad companies were chartered, and in 1832 work was already under way to connect Boston with New York. Pennsylvania started its railway system in 1827, and Maryland and South Carolina in 1828. The Baltimore & Ohio railroad system was commenced in 1828. In 1830, almost simultaneously with the opening of the first railroad line in England, railways were being opened in the United States in every direction.

—The growth of the railway system in the United States is best indicated by the facts, that in 1828 there were three miles of railway; in 1830, forty-one miles; in 1840, 2,200; in 1850, 7,500; in 1860, 29,000; in 1870, 49,000; in 1880, 93,671; and at the close of 1881, 104,813 miles. In 1882 the increase was about 13,000 miles, making a grand total mileage in the United States at the beginning of the year 1883, of about 115,000 miles of rail.

—The capital account at the close of 1881 shows a total of \$6,815,000,000. Adding, for 1882, \$40,000 a mile for about 13,000 miles, increases the total capitalization \$520,000,000, making a grand total of about \$7,335,000,000.

—The gross earnings of the railways of the United States in 1881 amounted to \$725,000,000, \$552,000,000 of which was from freight earnings, and \$173,000,000 from passengers; resulting in the payment of a dividend, over and above fixed charges, of \$93,344,200 interest on the bonds absorbed, of net earnings of \$276,654,119, the sum total of \$128,587,302, in addition to what went into other sources. In 1881 the tonnage transported was not less than 315,000,000.

—France was much slower than England and America in adopting the railway system. Independent of the fact that the Latin race is not so alert in adopting labor-saving contrivances as the Anglo-Saxon, there was a cause for the slower adoption of the railway in that country, as it was better supplied with highways than England, and transportation charges in the early half of this century were comparatively much cheaper in France than in England. With the exception of some few small lines, there was no development of the railway system in France until about 1842, when nine great lines were established, which subsequently were amalgamated into six. These at the present day divide and occupy between them substantially the whole French territory. Besides these, however, there are a few state lines and branch roads of insignificant importance. The names of these six great lines are *Chemin de fer du Nord*, *De l'Ouest de l'est d'Orleans*, *Paris-Lyons*, *Mediterranée* and *du-Midi*. The extension of the railway system in France has not been so great as it has been in England or the United States, owing to circumstances which will be referred to in the latter part of this article.

—The railway system of Belgium is 2,000 miles in extent, in a country embracing an area of 11,373 square miles. Two-thirds of the whole of the railway mileage in Belgium is composed of lines worked by the state, and one-third by private companies.

—In the Netherlands, with an area of 13,000 square miles, there are 1,230 miles of road, of which the state owns 630 miles, and private companies 600.

—Germany, Austria and Russia were somewhat behind the western nations of Europe in their railway development, but within the last decade an enormous extension in their development has taken place, for the purpose of competing with France for the eastern trade, as well as for the purpose of military operations of an offensive and defensive character. In the Franco-Prussian war the seizure and management of the railroads by the state, for the purpose of aiding strategical movements, formed so important an element in the military operations of Prussia against France, that throughout central Europe a large number of lines have since been built, to secure strategical advantages.

—The following table, taken from "Spofford's American Almanac" for 1883, gives the statistics of the railways of the world to Jan. 1, 1881:

	Miles
1. North America.	
United States (1883)...	117,717
Canada...	7,894
Mexico...	2,219

Total Australia...	5,592
Grand total...	264,826

—In England, by reason of the high price of land which the railways must occupy and acquire, and a rigid application of the rule requiring the railway corporation to pay for consequential and indirect damages, its railways represent the maximum of capitalization. Taking this extreme of capitalization of the English railways, of \$200,000 a mile, as a maximum, and the capitalization of the cheapest American railways, of \$25,000 a mile, including equipment, as a minimum capitalization, it is fair to say that the average capitalization of railways the world over is not less than \$50,000 per mile. Upon that basis the 264,000 miles of railway in the world would represent a total valuation, in the way of capital invested in these vehicles and means of intercommunication, of \$13,200,000,000.

—Compared with all the debts of all the nations of the earth, amounting, in round numbers to \$27,000,000,000, it appears that, within the period of the last fifty years, the industrial world has invested a capital in means of intercommunication alone, of

about one-half the sum that has been raised by way of loans for the purpose of carrying on, during the last few hundred years, all the wars, and constructing all the internal improvements, of all the nations of the earth.

—So great a manifestation of a social power, representing, as it does, a growth unprecedentedly rapid, must and does exhibit many peculiar phases of social and politico-economical problems, and must bring with it evils incident to its own existence which demand some form of intelligent treatment and cure. It would, indeed, be remarkable and without parallel, that any human instrumentality, however beneficial, could grow to such enormous proportions without having some shadow side in the way of defects, evils and even crimes attendant and concomitant to the immense good it brings forth. The first effect of the development of the railway system on the intercommunication of men, has been to give a great impetus to the transmission of intelligence and personal intercourse. One need but read the letters of Madame de Sevigny to see what an arduous task it was to travel during the middle of the seventeenth century. When she proposed to set out to visit her daughter, 200 miles distant, she prepared her will, and set about the journey with a solemnity of mind somewhat akin to that felt by a person at the present time who is about to investigate the sources of the Nile, or make a voyage to the north pole. But one need not go back so far for examples of the dangers, both anticipated and real, that down to within this century beset the traveler. The Newgate calendar is part of the history of the stage-coach, almost to the very time when railways were introduced. Highwaymen scoured the country round, within a radius of ten miles from London. Hounslow Heath, Black Heath, Epping Forest, Clapham Commons, all embraced post routes, and were the scenes of the exploits of many a man who, within this century, came to his end at Tyburn and at Newgate. The time occupied in moving from great centres to the capital is indicated by an advertisement of the York and London stage coach in 1706, in which the advertisers promise to be in London on the fifth day out from York, and to run from London to York in four days. It is said by Francis, in his "History of the Railways," that the abdication of James II. was not heard of in the Orkneys until three months after his flight. He says: "In the seventeenth century the charge for conveyance amounted, in many instances, to a prohibition. Heavy goods cost, from London to Birmingham, £7 a ton; from London to Exeter, £12 were paid. Coal was rarely seen, save in the neighborhood of the district which produced it. Pack horses, strong, enduring animals, the breed of which is now extinct, were employed to carry the produce of the weaver's patient skill, the pottery of Staffordshire, and even the coals of Newcastle, laboring along heavy roads, toiling beneath a burning sun, wending their way through bare, bleak moors, down steep descents, by dangerous rivers, on narrow tongues of land, between masses of mire and mud so deep as to be dangerous if they entered—a leading horse bearing bells to intimate the approach of the party he heralded. The group formed a most picturesque accompaniment to the wild, weird scenes it enlivened. \* \* The private carriage, if such, indeed, should chance to approach, left the track at the risk of never returning to it, while more numerous parties either resisted the cavalcade, or moved, like the solitary passenger, out of the way, as their weakness or strength might dictate. With such difficulties before them, few persons left their homes but those who were called by some most special reason."

—Macaulay says that the inhabitants of London, in the seventeenth century, were farther removed from Edinburgh than they are now from Vienna; and, indeed, it might be said, farther removed from Edinburgh than they are now from St. Petersburg or New York. The reason why, to this very day, parliament sits in summer, is because the roads in England were so bad, and the difficulty and danger of getting to the capital so great, that it was impossible in the midwinter months to convene a parliament with any expectation of having the members attend from the north, from the extreme west of the kingdom, from Scotland, or from Ireland.

—In the early part of the nineteenth century the difficulty of moving bulky articles was somewhat overcome by MacAdam's invention for improving highways, and by the introduction of canals. Part of the politico-economical results in the way of cheapening and distributing products was already under way by the creation of artificial waterways, which were introduced into England, France and Spain in imitation of the Netherlands.

—In fixing the price for the sale of every commodity, the element of cost of transportation must be considered, with but the very slight exception of articles that are consumed on the spot where created, like the food raised by the farmer for his own family. As the great bulk of commodities consumed in this world is transported from one point to another, it is obvious at a glance how important is the rôle that transportation plays in the work of production as well as of consumption. Indeed, transportation is a factor which enters into both the consumption and production of commodities as largely as money does into the exchange of commodities, and it plays even a more important rôle than money does in determining the price of commodities.

—The certainty, diminished cost and rapidity with which commodities could be transported from place to place by the introduction of the railway, not only increased the exchangeability of commodities, but also made it possible to forward to distant places, theretofore unsupplied with such commodities, products which formerly were consumed only at the spot where created, and the increased facility of transportation created values which could not have existed at all but for such improved methods of transportation. A familiar illustration of this fact is the great industry which had been created in Brittany and Normandy in producing eggs and butter for the London market; and vegetables even for Edinburgh's daily consumption. Before the existence of the railway, the rich dairies of Normandy could give to Normandy alone the enjoyment of fine butter, and there was no possibility for the Londoner or the Scotchman to enjoy a French egg or a pat of French butter at his breakfast table without going personally to France. For 600 or 1,000 miles the railway now carries the Frenchman's dairy and farm-yard products as easily as to the neighboring town. The prices of those commodities have gone up in France, because a market has been found for them. But, what is of greater importance, their enjoyment is possible to a greater number of people. Waste, that great destroyer of human efforts, is eliminated, and unsatisfied wants in the particulars above mentioned, can no longer exist. Through the instrumentality of the railway, the law of competition gets its widest possible extension, restrained and hampered only by limitations put by human law, in the way of tariffs, on the full enjoyment of the results of such competition. With the extension of the lines of commerce, within which a given commodity can find its

market, comes an increased demand, which not only again reacts to produce an increased supply, but equalizes prices, so that the element of chance is eliminated as much as possible from human affairs. French history gives us the fact, that during a period of 300 years, there were about 100 years of famine in one or another part of France, while absolute abundance contemporaneously prevailed in other districts. Such a condition of things, even long before the railway, has not only become impossible for France by the development of means of intercommunication, but is now made impossible the world over by reason of the railway, connected with rapid steam communication by sea. That periods of famine and distress arise in India, in an abnormally situated community living upon one vegetable product alone, and prevented by superstition from varying their food, does not diminish the force of the fact that such things are impossible in any community which has emerged from a semi-barbaric condition. Also, in India, the periods of distress are rapidly diminishing, and are becoming considerably less in intensity when they occur. An exaggerated picture of the evils incident to the present civilization is given by the colors in which the sensational modern press paints the distress and crimes of the day; and the inquisitorial and searching character of the correspondence produces a vividness which makes the superficial observer imagine that both crime and suffering have increased, whereas, in point of fact, they are constantly decreasing. What has increased, is the power and opportunity for observation and giving detailed results of such observation to the public eye and ear.

—That the several results of the introduction of the railway have become a common heritage of the great mass of mankind, and that its introduction benefits the laborer more than it does the millionaire, is indicated by the fact that the cost of transportation, which bears a greater and greater relation to commodities which are bulky and coarse and of general consumption, and forms a less and less ratio or element of expense in commodities which are easy of transportation, and not bulky in form, has been considerably lessened by the railway. Even during the middle ages the laces of Mechlin and of Brussels, and the tapestries of the Netherlands and of France, could be transported the world over. At the courts of Europe specimens of the art handicraft of the then known world could be found. Gems, laces and velvet could be transported on horseback without difficulty; but no food or clothes produced for common use or wear could be brought from a distance, the cost of transportation, added to the original cost of the article, increasing the price to such an extent as to make it beyond the means of the common man. Hence the individual born to a particular spot of earth, thus became the inheritor of all the evils and all the disadvantages incident to that spot. What the average man could not there produce, was not for him to enjoy. What his neighbor could not produce for him, he could not obtain in exchange for his own products. The cost of transportation served as an impassable barrier to placing himself in more comfortable condition, either by removal to lands more favorably situated as a market for his labor, or by bringing within his reach such more favorable condition in the shape of the importation of commodities.

—But even in India, the famine of 1873-4 was counteracted, the distress overcome, and the consequences removed, with a rapidity never before known in Indian history. Theretofore, the distress occasioned by a famine ordinarily lasted upward of ten years.

In the following year (1875), when the actual season of dearth ended in India, and some favorable results in the way of weather and crops were produced, the consequences of the famine were quite removed. Neumann is authority for the statement that in consequence of the development of the railway system, upward of 21,000,000 hundred weight of rice was distributed within eleven months by the English government during the prevalence of the famine. Even in the decade 1860-70, before the railway system was developed in India, several years of dearth and of famine occurred in the same district, and it is estimated that from two and a half to three and a half million people died during that period. The drought and failure of crops in 1873 and 1874 were greater than before, and authentic accounts show us that there were not at the utmost more than 20,000 persons whose death can directly be attributed to insufficient food. The accessibility of the newspaper correspondent, by means of the railway, enabled the world at large more thoroughly to realize the distress that occurred during 1873 and 1874, but the actual death rate, as compared with that from 1860 to 1870, from famine, was not 1 per cent.

—As the difficulty of transportation is an element of cost in the exchange of commodities, a saving in the cost of transportation, producing an increased market, results also in the additional effect that the capital which otherwise would be expended upon transportation is available for other purposes. It is true that the medium of transportation in itself is a costly contrivance, and that it has swollen, as we have seen, to \$13,000,000,000 for railway purposes alone; but as the great majority of these enterprises pay a return to those who have invested their moneys, the capital is productively employed, profitably expended, and constantly being reproduced by the return. The railway, therefore, in its general effects upon mankind and the investors, has been a blessing.

—The general result of railway construction has been an enormous increase of production and productive power on the part of mankind, and has also resulted in an enormous development in the character of productions, particularly in the direction of producing, for general and popular consumption, commodities which, until the railway was introduced, were in many cases impossible of transportation, except along the lines of waterway.

—One of the most interesting illustrations of the condition of life before the railway, is given by the philosophical agriculturist, Von Thünen, and quoted by Sax, in which, assuming as a central point, a city, he places around it, within a radius of fifty miles, an agricultural district, composed of six zones, for products which the farmer may raise with profit for the consumption of the city. In the first zone, lying closest to the city, he places the production of garden vegetables, fruit and milk; in the second zone he places the production of commodities which cost more to transport, such as potatoes, carrots, etc. In the third zone the production of wood is placed. In the next three zones, in certain proportions entered into too minutely for citation here, cereal productions and animals are put.

—The vast benefit conferred by freedom to cultivate land with alternate crops and with whatever suits the land best, has become possible only by the increase of means of transportation. Doubtless the rules laid down by Von Thünen were practically

adopted in consequence of difficulties of transportation, which, once wiped out, now not only makes the farm fifty miles remote as profitable and valuable as the one close to the city, but enables the latter in compensation to produce whatever the land is best fitted to produce, instead of simply that which proximity to the market compels. In other words, the natural advantages of production have, by the wiping out of the element of transportation, or rather, reducing it to a minimum, been permitted to come into full play. The producer was conditioned, by proximity or remoteness to the market, as to the proper use of his instrument, the soil. He now produces that which his soil is best capable of producing: all the markets have become near, by the railway. No better illustration can be found of this than in the development of the fresh fruit industry of the world within recent times. With the exception of those that ripen on the stem when detached from the tree, as oranges and bananas, but a very few years ago the consumption of fruit other than at the place where it was grown was almost impossible. To-day, however, the fruit of California can in lusciousness and perfection be better found on the tables of the inhabitants of New York and London than in San Francisco. Thus the trade in products which require to be consumed fresh has, by the increase of means of communication introduced by the railway, been added to the commerce of the world; and a vast addition to the world's wealth has been made by the exchangeability of natural products which either would not have been produced at all, or which, being produced in excess of the local demand, would have rotted upon their stems or upon the ground.

—A like addition has been made to the commerce of the world in the power of transporting cereals and bulky productions, such as grain, iron, wood, etc. The time is not far behind us when the locomotives of Illinois burned corn for fuel, in consequence of the high price of fuel, and the low price of corn, and the high price of the one and the low price of the other arose from the insufficient means of transportation of both to the localities where they could best be used.

—The diminishing of the cost and the increasing of the facilities for transportation introduced by the railway, have likewise substantially added to the world's mineral products. In parts of this country where the railway has not yet penetrated, it does not pay to open mines of silver-bearing ore yielding less than sixty dollars to the ton. The moment that a railway is opened to the point, bringing fuel thither and taking away either ore or base metal, the mine that was valueless before, becomes a valuable property if it yields forty or even twenty dollars per ton, and thus its treasury is added to the world's wealth.

—The rapidity of transportation has another effect. It diminishes the risk of capital, and increases its fertility, by securing a speedy return for money invested; and inasmuch as the return of the capital comes back more speedily, it lessens the rates of profits, thereby securing lower prices to the consumer. The effect which the production of our Kansas, Nebraska and Dakota wheat fields has had upon the English farmers, is a result, only on a wider field, analogous to that which has been had on the narrower field of Von Thünen's concentric lines.

—The influence of the railway upon manufacturing industries has been almost as great as it has been upon agriculture. In ante-railway days the furnace and the

smelting works were of necessity compelled to be close to the ore. It may now be situated close to where the capital, which contributes to establishing the works, is located. Although such industries suffer somewhat from the higher price of labor incident to the denser centres of population, yet the better supervision and more intelligent workmanship that is contributed to the manufacturing process by reason of the capitalist being able to superintend the operations of his factory, enable such works to find, by the securing of a larger application of capital, compensation, and even profit, notwithstanding their distance from the mine, owing to the absence of waste due to personal supervision. We therefore find the great manufacturing industries, though being at some distance from the actual output of raw material, gradually establishing themselves in the large cities, which are the centres of capital. Denver, in Colorado, is rapidly becoming the centre of the smelting operations of the state, for ores bearing precious metals. St. Louis is an important ore-reducing point, and successful reductions of precious ore are carried on in Philadelphia and in the city of New York, thousands of miles away from where the raw material is obtained. Equally true as to textile fabrics is this condition of things. Whether in the shape of wool coming from the cape of Good Hope, cotton from India, South America or from our own cotton states, hemp from the far west or from Hungary, the raw products are all used up at the same manufacturing establishment, at Manchester or at Paisley, at Cohoes or at Lowell, and but for the tariff the cost of distribution of the raw material would form but a small item compared with the advantages obtained from water power, proximity to ships and to coal, and, more especially, facilities for the obtaining and the supervision of the capital employed. By delocalizing the working up of the raw material into its finished product, and giving to capital the advantage of immediate personal supervision, a tendency has been produced which has been a puzzle to many economists—the centralization of industrial employment and the driving of the smaller handicraftsmen from successful competition by compelling them to become a part of vast industrial establishments. The controlling of millions of dollars of capital gives to such capital great advantage over the individual more favorably located as to territory, but less favorably located in the employment of the more expensive labor-saving machinery, and facilities for carrying on large enterprises at the lowest possible rates of interest. The result of this tendency is not an unmixed good. It causes cities to become overcrowded; it takes away the independence of the individual workingman; it makes the handicraftsman part of a huge machine, and compels the workman to give his time more and more to smaller and smaller parts of the whole operation necessary to produce a given result. The smith of the middle ages would produce an armor, and would even ornament it with devices. He would also shoe horses. To work in iron and steel in all its departments was his occupation, and he was probably a larger man in his development than the smith of to-day. But society is called upon to pay a penalty for the enormous counter-advantages of the division of employments in the decreased development of the workman. The division of employments of course increases considerably the output of each workingman, and as the sum total of output is thus enormously increased, the sum total of exchangeable products is enormously increased. A given amount of labor will at the present period produce to the smith of to-day an exchange of products many times greater than could be obtained in the middle ages, by the smith of that time, notwithstanding the superior general skill and workmanship of the latter.

—Frederick List, in urging upon Germany the necessity for developing the railway system in 1841, sums up in the following order the advantages to be derived from the development of the railway system: "1. As a means of national defense, it facilitates the concentration, distribution and direction of the army. 2. It is a means to the improvement of the culture of the nation, as it facilitates the distribution and promotes the rapidity of distribution of all literary products, and the results of the arts and sciences. It brings talent, knowledge and skill of every kind readily to market, and increases the means of education and instruction of each individual and of each class and age. 3. It secures the community against dearth and famine, and against excessive fluctuation in the prices of the necessaries of life. 4. It promotes the hygienic condition of the community, as it destroys distances between the sufferer and his means of cure. 5. It promotes social intercourse, and brings friend to friend, and relative to relative. 6. It promotes the spirit of the nation, as it has a tendency to destroy the Philistine spirit arising from isolation and provincial prejudice and vanity. It binds nations by ligaments, and promotes an interchange of food and of commodities, thus making it feel to be a unit. The iron rails become a nerve system, which, on the one hand, strengthens public opinion, and, on the other hand, strengthens the power of the state for police and governmental purposes."

—One of the first pathological symptoms that this great, beneficent growth has produced, was the speculative spirit that it promoted and fed. The era of speculation, however, does not begin with the development of the railway. Great speculative manias, destructive in their consequences, and of as far reaching and disastrous results, form part of the history of trade and commerce of the past two hundred years. The Mississippi bubble, under law, the tulip mania in Amsterdam, and the South Sea bubble in England, were eras of as wild speculation as the railway mania in England, and were much more disastrous in their consequences. When the shares of Law's bank declined, and the South Sea bubble burst, all money values represented in those elements of speculation were destroyed beyond repair. Wild as was the speculation of 1844 and 1845 in England, and culminating as it did in a great financial crisis in the winter of 1845 and 1846, the railway, the subject-matter of the speculation, still remained; and although shares were frightfully depressed during the crisis, they ultimately rose to something approaching their true value, the excessive premiums paid by individuals being all that was wasted. Every country which has allowed the railway to be built by private enterprise, has had its share of speculative ventures and speculative prices. Railway building has certainly fostered a class of unscrupulous operators as well as tricky and reckless railway officials, who found larger profits in the share market, and more rapid means of achieving great fortunes, than in finding capital for railway construction, or honestly and efficiently administering the railway properties and trusts in their hands. Absence of governmental supervision as to stock capital of railways, has caused the placing on the money markets of the world of a vast quantity of fictitious values, not representing actual construction in money value, but possible value to result from the development of traffic and anticipated dividends.

—In many instances the seemingly excessive profits made in the United States by railway building were but a fair and natural return for the great risks incurred. In the event of success the men who had the foresight and boldness to invest their capital in building lines like the Transcontinental Pacific through the territory of hostile tribes of

Indians, across plains and over deserts, at the risk of life and fortune, deserved considerable remuneration for their boldness and their enterprise. Differences of opinion may honestly be entertained whether they have not been overpaid, and whether the methods adopted through the instrumentality of political chicanery were in the least justifiable. These matters apart, however, it must be conceded, that but for the inducement held out of very large profits through the instrumentality of fictitious capitalization and subsidies of land or money, many of the newer territories of the United States would have been unsupplied by railways.

—What is here said is not meant to be a justification for fictitious capitalization, which is an evil of such great and wide-bearing consequence that it were better if railway building were somewhat delayed than to allow it to come into existence under such conditions. The writer simply desires to draw attention to the fact, that the absence of governmental supervision over capitalization leaves individuals or corporations free to devise whatever scheme they may think best to enhance profits in conducting doubtful enterprises, and results inevitably in railway management regarding no interest except that of the promoters and capitalists who respectively lay out the scheme and find the money, and in such a case the public will be woefully left out of sight. At the very outset of railway development, Stephenson, who was, from all we can learn of his career, as wise a statesman as he was an engineer, insisted that railways should be taken in hand and operated by the government, claiming, that, from its nature and character, it was a highway which would in time become more important than the ordinary road, and which also possessed the peculiarity that the owner of the road would, in time, do the business of transportation thereon. In terse language he expressed, before a committee of parliament, his opinion that competition would not be the means of producing in this case, as it does in others, the cheapest and best results for the community, because, said he, "where combination is possible, competition is excluded."

—Railway development took its origin in England and in this country contemporaneously with the growth of the democratic spirit, and with the dissemination of politico-economical ideas. The democratic spirit was jealous of governmental power, and aimed at its reduction and decentralization. The politico-economical doctrines taught, as an axiomatic truth, that the government performed its operations at greater expense than the individual, and that whatever could be left to individual enterprise should be excluded from the domain of government. Political economy at the same time asserted as an axiomatic truth the proposition that competition was productive of unmixed good; that it was universally applicable; that governmental regulation and interference tended to diminish or destroy competition; and that it would subserve the best interests of mankind if government would let things in commercial and industrial enterprise work out their own salvation.

—In England and America, therefore, railways were placed in the hands of corporations, which had power, on paying its value, to condemn property. In England, maximum rates of charges were in every case prescribed by the charter constituting the corporation, but these maximum charges were generally made so high that they practically did not interfere with the railway corporations; within the limitation of these maximum charges the railways were free to make such discriminations or

modifications as they deemed necessary to meet particular exigencies. For every addition to its public powers and for every extension of its line, the railway was compelled to go to parliament for powers. The opposition of the landowner and canal proprietor once overcome, however, the great benefits conferred from the very outset by the establishment of railway communication became so apparent, that parliament was but too willing to grant additional powers without inquiring very closely as to what use would be made of them.

—Both in England and America the legislatures of the period from 1825 to 1835 made the mistake of supposing that the railway bore an analogy to the canal, and traces of this mistake appear in almost all of the early charters. It was supposed, that, like the canal, the railway would be built by one class of capitalists, but that also, in the same manner as over the canals, the traffic over the railway would be carried on by another class of individuals or corporations, of forwarders and common carriers, who, under regulations and charges for toll established by the railroad company, would do the transportation business over the line. It was supposed that the railway was merely an improved highway, the carriages of which would run within certain grooves from which they could not depart, and that in all other respects the railway corporations would be one function and the business of transportation over it would be in the hands of others.

—The charter of the Ithaca & Owego railroad contains the following language: "Sec. 12. All persons paying the toll aforesaid may, with suitable and proper carriages, use and travel upon the said railroad, subject to such rules and regulations as the said corporators are authorized to make by the 9th section of this act." (Laws of N. Y., 1827, p. 17.)

—Certain members of parliament foresaw, that, as a means of protection of the public, the limitation upon excessive profits imposed in these undertakings by fixing a maximum rate of charges was insufficient. Pre-eminent among those members of parliament was Mr. James Morrison, who, in a speech delivered in the house of commons May 17, 1836, said: "The limitation of the rates of charge is in a progressive country good for little or nothing. The increase of population and trade has been so very great that a toll that would have yielded an ample profit on a railway constructed a dozen or twenty years ago, might now perhaps yield an equal amount of profit were the rates reduced a half. Nothing in fact can be more improvident or more absurd than that parliament should once for all fix the rate of toll when an undertaking is entered upon, and divest itself, unless by violating the right of property, of the power to reduce that rate in all time to come, how greatly soever it may exceed what would be a liberal return for the capital invested in the undertaking. I need not add that it is of the greatest importance to the interests of the public, that the cost of internal communication should be reduced as low as possible. The limitation of the dividend is a practice found to be as ineffectual as the fixing a maximum on the rate of charge. The public has no check on the system of management, nor can it explore the thousand channels in which profits may be distributed, under other names, among the subscribers, nor has it any means of preventing the wanton and extravagant outlay of money on the works, etc. To make the provision for limiting the dividends good for anything, it would be necessary that all the proceedings of a company so limited

should be controlled by commissioners appointed by the government." He therefore insisted that in every case a clause should be inserted in parliamentary concessions to railway corporations, by which parliament reserves to itself the right to revise the rates of toll every decade, or oftener. Mr. Morrison also deprecated the idea that competition would prevent excessive charges, and even at that early day he foresaw that a vast amount of capital would be expended unnecessarily in making duplicate lines, whereby the public would not be benefited by the securing of lower rates of charges, but the existing traffic would be divided in combination by the new lines and the prior existing lines, even though the roadbed of the latter was by no means taxed to its maximum capacity in doing the traffic on the line. He urged upon parliament the necessity of preventing such a waste of capital, claiming that by a reckless chartering of new lines competition was not secured, and that the new lines when built would by combination with existing lines prevent the public from securing the benefits to be derived from the chartering of the new lines.

—In a speech delivered in 1845, nine years after the former speech, Mr. Morrison, after showing the gradual reduction in the cost of and charge for transportation, and the enormous benefits which the railway system had conferred upon England, as well as the great social changes which were taking place in consequence of the existence of the railway system, continued: "These various circumstances prove that the question now is no longer one of private consideration, but one of great public policy, a matter not to be left to the control of inferior boards or private companies, but one which ought to be subject to the interference of parliament, and guided by the wisdom of the government. A great social change is in the act of taking place, and it is to this great subject that I invite the attention of the house, of the government, and more particularly of the right honorable baronet (Sir Robert Peel) at the head of the administration, and I entreat him to look at this question as one great whole, and not to regard it in detached, isolated details and fragments. If he will view it in all its many and important ramifications, if he will estimate the combined effects of all sorts that are certain to follow from this extraordinary combination of influences, he will, I think, agree with me in believing the subject to be one of the greatest moment, one fraught with unspeakable benefits if properly directed, but, if neglected or mismanaged, threatening us with evils of portentous magnitude."

—He then entered upon the question of tolls. He said: "I may here be asked the principle upon which I would regard the rates of toll. My answer is, that I would determine the rate of toll in every case by the sum at which the particular line of railway could now be constructed. The public are not bound to inquire what the line really has cost, but merely to ascertain the sum for which it could at the present time be constructed, and the railway proprietors ought to be compelled to carry the public and their goods for such fare as would yield a fair profit upon such outlay." "So little, indeed," he concludes, "was the subject of railways understood in its commencement that the original rates were fixed upon the supposition that the railway proprietor would be the proprietor of the road only, and that the persons using it would pay merely for the means of transit, as upon the canals. It is well known that such has not been the case. Railway proprietors are almost universally not only the owners of the line, but the carriers upon it. Still, strange as it will seem, the legislatures have continued, in every railway bill down to the last bill of the last session, to repeat these

lists of tolls, although in no single instance, I believe, has it been found practicable to carry them into effect. These rates of tolls are practically a mere delusion. In truth, parliament might just as well have ordered the several companies to exhibit in their stations a set of old sheet almanacs. They were a mere useless incumbrance."

—These were the utterances of a member of parliament of extraordinary intelligence, of a man who had worked his way up from a clerkship to the position of being the richest merchant in England, where he occupied a position somewhat akin to that held at a subsequent day by A. T. Stewart in the United States. To him England, and indeed the commercial world, owes the system of charging in retail transactions one uniform and undeviating price, without cheapening or bargain, a system which has since his time been adopted as the sound commercial rule in England, in America, and in the leading cities of France and of Germany.

—In this country, a few of the early charters, copied somewhat from the English parliamentary acts, contained maximum rates of toll in a schedule of rates. In some of these early charters the state reserved the right to purchase within twenty years the railway thereby authorized to be constructed. No general act then existed indiscriminately granting the right of way and the right to condemn property to any persons who saw fit to organize a railway corporation, but in every instance an application had to be made to the respective legislatures for the various powers to be exercised by the corporation. Some little safeguard was therefore left in the hands of government against too great an abuse of public power.

—In 1846, owing to the spread of the politico-economical doctrines before referred to, and to the corruption incident to the railway lobby in the legislative halls, the new constitution of the state of New York required its legislature to pass general laws under which corporations may be formed (Art. viii., § 1), and, acting in the spirit of this requirement, the legislature of 1848 did pass a general railroad act substantially like the one reenacted in 1850, except that the legislature, by the act of 1848, did, in each particular case, reserve the power to grant by special act the right of eminent domain, and give to corporations about to build and operate railways a means only, under the general law, of organization and of powers. In 1850 that safeguard was surrendered by the passage of a general railway act omitting such reservation. Thereafter twenty-five persons could, by the mere filing of articles of incorporation in the office of the secretary of state, become a railway corporation, endowed with power to take property *in invitum*, and to run lines wherever and in whatever form they saw fit, subject only to certain restrictions as to rights in cities, and to condemn property for such purposes. This placed railway corporations upon the footing of any private enterprise in the hands of corporate management, and, except as to passenger traffic, was a complete surrender of every attempt on the part of the government to supervise, regulate or control the railway corporations of the state, or to subject them to any conditions securing, without discrimination and injustice, fair and proper rates to the public. This general railway law did away with the railway lobby; and the immediate benefits in the way of extensions of the railway systems, and the freedom from public corruption resulting from this railroad law, caused other states to follow in the wake of the state of New York, and state after state passed general railway acts in imitation or modification of the one enacted by the state of New York in 1850. This

introduced the era of what was supposed to be competition, with results which we shall presently examine in detail.

—Now let us look at the course that the railway question took in other countries.

—*Belgium.* In Belgium all concessions for constructing railways are granted by the minister of the interior, subject to the ratification of the chamber of deputies and of the king. The expectant corporators deposit a plan, giving the line of the route, estimates of its revenue, and the probable expense of the undertaking, together with a tariff of tolls for passengers and freight traffic, at which they propose to carry. The project is then submitted to the department of roads and bridges, or to a special commission of engineers for report. All inquiries to verify the calculations and the statements of the projectors are made at the expense of those who deposit the plan, and for that purpose they are required from time to time to pay in to the ministry such sums as they may be called upon to contribute. Then for a period of from one to three months the whole plan is advertised in the locality to be affected by it. The local councils of the municipalities through which the road is proposed to be laid, consider the project, and report to the ministry. After these reports have been presented, a hearing is had, either before the commission on bridges and roads, or before the minister himself, at which the engineering work, the guarantees for its execution, the objections to its being undertaken, etc., are discussed, and the manner in which the government is to exercise surveillance over it is fixed. The rate of charges by the company, the time for which they may be demanded, and the time within which the work is to be commenced and finished, are also specified. After all these questions have been settled, the whole matter is then submitted to the chamber and senate and the king, either of whom can after it before it passes as a law.

—In Belgium the government itself, however, built the principal lines, or bought them up, and it now in theory allows private companies only to build extensions and developments of the main lines. In 1850, of the lines of railway in Belgium, 64 per cent. of the whole were owned by the government, and 36 per cent. by private individuals. After the construction of its main lines, however, the Belgian government retired from the work of constructing new lines, and in consequence there was, in 1860, 67 per cent. of the mileage in Belgium in the hands of private individuals, and only 33 per cent. in the hands of the state. By amalgamation, however, these small feeders in the hands of private individuals in process of time have developed into trunk lines, competing with the government lines on their own field.

—The *Grand Central Belge*, a private company, was formed out of seven companies, and the *Société General d'Exploitation*, another private line, was formed out of nineteen companies. So long as the government owns, controls and works its main lines of railway, and keeps down the interest upon the outlay to 7 per cent., no dangerous combination, however, is to be feared. It may at any time, if any line becomes very profitable, buy it up, as, under the terms of every concession, a railway line in Belgium is subject to purchase by the state for the benefit of the commonwealth. The purchase price is the net receipts of the seven last preceding years of the company's working, from which the receipts of two most profitable years

are deducted, and an annuity, equivalent to the average dividend of the five remaining years, with the addition of 15 per cent., is paid for the road.

—One of the peculiarities of the Belgian system is, that the government guarantees the line it allows to be built interest at the rate of 4 per cent. on its actual outlay; it thus has full justification for supervising the construction of the railway, and insisting upon the fullest possible reports, prescribing the method of its book-keeping, designating some of its officers, and generally regarding the railway corporation as wards of the state. This method of guarantee also prevents the undertaking of lines which do not promise to be fairly remunerative from the start. The rates of charge of both the passenger and freight traffic of all the railways of Belgium are fixed in the concessions themselves, which are limited to ninety years. The rates are, of course, maximum rates, the companies being at liberty to reduce their rates to any point below the figures set forth in the law. But when the state has guaranteed the 4 per cent. of the capital, the consent of the minister of public works is, however, necessary, before the tariff is permitted to be lowered. A very active competition was carried on in past years between the railways owned by the state, and the railways owned by individuals, wherever the lines touched the same points. This competition has resulted in the corporate railways being permitted to make special contracts in the same manner as the state railways did down to about 1864, when a law was passed forbidding the making of special contracts; and compelling both the state railways and the individual railways to carry all their freight at schedule rates.

—By this system of state guarantee of investment, the state is prevented from carrying its competition with the private lines beyond a certain point. The fact that the private companies must be permitted to earn a net revenue of 4 per cent. upon the capital invested therein or the state must make good the deficiency, serves as a check upon the competition of the state.

—This system resulted in giving to Belgium the best, and in every way the most efficient, network of railway service on the face of the globe. It had low rates of passenger traffic, and low and certain rates of freight traffic. The private companies were earning good dividends upon their capital. The state, on the one hand, prevented the private companies from becoming a dangerous monopoly; and, on the other hand, the constant competition with private enterprise compelled the state to manage its own property with frugality and intelligence, to be able to sustain the competition with private enterprise. The state reserves to itself the regulation at all times of the number of trains to be run upon the private roads; their connections with other railways, and the amount of the terminal charges, are likewise under state control. Before any contract between two different companies can be acted upon finally by the companies themselves, it must be submitted to the department of public works and the department of roads and bridges, and receive their approval.

—In every concession, clauses are introduced, requiring the companies to take the cars of other companies at certain rates, and to furnish the motive power for them to some point upon their own line, and the state can interfere authoritatively in the event of any company refusing to comply with these conditions.

—Besides the competition of the governmental railways, the private railways of Belgium are subjected to the active and constant competition of the numerous canals, which form quite a network of waterways throughout that little kingdom. From 1850 to 1860, the tendency in Belgium was toward private ownership; since 1860, the tendency has been toward governmental ownership, and this so strongly that probably in a few more years the government will be the owner of substantially all the main lines of rail. In 1870, about 400 miles of railway were bought by the government, and since that time, about 600 miles more have been purchased. Competition, however, can scarcely be said now to exist in a country where the conditions of the competition are fixed by so powerful a corporation as the state has become, and the private owner is helplessly impotent, and has no alternative but to sell out. Yet the public in Belgium is well and satisfactorily served by its railway system, and none of the disgraceful conditions of our own railway system are known there. The overpowering force of the competition of the state, of course, causes considerable criticism and dissatisfaction on the part of the investors in the shares of private railways, but this competition on the part of the state is not a new matter, as the projectors of the private lines invested their moneys and built their lines with a full knowledge of the competition to which their lines should be subjected. In 1870, the net result exhibited by the state railways was a return of 6 per cent. upon the capital invested, being, on the whole, as great a net result as any railway system in the world exhibits.

—*France.* To each of the great French lines, now six in number (originally nine), a distinct territory was laid out, in which it could construct its trunk line, which was supposed to be a profitable one; it was then required as a condition for having the district handed over to it, also as part of the condition on which it was to operate their main lines, to build a number of feeders and local lines, which were supposed, on the whole, not to be profitable. It was soon found, however, that these secondary lines were so unprofitable and burdensome, that, if they were to be built at all, without danger to the abandonment of the main lines, the state would have to come to the aid of the railways. The state, thereupon, did advance large sums of money to the railways, for the purpose of constructing their loop lines, and made the concessions upon the condition, that, at the end of ninety years, all the lines should become state property, and the state was to take the rolling stock at a low valuation.

—All the rates of charges, for both passenger and freight traffic, are regulated with the utmost minuteness in France. At any time before the ninety years expire, the government can purchase the whole of the road at a capitalization of an average of fifteen years' income, after disregarding the two worst years, and taking as the minimum figure of the capitalization the lowest year immediately preceding the purchase, below which figure it may not be capitalized. This is done to prevent the state from resolving upon the purchase immediately after an exceptionally good year. The rates of fare and of freight traffic are, of course, mere maximum rates, the companies being permitted to go as far below such rates as they see fit. Every tariff of charges must be submitted to the government for the purpose of receiving its sanction, and a month's notice must be given of any proposed change.

—France has a perpetual committee to supervise its railways and to arrange the tariff of charges, to settle disputes between competing lines, and between the public and the

railways. This committee is composed of the following persons: A president—the minister of public works; a vice-president, who is the director general of bridges, roads and railways; three experts appointed by the minister of war; three experts appointed by the minister of finance; one expert appointed by the minister of the interior; one expert appointed by the minister of commerce; two inspectors general of bridges and roads; one inspector general of mines, the inspector general of railways, and a secretary. This commission exercises both a commercial and a technical control.

—In France, every company is bound to receive and carry forward all goods tendered to it, and to publish, one month in advance, the mileage rate at which it will carry them, and the time within which it will deliver them, varying according to the distance carried. No private arrangement of any kind is permitted to be made with any organization. The terminal charges are all prescribed. No one, interested in the stock of the railway, or in its direction, is permitted to make any contracts with the railway for supplies, and even every passenger time-table is submitted to the government for approval.

—In France two tendencies have in recent years striven for precedence; one, the extension of the ownership by the state of the railway system, and the hastening of the right of the state to purchase, in less than ninety years, the rolling stock of the railways, and to acquire the rights of way of the existing lines; the other, a tendency to postpone the acquisition by the state of the railway system of France, coupled with the attempt, on the part of the railway corporations, to make themselves intermediately less dependent on the state. M. Leon Say, a well-recognized authority in matters of finance and political economy in France, recently became minister of France. His relation to the house of Rothschild is a well-known one, and it is also known that the house of Rothschild is the largest owner of the share capital of the most important and richest line of France, the *Chemin de fer du Nord*. In his budgets Leon Say devoted considerable space to the financial complications which may arise in consequence of the large additional outlays that may be required by the French government to acquire the existing lines of rail, and discouraged as much as possible additional outlays by the state, for the present, either to extend the system of existing lines of state rail, or to make any further attempts to acquire such transfer by anticipating the time for the acquisition by the state of the railways. Notwithstanding his powerful influence and the ability which all France recognized in him as pre-eminently the best qualified statistician and financial administrator, the French chamber of deputies refused to give countenance to his suggestions, and he was compelled to relinquish power mainly by reason of the unpopularity of his position on the railway question.

—The railways owe the French government about 600,000,000 francs, and the French government is now in process of investing additional sums of money, not only for the purpose of building its own lines, but to enable the railway companies to build lines of intercommunication in territory which is admittedly unprofitable.

—The ablest and strongest opponent to Say's project was Allain Targé, who, in concluding the discussion in 1881, said: "You want to temporize with the financial power of the great railways. Know you, gentlemen, what this power is? It is the greatest which now exists in France, next to the state and the order of Jesuits. You are

their confederates (addressing the ministry), and do not as you should stand in a perpetual condition of warfare with it. You can not deal with the railways as individual associations which are to be regarded each by itself, but you must regard them from the point of view that they have an interest in common, and that this common interest is so great as to make it a serious competitor to the state. They are indeed an *imperium in imperio*. They have a combined debt of 10,000,000,000 francs, and employ 280,000 officers. They stand in relation with all the trades, industries, commerce and agriculture of the community, and in their hands rests the fate of all laborers. This enemy you must fight, and the single weapon that you have in your hands is the right to acquisition and purchase. Their first word is, 'No purchase, no acquisition.' You must never surrender this weapon if you desire to hold power against them." The chamber, by an overwhelming majority, defeated Say's proposition, and France has again determined that nothing shall interfere with the ownership by the state of the railways at the time originally fixed by the concession, and that if possible that time shall be cut short, under the power of the French government, by a purchase long before the ninety years of the original concession shall expire.

—*North Germany*. All concessions are made by the minister of commerce, unless there is to be a guarantee of interest, or a subvention of some kind, in which event it must pass through the form of a law. Since the formation of the German empire, the separate states have agreed to concede to the empire the power of expropriation, and the new lines are to be constructed under the empire. This means under the chancellor of the empire, who thereupon, through a *reichsgesetz*, may authorize the construction of any line involving the interest of the state or of trade.

—*Prussia*. At the commencement of its system of railways, Prussia consciously renounced, as to this service, all the benefits that are supposed to flow from competition. The laws of 1838, section forty-four, enacted that no second railway running in the direction of the first one, and touching the same principal points, should be allowed to be constructed by any promoters or corporators, other than the promoters and corporators of the first railway, within a period of thirty years from the opening of such railway. The state, for a due consideration, by the very same law, however, reserved the right to purchase the property of all the railways and appurtenances organized under that law, after the lapse of thirty years. When such authority was to be exercised, the state was to pay twenty-five times the amount of the annual average dividend paid to the shareholders during the last five preceding years. It was also to pay the debts of the company in the same manner as the company would have paid them.

—A number of railways were built by governmental subvention in Prussia, and many of them have since that time become by foreclosure the property of the state. To a great many others large loans were made by the government, subjecting them to such a measure of governmental control as practically to make them state roads. As to all others, the state claims a right of a third part of the net revenue of the lines, beyond 5 per cent.

—In 1870 there were in Prussia 3,204 miles of rail which belonged to the state, and 3,595 miles of rail which belonged to private lines. All tariffs, both for freight and passenger traffic, must be submitted to the government, and receive its assent. These tariffs must be published, and can not afterward be raised without the consent of the minister of commerce. At the rates adopted, the companies are bound to convey, without distinction of persons, all goods delivered for conveyance, the transport of which is not forbidden by police regulations.

—Since the war with France, and the consequent acquisition by the empire of the Alsace and Lorraine lines of rail, by successive enabling acts, the governmental acquisition of railways proceeded with great rapidity, so that each year circumscribed the number of private lines, and now there are but very few lines to be acquired to make the whole railway system of Prussia a strictly governmental institution. Indeed, the railway directory never fully survived the decree of June, 1870, by which the minister of commerce took possession of the railways for military purposes, and held possession of them during the war with France. At the close of the war, the state claimed and exercised the right to supervise the expenditure of railways and to take part in their deliberations, also to determine the amount that they are to carry to the sinking fund, and the amount they are to pay as dividends. From that time forth the paternal and inquisitorial power of the government was so relentlessly exercised against them, that all power of resistance to state absorption was undermined, and they fell an easy prey to the will of the iron chancellor Bismarck, who had determined that the lines should become the property of the state. The directors of the private roads protested at first against this interference, claiming that under the laws creating them they were exempt from supervision of that kind. To this the minister of commerce answered, that he claimed the right of the royal commission, to take part at the meetings of the boards of the private railway companies, so as to see to it that the object of the meetings was in the interest of the public. He said that the railway administration could rest assured that the supervision of the state would make itself less and less felt in proportion as the railway administration, by a prompt, cheap and safe service, gave evidence to the public that they rightly comprehended and were endeavoring to fulfill, to the satisfaction of important public interests, the trust placed for public purposes in their hands. The minister of commerce closed his answer with the following significant admonition: "I can not, therefore, but recommend that the Prussian railway administrations press no further the opinion of the narrow limits of state supervision over private railways, as expressed in their memorial presented to the chancellor, as it is a position which certainly is not pressed in the interest of the shareholders. This much is certain, that for a long time past the commercial public has demanded the restriction of the independent power of railway administration, which went beyond the restraints hitherto enforced."

—The rapidity with which the acquisition of the private railways by the Prussian government has proceeded is indicated by the following figures: At the end of 1879 there were 3,800 miles of state railways; 2,170 miles of private lines under state control; and 6,200 miles of private lines under state supervision. At the end of 1881 there were 7,070 miles of state lines; 2,170 miles under state management; and 3,110 miles of private lines. At the end of 1882 there were 9,500 miles of state lines, 1,320 miles of private lines under state management, and 2,400 miles of private lines.

—The control of all this great system of ownership of railways in Prussia is given over to a special administration, at the head of which is the minister of public works, and under him are all the administrative officers, who respectively are located at Berlin, Bromberg, Magdeburg, Hanover, Ehrfurt, Frankfort, Elberfeld, Cologne and Breslau. These directors are appointed by the crown, and are special administrators to take the place of the private and individual administrators of the lines to which they respectively relate. These administrators have in charge the expenditure of moneys necessary for the establishment of new lines, and by the law of 1883 10,000 miles of new lines, to belong to the state and to connect with the existing lines, were devised. Mr. Von der Leyen, himself one of the most intelligent co-operators in this system of state acquisition, and holding a position of great trust under the minister of public works, in an article published in 1883, in the "Annual of Legislation, Administration and Political Economy," Berlin, says that "the first beneficial effects of the acquisition of the railways by the state in Prussia, was the uniformity of tariffs throughout the empire, and the impossibility of obtaining special rates or personal favoritism; also the extension of the through ticket system, and the cheapening of transportation for workingmen and persons of moderate means." The beneficial effects of these reforms is indicated by the increase of business. From 1879 to 1882 it rose from 12,000 car loads to 15,000 car loads. The surplus available for general state purposes, arising from the administration of the railways, over and above interest on money expended by the state on its state lines and operating expenses, was, in 1878-9, \$1,660,000; in 1879-80, \$3,450,000; in 1880-1, \$9,575,000; in 1881-2, \$7,862,500.

—Nearly all railway concessions contain clauses making it incumbent upon the board of administrators of the railway in all cases to come to proper agreements as to correspondence of time tables in the administration of railways joining each other. The time tables can only go into force upon the consent of the government. Persons and merchandise must be conveyed in the order in which the application is made. No difference is to be made between passengers and goods which come directly to the lines, and those which come to them in transit from other railways. A special tariff is also prescribed. The state, therefore, in addition to being represented on every railway board, and being in itself an administrator of railways, enters to a large degree as a member into all the councils of railway management in fixing rates and in determining through traffic.

—A writer in the "Quarterly of Political Economy," Berlin, 1876, in an argument against the maintenance of private control of railway property, says, "the example of the United States affords nothing to the point. There, the administration and construction of railways in the hands of private individuals and corporations is so bad, and so utterly irresponsible, that that country affords no argument in favor of private enterprise, and yet, notwithstanding this condition of affairs, no one seeks a remedy for the evils there existing by placing the railways in the hands of the state, because corruption has eaten so deeply into the government that its ethical regeneration is scarcely to be expected as long as it has a quadrennial rotation of office, and the state treasury is regarded as the general pocket from which each one is to abstract as much as he can." The reviewer then speaks of the system in England, in which the railway has, by amalgamation and consolidation, extended itself and become a power within the state so great as to be dangerous to the state. He refers to the speech made by the

president of the chamber of commerce of Plymouth, who says that "the railways have become our great highways, and should be regarded from an entirely different point of view from any other undertaking." The writer further refers in his article to the opinion of the royal railway inspector of Canada, in which he says that the monopoly of the railway in that province has become so great that the question will very soon be debated, whether the railway should own the state, or the state the railway. From all the conditions resulting from allowing free scope in private enterprise in railway construction and management, the reviewer comes to the conclusion, that on the whole it would perhaps be better for the German states to own the railways than to allow them to continue to be private enterprises, though subject to state control.

—*Austria*. This country followed the course of France, by making concessions for the period of ninety years to the railways. The government built several important trunk lines at the expense of the state, some of which are operated by private corporations, but it still owns its main trunk lines. Its system of supervision of state lines, as to the tariff of both passenger and freight traffic, is complete.

—*Switzerland*. No state lines exist in Switzerland. The republic has allowed private enterprise to build a net-work of railways. It has, however, and extremely effectual system of supervising the tariff of charges which must exist thereon. A perpetual commission regulates the relations of the corporations to the stockholders and the public, and provides for a thorough investigation of their affairs, and their constant publicity.

—*Italy*. This country owns of its lines about 1,000 miles of rail, and is in negotiation for about 4,000 miles more, so that within a very short time it will possess a large majority of the mileage of rail within its own territory.

—In all these countries, therefore, even including England, the railway has never been regarded wholly as a matter of private enterprise. In the majority the state built or assumed ownership of the trunk lines, and in all of the nations of continental Europe the proper conduct of these corporations has been regarded as so bound up with the welfare of the community that they could not safely be left wholly to private enterprise, but that the state, representing the public, should exercise continuously a more or less rigid control over their construction and administration.

—Taking up the history of the relation of the government to the railways in England, where we left it with Mr. Morrison's speech in 1839, let us look at the steps taken by the English people and government to reacquire, as to railway enterprises, the control which, notwithstanding the warnings given by men like Stephenson and Morrison, they had allowed to slip from their hands.

—In 1839 an attempt was made by royal commission to subject railway schemes to some harmonious direction as to the points from which the roads were to radiate and to which they were to go, so as to make them somewhat analogous to the French system; but the reply came that it was already too late, because so many railroads had already been constructed and projected, that it would be an unjust impairment of the rights of property to interfere with them; that the roads were already built, and could

not be removed, and that others were too far under way to have their powers changed. Between 1836 and 1839 public agitation was directed mainly against excessive charges for passenger traffic; as to which, limitations were there upon fixed. The powers of the railways had already become so great that many members of parliament were directly under their influence, and many others owed their seats to the railway power. Notwithstanding this influence, however, a bill was introduced in 1840 to create a commission for the superintendence of railways, the commission to be a kind of sub-organization to the board of trade. This bill, after several amendments, was carried, mainly through the influence of Sir Robert Peel, who, although a few years before bitterly opposed to any interference with private control of the railway system, now admitted "that they were monopolies, and that it was necessary to create some tribunal as a standing investigating committee for parliament, to prevent too manifest and too great an abuse on the part of these powerful and moneyed organizations." The bill was considerably modified during its passage through the house, more especially in the second section, which, as originally reported, had provided for a uniform system of book-keeping, and for a very thorough system of reports on the part of the railways to the board of trade. This provision, however, in the bill that eventually became law, was so emasculated as to require simply reports in such manner as the railways saw fit to make them. The bill as passed embodied a clause which established a bureau of railways as a part of the board of trade.

—A glance at the 55th volume of "Hansard's Debates." p. 125, etc., will show how greatly the ablest men in parliament were, at that time, under the influence of general phrases in relation to the non-interference of government, and how completely they misunderstood the essentially monopoly character of the railway corporation, interference with which was, in this case, a duty which, if neglected, was a renunciation of one of the chief functions of government. It was assumed in the debate, by those who were opposed to the bill, that the right of the state with reference to the railways was entirely limited to securing the safety of the traveling public, and that as to the carrying of freight or goods the railway was an entirely private enterprise, like any other common carrier. The first protest of moment against this view, in addition to Mr. Morrison's efforts, was the publication of William Gault's pamphlet on "Railway Reform" in 1843. After a very thorough examination of the whole subject, and recognizing fully the fact, that, in its importance, the railway bore the same relation to the highway that the highway bore to the footpath, inasmuch as the traffic of the country was being carried, to a very considerable degree, almost wholly by rail, he came to the conclusion that the existing lines of rail should be acquired by the state, and that all further extensions of the railway system should be carried on by the state as the owner of the public roads.

—At the beginning of the session of 1844, Mr. Gladstone, then president of the board of trade, requested the house of commons to appoint a committee to report what, if any, changes should be made in relation to the consideration of railway bills; what amendments should be made in the railway concessions and franchises already granted, and what changes, if any, should be made in the standing orders as to the manner of the consideration of railway bills. Mr. Peel objected to the extent of the inquiry, claiming that it was an interference with vested rights, to consider grants already made. He expressed his conviction, at that time, that the further development

of the railway system would bring about a competition which in time would do away with much of the monopoly character of those enterprises. A committee of fifteen was appointed, and testimony was taken, mainly upon the question of the absence of competition and combination between railways, the building of loop lines for subserving special interests without regard to the public needs, and the tendency to amalgamation which then had begun to make itself felt. A large proportion of the time of the committee was taken up in the examination of the question of minimum rates for passenger traffic. Mr. Glyn, the banker, who, next to Hudson, the railway king, was, at that time, the largest share proprietor in England, and who had been for many years, and was then, the president of the London & Birmingham railway, stated his conviction that no corporation ought to have any larger powers than were absolutely necessary for the profitable working of its line; he conceded that if the matter were an entirely new question, he had no doubt whatever but that the best way of dealing with it was for the state to own the railways, because, he said, the people as a whole had as much right to their great public highways as they had to the light of heaven. On economic grounds, however, he disapproved of the purchase of the railways by the state, saying he feared the state would be cheated in the transaction, and intimating that the roads had not cost what they were capitalized at; but he believed that thenceforth it was the duty of the state to control the railways with greater rigor and force. The report finally made by this committee contained a severe criticism upon the then existing mode of considering and passing railway bills, which the report suggested should all be submitted to the board of trade for criticism before being entertained by the proper committees of the houses of commons and of lords. Parliament took up the report for action in 1844. The suggestion was then made, that, when any new railway shall, after fifteen years, pay for three successive years, consecutively, 10 per cent dividends, it shall be in the power of the board of trade to revise its tariff, but in that event, that parliament must guarantee the 10 per cent dividend to the railway. This suggestion was again modified by the further suggestion that the board of trade could demand a rebate of the guarantee by reason of bad management. A further limitation was made by providing, that, during the existence of the guarantee, the corporation shall not increase its capital stock, and that at the end of fifteen years the board of trade might purchase every new railway at twenty-five times the average dividends of the last preceding three years, from which, however, a deduction was to be made for insufficiency of the permanent way, and the rolling stock being out of repair.

—Against the passage of this bill the railways fought principally for time. In this they were aided by the powerful Sir Robert Peel, who suggested that a year's notice, at least, should be given before a bill of such magnitude could be passed. (Hansard's Debates, vol. i., 76, p. 482.)

—Mr. Gladstone referred to Mr. Saunders' testimony and to that of George Hudson, showing that the railways did not consider them selves free from competition and opposition by other lines of rail, and his admission was used by the opposition to show that the natural law of competition would apply to cure the evils that were complained of. Mr. Gladstone, in a speech, showed that the threat of the passage of this law did not prevent new railways from being organized; that fifty new bills, representing £20,000,000, had been filed since the report was made. He stated, that,

though he knew the railway had become sufficiently powerful to send representatives into parliament instead of having them hang around the lobby, he did not believe they would become so formidable, or that parliament had sunk so low, that its members would, at the bidding of the railway interests, refrain from giving their sanction to the bill unanimously reported by their own committee.

—John Bright was the most formidable opponent to Mr. Gladstone's suggestion. He was a free trader, flushed with the great victory which had just attended his efforts in the establishment of his principles, and was ready to apply these principles to the most incongruous subjects. He was in the full vigor of his power, and had already made for himself a great reputation for honesty of purpose and for oratory. He dwelt upon the enormous benefits which railways had conferred upon society, showed that they were the benefactors of mankind, and that monopolies had always been the enemies of mankind; and therefore, he argued, it was monstrous to apply the term monopoly to them. He showed that the railways then already represented, in the way of vested capital, £60,000,000 in England; that they were carrying 25,000,000 passengers annually; and that it was extremely dangerous to interfere with so great and constantly growing an interest.

—Sir Robert Peel argued on both sides of the question, but insisted, almost in the spirit of apology, that the government had a right to provide the same sort of publicity, with reference to the railways, that it had provided with reference to the bank of England's accounts, and he concluded with asking a vote in favor of the bill. The bill obtained, on the second reading, 186 votes in its favor, against 98 in opposition. Among those who opposed it were Messrs. Bright, Cobden, Milnor Gibson, Ricardo and Macaulay. The bill was then considerably amended before it obtained its third reading, all the amendments being in favor of the railways. As modified, it was passed, but the modifications made it useless legislation. The changes that were made in it gave the railways twenty-one years instead of fifteen, before their railway tariff could be changed, notwithstanding the payment of 10 per cent. dividend. It was then provided that the guarantee of the state should run for twenty-one years after the 10 per cent. annual dividend, thus making it quite certain that the state would never interfere with the tariff. All the deductions which, in the event of purchase, were to be made, by reason of bad management and restrictions upon increase of capital, and for want of repair, of permanent way and rolling stock, were struck out. The provisions with reference to the purchase by the government were thus made extremely onerous to the state. As the provision in relation to state acquisition was further modified, so that before it could take effect it required another act of parliament to guarantee the purchase money, the act has remained ever since, to all intents and purposes, a dead letter.

—The discussion on this bill did, however, direct public attention to the question, and the "Quarterly Review" of 1844, in an article on "Railway Legislation," (pp. 224, 280), says in conclusion: "It is perfectly clear that sooner or later this great public trust can not remain in the hands of private corporations. The railways themselves have given the best evidence of their desire and of the necessity for amalgamation, by which they admit that the individual corporation can not, in a system which requires uniformity and harmony, exercise absolute sway; and when the time shall have

arrived that this amalgamation will bring the railway into the hands of the fewer corporations, or of a single corporation, which means into the hands of a few individuals, it is then but a step to the suggestion that the state, for its own safety, is compelled to take possession thereof; for a system of transportation which permeates every part of the land, which destroys and devours every other system of intercommunication, which incorporates itself into every public and private interest, which is as universal and all-present as the arterial and venous systems of the human body, sooner or later will come under the general control, for better or worse, of the state organization."

—In 1844, a special act was passed (8 and 9 Victoria, chap. 96) by which general leasing powers in private railway acts were restricted, and all powers granted by any private act of that session, to lease, were repealed.

—Pursuant to the act of 1844, a railway board, which existed just one year, was constituted as part of the board of trade, the duty of which was to report upon new railway schemes and purchases, and upon proposed extensions, amalgamations and competition. The board reported by giving its decisions without assigning reasons. It sat in secret, and published no debates. This un-English proceeding subjected it to a degree of criticism and animosity that compelled the government to recommend that the board be abolished, which was accordingly done in 1845. In that year the competition between railway corporations became so keen, and the canal companies suffered to such a degree from it, that a law was passed authorizing the canal companies to vary their tolls, and to borrow money so as to maintain the competition. The railways thereupon rapidly bought up the canals, and canal and railway amalgamations went on with great vigor. In 1846, one year thereafter, a committee of parliament reported, that within that year a large number of canals had passed practically under the control of the railway corporations, and were working under joint management. This committee recommended that all amalgamation between canal and railroad companies should be forbidden, except under the sanction of parliament. They also recommended that it was absolutely necessary that some department of the executive government should be so constituted as to command general respect and confidence, and to be charged with the supervision of railways and canals, with full power to enforce such regulations as might, from time to time, be indispensable for the accommodation and general interest of the public. They particularly recommended this in view of the fact that the private arrangements which are made between railway companies and railway and canal companies, and which may or may not be *ultra vires*, do not come under the supervision of parliament at all, and expressed their belief, that, with a properly constituted executive body, it would come under their supervision, and could be subjected to restriction.

—Between 1844 and 1846, came the period, already referred to, of the railway speculative mania. The influence which that had upon parliament is given by Francis, in his "History of the Railway," in these words: "Members were personally canvassed, solicitations were made to peers, influences of the most delicate nature were used, promises were given to vote for special lines before the arguments were held, advantages in all forms and phases were proposed to suit the circumstances of some and the temper of others. Letters of allotment were tempting, human nature was frail,

and the premium on five hundred shares irresistible. The 'Athenæum,' about that time, said: 'It is the fashion to assume that our legislators are not now open to pecuniary bribes. It may be so, but we must leave that question to be decided by our children's children. If public rumor be no more than usually scandalous and false, there are some curious revelations yet in store for these youngsters, relating to railway bills.' The curious revelations had not to be waited for until the birth of our children's children, but they came in 1845, and in the winter of 1846, with the railway crash. A return called for by the house of commons, of the dealers in railway undertakings, formed a very remarkable blue book. The noble, who, in the pride of blood and birth, had ever held traffic in contempt, was there blazoned as a trader. The priest, who, at his desk, prayed to be delivered from the mammon of unrighteousness, was there revealed in the city to sell his scrip at a premium. There were 900 lawyers, and 364 persons connected with the banking interest, who subscribed contracts for above £2,000; one solicitor was down for £154,000. There were 157 members of parliament, of whom one signed for £290,000, one for £250,000, and one for £171,000; while the remainder were down for sums which must have influenced their feelings to a degree which might have influenced their votes." (Francis' "History of Railways." vol. ii., pp. 188-190.)

—In 1846 an act was passed constituting the railway commission, which was composed of five persons, the president of which was paid £2,000 a year, two members were paid £1,500, and two others received no pay. The main purpose of this commission was to take into consideration all schemes which were to be submitted to parliament, to make special inquiry and reports, and formally to report upon all bills before parliament on railway matters, so as to guide the parliamentary committee. But as the railway committees of the house of commons and house of lords refused to be guided by the recommendations of this commission, it was abolished, and their duties were once more transferred to the board of trade. A series of bills was passed to prevent the absorption of lines by rival companies, but the ingenuity of railway counsel was superior to the ingenuity that drafted these bills, and by the purchase of stock of other railways and appointing railway directions who were mere *simulacrums*, the railway corporations absorbed each other's lines without having parliamentary powers so to do.

—In 1853 another railway special committee was appointed by parliament. This committee, after taking testimony, recommended the appointment of a committee of a more permanent character than had theretofore been in existence, to consider all schemes submitted to parliament at every session, and that a railway department of the government should be created for the purpose of affording assistance and advice whenever the committee might desire it. It then pointed out that amalgamation of railways had proceeded to such a degree in England, that each particular part of England had become the centre of a system of railway management of its own, and that the great railway corporations had swallowed up all the competing and intersecting lines. It suggested the passage of a bill relating to the traffic arrangements between different companies, and submitted a plan of a measure by which the canals were to be maintained. The result of these recommendations was the passage of the canal and railway traffic act of 1854 and a prohibition of preferences in traffic contracts given by different railways. Part of the scheme of the act of 1854 was to

submit grievances to the board of trade only, after the court of common pleas, sitting as a court, assisted by an engineer and barrister, had determined that an actual grievance existed. This part of the act proved inoperative. Lord Campbell foresaw and foretold that it would become inoperative, insisting that a lay tribunal should be created for the investigation of such questions, and that judges were not the proper persons to consider matters of that kind, as they were naturally disinclined to act in an advisory manner to governmental bureaus, and that such disinclination would render resort to them well nigh useless. However, the law of 1854 contained one very useful provision, to the effect that no preferences of any kind should be given by railways for services of a like character, and forbade all discrimination between individuals as to traffic of like character.

—In 1865 a royal commission was appointed to consider the subject of railway communication. It made its report in 1867, after taking a great mass of testimony as to British and foreign railways. As regards legislation, this commission insisted upon the expediency of requiring the board of trade to assist the parliamentary committees by reports. It made many valuable suggestions as to interchange of traffic; it considered the subject of amalgamation, and the necessity of checking it; nothing was done, however, to prevent the proceeding of the amalgamation and consolidation of English railways, as is shown by the fact, that, in 1845, the London & North Western railway had owned but 379 miles of road, and that in 1870 it operated and owned 1,507 miles. The Great Western, which originally consisted of 118 miles, operated and owned 1,370 miles in the year 1870. The North Eastern, which in 1846 owned 274 miles, had, in 1870, extended its line so as to be the owner of 1,281 miles; and the Great Eastern, which originally had 138 miles of road, operated and owned 874 miles in 1870. Amalgamation had therefore proceeded in England to such a degree, that, in 1870, the field was practically divided between the great lines of railway, so that, somewhat like France, England had seven great systems of lines brought into existence without concessions of fields of territory by the state, but which by the natural course of development and consolidation, and the economy produced by such consolidation, divided the field of railroad enterprise in England, and created a concentrated power that presented at that time to the English government the formidable question, whether ultimately the state should control the railways, or the railways control the state.

—We now come to the most important epoch in the English railway history, one reversing the policy which, down to that period, regarded the railway as private enterprises—the appointment of a joint select committee, in 1872, of the house of lords and house of commons, to consider the subject of railways. This committee was composed of Mr. Chichester Fortescue, Lord Derby, the Marquis of Salisbury, Earl Cowper, Lord Redesdale, Lord Belper, Mr. Hunt, Mr. Childers, Mr. Cross, Mr. Dodson, and Mr. Stephen Cave.

—After taking testimony, covering, with appendix, upward of a thousand pages of an English folio blue book, the committee recommended the organization of a new tribunal to consider railway grievances, constituted both as a court and as an advisory committee on railway legislation. The committee recommended this course in preference to fixing tariffs by statute, as the change of circumstances often makes

such tariffs inapplicable or impossible. This was not only the recommendation of the committee, but followed the opinion of almost every leading railway official of England who was examined as to the proposed remedies, among whom were Mr. Allport, Sir Edward Watkin, Mr. Price, Mr. Broughton, Mr. Dawson, and others.

—The committee conceded that it was difficult to provide any fixed or self-regulating rules which would, through the medium of selfinterest or of the ordinary action of law, protect the public. They recommended that the proposed tribunal should be endowed with certain functions, among which were, to see to it that railways publish rates and fares and live up to them, and to consider and act upon such alterations as from time to time are adopted in the classifications; to examine into every case of undue preference; and to investigate complaints of unfairness between traders or between towns and districts, so far as they can be raised under the railway and canal traffic act (Lord Cardwell's act of 1854, and amendments). It having been found that the expense of going to the court of common pleas was so great as to give the wealthy companies great advantages over private traders, and that the nonpublication of rates prevented the trader from knowing whether he had a case or not, the committee recommended that exclusive jurisdiction be given to the tribunal to examine into cases of preferences, and that appeals from these decisions be limited to such cases as the special tribunal should certify involved questions of law which should be considered by the Westminster tribunals. A further function with which, according to the recommendations of the committee, the tribunal was to be clothed, was to see to it that proper facilities be given for the forwarding of passengers and goods under the provision of the railway and canal traffic act relating to that subject.

—It was conceded in the report of the committee by Mr. Broughton, Sir Edward Watkin and Mr. Price, that the courts were incompetent to deal with the subject, and that arbitration was unsatisfactory; hence the necessity for the organization of a tribunal to secure those ends.

—The committee also recommended the control of tolls on canals by the tribunal, and the enforcement of any obligation imposed on the railway companies to secure the proper maintenance of free navigation on the canals. The tribunal was to settle questions between the local authorities and the companies concerning new branch lines, and also to settle all disputes between railway and canal companies. They were also to settle all questions arising between the war and postoffice departments on the one hand, and the companies on the other.

—The additional duty to be conferred on this special body was to advise parliament in reference to railway legislation. As to the necessity for constituting this court, the committee say: "No existing institution possesses the necessary qualities. The board of trade has not the requisite judicial character or means of action, a court of law fails in practical knowledge and administrative facility, and the committees of the houses of parliament have no permanence." A new body, therefore, was, in their opinion, to be constituted for all these purposes, and to wield all these powers, to be called the railway and canal commission, and to consist of no less than three persons of high standing, one of whom should be an eminent lawyer, and another a person well acquainted with railway management, their proceedings to be as simple and

inexpensive as is consistent with giving due consideration to and hearing questions openly and fairly. In conclusion, the committee state that "competition between railways exists only to a limited extent, and can not be maintained by legislation; that combinations between railway companies were increasing and likely to increase, whether by amalgamation or otherwise; that the self-interest of the companies alone was not sufficiently protective of public interests, and that their interest was only to a limited extent the interest of the public. And it therefore becomes necessary," they add, "to consider what can be done in the way of enforcing statutory obligations." As to the ineffectual character of past legislation, both in limiting dividends and creating a maximum of rate of charge, the committee were by no means mealy mouthed in the way of condemnation. They say of the railway companies. "They are monopolies who are unlimited in their charges for carriage except by the parliamentary maximum, and who are restricted by no definite limit whatever as regards terminal charges; these two charges they mix up together, and under the present system do not separate. They are practically under no restriction except that of their own interest, which may not be the same as that of the public. They claim and exercise the right to vary their charges to any extent they please within the parliamentary maximum, to favor one set of men or description of goods at the expense of another; to charge high rates for short distances, and low rates for long distances, or to charge two different rates for the same service if they think it to their interest to do so; and not only do they claim to exercise all these powers, but they refuse to tell the public how they exercise them or why they exercise them. The remedies given by the canal and traffic act of 1854 must, under such circumstances, fail for want of the requisite knowledge; and the recent act, by which companies carrying goods are bound, on application made within a week after payment, to give an account distinguishing between rates for conveyance and terminal charges, is wholly useless, because, in the first place, the trader is practically unable to enforce the law against the rich and powerful company; in the second place, he wants to know what he has to pay before paying it, and also what his neighbors and rivals are paying; and in the third place, because the companies do not themselves distinguish accurately between terminal charges and mileage, and, when an inquiry is made, can only give an approximate answer."

—Upon the question whether the interest of the public and that of the companies are identical in the same sense that they are in the case of a private trader, the committee say, "That it must not be hastily assumed that self-interest will play the same part in these large undertakings which it plays in ordinary trading concerns. There is a powerful bureaucracy of directors and officers. The real managers are far removed from the influence of the shareholders, and the latter are, to a great extent, a fluctuating and helpless body. The history of railway enterprise shows how frequently their interests have been sacrificed to the policy, the speculations or the passions of the real managers. On the other hand, the directors and principal officers of these great undertakings are often men of high standing, who feel that their position is something different from that of mere managers of a trading concern, and become in a certain sense amenable to public opinion, and especially to its expression in parliament. Thus for good as well as for evil the management of railways differs from that of an ordinary trade or manufacture, and approximates in some degree to the business of a public department." And, as a summary of the history of legislation preceding the sessions of the committee, they state "that committees and commissions

carefully chosen have for the last thirty years clung to one form of competition after another, but that it has nevertheless become more and more evident that competition must fail to do for railways what it does for ordinary trade, and that no means have yet been devised by which competition can be permanently maintained."

—This report, made under a liberal government, and one which was, therefore, considerably under the influence of the very men who opposed all interference with railways, on the ground that such interference was, in one form or another, a violation of the principles of free trade, marked a complete change of the views of the leading political thinkers of England. Even Mr. Bright no longer opposed the formation of a railway commission. Experience had taught the English people that in many departments of human activity the doctrine of non-interference of government would not apply, and not only were railways rapidly being subjected to governmental supervision and control, but also factories, merchant shipping and other industrial manifestations. The report of the railway committee of 1872 resulted in the law of 1873, creating the tribunal recommended by the commission. The gentlemen appointed by the crown under this commission were Sir Frederick Peel (the second son of Sir Robert Peel), Mr. William Phillip Price, who was for many years the chairman of the Midland railway company, and Mr. Macnamara, who held the position until 1877 (the time of his death), when his place was filled by the appointment of Mr. Alexander Edward Miller. Mr. Balfour Browne became the registrar of the railway commission. A large number of cases were brought before the commission, which were promptly and ably dealt with.

—The commission was originally appointed for five years. During those five years the railroad companies tried two different methods of discrediting the commission. One method was, by carrying cases up on appeal, to show that the commission acted arbitrarily and against law; the other was, to avoid as much as possible resort to the commission by complying with all the laws, and settling cases before they could be brought to the commission's attention. By the one course they tried to prove that the commission was composed of men not well qualified for the work, and by the other, that it was superfluous. In both attempts they signally failed. The cases carried up on appeal by them were generally affirmed in favor of the commission, and the fact that the fear of the railway commission induced the railway companies to behave with proper regard for the laws which constituted them and in the interest of the public, did not prove that the rod was superfluous by reason of it not being necessary to apply it, but proved that the very existence of the commission had a wholesome effect upon the railway companies. In 1878, therefore, notwithstanding the efforts of the railway corporations, and more especially the strenuous opposition of Sir Daniel Gooch, chairman of the Great Western railway, the commission was reconstituted by an act enlarging its powers, and the same commissioners were continued in office. The railway commission is now a permanent tribunal of the English judicial and administrative system, and will in all probability be made, within a very short period, one of the branches of the supreme court of judicature, with the power of appeal limited so as to avoid the expensiveness of protracted litigation ruinous in England to a private litigant against the practically illimitable purse of a great corporation such as the London & North Western or London & Midland railway.

—With the appointment of the commission of 1873, the English railway system entered upon a new phase. A proposition of the ownership by the state of the railways of England, which twenty years ago was almost looked upon as chimerical, is now regarded as a very possible, and will very soon be regarded as a very probable, contingency. The amalgamations which have been going on have somewhat facilitated this possible acquisition by the state. Lord Derby, in a discussion at a meeting of the Society of Arts in 1873 upon that subject, stated that he had not the slightest doubt, that, if the public really wanted the railways purchased by the state, it could be done, and the question of price would not present any insuperable difficulty. The first step in that direction has already been taken in England by the purchase of the telegraph lines and adding that service to the postal department of the government.

—Mr. Joseph Parsloe, in a monograph on the railways, says upon this subject, after weighing the arguments *pro* and *con*, as to state purchase, "that an endeavor has been made to show that enormous benefits would accrue from the management of railways by the state. At the same time it should be only after the very fullest consideration of the question, in all its multitudinous bearings, that such a change in working the system should be introduced. It has been a common practice on the part of some critics to characterize as visionaries any who have urged the adoption of a scheme of state purchase; or the ability to form a correct judgment upon the matter has been questioned. For the most part such criticism has originated with those interested in keeping things as they are, and who, while questioning the usefulness of one proposal, have not been prepared with any other to put in its place. It will scarcely be questioned that our railways have in them the material from which it is possible to obtain a much larger amount of national benefit than is now derived. What remains to be done is, that the best means shall be adopted for the attainment of the greatest public good, and if any plan preferable to state management can be devised, it will doubtless be received with satisfaction." He himself seems to be doubtful as to whether any such plan can be devised.

—One of the dangers apprehended by the opponents of state interference in England was, that in the creation of a special tribunal to supervise railway administration the individual shareholder would be injured. The very opposite has been the result. Apart from the fact, that from 1873 there was considerable additional activity in the commerce of England, a great general rise in the value of railway securities has taken place since that time, not entirely attributable to the increased activity of trade and commerce, but due in great part to the fact, that in England, as in all other countries where private administrations were freed from the direct supervision of the state, the indirect and comparatively remote supervision exercised by the shareholders over the corporate managers was not sufficient to insure the most economical and wisest administration. Special interests of railway directors would interfere with the administration, would cause the building of loop lines for the purpose of benefiting special local investments by them and their friends, and even the management of English railways is not entirely free from jobbery to benefit members of the boards of direction. The supervision of the state has made this so difficult and almost impossible, that the administration of those trusts has sensibly and visibly improved. No interest has reaped a larger benefit, not even the public, than the shareholder himself, from the reversal of the policy of the English government. Greater certainty

and publicity of railway charges, and the system of interchange of traffic, facilitated and enforced by the railway commission, have been of as great a benefit to the stockholder, on the one hand, as the holding of boards of direction to a rigid amenability to the public has been of benefit, on the other hand, to the people.

## RAILWAYS

RAILWAYS, Legislation Concerning, and Management of, in the United States. After the passage by the state of New York, in 1850, of its general railway act (see the preceding article) there was inaugurated in the United States a deliberate withdrawal of governmental supervision from railway enterprises, on the theory that they were private businesses, to be left as unrestricted as the manufacture of boots or clothing.

—The New York law, with but slight modifications, was enacted by the various states, so as to promote railway building, and also to remove the corrupting tendency of special railway legislation. When each railway corporation was the recipient of a special grant by legislative enactment, the railways, in consequence of the large interests involved, corrupted the members of the legislature, and it was honestly supposed that by permitting everybody to build railways the principle of competition would be applicable. It was argued that there could be no such thing as monopoly in matters free to all, and that the rivalry between the respective lines for business would create, as to railway administration and railway management, the same beneficial results that rivalry and competition create in other private enterprises. The rapid development of the country from 1850 to 1857, under the low tariff, good crops and general confidence, in connection with the rapid development of the railway system, prevented, down to that period of time, any evil effects arising from this absence of control from becoming apparent. Though some few evil consequences did come to the surface, yet these were so largely counteracted by the beneficial results of railway construction, that the community regarded them as but passing vexatious incidents to a great benefit, and that time would cure the evil.

—When, in consequence of the financial crisis of 1857, many of the railways became embarrassed and mortgages were foreclosed, a new device was concocted, which at the outset appeared conservative and innocent enough, but brought in its train evil consequences of considerable magnitude in the relation of the railway to the state. These foreclosures, if carried out rigorously, threatened to destroy the value of all junior mortgages and of railway stock. The junior mortgagees and the stockholders thereupon fought desperately in the courts, to delay as much as possible the right of the holders of the bonds under the first mortgage either to take possession of the railway, or, by a sale under the hammer, to cut out all equities beyond the first mortgage, in the hope that such delay would tide the road over into better times. To bridge over these difficulties, and to prevent such delays, railway lawyers devised a scheme of reorganization committees, to represent in the reorganization of railways all the rights existing with reference to the property at the time of the insolvency, and on their behalf to repurchase the property, and, by a new capitalization, to readjust these rights. Under the reorganization the first mortgage holders received new bonds representing again a first lien, and certificates or bonds to represent accrued interest; the junior mortgages were again recognized by junior liens or preferred stock; and the stock holders generally, on condition of making some payment toward defraying the expenses of the readjustment and putting the line in proper condition, received scrip or stock to represent their former interests in the roads. Bankruptcies, therefore, did

not, after this device was generally adopted, produce as to railways the same result in the way of the destruction of fictitious value that they produce by failure in other departments of business, *i.e.*, to transfer the commodities or property, by means of such a sale or title, at bottom or conservative figures; but, on the contrary, the stock and bond capital of the corporations which had emerged from insolvency came to the surface with a larger capitalization than before default, with no construction to balance such additional capitalization account. Therefore, to enable the corporation to pay, in addition to operating expenses, interest upon its stock, the directions were under the strongest incentive, and even necessity, to oppress, at non-competitive points, the territory where the railways had a monopoly power.

—The courts lent themselves readily to this new device of reorganization, because it appeared to be conservative of vested rights of property, and prevented waste and destruction. The possible influence of these devices upon the future development of the railway system in its relations to the state and the people, was either not thought of or disregarded.

—From 1857 to 1860 many insolvent railways were reconstructed upon this plan, and, at the end of this reconstruction period these railways emerged with a considerable additional capitalization, representing simply accumulated debt. In 1861 the war broke out, severing the lines running north and south, and in consequence of the operations of the government and the increased and feverish activity of the country during the four years of the war, the trunk lines running east and west were greatly developed. It was during this period of the war that congress began, upon an extensive scale, to charter the transcontinental lines of rail so as to connect the Pacific coast with the east.

—The charter of the Union Pacific railroads was passed July 1, 1862. Under this charter the right of way, and a subsidy of land and of money, were granted. By the act of July 2, 1864, the governmental subsidy was greatly increased. Land to the amount of five alternative sections per mile on each side of the road was granted to the railways. The secretary of the treasury was required, upon a certificate in writing of the commissioners, showing the completion and equipment of forty consecutive miles of railroad and telegraph lines, to issue to the company bonds of the United States, of dollar; 1,000 each, to the amount of \$16,000 per mile; and as to the 150 miles westwardly from the eastern base of the Rocky mountains, and 150 miles eastwardly from the western base of the Sierra Nevada mountains, \$48,000 per mile, and between the two mountain chains \$32,000 per mile. The Central Pacific railroad, chartered under the laws of the state of California, was taken care of in the same manner. A like amount of land was granted to it, and a like sum of money subsidy. These were not, however, the only grants made by congress in this act. The Hannibal & St. Joseph railroad, the Leavenworth, Pawnee & Western railroad and the Kansas Pacific railroad became the recipients of sections of land and subsidies of bonds. The Burlington & Missouri railroad was also the recipient of a land grant.

—The act of 1862 gave to the government of the United States, in return for the subsidy, a first mortgage upon the railway property to be created by the Union and Central Pacific railroads. The act of 1864 allowed the corporation to postpone the

government's lien by a first mortgage to an amount equivalent to the subsidy given by the United States, and made the lien of the United States for its money subsidy subordinate to that of the bonds of the companies issued under such first mortgage. About \$65,000,000 was thus given to these corporations, in addition to their valuable land grants, and the lien of the government postponed to that of another mortgage, authorized to be issued for an equal amount. The Union Pacific railroad was thereupon constructed by an organization known as the *crédit mobilier*, composed, as to persons interested therein, mainly of the persons who were instrumental in procuring the passage of the act, and who were the real incorporators of the road. To this corporation all the issues of bonds and stock were made, and it also was the recipient of the subsidy of the United States after building and equipping certain parts of the road. It proved an instrumentality of distribution of profits under the cover of building the road.

—The grants of land to the Union Pacific railroad amounted to 2,000,000 acres; to the Kansas Pacific, 6,000,000 acres; to the Central Pacific, as successor of the Western Pacific, 1,100,000 acres; to the Burlington & Missouri River, and to the Sioux City & Pacific, 2,500,000 acres.

—On July 2, 1864, the Northern Pacific railroad was also incorporated, and although no money subsidy was given to that corporation, it was the recipient of the largest land grant of any of the corporations, being entitled to receive under its grant 47,000,000 acres. By the act of July 27, 1866, there was granted to the Oregon branch of the Central Pacific, 3,000,000 acres; to the Oregon & California railroad, 3,500,000; to the Southern Pacific, 6,000,000; and to the Southern Pacific branch line 3,500,000 acres. A considerable proportion of this acreage may be saved to the people by the failure of many of these railway companies to complete their lines within the time specified by the acts of incorporation. But these grants show with how liberal a hand the congress of the United States disposed of the public domain in favor of these corporations, to aid them in the construction of their lines.

—During the same period of time large grants of land, owned by the general government within the states, were made by congress to the states, for the purpose of enabling such states to make large land grants to the railways proposed to be built within their borders. As early as 1850, about 2,500,000 acres were granted to the state of Illinois, and by it granted to the Illinois Central railroad, mainly, to aid in its construction. In 1856 Florida received grants of land amounting to about 2,000,000 acres, and which Florida, in turn, transferred in great part to the Florida railroad and the Florida & Alabama railroad. Arkansas was the recipient of more than 2,000,000 acres, which it, in turn, transferred almost wholly to railways. Minnesota, Kansas, Wisconsin, Michigan and Iowa were all the recipients of large grants of land, from which these states endowed railway corporations by heavy grants of land. The territory of the United States appeared to the legislator of that period an inexhaustible fund of land, and millions of acres were given away with what now appears to be reckless extravagance. Long anterior to these munificences on the part of the general government, some of the states were called upon to aid, by actual grants of money, some of the railways which were built within their borders. The state of New York paid to the various railroad corporations within its borders about \$8,000,000, of which

about \$5,000,000, granted to the Erie railroad company, was wholly lost, and granted about \$30,000,000 in municipal and county subscriptions.

—The right of the United States to charter railway corporations was exercised under the power given to it by the constitution "to regulate commerce with foreign nations and among the several states and the Indian tribes, to establish postoffices and post roads," and also under the general authority to execute all powers vested by the constitution in the government of the United States, and likewise under the authority given to congress to provide for organizing the army.

—The lines of the Pacific roads were constituted post roads, as they necessarily carried on the function of interstate commerce; and, as they were required to carry the army and army supplies of the United States, the establishment of these corporations as United States corporations is warranted under a liberal construction of the constitution. As these corporations have been the recipients of immense gifts of property from the general government, and as the latter is in nowise restricted by the prohibition as to impairing obligation of contracts, these beneficiaries can not possibly make any valid claim against being subjected to regulation, even if such regulation be in the nature of afterthoughts on the part of the United States government in the interest of the people of the country.

—The system of through lines, now known as trunk lines, developed between 1868 and 1872. The Lake Shore road passed under the control of the Vanderbilt interest, and there was no longer any necessity to break bulk as far as Toledo. The Michigan Southern and Michigan Central likewise passed under the same control, and through lines were established to Chicago, although the several railways remained state organizations, and were never consolidated as one company. The Pennsylvania railroad, under the name of the Pennsylvania company, leased the Fort Wayne road in June, 1869; the Erie & Pittsburg, in March, 1870; the Columbus, Chicago & Indianapolis, in February, 1870; the Little Miami road from Columbus to Cincinnati, likewise, in February, 1870, and the Cleveland & Pittsburg road, in 1871. These, together with the Ohio, Madison & Indianapolis railroad, and the Cincinnati, Wilmington & Zanesville railroad, gave to the Pennsylvania line practically two lines to Chicago and one to Cincinnati during the same period. The Baltimore & Ohio road was opened to the Ohio river in 1852; it leased the Central Ohio road in 1872, and then built an independent line to Chicago in 1874, completing its through connection to Chicago. The Grand Trunk railway, by controlling and leasing other lines and building links, pushed its connection at about the same period through to Chicago, so that there were substantially, from the seaboard to Chicago, five trunk lines vying with each other for business for the west, from the time these trunk lines pushed their connections on to Indianapolis and St. Louis.

—Prior to completing the organization of these trunk lines, freight was compelled to break bulk and suffer transshipment at the end of each state line, where a new corporation took up the traffic and carried it beyond. To prevent this breaking of bulk, and to expedite the carriage of freight, fast freight lines on separate capitalizations were organized, at first by the managers of the railways themselves owning or leasing their freight cars, and then made profitable by special arrangements with the railways

readily enough secured, because of the fact that the railway officials themselves were largely interested in the fast freight lines. These lines carried a considerable proportion of the traffic in the period anterior to the organization of the trunk roads. With the completion of the trunk line west came also a change in the organization of the fast freight lines. The managers of the railways became more largely interested in the success of their trunk organizations than in the subsidiary lines that were absorbing a considerable proportion of the business of the roads. These subsidiary lines were therefore broken up, and the private corporations abandoned and each of the various railroad corporations constituting the trunk lines, in the proportion of the percentage of traffic carried over their roads, as nearly as that could be ascertained, contributed freight cars to the formation of fast freight lines intended to carry through traffic. Thus a great reduction in the cost and an increase in the speed with which goods were carried, were introduced, and it is now no longer necessary to break bulk at various points, but goods can be shipped to their terminus by either of the trunk lines through the instrumentality of fast freight lines connected with them.

—From the fact that a large portion of the business of the roads was thereupon done by these fast freight lines, and that these fast freight lines were represented by an independent organization or staff of officers and agents, it was supposed by the public that these lines were barnacles fastened upon the railway companies for the purpose of abstracting from them, to the advantage of the managers and to the detriment of the shareholders, a large proportion of their traffic.

—Although this suspicion was well founded in the early history of the fast freight lines, it ceased to be true after the organization of the trunk line system. A peculiar result, however, arose from the existence of the fast freight lines as an independent organization. In consequence of the freedom of the freight agent of the fast freight lines from the direct control of the trunk managers of the railroads, the railroad companies themselves found it almost impossible to fix a rate of freight which would not, in the intense desire to gain traffic, be immediately cut by the fast freight lines doing business over their roads. Thus, contemporaneously with agreements between the trunk line organizations to maintain rates, an active rivalry was kept up in the rates charged by the railroad corporations themselves and by the fast freight lines which ran over the roads and belonged to them.

—The pool agreement, to which reference will presently be made, removed this difficulty. The financial crisis of 1873, like that of 1857, caused the insolvency of a large number of railroad corporations, and the same proceedings which resulted in the emerging from bankruptcy of the railroad corporations that became insolvent in the preceding crisis, followed the insolvency of the railroad corporations in 1873, by which reconstruction committees were appointed. The various corporations emerged after insolvency through this process of reconstruction with capitalizations of funded debt and stock capital generally larger than that with which they entered into this condition of insolvency, and without any additional road or construction to account for the increase.

—The general depression of trade and the failure of crops succeeding the crisis of 1873, and the struggle for business between the roads, caused them to carry through

traffic to the east at very low rates, for which they sought to compensate themselves by excessive charges for local traffic. This produced in the western states a very general feeling of dissatisfaction with railway methods and railway management, and gave rise to what is known as the granger movement.

—The western states were more liberal than the eastern states in grants of land and money to railroad corporations. From 1860 to 1870 these railroad corporations not only obtained large donations of land, but counties, townships, cities and villages desirous to become connected with the net-work of railways of the United States, and to be brought into active communication with the movement of commerce throughout the country, vied with each other in debt accumulation for the purpose of granting subsidies to railways. A large proportion of the whole bonded municipal indebtedness of the United States is due to what may be termed the frenzy on that subject. This recklessness of debt creation for the purpose of obtaining railway communications has some degree of justification in far western states, which it would not have had in any community otherwise situated. France, England and Germany, and also the seaboard and middle states of the United States, had, prior to the existence of the railway, good means of intercommunication by canals and highways. But, in the far western states, the railway was practically the only road. The western counties, townships and cities regarded the expenditures on railways as something analogous or equivalent to expenditures on the ordinary roads, and much of this debt creation was fostered by the influences of the railway corporations themselves, and a great part of it was doubtless fraudulently contracted through the bribing of local officers. In many cases the railways obtained subsidies of bonds, which they sold, and never built the railways. A large number of litigations, on the question of the liability of the public bodies granting such subsidy bonds, arose in the states themselves, many of which were disposed of in the United States courts. The innocent holders of these bonds sought to obtain judgment against counties or towns, which, either failing to obtain the consideration for which the bonds were issued, or discovering that the bonds were fraudulently issued, or from the mere desire to repudiate the burden imposed by the issue, sought to escape from the payment of the principal, or the levying of a tax to pay the interest. In a great number of these cases the decision of the supreme court of the United States was favorable to the bondholders, and the burden once imposed was allowed to rest, however recklessly or extravagantly the bonds were issued and the burdens assumed.

—The extent of this indebtedness, however, added fuel to the spread of the granger agitation. The heavy local taxation reminded the farmer or local tradesman of the aid which he assisted in giving and was called upon to pay to the railway; at the same time, the railway, which he supposed would confer upon him a great benefit, was placing his particular locality at a disadvantage by carrying past his door to more distant points and to the seaboard freight at rates very much lower than he was charged as local rates, the reason being simply that the more distant point was a competitive point, and he was entirely at the mercy of a single railroad corporation.

—The western farmer's efforts to seek relief from this condition of affairs would have met with very considerable obstruction had he not been aided by the wording and language of the constitutions of the several states, which enabled him to avoid any

contract relation being successfully established between the state and the railroad corporation by reason of its original charter.

—In the Dartmouth College case it was decided, in 1819, by the supreme court of the United States, that, by the legislative charter to a private corporation, a contract relation was created, which, under the clause prohibiting the states from impairing the obligation of contracts, forbade the state from thereafter passing laws substantially changing property rights of such corporation. The various states of the Union took alarm at the possible consequences of that decision, and, either by general laws or by constitutional amendment, provided that the legislature shall, at all times, be at liberty to alter, amend or repeal the rights or privileges conferred upon corporations.

—The state of New York, after having had for many years a provision to that effect upon its statute books, embodied, in 1846, such a provision in its constitution; and the western states, on their organization, followed substantially the provision of the constitution of New York. In obedience to a strong public sentiment, which made itself felt during 1871-4, throughout the western territory, the legislatures of Iowa, Wisconsin, Illinois, Ohio, Missouri, Minnesota and Michigan, passed laws, known as granger laws, by which railway commissioners were appointed, railway tariffs sought to be regulated, preferences forbidden, and railways required to carry for the inhabitants of a locality freight at a rate somewhat proportionate to that which they established for through traffic.

—This legislation was violently attacked in the courts by the railways themselves, and the bondholders of the railways also called it in question on the ground that such legislation impaired the obligation of their contract, because, though it left the rails and the cars, it substantially took away the profit of operating, and thus, in disregard of the constitutional provision that no private property shall, without compensation, be taken for public purposes, deprived them of property without compensation. These cases came before the supreme court of the United States in 1876, in the test cases of *Munn vs. Illinois*, and *Peake vs. The Chicago, Burlington & Quincy Railroad*. This controversy was disposed of by the supreme court of the United States adversely to the claim of the railroads and of the bondholders, by upholding the validity and right of all such state legislation.

—Panic legislation of this character was, of course, faulty. It proceeded from an insufficient examination of the whole subject. It was, in fact, treating the symptom instead of the disease. Notwithstanding the complete vindication, by the supreme court of the United States, of the right of the states to enact legislation laying down tariff rates for railways, whether remunerative or not, the majority of the states which had enacted such legislation receded from their original position and modified their tariff rates; many abrogated them, and contented themselves with the establishment of railroad commissions for the purpose of investigation and examination of grievances, and to report thereon to the legislatures, but left on the statute books, however, prohibitions against preferences, and forbade the railways from destroying the commerce and trade of a locality by rival contests for through traffic.

—In some of the eastern states, notably in Massachusetts, a different course was pursued. In that state an excellent board of railroad commissioners was appointed by the act of the legislature of 1869, composed of Charles Francis Adams, Jr., James C. Converse and Edward Appleton. The duty of these commissioners was to inspect the railway system of the state, and to inquire into accidents and the system of management, as well as the general question of railroad development, and the relation of the community to its railroad corporation. To entertain complaints of individuals or localities against discriminations or unjust treatment, and to report thereon, was also made part of their duties. Authority was also given them to hold public sessions, and to make report of their conclusions to the legislature. They had no judicial powers, but were constituted a general board for public investigation of railway management, thus to draw public attention to, and to bring to bear public opinion upon, the subject. To concentrate responsibility, to sift information, and to advise the legislature, also appertained to their functions. They were subsequently empowered to prescribe and enforce, and they did prescribe and enforce, a uniform system of accounts.

—This board has been in successful operation since its organization; and has been of great benefit to the commonwealth which appointed it, and of great service as an example, beneficially imitated by other states, of one of the most conservative modes of dealing with railroad corporations.

—Mr. Charles Francis Adams, Jr., the chairman of this commission, in an argument before a committee of the federal congress in 1880, in speaking of railroad management and its relation to the public, says: "I must ask you to dismiss all preconceptions from your minds, and to fairly consider what is the real cause of the inequality, the injustice, the discriminations of the existing railroad service, those ills of the body politic for which you are now undertaking to prescribe. I will not stop to dwell upon them or to denounce them. It is not necessary to do so, for I hold them to be proven and their existence notorious. The record is full of evidence on the subject. We all know, every one knows, that discriminations in railroad treatment and charges do exist between individuals and between places. We all know that railroad tariffs fluctuate wildly, not only in different years, but in different seasons of the same year. We know that certain large business firms, the leviathans of modern trade, can and do dictate their own terms between rival corporations, while the small concern must accept the best terms it can get. It is beyond dispute that business is carried hither and thither—to this point, away from that point, and through the other point—not because it would naturally go to, away from or through those points, but because the rates are made on an artificial basis to serve ulterior ends. In regard to these things I consider the existing system nearly as bad as any system can be. Studying its operations as I have, long and patiently, I am ready to repeat now what I have repeatedly said before, that the most surprising thing about it to me is, that the business community sustains itself under such conditions. The first principles of law governing common carriers are habitually violated. Special contracts covering long periods of time are made every day with heavy shippers, under which the common carrier, whose first duty it is to serve all equally, gives to certain parties a practical control of the markets. There is thus neither equality nor system, law nor equity, in the matter of railroad charges. A complete change in this respect is a condition precedent to any just and equitable system of railroad transportation."

—Coming as they do from a gentleman of high authority, who for ten years held the position of chairman of the railroad commission of the state of Massachusetts, and who at the time when he spoke had held for one year the position of arbitrator, selected by the great trunk lines to settle disputes and differences between them as one of a court of three arbitrators voluntarily constituted, these words are more cogent, and are to be assumed as a more correct representation of existing conditions resulting from the development of the railroad system of the United States, than any speech, either of granger suffering from his particular grievance, or of railway president anxious to retain his hold upon a monopoly interest.

—The attempt to enforce upon the railways of the state of Massachusetts the adoption of a system of accounts prepared by a set of "theorists," was vehemently opposed by the railway corporations, who called it an infringement of their chartered rights, which would prove a mere appliance for exacting blackmail, and expose details of management concerning which the public had no interest. The commissioners, on the other hand, insisted that the community had an interest in its railroad lines, and that an administration which was a mere hot-bed of abuses should be thereafter managed in full public view. To the new system of accounts prescribed, the railways quickly accommodated themselves, and, much to their surprise, they experienced no evil result from their rendering of accounts intelligible to public bodies and to the public at large, but rather found great benefit flow therefrom.

—The recent instances of the failure of the Eastern railroad company, the sudden collapse of the New Jersey Central and of the Reading railroads, show how utterly unable was the public to form, from the published accounts in annual reports, any adequate conception of the condition of railroad property. In each of these cases the annual report preceding the insolvency claimed the roads to be financially in flourishing condition. Against such abuses as these, the system of uniform accounts and thorough investigation seems to be a specific. On this subject and its success, the Massachusetts commissioners, in their report for 1879, draw a very correct line of distinction. In speaking of the spirit which called forth an investigating board such as the Massachusetts commissioners, and that which prescribed a hard and fast tariff of rates for railway companies such as granger legislation attempted, they say: "After a careful investigation, which extended through a year, and the conclusions of which are to be found in its earlier reports, this board wholly rejected the idea of attempting to regulate railroads in this country, at least through direct legislative intervention. It was said that such an attempt would result only in failure, or perhaps generate new and dangerous abuses of its own. The board, on the contrary, maintained that every desired result or needed reform could be secured by simply developing in the public mind the idea of corporate responsibility, and supplying the necessary machinery to act directly upon it. To bring this about, it was necessary to force the corporate proceedings into the full light of publicity, and to compel those responsible for railroad management, whenever an abuse was alleged, to submit to investigation, and to try to show that the abuse did not exist. Failing to do this, their only alternative was to discontinue its practice or to persist in it in open defiance of public opinion. This is the theory of railroad regulation now known as the commissioners' system, in contradistinction to the granger system. The public supervision of the accounts of the railroad corporations is an essential feature in the successful development of this

theory. If that can be established, it will certainly lead to the gradual abandonment of the granger system in favor of a supervisory system. The commissioners believe that it has been established in the practical experience of the Massachusetts railroads in the last two years, and they further believe and say that the system works well." (Massachusetts Railroad Commissioners' Report, 1879, pp. 29, 30.)

—In New York state the board of trade and transportation, a body originally organized under the title of "The Cheap Transportation Association," set itself the task, in 1873, of bringing the railway corporations of the state of New York to public amenability. From 1850, down to that period, no serious attempt had been made in that state to create in railroad management any sense of public responsibility. The reports which the various railroad corporations of the state were required to file with the state surveyor and engineer, were almost wholly meaningless. No balance sheet accompanied the reports, and the railroad corporations, in conforming with the letter of the law, vied with each other in giving as little information as possible. The state surveyor had neither power nor desire to make any independent investigation. He simply published from year to year such information as the railway corporations saw fit to give him. No penalty, which had the slightest deterring influence, was imposed for giving insufficient or even false information. The state law forbade parallel lines from being leased to each other. Nevertheless, railroad corporations, by purchasing the majority of the stock of the parallel lines, ran them in the interest of their main railroads.

—In 1868 a consolidation took place between the New York Central railroad and the Hudson River railroad, by which they subsequently became one line. On the consummation of the consolidation new stock was issued, substantially doubling the capital, or, in other words, watering the stock, of both lines. This watering of stock was promptly legalized by the legislature of the following year, which conferred authority for exchanging the certificates into shares of stock. Thus, these roads in their new capitalization neutralized all the advantages that they had of easier gradient and no mountains to pass over, which had given to New York state cheaper railway construction than to Pennsylvania and Maryland. Although during the summer months, when canal competition is active, or under circumstances when the competition for through traffic with other roads creates a strife, capitalization is of little or no consequence, yet, on the local traffic, capitalization produces the result of compelling the local shipper to pay such a rate as to make it possible for the proprietors of the road to pay dividends on their stock. By the general railroad laws of the state of New York it is provided, that when the dividends of any railroad corporation shall reach 10 per cent., the state can declare how the surplus above the 10 per cent. shall be applied. This provision, however, was made quite nugatory by the trick of stock watering. It is clear, if with each increased valuation of the road the proprietors can declare stock dividends not representing construction account, that a dividend of 10 per cent. on stock will never be declared, although in point of fact the railway may be earning 20 or 39 per cent. upon its actual cost of construction.

—This bold stroke of financial policy, which laid the foundation for the colossal wealth of the Vanderbilts, drew attention to this evil, and gave to the cheap transportation association (subsequently the board of trade and transportation) an

excellent ground for agitating the subject of railroad abuses. To this agitation considerable vigor was imparted about this time by the discrimination then practiced against the interest of the commerce of New York, whereby the railroad corporations chartered by the state of New York made more favorable rates to Baltimore, Philadelphia and Boston in their charges for all west-bound as well as east-bound freight, than to New York.

—One of the periodical treaties of peace after a railroad war of great intensity gave to Philadelphia an advantage of two cents a hundred on freight rates from the west, to Baltimore four cents a hundred, and to Boston the same rate as was given to New York, on the lowest class of freight. On the western-bound freight the discrimination against New York in favor of Philadelphia and Baltimore amounted to from seven to ten cents a hundred on the different classifications of freight. This difference in rates was made on the theory that Philadelphia and Baltimore were relatively nearer to the western centres than New York. Boston, however, which was farther away by two hundred miles than New York, was given the same rate. On east-bound freight the theory upon which the discriminations were made against New York was, that the ship charters from and to New York were lower as compared with the other seaboard cities. This, however, on examination, proved untrue. Upon this state of affairs being made apparent, the chamber of commerce, as well as the board of trade and transportation, took up the question of railroad discriminations, and in a report published by the chamber of commerce in 1878, it appeared that during a considerable part of January of that year, the rates over the New York Central, the Erie and the Grand Trunk roads, were from Boston to Chicago from thirty-five to forty cents a hundred. From Boston to Chicago salt was shipped at fifteen cents, while forty-five cents was the lowest rate from New York. From Philadelphia to Chicago the rates during the same dates were made as low as seventy cents on first-class goods, while during the same period the rates were maintained at a dollar from New York to Chicago. The lower classes were relatively as high. The committee reported that goods stored in New York were shipped to Boston to be forwarded to the west through New York over the Erie road, or via the Boston & Albany over the New York Central road, at a saving of almost 50 per cent. over direct shipments from New York. Through freights from Liverpool to Chicago, fourth class, were as low as twenty to twenty-five shillings per ton, while the rates remained from Liverpool to New York forty to forty-five cents per hundred pounds, equivalent to about thirty shillings per ton. These facts were brought to the attention of the railway presidents, and their aid was solicited to remove the discriminations against New York. They made a contemptuous answer, Mr. Vanderbilt more especially drawing attention to the facilities offered by other cities to their railroad corporations, and claiming that the New York Central had not the same facilities offered to it by the municipal government, and that the merchants should use their influence upon the municipality to extend the facilities afforded the railway corporations in like manner as facilities were extended to the Pennsylvania railroad by Philadelphia, and to the Baltimore & Ohio railroad by Baltimore. A commissioners' bill, which had been drawn, was, for four successive years, submitted to the legislative committees of the state of New York for action, but in almost every instance it had either been reported upon adversely, or, if reported favorably, had, through the influence of the railway companies, been smothered in one or the other of the houses.

—Finding redress impossible through the voluntary action of the corporations themselves, the chamber of commerce, through its committee on transportation, therefore determined to lend its aid to procure the establishment of a railroad commission for the state of New York.

—Besides the grievances before referred to, another, of an extremely burdensome character, which affected the people of the state at large, also existed at that time. Between 1875 and 1877 the great railway corporations entered into an active railroad war, and in consequence of the resulting freight rates, cereal products and flour were frequently carried by the companies at a loss from the west to the seaboard. That loss might possibly have financially ruined the railway corporations of the state had a corresponding reduction been made in their local tariff; but to recoup this loss on through rates, they maintained, as to the local shipper, rates which under such circumstances became extortionate; thus making the people of the state bear the burden, through the exactions of the local tariff, of the trunk line war, in the same manner as though the state were at war and levied a tax upon its inhabitants to maintain it. This discrepancy between through and local tariffs led to the practical abandonment of milling at the great flouring centres of the state of New York, such as Rochester and Black Rock. It was impossible for them to maintain competition against the Minneapolis miller who had his cereals produced at his door and had the flour carried to New York at twenty cents a hundred, when they were compelled to pay more than that for the mere carriage of the wheat to their mills, and a higher absolute rate for the carriage of the product of their mills to the seaboard.

—The grazing and cattle interest of the western part of the state suffered in consequence of the low rates of carriage from the western country of cattle on the hoof, and a destruction of interests took place to such an extent that grazing and cattle raising became a non-remunerative occupation solely by reason of discriminating freight rates against the western part of the state. These subjects were taken up and agitated by the state grange organizations and the farmers' alliance, who joined hands with the chamber of commerce and board of trade and transportation in insisting upon some remedial measure against such discriminations.

—Another abuse, which, however, was carried to its extreme limit by the New York Central railroad company, gave additional ground for complaint. This abuse was the entire abandonment of any fixed schedule of tariff rates for local traffic. There was a tariff of rates which existed only for the unwary shipper who made his shipment on the assumption that all shippers were treated alike, and he was punished for his want of knowledge by being compelled to pay extortionate rates. A special rate, which was entirely personal to the particular shipper, was made almost invariably, on application, by the freight manager of the New York Central railroad exercising his discretion to make it as he saw fit. At the time when a legislative investigation was ordered, there were in existence on the line of the New York Central railroad upward of 6,000 different contracts varying in the most arbitrary manner the published schedule rate for the carriage of local freights. Underlying these special rates there was neither principle based upon car loads or train loads as contradistinguished from single packages, nor upon extent of business or readiness of handling, nor any other well-known basis of railway management. They were granted as the caprice, the whim or

the interest of the railway freight agent dictated at the hour. The charge that such discriminations and special rates existed, when made to the legislative committee appointed in 1879, was at first flatly denied, but within the first few days of the investigation which followed, and to which reference will presently be made, it was overwhelmingly proved.

—Public opinion had become so agitated upon the subject that at last all the opposing influences of the railways in the assembly were overcome. An investigation of the railway system of the state of New York was ordered by the legislature of 1879, and a committee appointed to investigate the abuses alleged to exist in the management of the railroads of the state of New York. This committee was composed of A. B. Hepburn as chairman, H. L. Duguid, James Low, William L. Noyes, James W. Wadsworth, Charles S. Baker, J. W. Husted, and Thomas F. Grady. The committee invited the chamber of commerce and board of trade and transportation, which had made the charges upon the basis of which the committee was acting, to appoint counsel to conduct the examination, and stated that the committee would give to such counsel standing before it by substantially adopting him as the counsel of the committee. Under this invitation the chamber of commerce and the board of trade and transportation appointed the writer of this article as its counsel to conduct the investigation, and then during a period of eight months the investigation proceeded in the taking of testimony and the preparation of its report.

—Prior to the appointment of this committee a great change had taken place in the management of the great trunk lines in their relation to the public. Mr. Fink—who had been the vice-president of the Louisville & Nashville railroad, and who was commissioner or chairman of the committee of the Southern railway and steamship association, which was comprised of twenty-five railroads, and who by a pooling arrangement of freights in the organization of that association had substantially stopped railroad wars and competition among them, and the success of whose management had drawn attention to his executive ability—was invited by the railroad magnates of the east to organize, upon the plan of the Southern railway and steamship association, an organization to keep the peace and maintain rates for the trunk lines centring at New York, Boston, Philadelphia and Baltimore. Down to that period of time every attempt to create a "joint purse," as it is called in England, or a "pool," as it is termed in the United States, by which, to prevent railway wars, the proceeds of freight charges were divided between the railway companies, had proved fruitless. Scarcely was the ink dry on the contract made between the railway presidents before each particular railway company attempted, in one way or another, to break away from the contract thus made. So little under control were some of the freight agents, that even if the railway presidents desired to maintain the contract in its integrity, they found it impossible to control the various freight lines doing business over their own roads, and the contracts were broken almost as soon as made. Thereupon, in June, 1877, Mr. Fink was appointed commissioner of the four trunk lines, the Baltimore & Ohio, the Pennsylvania, the Erie, and the New York Central & Hudson River railroads. In December, 1878, he was further appointed commissioner of the combined trunk lines of the western roads. A contract was made, by which, in addition to the agreement as to regular tariffs, each railroad corporation agreed to accept a certain percentage of all the freight that was offered, and to send to the other lines which had

a deficiency whatever surplus was offered to it, in consideration of which it was likewise to receive from the other line its own deficiency. Substantially it was then agreed as to west-bound freight, and subsequently as to east-bound freight, that the roads were to be operated with reference to traffic as though they were one corporation, and Mr. Fink, as a commissioner, was to see to it that this arrangement was faithfully carried out. He had supplied him a large staff of clerks to make these equalizations from time to time. A further development of this principle was the appointment of arbitrators, three in number, to determine disputed questions. The system has certainly resulted, first, in maintaining rates, and secondly, in stopping railroad wars between the contracting parties. A railroad war, while, on the one hand, great demoralization in business by the element of uncertainty in commercial transactions caused by the absence of a certain rate, vastly more expensive in its ultimate results than the higher rate for freight.

—The all but unanimous report of the investigating committee appointed in 1879 was made after an exhaustive inquiry, contained in five closely printed volumes of testimony. This committee, in summing up the condition of railroad management as they found it in the state of New York, pass in review the various abuses which have grown up under the management of these great highways by private corporations without responsibility to the state. They refer to the evil of the drawing room or sleeping car companies, which, by their contracts with the railroad companies, create a special interest that diminishes the return of the shareholders of the railroad companies. They speak of the fast freight lines and express companies as now conducted as free from evil. They condemn the methods by which the stock yards at the terminal points of the railways are let out to individuals, and speak of this as an instrumentality which is usually attended with additional taxes upon transportation. They consider the suborganizations of railways in the way of coal companies and elevator associations, which are designated as barnacles upon commerce, as organized for the purpose of tolling the commerce of that port (Buffalo) to the greatest possible extent. On alluding to watered stock the committee refers to the fact that it was proved before them, that \$40,000,000 was probably the whole value of the property and equipment of the Erie Railway company, and that \$25,000,000 more would cover all the additional value of the road, as represented by stock and bonds and interests in other corporations, while it was capitalized at about \$155,000,000; that its construction account covered in 1873 an item of "legal expenses" of \$891,000; and that the watering of the stock of the Erie railway, as well as its bonds, is estimated by them to be not less than \$70,000,000. They proceeded to examine the accounts of the New York Central railway. They found that in 1853 the stocks and bonds of the roads which at that time formed the various links of the chain of consolidation thus effected, amounted to a total of \$23,000,000, and that at the time when the first consolidation was effected, premiums, or, in other words, water, to the extent of almost \$9,000,000, were given to the stockholders and shareholders of these various roads. From 1868 to 1870, by the consolidation of the New York Central and Hudson River railroads, over \$44,000,000 was added to the combined capital of both the Hudson River and the New York Central roads, by stock dividends of 80 per cent. on the New York Central road in 1868, and 85 per cent on the Hudson River road.

—The committee pass in review local questions, which it is not necessary to enter into here, on the subject of the terminal facilities and the injustice done by the discriminations against New York by the arrangement of discriminating rates, and then they touch upon the abuse fully developed before them, connected with the Standard oil company.

—It appeared by the testimony submitted, that on Jan. 8, 1872, the Central, Erie, Lake Shore and Pennsylvania roads made an agreement with the South improvement company, a Pennsylvania corporation, giving to the improvement company, on shipment of oil to different points, rebates ranging from forty cents to \$3.07 a barrel. The agreement provided that its object was to maintain the business of the South improvement company against loss or injury by competition, and that the roads would lower or raise the gross rate of transportation over their respective railways and connections, to such an extent as might be necessary to overcome all competition.

—When the agreement became public, the legislature of Pennsylvania was compelled by public opinion to vacate the charter of the corporation. A more ingenious and secret agreement, however, was subsequently made with the Standard oil company, by the railroad corporations, securing to that corporation the objects which were intended to be secured to the South improvement company. This company, originally composed of a few enterprising oil men of the western states, gradually absorbed into its management the Standard oil company of Cleveland, the Standard oil company of Pittsburg, the Acme oil company of New York, the Imperial oil company of Oil City, the Atlantic refining company of Philadelphia, Charles Pratt & Co. of New York, the Devoe manufacturing company of New York, J. A. Bostwick & Co., and Messrs. Rockefeller, Day, Flagler, Warden, Frew & Co., and others.

—This combination against the remainder of the trade, now banded together under the name of the Standard oil company, is characterized by the committee as a flagrant violation of every principle of railroad economy and natural justice. It resulted in driving out of business nearly all competitors, and enabled the Standard oil company to purchase, at such rates as they saw fit, the refineries distributed over the United States which they desired to control either for the purposes of manufacturing or to dismantle. This threw the production, distribution and refining of oil into the hands of a single corporation, to the extent, estimated at that time, of 95 per cent. of the whole product. In this regard the committee say, that from January to October, 1879, the total shipments from the oil regions to all points were 12,900,240 barrels, and that all shipments to the seaboard would have easily borne one dollar more per barrel than they did (the rate then being about twenty-five cents a barrel); that, tested by the charge which the roads imposed upon every other commodity, it should have borne that much more; and that all the trunk lines have grown into such relations with this oil company that they were forced to forego all these millions they might have earned, and compelled to look to the other products of the country for their revenues; thus burying their own interest in the interest of the Standard oil company, and joining in this war of rates to protect the latter against injury by competition.

—The attention of the committee had been drawn to the evils connected with the proxy system, by which railways were captured by the mere purchase of voting power

from persons, mainly bankers, in whose names large amounts of stock were registered, but which had been sold and distributed to their customers, and were left on the stock books of the companies, standing in their names, simply for prudential reasons. This situation gave to such persons a large voting power in the railway without a substantial interest or stake in the result of the vote. To persons who desired to capture the road, it was a strong temptation to purchase such voting power; and, to persons who had no permanent interest in the road, it was a corresponding temptation to sell the power, the evil effects of which sale they were not called upon personally to bear. The committee, therefore, recommended the passage of a bill to remedy this abuse.

—The committee likewise condemned the system of the reports to the state engineer and surveyor, and then passed under review the system of special rates, which was founded upon no other basis than the arbitrary will of the freight agent in giving individual shippers, located in the same town, rates varying as much as thirty cents a hundred. The committee investigated the theory that had been advanced by all the railroad experts of "charging a traffic what it will bear." Of this they said, that, "as to an increase of from fifteen cents in August to forty cents in November on grain, the rate was raised simply because the condition of the market warranted it, and the product could bear it. It would be difficult to make a criticism upon that raise which public judgment would sustain, but we are distinctly told that public interest plays an insignificant rôle in the theatre of railroad management. It is at best but a service waiting upon the interest of the stockholders. The wrong consists in exercising a censorship over the business affairs of the community; secretly, arbitrarily and unequally varying rates, building up this, developing that; not only performing the proper functions of transportation, but taking into consideration the probable or possible profit of a shipment, and adjusting their rates accordingly. If the shipper is likely to make a large profit, they compel him to divide; if the margin is a close one, they determine whether the shipment shall be made or not, whether it shall result in a profit or loss. Thus, under this system of management and this method of giving rates, is every merchant, every manufacturer, every shipper, and, through them, every individual along the 5,500 miles of railroad in this state, with its five hundred millions of capital, measurably in the power of these corporations. Conciliate their good will, court their favor, and favorable rates will follow; incur their hostility, and the margin of their displeasure may be read on your freight bills."

—The committee speak of the enormous political influence which is wielded by corporations having in their employ, in 1879, upward of 30,000 voters. They speak also of the contemptuous disregard exhibited by the railroad corporations of the state to the milling interest, in April, 1879, when they answered a temperate statement of grievances by saying, "that the first condition of having them listened to was to retract their signatures from a certain circular, dated March 15, 1879," in which these grievances were stated in moderate terms, and "to withdraw their support from a *pro rata* freight bill, which was then before the assembly."

—The committee conclude their analysis of the testimony with the citation of the Shoelkopf & Matthews agreement, whereby the New York Central railroad bound itself to carry to New York, for these millers situated at Niagara Falls, at a pro rate of

the through east-bound rate on grain or flour, whatever it may be, which enabled these millers to maintain their mill in full operation while their neighbors were going out of business simply because they had not as favorable a contract. The contract appeared to have been made for five years, and was to be valid on condition that it was to be kept secret. Personal discrimination could no farther go than was illustrated in that case.

—This investigation proved conclusively that every charge that had been made against the railway corporations by the commercial bodies of the state was understated rather than over-stated; that these great trusts had fallen into the hands of persons who exploited them for their personal benefit solely; that the public was only in so far regarded as any tyrant would regard the public; that it was dangerous to exasperate them too much; and that as freight charges are in the nature of taxes, if you want a continuous revenue from taxation, it must stop short of confiscation.

—The recommendations of the committee, therefore, were embodied in bills which embraced, in substance, the commission bill which, with some slight modifications, had been previously drafted at the request of the board of trade and transportation; a bill upon the subject of railway proxies, railway consolidations and stock waterings; a bill to regulate the transportation of freight by the railroad corporations, so as to prevent unjust discriminations; and a bill to insure a uniform system of accounts and a different system of reports.

—Of these bills, the one to create a board of commissioners became law; likewise the one, with considerable modification and amendment, upon the subject of proxy voting; also the one which prescribed a different method of rendering accounts. The other bills failed of adoption.

—During this period, the valuable reports on internal commerce, issued by Mr. Joseph Nimmo, chief of United States bureau of statistics, aided considerably in creating an enlightened public opinion on the relations of the railways to the state, and the part that they perform in the movement of the commerce and development of the industry of the nation.

—The New York commission bill was passed, and Gov. Cleveland, as one of his first acts after his installment into office, appointed Messrs. Kernan, O'Donnell and Rogers commissioners. The bill authorized the chamber of commerce, the board of trade and transportation, and the anti-monopoly league, to nominate one of the commissioners to the governor; and Mr. O'Donnell was so nominated by two of the three bodies, and the governor, under the bill, made the appointment.

—By the establishment of this commission, the long struggle between the railways of the state of New York and the people was brought to a close, favorably to the people. A body was now interposed, with power somewhat similar to that of the Massachusetts commission, between the people and the powerful railway corporations, clothed with authority for searching and continuous investigation and, in all probability, that body will prove to be a permanent one. The sense of responsibility in the performance of the task, together with the natural aptitude of intelligent men to

grow to the work they have in hand, will, in time, make this commission a valuable aid to proper legislation. The important interests constantly connected with the subject committed to their care, will cause the work of the commission to be carefully watched, and the strong temptations that are placed in the way of these commissioners, in consequence of the enormous wealth and power of one of the parties constantly before it, will inevitably cause the commission to act with prudence, for the purpose of shielding themselves against suspicion.

—During the same years, other states had parallel experiences with struggles for the appointment of railroad commissioners. There are now in existence fourteen railroad commissions in the various states of the Union, whose business it is to supervise and investigate, if not control, the railroad corporations within the state; to report such amendatory laws as in their opinion are necessary for the purpose of correcting the abuses incident to railroad management; and to cause actions to be instituted to prevent either violations of charter limitations or violations of the rights of shippers or passengers, which may be brought to their notice.

—During the last five years, efforts were made in the United States congress to create a board of railroad commissioners for the United States, to exercise over all the railway corporations doing an interstate business the same kind of supervision and control as is exercised by the various state commissions over corporations chartered by the several states. Almost *pari passu* with this attempted reform, an annual effort is made in congress to regulate interstate commerce, without the intervention of a commission, in the passage of a freight bill, in the nature of a *pro rata* bill, containing anti-discrimination clauses. Thus far, the advocates of the two measures have opposed each other, and no good results will probably be accomplished until the friends of federal legislation agree upon a commission bill, as the entering wedge to such legislation as should properly be passed by the United States, for the purpose of making this enormous interest, in the aggregate more powerful than any single state organization, amenable to the better concentrated public power, as represented in the United States congress. The railroad corporations, organized by the states, have thus far resisted, at every step, every attempt to make them amenable to federal legislation. Although many of these corporations derive their charter powers from several states, and substantially run cars over the territory of half the Union, they nevertheless insist that they are amenable only to such states as have granted them their charter privileges, and that the United States congress can not properly exercise any control over them. The necessity of the case, as well as sound logic, fights against their cause; and the time is not far distant when all the people of the United States, as represented in the general government, must take in hand the railway corporations of the United States, concentrated as they now are in power by becoming more and more under the control of a few leading minds, who can be gathered together in a single room of a private gentleman's house, and, for weal or for woe, can, and do, more materially affect the welfare of the people of the United States than can any representative body which has been organized in any of the states of the Union, or under the federal constitution. It is, therefore, not a figure of speech to say that an *imperium in imperio* has grown up in the community, which, by combination and concentration of power, is more powerful than the community, and that the question of making it amenable to

the general powers of the government is no longer one of expediency, but one of prime necessity.

—This brings us to a consideration of some of the general questions, which are as yet unsolved problems, with reference to the government of railways, either by the state or by private management.

—The general result of investigation upon the question of railways within the past fifteen years, in the United States, and the development that has taken place, both in railway construction and in many of the evils incident to railway administration, have modified both public opinion and the opinion of experts who are not blinded by personal interest, on the subject of the extent to which competition is a regulator of the price of service in railway transportation. It went hard for the free trader to surrender his faith in competition, and to admit that it is not a universally applicable principle. It has now been ascertained that, notwithstanding the enormous progress of railway construction in the United States within the past thirty years, railways can never be multiplied to such an extent as to make them compete in the same sense that grocers, butchers, hatters and shoemakers compete. They will be at war for a time, and then comes a long period of peace, when the railways work under combination even at competitive points. It is difficult to tell whether the war is not more injurious than the peace, so far as public interests are concerned. When there is competition between rival hatters, customers are treated alike at one or the other shop in the purchase of the commodity they want, and even if they were not so treated, no great harm would be done. A railway war is generally carried on secretly for a considerable period of time before open hostilities begin. Railways, in vying with each other, seek to obtain the more important customers from each other, and make concessions to larger shippers, which they are not ready to make to the smaller men. This instantly gives to the larger shipper so great an advantage in addition to that which he already has by reason of his greater capital over the smaller man in the same line of trade, that the smaller dealer does his business at a loss; he discovers that his formidable rival can offer goods at prices with which he can not compete, and he is frequently driven out of business or into bankruptcy by reason of a secret advantage which his stronger competitor has in transportation rates. Thus monopoly breeds monopoly, and centralization of business is built up, not by greater natural aptitude, but by injustice and wrong. Even during periods of railway peace these advantages are frequently got and maintained by the more formidable shipper for the purpose of tying him to a particular railway, with the mischievous tendency to make the poor poorer and the rich richer. This personal system of tariffs produces absolutely the same effect as unequal taxation. As the beneficial results of competition are not obtained by duplicating lines such additional routes are an evil rather than a good. The large expenditure of capital in creating the duplicate line might have been saved, since but very few railway corporations in the world have their road bed taxed to their maximum capacity. The existence of the new line built for competition is in reality an investment of an enormous amount of capital to divide the traffic which the existing line is perfectly competent to carry, and results in the traffic being done at a very much greater expense for fixed charges than if the existing road had added to its rolling stock facilities and had been permitted alone to accommodate such traffic. When peace is made, rates are fixed so high as to afford a reasonable expectation of a

return upon a very large amount of capital unnecessarily expended in the building of so-called rival lines. This has led to the general conviction, that, for economizing capital and producing, through these instrumentalities of commerce and of trade, the maximum result for the benefit of society, it would be better were we to start *de novo*; and instead of dealing with existing conditions, to transfer to a corporation a definite field for its operations, under strict supervision of its tariff rates, and to stipulate that the corporation shall not be interfered with as to the field so long as it keeps down its rate to a certain percentage of profit. At almost every western point, whether in Colorado, Utah or Arizona, we find railway corporations just constructed, and who operate upon their roads two or three trains a day all included, threatened with rival enterprises, which propose to divide between them the little traffic that there is, and to destroy the profitableness of the capital investment in the original line, so that in the end the business divided between them, at extortionate rates, is not sufficient to pay for operating expenses and fixed charges on both capitalizations. But we are not now called upon to deal with this question *de novo*, as railway development in the United States has proceeded to a point to make assignments of fields almost impossible of accomplishment through the instrumentality of legislation. The railway companies themselves are beginning to discuss the expediency, as a matter of self-preservation, of coming to some agreement as to fields between them. This, however, will be extremely difficult to accomplish by voluntary action. However faithfully existing railroad corporations adhere to an agreement not to invade each other's field, the absence of legislation holding the railway corporation to a strict accountability as to charges within the field with reference to which it by common consent thus obtains a monopoly, makes such an agreement one that the courts would probably declare void as against public policy, and it would, in reality, in the absence of such supervision and control, be a conspiracy against the public. That the railway corporations already discuss these questions, and begin to regard the occupation of a field as a right arising from the circumstances of the case in favor of the particular railway occupying it, is an indication that the railways themselves have abandoned all pretense of competition in the same sense in which that term is understood in private enterprises. The practical consolidations rapidly proceeding under the commissioner-ships such as that of Fink's, will tend somewhat toward the solution of this problem, because it will enable the government to deal with these corporations upon the basis of their dealing with each other, and at some day or another to practically appoint fields to conglomerate bodies of railway corporations in following out the line traced by their voluntary action.

—One of the peculiarities of railway competition is, that the unsuccessful competitor in a railway war, driven to insolvency, unlike the unsuccessful competitor in mercantile life who is driven into insolvency, is not thereby driven out of the market. The insolvent corporation becomes in many respects a menace to the solvent corporation more formidable than it was in its solvent condition. It begins, in railway parlance, to "run wild" after its insolvency, being exonerated from paying interest upon bonds, or dividends upon stock. Being required to earn simply operating expenses, it carries on a war of rates with a recklessness that threatens to break the solvent corporation fighting it into the same condition of insolvency. Therefore, during the active railway war of 1875-7, carried on between the New York Central, the Erie, the Baltimore & Ohio and the Pennsylvania railroads, the more favorably

placed New York Central railroad did not dare to carry the war to a point which would drive its adversaries into insolvency, lest the insolvency of the Baltimore & Ohio railroad, and possibly of the Pennsylvania railroad, might threaten the solvency of the New York Central. The motive and the facility for combination are so great that combination will almost invariably take the place of competition; and railway managers and legislators must now recognize as a fact that the railways are not and can not, without the interference of government, be subjected, within any period of time about which we need give ourselves any concern, to the law of competition to that degree that we may look for the same results as in other departments of human activity, with any confident expectation of maximum results to society at minimum expense. The natural law of competition being inapplicable, the question of governmental interference, therefore, resolves itself simply into one of degree: how far is it expedient to regulate railways by the public? and that depends very much upon other questions to which in this country we can not shut our eyes.

—As political machinery has, by a vicious party system which by no means can find its complete corrective in the rules of civil service reform, more and more insidiously divested the people of self-government within the past generation, we are in a condition in which is presented the question when we speak of governmental control, not whether the railways shall manage themselves, or the people, through the government, shall control their management, but whether the railways, banded together in organizations, having at their head powerful, astute, intelligent and somewhat unscrupulous men, shall, in affairs in which they have a large interest and in which they must pay to public welfare some regard, varying in degree according to circumstances, manage those important trusts, or whether the politicians, equally unscrupulous and astute, but not quite equal in intelligence as banded together in party machinery, shall, in the interest of those political organizations which represent even more remotely the public interests than the railway direction represents them, manage those important trusts for them. There are many important reforms, therefore, in our governmental machinery which must proceed contemporaneously with the transfer of power from the corporation management to public control before we can hope for any great relief from public control as compared with corporate management. It is, therefore, well to proceed slowly even in a proper direction until the machinery of government in the United States shall be emancipated more from the bossism, political corruption and chicanery concomitant and attendant under existing representative and party conditions. It must be admitted that the direction must be toward governmental control, but this imposes upon the people of the United States the duty of making its governmental machinery fit to exercise such control. Neither the state nor federal machinery is as yet in that condition.

—Another important question which must be taken in hand with reference to railway management, is to find some proper-basis for railway charges. The doctrine which now prevails among railway managers, of charging the traffic all that it will bear, the basis upon which its classification as well as its tariff rates depends, is monstrously unjust, and should be radically changed. It is true that the responsibility on the part of a corporation for the carriage of a case of silks is greater than it is when it carries a bale of cotton. But the difference in the rate charged is not based upon the slight premium which would represent an indemnity fund for the losses they might possibly

incur by the loss of the package, but the difference is based really upon the supposed profit that the merchant or jobber makes on a case of silk as compared with the bale of cotton, and that he can afford, therefore, to divide with the railway the larger amount in the general result. This makes this service differ from that of any other rendered under competition in society. What regulates prices ordinarily is the cost of production, not benefit to the consumer. The ounce of laudanum that is intended to cure a toothache costs at the store of the druggist the same sum as the laudanum which is to save a life. The use to which the object is to be put, or the benefit conferred upon the consumer, does not affect the price. It is said, in answer to this position, by the railway manager, that he must regard his traffic as a whole, and that, by reason of the greater value of these first-class goods and the higher charge which he can make on them, he is enabled to carry the lowest price goods at a rate at which they can be moved, and that, if he were precluded from charging the higher rate on goods as readily handled, but which are much more valuable in money, he could not carry ores, coal or stone at any such rate as would justify their transportation from place to place. There is force in this position, but not to the extent to which it is claimed, and in that respect intelligent investigation and careful governmental control will have to strike a mean which will be more just than the existing classifications, and so adjust the rates both to consumer and producer as to enable all classes of commodities to be moved without doing injustice to the railway corporation.

—The application of the doctrine of charging what the traffic will bear, substantially makes the railway corporation a special partner, without investment of capital, in every enterprise along its line. The extent to which unscrupulous traffic managers and agents can, for their private emolument, carry this power of enforced copartnership, and that this power is availed of, is exemplified in the fact that on comparatively moderate salaries these traffic managers very often do become men of great fortunes, within a very few years. It is a power to which modern society has known no parallel since the days of the farmers general of France, who, in consideration of a sum total paid into the French treasury during the corrupt regency of the duke of Orleans, and the reign of Louis XV., obtained the privilege of having a section of France farmed out to them to tax at their own will. It is therefore absolutely essential with reference to transportation lines, that without thereby fixing absolute rates, severe penalties shall by legislation be imposed for breach of the public trust for personal ends, and also stringent penalties imposed upon the making of discriminations between persons of the same locality. It is likewise the duty of the public to see to it that some unit, whether car load or train load, be established, upon the basis of which all shippers shall be treated alike, and to place the smaller shipper upon some basis of equality with the larger shipper. The smaller shipper should by law be permitted to avail himself, in combination with other people, of the car load unit.

—Maximum charges have, in the experience of England, been found to be almost universally useless. The economies in railway traffic arising from steel rails, improved roadbeds, better gradients, the greater power of engines, reduced rates of fuel, and through lines obviating breaking of bulk, have been so great within the past fifteen years that any fair rate at one period of time becomes at any other period so excessive as to cease to be a criterion. Maximum rates, therefore, when fixed, must be so arranged as to be under the supervision of some tribunal commanding public

confidence and authorized to exercise such supervision, and to be from time to time registered upon a lower scale with reference to cost of traffic.

—A serious grievance in relation to American railway administration arises from railway tariffs being secret, and subject to sudden changes or modifications. No tariff of transportation rates should be permitted to be changed, except upon previous notice of a considerable period of time. Even the lowering of a tariff rate produces at the outset as much financial and commercial disturbance as the raising of it does. It is said that the knowledge obtained by the officers of the Standard Oil company in 1880, that the tariff rates on oil would be suddenly increased by the railroad corporations, gave to that combination a profit of several millions of dollars. Whether true or not, is immaterial. It is possible for special favored private interests to be informed secretly of an intended sudden change of tariff on an important commodity. In consequence of that information, which necessarily changes the price of that commodity at the point of delivery or at the point of shipment, the making of a purchase or a sale in advance, based upon that knowledge, gives absolute certainty of a large profit, which is so much wrested from those who do not know it. This is an advantage which should not be permitted to remain in the hands of railway administrators to make use of, either for personal ends or for the benefit of friends as they may see fit. A law, therefore, providing with great stringency that all tariffs shall be published for at least six months in advance, and that no modifications thereof shall be permitted during that time, is a necessity to avoid this mischief. Tariffs also should be published at every station, with classifications, so that every man doing business with the railway corporation should be permitted, at a glance, at every station either of delivery or of receipt, to compare his freight bills with the published tariff rates, and see to it that he is fairly treated. Every deviation from the tariff to a favored shipper should result in imposing upon the railway corporation that allows such a deviation the payment, to every other shipper, of a rebate based upon the lowest shipment made. This penalty would be so severe that there would be no longer any favored shippers, and it is right that it should be so, because, of all evils incident to American railway administration, that of personal favoritism has been the most shameless and the most mischievous.

—Another problem presented by the existing condition of the railways in the United States, is that which arises from secrecy of management. This evil must be dealt with radically. One of the prime motives for secrecy of management is the enormous advantage which at the present day it gives to the managers in the maintenance of their power. They alone know where the stockholders are to be found, and can therefore control votes by the knowledge of how to reach or buy them, thus perpetuating their control. Another motive is the advantage thus afforded for stock speculations. The board of managers, by keeping unto themselves the knowledge that their property is losing heavily in comparative traffic, can sell their own holdings and go short of the market, under circumstances which will yield them an absolute certainty of profit on the transaction. This gives them an enormous advantage over the community by depleting the pockets of the unwary, who find themselves saddled with stocks at high prices, bought months in advance of the public announcement that the road is in difficulties. The knowledge of rapid gains in the development of business likewise gives, so long as it can be kept secret, a like advantage in purchase of stock. This advantage has been exploited to such a degree in the United States that the

investing public has become inspired with a general distrust for railroad stock investments.

—In the states of the Union and in the United States the existing condition of legislation which gives the absolute control of corporate enterprises into the hands of majorities of stock, and which gives to such stock equal weight, lends itself to this species of management, and places the stockholders' interest, as well as the public, at the mercy of this class of railway directors. The majority of the holders of record at the time of the closing of the books of a corporation, have, at the annual election, the power to elect the whole board of directors. As much of the stock of great railway lines in the United States is held abroad, and is not transferred on the books to the actual owners of the property, but remains registered in the names of the persons who had long before parted with all interest therein, there is, at the time of the closing of the books in a great many of these railroad corporations, a large fictitious holdership, ranging from one-half to one-eighth of the whole capital stock holding interest, and this fictitious holding frequently controls such election. Who are fictitious and who are true holders are, as a general rule, approximately known to the directors. The directors, therefore, can sell their real holdings at high prices, and can purchase at low prices the fictitious holdings or power to wield proxies, and thus, for the purpose of depleting the road, capture the railway, in which neither they nor the constituency that elected them, have a substantial interest. This evil also can be remedied by legislation. Severe penalties should be imposed upon any one, having no interest in the corporation, offering to vote, or voting, either personally or by giving a proxy to vote, at any election of directors of such corporation.

—The severest blow, how ever, which could be dealt to corporate mismanagement, would be the rigorous introduction of minority representation in boards of direction, which would make secrecy of management, as against the interest of shareholders, substantially impossible, and would prevent the possibility of the recurrence of some of the worst abuses which characterize their administration. Suppose twenty directors were to be elected, the reform would consist in allowing each section of one-twentieth of the stockholding interest to elect one director, by accumulating their votes upon a single name, or by distributing their votes for one or more, as they may see fit. This is the cumulative plan. Another is the preferential or list plan, in allowing each twentieth part of the constituency to elect one director, by preferences indicated on a ballot, in the order of the names as printed. When the first name has a quota sufficient to elect him, *i.e.*, one-twentieth of the votes cast, the ballot is counted for the second name, and so forth. The result of this system of minority representation would be to make of the board of direction a reduced photograph of the whole constituent body, and make it impossible to capture an organization like a railway from the actual owners thereof. Any one of the numerous plans suggested for securing minority representation, if applied to corporate management, would successfully accomplish that result. The objection which has been urged to the adoption of minority representation in public representative bodies, has no validity to corporate elections, as in corporations neither localities nor persons are supposed to be represented, but pecuniary interests only. It would better secure fair representation than does the English system of diminished value of votes in proportion to stock holders' interests, *i.e.*, one vote for every share up to ten, an additional vote for every five others beyond the first ten, and one vote for

every ten beyond one hundred shares; or the classification plan, by which only a few directors of the whole retire each year; minority representation would give permanency in management, and prevent the swamping of the interests of the smaller shareholders.

—*Pro rata* tariffs are the refuge of people of little thought on the subject of railway management. It is fair that for the haul or for the car load alone there should not be permitted a higher rate for the shorter distance than for the longer, as it is manifestly unjust artificially to wholly wipe out and even to reverse the advantages of proximity to the market; but to arrive at anything like a just conclusion on this subject, it will be necessary for the railways themselves, or through legislation to be compelled, to make a distinction in their freight rates between what they charge for terminal handling and what they charge for the haul. The terminal handling at a great market is effected on so large a scale that it can be done at very much lower rates for each particular package than the terminal handling at a way station. The cars are more likely to be filled than they are at way stations, so that a perpetual difference must exist in favor of the facilities of commerce which the great centres of activity produce. This would be represented by lower terminal charges for places like New York, Buffalo and Chicago, than at the small way stations or small hamlets along the line. And the haul would be proportionately much less, and justly so, from extreme points of concentration of freights to extreme points of market, because the whole train loads would go unbroken straight through. On the other hand, it should not be permitted to be so much less as to invert the situation, and to make the more distant point more favorably situated to the seaboard than the nearer point.

—*Pro rata* freight rates disregard the laws of commerce in that particular, and must therefore be receded from wherever introduced. On the other hand, we must not be blind to the justification which lies at the root of the demand for *pro rata* rates, *i. e.*, the unrighteousness of inverting the natural situation, which is ordinarily done under the spur of a railroad war at competitive points, under the effect of which the intermediate localities, which are at the mercy of the monopoly power of the railway, must suffer the burden of the war. This can be remedied only by legislation, but in that particular care must be taken that the legislation shall not go too far, as in doing so it defeats its own ends, because it becomes impracticable to work under it, and the repeal of the law leaves matters worse than before the law was enacted, as the unsuccessful law is used as an argument against the expediency of any law on that subject.

—A director found speculating in the stock of his own road, either by purchase on margins or sales on margins, should be severely punished. The temptation to sacrifice the interests of the road to subserve his stock operations is too great to be permitted to exist. The man who desires to speculate in the stock of his own railway should be required first to leave the board of direction; if he fails to do so, he should, on detection, be punished as a malefactor.

—The fictitious capitalization of railroads in the United States is an evil more difficult to deal with. Many motives combine to create such fictitious capitalization. Some are justifiable, others are sinister. Take the case of a mining property. A prospector

discovers a silver mine; he sells it for \$30,000 to a capitalist in the neighborhood. The property is not developed; the discovery may amount to nothing. It may also be worth millions of dollars. The capitalist, the first investor, spends a few thousand dollars in developing the property, and thereby ascertains that the leads open into a vein within the domain of the lines of the stakes. He has his ore analyzed, and discovers that it yields from sixty to eighty dollars a ton. He thereupon proposes to sell this property, and does sell it to a stock company, who capitalize the property at a million of dollars, pay him a hundred thousand dollars cash, and something less than half the capital stock, and with the remainder of the capital stock, they supply the treasury sufficiently to develop the property. They find some takers on the basis of a million; others on the basis of half a million; others on the basis of a quarter of a million; but, as it is possible that the mine may be worth a million of dollars by capacity to yield sufficiently to pay interest upon such a sum and to return the capital invested within a given period of time, there is no public wrong in such fictitious capitalization, unless it is accompanied by fraudulent pretenses. The injury, if any is done, is limited also. The individual has invested his money at an excessive valuation, and there is an end. Railway corporations are, however, organized upon fictitious capitalization upon a different basis. A line from one point to another, say a distance of a hundred miles, is surveyed. It is ascertained that it will cost about \$15,000 a mile to build, including acquisition of land, and about \$5,000 a mile to equip; a total of \$20,000 a mile. Application is then made for town and county aid, which aid is generally represented by investment in the stock of the road. The first purpose is to give as little as possible in the way of value in return for such money aid, and it is, therefore, necessary to interpose between the stock and the property a sufficient number of mortgages to make the prospective value of the stock of little or no value. A construction company is then organized, which takes the town and county aid as part of its capital, and the railway corporation, instead of making its contract upon the basis of cash, issues to the construction company, say first mortgage bonds of \$20,000 a mile, or possibly \$25,000 a mile; second mortgage bonds of \$20,000 a mile, and stock of an equal sum, making a total capitalization of \$65,000 a mile, instead of the \$20,000 a mile at which the road could be constructed. The construction company is composed generally, directly or indirectly, of the officers of the road and their friends, who build the road upon the basis of cash obtained by negotiating through bankers the securities represented by the bond issues of the railroad company; they acquire the stock for little or nothing, and also frequently a large proportion, if not the whole, of the second mortgage, and in prosperous times they may succeed in building and equipping the road on the issue of the bonds secured by the first mortgage alone. By this system the road comes into existence laboring under the necessity to earn, over and above operating expenses, interest on a funded debt, about double the cost of the enterprise, and, if possible, to earn dividends on the stock beyond that sum. That this rate of earnings has been accomplished in the United States to a very considerable degree is an illustration of the remarkable development which the country has experienced in every direction during the past twenty years, and is an illustration, likewise, of the enormous growth and progress of all material interests which have taken place; because this mode of stock and bond issue is the all but universal rule with reference to the construction of new lines in the United States.

—The excuse made by railway builders for this course of proceeding is, that upon the basis of an ordinary profit no one would undertake the extremely hazardous task of introducing railways into new territory. The peculiar risks incident to such an enterprise are, that if the traffic fails to come they lose their money, and if the traffic develops they are in imminent danger of being immediately compelled to divide such traffic with some other rival line; that, therefore, they must find the return of the capital and their profit, not in waiting for the development of the business, but in selling bonds and stock to the investing public upon a basis of fictitious value. So long as investors purchase without proper investigation this class of securities, it is difficult to see how they have any ground for complaint; as the mode of manufacturing these securities is sufficiently well known to be a matter of public notoriety. As to the people at large, however, the effect of this fictitious capitalization bears a different aspect. It is true that the cost of a road and its capital account have but little to do with the rate at which it is required to carry to and from a few competitive points. It has, however, very much to do with the fixing of the local rates, and is a constant incentive to increase the rates for the purpose of paying interest and return upon all the capital issues of the road. For the state to interfere and absolutely forbid any false capitalization, which is, in other words, the anticipation in the capital account of the development in time of the traffic, would probably interfere considerably with the undertaking of new railroad building, unless such interference and prohibition are accompanied with some guarantee of the field.

—The two evils, unrestricted competition in railroad building and false capitalization, hang together. Were railway projectors secure that a certain territory would be left in their possession until they could receive back the return of their capital and a reasonable percentage on the outlay, there would be no reason for continuing the incentive to railway construction of false capitalization, so that the promoters can immediately obtain by means of this quasi-fraudulent element a return and profit for the outlay of their money; they could then contentedly wait to receive an adequate return for their money upon the basis of a capitalization bearing a close relation to the actual cost of the construction and its equipment. Justified as is the opposition to stock watering, both on the part of the investor and on the part of the public, the reform of this evil can only then be safely entered upon, so as not to avoid materially checking new railway enterprises, with a concomitant change in the policy of the state governments as well as the national government, recognizing the fact that railway construction should not be left to absolute free competition, but is a trust which should be given with circumspection, and, when given, surrounded, first, with guarantees to the state and to the people that the men who undertake it will faithfully perform their trust, and secondly, with guarantees from the people and the state to the *entrepreneurs* that they will permit them for a given number of years undisturbedly (under limitations as to charges) to obtain the advantage of the traffic development which their enterprise has created, without incurring the danger of being compelled to divide such traffic with another organization, which takes possession of the developed field, not to render additional services to the public embraced within its line, but simply to take away from and divide the income of the existing road.

—There is no question but that the system is entirely vicious, but it is a system that has its roots in the false path which the public has traveled in relation to railway

enterprises by treating them as private enterprises instead of public ones, and therefore has given a basis for the railway speculators point of view, that it is their business, and not the public's business, at what rate they see fit to capitalize their roads; and, as the public gives no care to protect the railway constructor in his enterprise, the railway builder, in his turn, imagines that he owes nothing to the public in that regard.

—Mr. Poor, in his introduction to his Manual for 1883 (and he speaks from the railroad point of view), can not but admit "that the increase of share capital and indebtedness of the railroad companies for the three years ending Dec. 31, 1882, was \$2,023,646,842, the average cost per mile of the new roads being in round numbers \$70,000." He estimates that the cash cost of all the railroads built in the United States in the last three years did not exceed probably \$30,000 per mile, or \$900,000,000 in all. He estimates, therefore, that more than half of this enormous capitalization is entirely fictitious. He says, with great frankness, "Of course such an enormous increase of liabilities over cash outlay is to be greatly regretted, and is well calculated to create a distrust of all securities, good and bad." There is an abuse connected with railway administration which requires legislative remedy—the granting of the right of way for telegraphic purposes at the same time with that for railway purposes. With every extension of an old railroad or the building of a new one, the Western Union telegraph company is ready to step in and stretch wires for the new corporation or line, under a contract that the railway company gives to the Western Union telegraph company the exclusive right to maintain the telegraph service to the towns and stations along the line, in consideration of which the railway company can, for its purposes in the management of its road and in the dispatching of its trains, use the telegraph line thus built. This gives to the telegraph line a free right of way; and, as the railway in all territory west of the Mississippi and south of the Potomac is in reality the main line of travel, along the line of which towns spring up and population congregates, it gives to that particular organization an enormous advantage over its competitors and all new organizations, inasmuch as it not only gives the free right of way along the line of the railways, but an exclusive service in connection with the railways. This abuse, which as yet has scarcely attracted public attention, came to the surface only during the recent controversies in relation to the stock waterings and acquisitions of rival properties by the Western Union telegraph company. This is also difficult of remedy without legislation recognizing the monopoly character of railroad and telegraphic enterprises, and should, if permitted hereafter, be allowed only on condition that such field may be secured in consideration either of lower charges to the community, or providing some species of sinking fund by which the community shall ultimately acquire the property.

—This brings us to the final consideration of what is the probable future of the railway question in the United States. The railways now represent an aggregate capital of something approaching \$7,000,000,000. A considerable proportion of that total capitalization is in the hands, or largely under the control, of less than one hundred men, who are not the highest type of modern civilized life. After giving them credit for business capacity, shrewdness and intelligence, there are still lacking some elements of character which are created by living up fully at all times to contracts, the basis of the modern social organism. Unlike increase of capitalization in any other

business, increased capitalization in railroad enterprises does not increase the number of great capitalists engaged in the business, but has a tendency to decrease them, because amalgamation and consolidation proceed with greater rapidity than extension of mileage. Compared with the power represented by this vast aggregate of capital, the power and the influence of nobility in any civilized community are small.

—One of the arguments in favor of a great national indebtedness at the time when it was in process of growth, was, that, though unfortunate for the country to be compelled to roll up so large a debt, yet it had a counterbalancing good, inasmuch as it interested vast numbers of people in the success of the government and in its stability by the pecuniary interest of the bondholders. As the indebtedness of the United States was, at its very highest, less than one-half of the aggregate capital now represented by the railway interest, it is clear that there is a larger pecuniary interest on the side of the railway to-day, arising from capital investment in its obligations, than there was at any time on the side of the government. Railway capital is now *four* times the amount of the public debt. In any contest, therefore, between the government and the railway enterprises, it is clear, that, so far as mere pecuniary interests are concerned, the railway enterprises largely preponderate. Adding to this the circumstance of the concentration of this great railway power in comparatively few hands, the extent to which they can corrupt the commonwealths is practically limited only by their will.

—At the time of the institution of the government of the United States and of the various states, European governments were great monopolies in the hands of the few. From the corrupting influence of a like power American statesmen sought to shield the American people. Governmental responsibility and prerogatives of executive power, instead of being centralized, were diffused and split up, and to a large extent sacrificed, for the purpose of creating a larger degree of individual freedom. The governments of the states of the Union were therefore loosely put together, so that public opinion could break through at any point and influence them. Permanent large ownerships of land; titles of nobility, special privileges and great accumulations of capital were guarded against by abolishing the right of primogeniture, of patents of nobility and of accumulations. The corporation was but little extended, because credit was but little developed at the time of the organization of the United States government. Hence it was not observed that some of the evils which were thus carefully intended to be guarded against, such as primogeniture and accumulations, were allowed to come back in more aggravated form through the perpetual existence of the corporation, making a continuous increase of capital accumulations possible through its instrumentality, with the aggravating circumstances, that, instead of those vast properties being in the hands of individuals responsible for their right conduct in their individual capacity, and distributed by the natural process of death into a greater number of portions, the great accumulations and vast possessions of modern times are under the control of boards of directors having less immediate responsibility than the individual to legal influences, and being less governed by considerations of a social character properly to administer their trusts. The United States constitution and the constitution of the states contain provisions against unjust taxation by carefully worded provisions that taxation shall be equal. The amount collected for freight and passenger traffic in the United States by the railways of the United States in 1882 was

\$770,000,000, an amount double that of the revenues of the United States government. Every dollar of this, as to mode and manner of expenditure, is in the hands of boards of direction, with scarcely any accountability to the public, and but a very remote one to their own shareholding interests.

—In every presidential election for the past twenty years the railway corporations took an important part. In the election of governors in the various states and in the formation of the state legislatures, in influencing appointments of committees, they play a significant rôle, and one which is scarcely any longer disguised. They do this avowedly on the theory of self-protection; but no irresponsible body ever stopped short at self protection, because the power which enables them to protect themselves against aggression is likewise a power which may be wielded in aggressing upon the rights of others.

—The mode and manner of the collection of this revenue is not yet amenable to public control in the United States, and yet the cost of transportation more closely resembles taxation in all its incidents than any other method of receiving return for services in the industrial world.

—When the railway corporations, under the administration of Mr. Fink, in July, 1882, raised their rates on west-bound freight from New York to Chicago, from forty-five to sixty cents per hundred pounds on first class, from thirty-two to fifty cents on second class, from twenty-six to forty cents on third class, and from nineteen to thirty cents on fourth class, every commodity transported from New York to Chicago had this additional tax imposed upon it as part of its cost of production in Chicago, in the same manner as though the government had imposed the tax, and there was little and even less possibility of escaping from that imposition than there is from a governmental tax.

—It is, therefore, of at least as much importance to a community to be fairly and equitably dealt with in its cost of transportation as it is to be fairly and equitably dealt with as to taxation. And unfairness and injustice in the cost of transportation bring about the same disastrous consequences to individuals and to classes as unfair and unjust taxation does. It is indeed, a mild statement of the case to say that the injury inflicted by the unfair cost of transportation is as great as that inflicted by unequal taxation, because the mischievous consequences of unfair or unwise transportation rates are necessarily greater than those that arise from unequal taxation, and dry up, more rapidly than would bad taxing laws, the prosperity of a community. Therefore, by carefully worded constitutional provisions, to protect the community from the evils of oppressive and unequal taxation by government, and then to leave this great and growing power of private taxation without responsibility to government in its administration, is to guard the public against the ravages of the wolf, and to leave it unguarded from the attacks of the tiger. That already the legislative bodies of the states of the Union are as wax in the hands of the modeler under the manipulations of these great corporations, is a truth which, in all the more densely populated states, in the north and the east, the people have been made to feel. How to get back their control, and yet not change it into a control of a very dangerous character, by adding the supervision of the expenditures of the enormous revenues of the railways to the

supervision of the enormous revenues of the United States, and of state and local administrations, administered as they are in the main by politicians not much, if any, above the status of the railway magnates, is probably the most serious problem which, since the abolition of slavery, has confronted the people of the United States. There is much keen perception and wisdom in the way Professor Sumner puts the relation of the government to the people in the United States, when he says that the government, in the abstract, is all of us, and, in the concrete, some of us, who, by accident or chicane, obtain control, and those some of us not the best of us, and that, therefore, it always becomes a serious question what these some of us should be permitted to do for all of us. Therefore, no heroic measures can, in the present aspect of political conditions in the United States, safely be entered upon. These very political conditions suggest a possible point of view from which we can regard this powerful *imperium in imperio* of the aggregated railway corporations as something other than an unmixed evil. The corruption of our political machinery has proceeded almost simultaneously with the growth of the railway corporation. As the basis of civilization, the security of capital is certainly of as much importance to a community as its form of government. Peoples have become civilized, and enjoyed a certain degree of prosperity, under forms of government other than our own. No community can enjoy prosperity, or attain any high degree of civilization, where property rights are not secured. Property protects itself best from aggression, or unjust tribute, when it is congregated under corporate management, in few hands, because it becomes, in its centralized form, capable of wielding a power which the politician is bound to respect. Under the corrupting conditions of existing administrations, it has, perhaps, been one of the modes of preserving property from the grasp of those who, in national, state and municipal governments, represented public power ostensibly, but really represented their personal interests first, and party caucus and boss interests in the second rank. In the long run, however, this condition becomes intolerable. No community can safely pursue its course of happiness and well-being where the actual highest power wielded in the community is not responsible to the people, where its government is a mere simulacrum, and all real power is moulded behind the throne by a moving power. It is just as objectionable if this moving power be a band of railroad directors who move the government, as that it should be the mayor of the palace, a church institution, a cabal of courtiers or loose women. Against such an insidious power the ballot is ineffectual, and even revolution almost hopeless.

—It is, therefore, essential, as a necessary part of the solution of the problem before us, that the people of the United States should awaken to the fact that their methods of legislation and their methods of selecting legislators, their political organization and political administration, must be reformed as well as the railway administration, and that the amenability of railways to the public is very largely dependent upon such reform in political administration. The civil service reform is already a step in the right direction, and its permanent establishment will make thoughtful investigators on current events less fearful of clothing governments, both state and national, with the additional powers necessary to cope with the railway problem. The other more important reforms, however, are those of methods of legislation and representation. (See LEGISLATION, REPRESENTATION.) The people must concede, once for all, that the line of policy as to railway management has proceeded upon a mistake. They must recognize the fact, that in all services, the supply of which is limited to a certain

locality, and which, as to such locality, can practically be indefinitely increased without proportionately increasing the plant, there is a monopoly character implanted upon such service, whether it be the supply of ways and means of transportation, of gas, of water, of electricity, or of motive power on some general plan, which takes these enterprises out of the domain of competition, and compels a treatment separate and apart from that of strictly private enterprises. Some modification must be made, limiting the existence of corporations, so that from time to time something analogous to the service that death performs in the individual world shall happen to their accumulations and power. Some plan should be provided, by way of sinking fund, or gradual acquisition by the government, by which enterprises of this character shall in time become the property of the state. Such a plan of compulsory sinking fund to repay capital must, of course, in all cases be accompanied by some guarantee against invasion of the field by other organizations; and, as Mr. Fink observes, in his answer to inquiries of Mr. Nimmo, in his report for 1878, "In the consideration of this subject one important fact should always be kept in view, to-wit, that the effect of the construction of a greater number of railroads than are necessary to accommodate the traffic, is to increase to a great extent, not decrease, the cost of transportation. The interest on the cost of two roads built for the purpose of transacting the business that could be transacted by one, and the cost of maintaining the two roads, are of course twice as much as the interest and the cost of maintaining one road." The interest and cost of maintaining a road, he estimates as from 40 to 60 per cent. of the whole cost of transportation. "It follows, therefore," he continues, "that for every additional road built for the purpose of transacting the business that could be accommodated by the road already built, the cost of transportation is increased from 40 to 60 per cent." This truth borne in mind would enable the government to give practical control of the field, without thereby adding to the cost of transportation. It could at all times annex the condition that no more than a certain percentage of profit shall be earned, and that out of this surplus a sinking fund shall be provided, to repay capital outlay, and that, when the cost shall be repaid, the road shall become public property.

—We are very far yet from this solution. The course which is likely to be run in the United States in regard to the railway problem is the extension of the commissioner system by state legislation and its adoption by the federal government. A mass of light thrown through the investigations of these bodies upon the subject will make matters appertaining to railway administration more generally understood by the people of the United States. And, by the time the railways are ripe for more heroic treatment of the question, the people in all probability will also be ripe to treat it more intelligently, and will have made such progress in the moral development of the administrative machinery of the government that the additional powers to be intrusted to that machinery can safely be to it delegated by the people.

## RANDOLPH

RANDOLPH, John, was born in Chesterfield county, Va., June 2, 1773, and died at Philadelphia, May 24, 1833. From 1799 until 1813 he was a democratic congressman from Virginia. After 1801 he was for some years the administration leader in the house; but in 1805 he quarreled with his party (see QUIDS), and for some years he was a free lance, claiming to be a better democrat than the dominant party, and yet opposing the embargo and the war of 1812 in company with the federalists. He was out of congress 1813-15, having been defeated by Jefferson's son-in-law, John W. Eppes, but was again in congress 1815-17, 1819-23 and 1827-9, and in the last interval was United States senator, 1825-7. During a part of the year 1830 he was minister to Russia.

—Randolph's attenuated frame, his shrill voice, his powers of bitter sarcasm, his extraordinary eccentricities of speech, dress and manner, his pride of descent from Pocahontas, and, with it all, his real political power of thought, made him the problem of his own time. He was variously supposed to be crazy, emasculated, or guilty of some enormous secret crime; but he seems to have been only a supremely selfish spirit, loving a few others because they belonged to him, and his selfishness was concentrated into disease as they were taken from him by death.

—See Garland's *Life of Randolph*; F. W. Thomas' *John Randolph*; Parton's *Famous Americans*; 2.5 *Harver's Monthly*; 103 *North American Review*.

## REBELLION

REBELLION. By rebellion is understood the act of resistance by one or more individuals to lawful authority acting within the limits of its power. Insurgents are those who attack the government with the intent of overturning it, and rebels those who refuse to obey it. It is true that rebellion quickly becomes insurrection. The distinction between them, consequently, exists especially at the beginning, but exact definitions are necessary in political language. Rebellion is, at bottom or in principle, a refusal of obedience, which manifests itself either by violence and assault, or by passive resistance.

—There is no rebellion unless the public force, against which the rebels rise, be acting in the execution of the laws, or of legitimate orders of the authorities or the courts. This is the essential element of rebellion. When peace officers act outside of their right, or exceed their power, resistance is not rebellion. This principle was written in the Roman law (see law 5, of the Code *De jure fisci*); it was even taught in French law by Jousse (*Traité des mat. crim.*, vol. iv., p. 79). In such a case, the act of the officer is an act of brute force. But the presumption of legality is in favor of the officer, and it is for the person who believes himself to have the right to resist, to show grounds of excuse in justification. And, further, when a public officer acts within the limits of his power, an irregularity of form which clouded his title or acts would not constitute an excuse, because then the officer commits no violence, and at bottom his title and acts are legal. But if, for instance, the officer purposes to make an arrest, except in the case of *flagrante delictu*, or to effect an execution without a judgment, resistance is an act of lawful defense, provided that it does not go beyond the bounds of strict necessity.

—These are the least serious cases of rebellion. They are what may be said to constitute petty rebellion. Rebellion, in its greatest development, goes much farther than contesting the acts of a police officer; it calls in question the very government whose orders he executes; it raises against the government the same objections, of incompetency, or of exceeding its powers, which we have just supposed in the case of public officers. The same principle, as to the lawfulness of the resistance, must be applied here.

—Rebellion, we have said, may show itself without violence, and be entirely passive. Thus, breaches of certain legal obligations are, in our opinion, acts of rebellion. If the commander of an armed force refuse to cause it to act, though he be lawfully required to do so by the civil authority, he deserves, according to our idea, the title of rebel, quite as much as the wretch who meets a sheriff with a blow from his fist.

F. A. HÉLIE.

## REBELLION, The

REBELLION, The (IN U. S. HISTORY). The name rebellion has been retained in this article for the struggle of 1861-5, in preference to that of civil war, which has latterly obtained considerable currency as a milder expression. Whether it was a rebellion or a civil war could only be decided by its result. If it had been successful, it would have decided that the United States had never been a nation in its domestic relations, and the conflict between the states of a voluntary confederacy might very properly have been termed a civil war. As it was unsuccessful, and as the nation maintained its previous and future entity, the logic of events has stamped the struggle as a rebellion by individuals, not a civil war between states. It is true that many of the enactments of congress and of the judicial decisions from 1861 to 1867 can only be explained on the theory that the war was maintained against states: these instances have been collected by Mr. Hurd, as cited below. But they are opposed by more numerous instances to the contrary, and are rather proofs of haste than of a consistent theory or policy. Legally, it may have been a civil war as well as a rebellion; politically, it was a rebellion only. Mr. A. H. Stephens, who regards the struggle as a revolution by which a voluntary confederacy was transformed into a nation, very properly entitles his history of it "A Constitutional View of the War Between the States"; but even he would be compelled to call any similar struggle in the future a rebellion. The name is retained here, therefore, not in any invidious sense, but as one which can not truthfully be avoided. (See NATION, STATE SOVEREIGNTY.)

—It is impossible to date the outbreak of the rebellion exactly. The secession of South Carolina, or of any other state, can not be taken as the date, for it might have been possible for a state to pass an ordinance of secession, refuse to take part in the government, and yet remain peacefully in the Union so long as the execution of the laws was not resisted. The seizures of federal forts, arsenals, mints and vessels in January, 1861, bear far more affinity to a rebellion; and yet these were so irregular and scattered, some of them with, others without, and others disavowed by, the authority of the state, that there seems even yet to have been a *locus penitentiae* to the participants. But the organization of the new government at Montgomery (see CONFEDERATE STATES), was a different matter; this was a step which there was no retracing, and with it the rebellion takes a tangible form. From that time there were two incompatible claims to the national jurisdiction of the seceding states, and neither of the two claimants could exist except by forcibly ending the claim of the other. War was a necessity, and the rebellion a fact to be acknowledged.

—The rebellion, however, was not at first acknowledged, nor were instant measures taken for its suppression. The responsibility for this mistake has been concentrated by popular belief upon the head of President Buchanan (see his name), but it is unfair to deny a very large share of it to the politicians of all parties in and out of congress, to their complete ignorance of their constituents, of their associates, and of themselves, and to the inevitable tardiness of action in a republic. Hardly a northern man in congress felt sure of his footing, or felt certain how far his constituents, who were quietly and steadily working at the plow, or in the office, or at the mill, would support

him in the hitherto unheard-of measure of "making war upon a sovereign state." And so, through the whole dreary winter of 1860-61, the air of congress was redolent with propositions for compromise; with protestations of belief that the seceding states could never mean it, and that the republic would yet go safely through this crisis; and with appeals to the erring sisters to reason together, to pause a moment, to reflect and see if something may not yet be done; but, so far as preparations to suppress the rebellion were concerned, that congress, on its final adjournment, was as if it had never existed. It is not true that northern politicians hurried the northern people into the war against the rebellion; it is rather true that the uprising of the north and west, after the capture of Fort Sumter, April 13, 1861, educated their politicians as they had never been educated before. A decade before, July 22, 1850, Clay had passionately said of Rhett in the senate, "If he pronounced the sentiment attributed to him, of raising the standard of disunion and of resistance to the common government, if he follows up that declaration by corresponding overt acts, he will be a traitor, and I hope he will meet the fate of a traitor." Unfortunately, it required a popular uprising to bring the average congressman up to Clay's level.

—It is, therefore, almost a waste of space to detail the failures of congress to act in 1860-61. The president suspiciously opened the session with a message which John P. Hale, in the senate, very fairly summed up under three heads: "first, that South Carolina has good cause to secede; second, that she has no right to secede; third, that we have no right to prevent her from seceding." Much of the time of the session was consumed in the consideration of proposed compromises (see, for the principal ones, COMPROMISES, VI.; CONGRESS, PEACE; CONSTITUTION, III., B.), the debates being occasionally interrupted by the farewells and departure of the representatives of the states which seceded without waiting to be conciliated. In the south everything was drifting straight toward war. In Charleston harbor Maj. Anderson, with his force of eighty men, had abandoned Fort Moultrie, Dec. 26, 1860, and established himself in Fort Sumter, a far stronger position, commanding the mouth of the harbor. The same day commissioners from South Carolina to the president arrived in Washington, but he refused to recognize them officially, and they went home again, Jan. 3. Thereafter the state continued to erect batteries at every advantageous point around the fort, and these were strong enough to fire upon, Jan. 9, and drive back the steamer "Star of the West," with provisions for the fort. The confederate government, immediately after its organization, appointed three commissioners to treat with the federal government. These arrived at Washington March 5, and at once opened communication with Seward, the new secretary of state. March 15, Seward refused to recognize them as diplomatic agents of any government, but his reply was not delivered to them until April 8, on which day official notification was sent to Gov. Pickens, of South Carolina, that Fort Sumter would be provisioned at once, and by force, if necessary. On this delay of twenty-three days in delivering the reply, the commissioners based a charge of bad faith against Seward, but it seems to be unjust. Seward seems to have been personally in favor of abandoning Fort Sumter, and the reply was sent only when the rest of the cabinet had persuaded the president not to yield. The notification to Pickens was effectual in one way. Before the relief expedition could reach the fort, it had been summoned and bombarded, and had surrendered.

—Some of the northern states were at least partially prepared for the struggle. In 1857 and 1858 the militia of Ohio had been thoroughly reorganized by Gov. Chase. Gov. Andrew, of Massachusetts, in his inaugural address, in January, 1861, had advised the legislature to put a part of the militia on a war footing, and immediately afterward had sent an agent to Europe to purchase arms, and invited co-operation by Maine and New Hampshire. Jan. 11, the New York legislature voted to offer the whole military force of the state to the government, and five days later the New York city militia formally offered their services to the president. But all these were exceptional instances, and as a general rule the northern and western states were quite unprepared. The president's proclamation, April 15, commanding insurgents to disperse within twenty days, and calling for 75,000 of the militia to secure the execution of the laws in the southern states, met with varying responses. In the south the proclamation was answered by the rapid secession of those states which had hitherto refused to secede, but were opposed to coercion. (See SECESSION.) In the border states, Missouri, Kentucky, Delaware, and, probably most important of all, Maryland (see that state), refused to secede, and gradually came over to an acceptance of the idea of coercion. In the north the response to the call for men was instant, and the quotas of the states were filled twice over. One regiment, the Massachusetts sixth, mustered early on the morning of April 16, and reached Washington three days afterward, after the first loss of life in the rebellion, during a street fight with a mob in Baltimore, April 19. The day before, several hundred unarmed Pennsylvania troops had arrived. April 25, troops began to pour into Washington, having made their way around Baltimore, and the capital became, as it remained for four years, an entrenched camp.

—In the meantime, by alternate proclamations of Presidents Lincoln and Davis (see ALABAMA CLAIMS), open war had begun, the latter regarding it as a war declared by the United States against the confederate states, the former as the suppression of a rebellion. The two difficulties which most embarrassed President Lincoln are elsewhere detailed (see INSURRECTION, I.; HABEAS CORPUS); but, besides these, there were others, more serious, if not so annoying. The loss of Harper's Ferry, April 18, involved a loss of very much of the government machinery for making arms. The burning of Gosport navy yard, April 20, almost annihilated the little remnant of the federal navy. The wholesale resignations of southern-born and even northern-born officers in the public service had seriously crippled it, and of those who remained it was impossible to know whom to trust, or to be confident that any given officer would not resign without notice and betake himself to Montgomery. The treasury had been so nearly bankrupted in the preceding December that the robbery of about \$1,000,000 from the Indian trust fund in the war department could hardly be made good. An army, navy and treasury were to be evolved out of nothing, by an administration and a people who knew nothing of war, and all was to be done without legal appropriations of money or authorization by law, for congress, by the president's summons, was not to meet until July 4. For this failure to summon the special session for an earlier date, Lincoln has been sometimes severely censured, but it was either very fortunate, or the result of a wise forecast. So late as July there were among the members of congress several, such as Breckinridge and Burnett, of Kentucky, who were with the confederacy in spirit, and were soon afterward with it in the body. The number of such would undoubtedly have been much larger if May 1 had been fixed for the meeting of congress. And, further, congress would have been divided and probably

incompetent at the earlier date. A part of its members would have come only to renew the tedious attempts at compromise of the past winter, and a part animated only by the enthusiasm of the Sumter rising; and internal dissension would have had more attention than the public good. As it was, when congress met, the time for conciliation and compromise was evidently past; a sober realization of the enormous task to come had taken the place of the first inconsiderate, and sometimes foolish, excitement; and congress was a homogeneous body, well fitted for the emergency.

—When congress met, the area of the rebellion had been fairly defined. Its northern boundary was an irregular line from the Atlantic to the gulf of Mexico, following the Potomac and the southern boundary of Pennsylvania to the Blue Ridge; then trending southwest through western Virginia and west through southern Kentucky to the Mississippi; thence west through central Missouri to Kansas, and south and southwest to the gulf of Mexico, taking in the Indian territory, whose people had replaced their former treaties by new ones with the confederate states, and Texas. South of this line the whole people was in rebellion, for the sincerest Union men among the local leaders felt bound to obey the final action of the state (see ALLEGIANCE), and the new national government claimed and received the allegiance of the doubtful mass. Within this line the southern states stood in the attitude of a beleaguered fortress, covering an area of more than 700,000 square miles, with a line of investiture of 10,500 miles, and containing within it a population of 8,000,000 whites, 1,400,000 of them fighting men, and 4,000,000 blacks, most of whom remained faithful laborers to the end. The military and naval events of the rebellion need be only briefly summed up here.

—At first the rebellion was to be overthrown by the "anaconda system," if it can be called a system. The line of investiture was to be assailed at every available point, and the rebellion was to be pressed to death. In the east this idea had several important results, only one of which, the blockade, was of any use, if the captures of Port Royal and Hatteras are to be considered as an integral part of the blockading system. Outside of the blockade, without which the rebellion could never have been suppressed, it is very doubtful whether any military operations in the east were ever of any great service, beyond employing a large part of the confederate armies to counteract them. Even if they had been successful in the first years of the war, they could only have had the distinctly evil result of pushing the rebellion, with its natural energies unimpaired, into the infinitely stronger positions of its central territory. In the west the one great object of desire was at first the opening of the Mississippi to the gulf, and this was effected by the capture of New Orleans, April 24-27, 1862, by the capture of Vicksburg and Port Hudson, July 4 and 8, 1863, and a countless number of subordinate battles. But during this struggle the war had practically been ended, though indirectly, for the enormous wedge of highland east of the Mississippi, running south into the heart of the confederacy, and the natural citadel of the continent, was almost entirely in the hands of the western armies. In November, 1864, Sherman's army, gathered on the southern edge of the great citadel, and, assured of Thomas' ability to master the only confederate army in their rear, had only to choose the direction in which they should pour down upon the plains below and push the rebellion *from* the mountains *to* the coast. Thereafter there could be but one object for the officers and men of the confederate armies, to maintain undiminished to the end

that high reputation for personal bravery which the national armies have always and cheerfully acknowledged. Lee's surrender took place April 9, 1865, and the first amnesty proclamation of President Johnson, May 29 (see AMNESTY), may be taken as the formal close of the rebellion, though isolated surrenders continued throughout the following month.

—During this long struggle, another was going on at Washington, even more difficult. In the field the general line of success was only developed when the original disadvantages of civil life had worn away, when the original leaders, who fought with one eye on the war and the other on home politics, had been eliminated or forced to subordinate positions, and when the new group of professional soldiers had been developed, Grant, Sherman, Sheridan, McPherson, and others, who were for the time absolutely reckless of political and civil considerations, and who knew but one object—war. But at Washington no such development could or ought to have taken place. There politics had to have at least an equal consideration with war, and the difficulties arising from the complication of the two subjects did not cease even with the cessation of the war itself.

—The 37th congress met July 4, 1861. In the senate there were thirty-one republicans and eighteen opposition, ten of the latter being democrats, and eight "unionists," remnants of the old "American party," such as Garret Davis, of Kentucky, and Anthony Kennedy, of Maryland, supporters of the war, and opponents of every interference with slavery. In the house there were 106 republicans and seventy-two opposition, forty-two of the latter being democrats and thirty "unionists." The house voted to consider at this session only bills relating to the military, naval and financial operations of the government; and July 15, by a vote of 121 to 5, it pledged itself to vote any number of men and any amount of money necessary to put down the rebellion. Laws were passed, by heavy majorities, to authorize a loan of \$250,000,000, to define and punish conspiracy, to increase the tariff, to appropriate money for the army and navy, to suppress insurrections (see INSURRECTION, I.), to authorize the president to collect the revenue in federal vessels or to close southern ports in case collection was impossible (July 13), to call out 500,000 volunteers, if the president should think so many necessary (July 22), and to confiscate property, including slaves (see ABOLITION, III.), if permitted to be employed against the government (Aug. 6). A resolution to validate and confirm the president's "extraordinary acts, proclamations and orders," his calling out men, blockading southern ports, and suspending the privilege of the writ of *habeas corpus*, failed to pass, but was made the third section of the act of Aug. 6, to increase the pay of the army. (See HABEAS CORPUS.) An important act of the session was the passage of a resolution that the war had been forced on the government by southern disunionists; that it was waged by the government in no spirit of oppression, and for no purpose of conquest, subjugation, or interfering with the rights or established institutions of the seceding states, but to defend and maintain the supremacy of the constitution, and to preserve the Union with all the dignity, equality and rights of the several states unimpaired; and that, as soon as these objects were accomplished, the war ought to cease. It passed the house, July 22, by a vote of 117 to 2, and the senate, July 26, by a vote of 30 to 5. (See RECONSTRUCTION.) Aug. 6, congress adjourned, having voted all that the executive had asked for. When it reassembled in December (see

CONGRESS, SESSIONS OF), the scattered drops of July had settled down into the heavy and steady storm of war which was to beat upon the country for more than three years to come. From the first day of meeting, it was evident that congress had very considerably changed its views as to the proper mode of dealing with slavery. In both houses a large number of resolutions were immediately introduced, looking toward emancipation, and with them began the course of legislation which ended in the general abolition of slavery. (See ABOLITION, III.; FUGITIVE SLAVE LAWS; WILMOT PROVISIO.) These acts were then, and have since been, denounced as in violation of the good faith pledged in the resolution of July 22, above mentioned. That resolution undoubtedly expressed what was then the policy and intention of both congress and its constituents, when the magnitude of the war was not yet apparent, and its interdependence upon slavery was not yet plainly perceived. But a congressional resolution is certainly not a part of the organic law, but a mere piece of legislation open to change or repeal at any moment. Other governments are never reproached for vitally changing their policy as a war in which they are engaged grows more desperate. It is a tribute, though sometimes a provoking tribute, to the exceptional good faith of the American republic, to find canons of good faith laid down for it which would not be considered applicable else where. Outside of anti-slavery legislation, and the appropriation bills, the most important action of the session was the act of Feb. 25, 1862, authorizing the issue of \$150,000,000 non-interest bearing notes, receivable for all dues to the United States, except duties on imports, and for all claims against the United States, except interest on the public debt, and a legal tender for all debts, public and private, within the United States, with the exceptions above noted, which were to be paid in coin. The legal tender clause was much disliked by Secretary Chase, who only finally yielded to it on the score of military necessity, and as a war measure. (See, in general, FINANCE.) This development of anti-slavery feeling and action in the dominant party, the preliminary proclamation of the president looking toward emancipation (see EMANCIPATION PROCLAMATION), and the summary suppression of opposition to the war by arrest (see *Arbitrary Arrests*, under HABEAS CORPUS), produced almost a complete political change of relations in the north. Hitherto, democrats in and out of congress had very steadily voted for all measures designed to suppress the rebellion by arms, while they as steadily accompanied their votes with the declaration that the republicans, by abolition agitation, had been as much to blame for the war as the secessionists. They now alleged that the new anti-slavery policy had been adopted mainly for the purpose of forcing their party into an attitude of opposition to the war itself. If there was any truth in the charge, the manœuvre was successful: the democratic party gradually became a peace party (see DEMOCRATIC PARTY, VI.), and those of its members who were willing to include slavery as one of the vulnerable points of the confederacy were forced into the "union party," as the republican party was henceforth frequently termed. The first results of this *bouleversement* were unfavorable. In the autumn elections of 1862 the great middle and western states, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, and Wisconsin, all of which had voted for Lincoln in 1860, gave democratic majorities. But, as it happened, the democrats gained and the republicans lost little by these elections: in only two of these state, New York and New Jersey, the election involved a change of state government; and in the members of the house of representatives of 1863-5, chosen this year, the republican majority was hardly impaired. The results were just sufficient

to confirm the democrats in opposition to the war, and the republicans in active opposition to slavery, while it should have been evident that, as the two ideas became familiar in the future, the tide of recruits must run steadily from the democrats to the republicans, and no longer from the republicans to the democrats. The democratic party touched high-water mark in 1862-3; thereafter it could only recede.

—The session of congress which began in December, 1862, was used by the republicans mainly in securing the positions which they had already gained, and in making the necessary appropriations for the war. No great advance was made in anti-slavery legislation, except that the final thirteenth amendment was introduced and left to become familiar. The fundamental idea of final reconstruction by congress was also plainly put into form, and left to become familiar. (See RECONSTRUCTION.) In practical legislation the great features of the session were the conscription act (see DRAFTS), by which the national power to compel the military service of its citizens was for the first time declared and maintained; and the national bank act of Feb. 25, 1863. (See *National Banks*, under BANKING.) West Virginia was admitted (see that state); and the suspension of the writ of *habeas corpus* was confirmed and regulated. (See HABEAS CORPUS.) The appropriation for the navy this year footed up \$71,041,401.01; and for the army \$729,861,898.80, with \$108,807,645.20 for deficiencies.

—The wonderful tenacity with which the majority in congress held its ground during this last session, taking no step backward on the slavery question, and actually advancing in other respects, in the face of the adverse majorities of 1862, was fully justified by the event. Every day increased the number of democrats to whom the idea of emancipation as an incident of the war became less dreadful as it became more familiar. July 4, 1863, seems to have been the political as well as the military turning point of the war. From that day it was certain that the confederate armies in the east were to be so held in play as to be unable to defend successfully their vital point in the west. Nothing succeeds like success; and every mile of advance by the western armies was a new guarantee to the republicans of security for the past and for the future. Everything had been gained, and nothing lost, and it was only necessary now to pass at leisure the crowning amendment for general emancipation (see CONSTITUTION, III., A.), and to wait patiently while the armed forces worked out the already secured political future. The autumn elections of 1863 were not generally for important offices; but they indicated a strong republican gain for the first time since 1860; and in the states of Ohio and Pennsylvania, where the control of the state government was involved in the election (see those states), the republican majority was decisive.

—A new congress met in December, 1863 the republican majority being 36 to 14 in the senate, and 102 to 84 in the house. Its action was mainly confined to the routine business necessary for prosecuting the war, and to the amendment and enforcement of previous legislation. Provision was also made for the admission of Nevada, Colorado and Nebraska as states (see those states), and for the repeal of the fugitive slave laws. (See that title.) A first attempt was made to pass the thirteenth amendment; the portentous question of reconstruction was fairly introduced; and the existence of the new class of professional soldiers was recognized by the revival of the grade of

lieutenant general commanding all the armies. This last grade was intended to be filled by Gen. Grant.

—With the adjournment of this session of congress, the political history of the rebellion practically ends. Little was to be done by the dominant party, beyond gathering up the fruits of victory, and drawing breath for the coming struggle of reconstruction. Lincoln's reelection, in the autumn of 1864, hardly doubtful in the event of any action by the opposition, was made certain by the democratic peace platform of that year. This was followed by the final adoption of the thirteenth amendment, abolishing slavery, the only work of the session of 1864-5 which rises above routine. During the year, it was ratified by the states. (See CONSTITUTION, III., A.)

—Throughout the political work of congress in these eventful four years, its main characteristics are its general reflection of the will of its constituency, its openness, and its determined resolution to retain the supremacy of congress over the generals and armies in the field. In the last two points it differed absolutely from its rival, the confederate congress. (See CONFEDERATE STATES.) At the opening of the war, while most of the military leaders retained the habits of civil and political life, these characteristics led to many evils; annoying interferences and conflicts by the committees on the conduct of the war, with various military leaders; needless assertions of power and dignity by the disputants; and the revelation in the debates, of things in which not only military science, but common sense, should have dictated secrecy. But these evils cured themselves. As the new class of generals grew up, habituated to regard congress as a master, not as a would-be tyrant, congress itself learned self-control by bitter experience; and the war ended with entire harmony between the civil and military agents in it.

—Nor can it be doubted now that congress generally reflected the will of its constituents. The single plausible exception is the winter of 1862-3, above referred to. But, in that instance, the majority in congress, if its members chose to risk their political existence on the supposition had a fair right to presume, 1, that the elections of 1862 were lost through their own lack of importance, and the consequent neglect of many republicans to take part in them; 2, that the coincident choice of a republican majority in the next congress was a fair popular indorsement of their own change of policy; and, 3, that every indication showed that the popular tide in their favor would inevitably be strengthened by the success of the union forces, without which any policy would, of course, have proved a failure. The result proved that in all three suppositions they were correct.

## RECIPROCITY

RECIPROCITY is a relation between two independent powers, such that the citizens of each are guaranteed certain commercial privileges at the hands of the other. Up to the middle of the present century the term referred almost exclusively to the grant of privileges to foreign shipping. The earlier English policy had been very illiberal in this respect, carrying out the principles of Cromwell's navigation act, and of the colonial system of the last century. But as time went on, it became more important for England to extend her carrying trade in foreign lands than to monopolize it in her own; and in the early part of this century, under the influence of statesmen like Huskisson, reciprocity treaties were concluded with the leading maritime powers, by which each of the contracting parties admitted the other's ships in its ports to the same privileges as its own in the matter of the international carrying trade. This system aroused much opposition at different times in England; and in the United States was strongly opposed by Webster; but it soon became the prevailing one.

—The commercial treaties of earlier times aimed at securing special privileges and discriminating rates of duty. The one most commonly referred to as a type of them all is the Methuen treaty of 1703 between England and Portugal, by which England made special rates for Portuguese wines, and Portugal removed her prohibition of the import of English woollens. The same general principles, but applied with far sounder judgment of political and social needs, appear in the series of German treaties beginning with that between Prussia and Hesse in 1828, culminating with the establishment of the Zollverein, and ending with the treaty between the Zollverein and Austria in 1853.

—The treaty between England and France in 1860 was the beginning of a new order of things. Preceding treaties had been dictated by special reasons of social policy: this was intended and understood as an attempt in the direction of free trade. France had an almost prohibitive tariff; Napoleon wished to reduce it, but in the existing state of public opinion dared not do so without the appearance of international co-operation. He had in view the general development of French commerce, but he wished to be able to show definite advantages to distinct interests. The treaty with England, arranged in 1860 by Chevalier and Cobden, was the first result of this policy. The English tariff was already on a revenue basis; yet in return for the important French concessions it was still further reduced on French articles of export. But what distinguished this treaty from preceding ones was the fact that these reductions were not bargained for as special and exclusive privileges. This treaty was intended to become part of a system; it was contemplated that both England and France would make similar treaties with other nations, and in view of this it was provided, that in case either of the contracting powers should subsequently grant to a third power conditions more favorable in any respect, the other should have the benefit of such conditions. This provision constitutes what is known as the most favored nations clause; it was incorporated in subsequent treaties, as had occasionally been done in previous treaties, and soon became the important element in them; for by it a special concession made in favor of any one nation at once inured to the benefit of all who

had similar treaties. It is this provision that distinguishes the modern European reciprocity system, and has caused that system to work so strongly in favor of free trade.

—The gain to the commerce of France and England was so great that other nations hastened to secure the same advantages. Similar treaties with France or England were made by Belgium in 1861, Prussia in 1862, Italy and Spain in 1863, Switzerland in 1864, and by most of the other European states in 1865 and 1866. Even Russia ultimately secured at the hands of some of the powers the benefit of the most favored nations clause, though without much reciprocity on her part. Within ten years the system seemed to be firmly established all over Europe, and to insure steady progress in the direction of free trade. (For certain special statistics, see Leone Levi in *Journ. of Stat. Soc.*, 40, 1; for discussion of principles, a work entitled "Letters on Commercial Treaties," etc., "by a disciple of Richard Cobden.")

—But several circumstances combined to stop this progress, and to a certain extent unsettle the system. The first of these was the downfall of Napoleon III. He had not only started the system, but had by his strong influence done more to extend it than most people were aware of. It had never been really popular in the sense of calling forth general enthusiasm. It savored too much of bargaining, too little of principle. And it was rendered less popular than ever by wars like that of 1870, which intensified the opposition of national feeling, and substituted a spirit of embittered rivalry for one of mutual help. This acted against the reciprocity system in a variety of ways. Increased military expenditure demanded larger revenue; and nations chafed under treaty restrictions which hampered them in raising this revenue. The commercial treaties looked toward free trade; but national pride and the constant possibility of war led men to demand a protective system. While men's minds were in this state came the crisis of 1873; and public feeling was only too ready to attribute the hard times which followed to the one tangible grievance of foreign competition, and to seek to be rid of this grievance in all possible ways.

—The diplomatists were mainly free traders; and it was some time before they understood the strength of the feelings they had to contend against. The failure of the English negotiators in 1876 to obtain some expected concessions from France, began to reveal the true state of the case. The termination in the same year, by the action of Italy, of the French-Italian treaty, and the rejection by France of a proposed compromise treaty in 1877, were equally significant. Of still greater importance was Bismarck's change of attitude in 1878. Ever since the year 1818 the Prussian government leaned toward a free trade policy, much more so than any other great power except England. In 1862 their steps in support of the reciprocity system had been bold in the extreme. Now, such a change on the part of Prussia, as well as France and Italy, rendered the future of the system extremely doubtful.

—To understand the negotiations which followed, we must observe that in the application of these treaties of commerce, two different courses had been pursued by different states. One group of states, headed by England and Prussia, had no sooner made a concession to a single nation, than they modified their whole tariff in accordance with it, so that all nations, even those outside of the system, at once had

the benefit of the change. Another group, represented by France, left their general tariff unchanged, but in the collection made a deduction of that amount in favor of nations having the benefit of a treaty. Spain went so far in this direction as to have two tariffs, the lower for "most favored nations," the higher for all others.

—As long as the statesmen on both sides were animated by common aims, this distinction made very little difference. But when it became a matter of international bickering the nations of the first group found themselves at a great disadvantage. What special privileges are you offering us under the treaty? French negotiators constantly asked of the representatives of those nations which had reduced their general tariff. To this question there was no thoroughly available reply; and it was this diplomatic helplessness that led to the "fair trade" agitation in England, and to a full discussion of certain points in the theory of reciprocity into which we can not here enter. (Westminster Rev., 112, 1; Contemp., 35, 269; Nineteenth Cent., 5, 638, 992; 6, 179; Fawcett, "Free Trade and Protection," last chapter.)

—In the year 1881 a number of French treaties were about to expire; and it was felt that a critical point had come in the history of the system. After some difficulties, particularly in connection with the Italian and Swiss treaties, they were nearly all renewed on the basis of increased duties on either side. The treaty with England was not renewed, but a special act was passed placing England on the footing of the most favored nations. On the whole, it may be said that the continuance of the system has been secured, but its efficiency in the direction of free trade destroyed.

—The United States has never been in any way connected with the system. At the time of its adoption and growth, American tendencies were all in the direction of increased duties. Our reciprocity treaties have all belonged to the earlier type of special arrangements. By far the most important of them was the one with Canada, proclaimed Sept. 11, 1854, and terminated March 17, 1866, on notice given by the United States one year previous. By the terms of this treaty food products of all kinds, nearly all raw materials, and some half-manufactured articles, were allowed to pass free from one country to the other. The dissatisfaction with the treaty arose from the owners of mines, timber, etc., in the United States, who found the price of their products kept down by Canadian competition. A memorial in favor of its renewal was presented to the United States government by the national board of trade in 1873, but without calling forth vigorous general support.

—A similar treaty was concluded with Hawaii in the summer of 1876, for the benefit of certain business interests of the Pacific states, particularly the sugar refiners. It was severely criticised by Secretary Sherman, after having been in operation about two years; but it now seems to have accomplished what was expected of it. The position of the United States government on the subject of commercial treaties is illustrated by the fact, that, when the Hawaiian authorities attempted to negotiate a similar treaty with Germany in 1879, they were checked by an intimation from the United States that the value of those privileges lay largely in their exclusiveness, and that the treaty must guarantee the United States exclusive rights.

—In, the years succeeding the exhibition of 1876, strong efforts were made by French exporters to secure reciprocity privileges from the United States. It was hoped that if France would place America on the basis of the most favored nations, America would lower its duties on French wines and silks. In spite of the repeated efforts of the French manufacturers' agent to secure public sentiment in its favor, the subject was never officially taken up.

ARTHUR T. HADLEY.

## RECOGNITION

RECOGNITION. It is customary for princes to notify the states with which they hold relations of their accession to the throne. The same is the case with all new governments. As a rule, especially in the case of a prince who succeeds regularly and peaceably, this announcement is met by congratulations and sometimes by sending ambassadors, more or less extraordinary. At other times only an official certificate of the notification is given, and the receipt of it acknowledged. There are even cases in which, at the time of a change, no formality is employed; relations with the new government are entered upon, and it is thus recognized *de facto*.

—International recognition was formerly of much greater import than in our day. The dogma of national sovereignty had as yet been accepted by but a few daring innovators; and right, justice and law were summed up in the will of the prince. This was the period in which a haughty king could say: *l'état, c'est moi*.

—It is now admitted that a people is independent by its own right, exclusive of any recognition. Let an island arise in the Atlantic to-morrow; let people land and settle there; let them form themselves into an independent political society and choose a government; and that island would form a state as lawful and regular as any other. International recognition is at bottom only the authentication of a fact, an authentication which requires no formality. In entering into relations with Japan, with Burmah, or with any country, the remoteness of which preserves it from European enterprise, it never occurs to any one to begin by recognizing the government with which they are about to treat. It is sufficient that it exists, and in treating with it recognition is implied.

—In such cases as these, there could never be any doubt; but doubt has arisen sometimes, when, in consequence of internal revolution, one government has been replaced by another. The independence of the state is not called in question, but it is hoped to authenticate or legitimize the new government by recognizing it, though often again family motives or interested motives may prevent this being done. The principle of national sovereignty, better understood, has silenced all these scruples. Recognition no longer implies approbation, and foreign countries are not obliged to distinguish between the government *de jure* and the government *de facto*. If the government appear established, if the nation accept it, and, above all, if it has appointed it, it has all the legitimacy necessary in order to be recognized.

—Thus recognition adds nothing to the right of existence of a state; it is only a means of facilitating international relations. A state which is not recognized is regarded as not existing for those which deem it expedient to remain a stranger to it; but if any inconvenience result from this lack of intercourse, both the states suffer. The injury is greater, however, to the state which refuses recognition than to the one which is deprived of it. Spain lost nothing from the fact that the emperor of Russia would not recognize Isabella II., while Nicholas I. made it impossible to exercise an influence

over Spain. Besides, it was Russia which was destined to yield in the end, and, in such a case, the longer the sulkiness has lasted, the more it costs to effect a reconciliation.

—We have just been speaking of governments established in consequence of a profound change, violent or peaceful, in the constitution of a state. But before the new public powers are well established, several cases may occur, and we must review them. In the first place, there may be a "provisional government." A diplomatic official agent, ambassador or minister is never accredited to a provisional government; but power may be given to an agent more or less official to enter into relations with it, and to treat with it on all pressing matters. In reality, such an agent is an ambassador deprived of the honorary immunities customarily enjoyed by the representatives of foreign powers. However, many shades of difference are possible here. Then, two parties may be contending for power. As long as there is a doubt as to the definitive success, foreign governments recognize only the one to which its agents have been accredited. The new government does not as yet exist; there is, consequently, no occasion for recognizing it. Besides, if relations are prematurely entered into with the chiefs of an insurrection, the government still established would have a right to consider itself offended. When there is too much haste to recognize, it is often in order to aid or intervene. The third case to consider is, when a part of the territory, a province, or colony, wishes to detach itself from the state of which it has hitherto formed a part. If this territory be victorious in the contest, to the extent that its independence is recognized even by the state from which it has separated, foreign powers can have no doubt what to do: recognition is then a simple authentication of a patent fact. If peace have not been formally concluded, each foreign state will be able to estimate, at a given moment, if the territory which claims to be independent has acquired sufficient political stability to offer a guarantee for the future. But we must not lose sight of the fact that a state threatened with the loss of a province will always see with displeasure that the separation is looked upon as accomplished, and, according to circumstances, it will protest or declare itself offended. A powerful country will pay no attention to these complaints, but a weak country will act with prudence.

—We do not need to say that to recognize the independence of a country at the moment when the insurrection begins, constitutes a real *casus belli*. War will not be recoiled from, unless the insult come from too powerful a state.

—In 1861 a new situation was introduced into international law, the *recognition of belligerents*. We have had as yet but one example of this, that which recognized as belligerents the confederate states fighting to separate themselves from the United States. It will be understood that to recognize the southern states of the American Union as belligerents, was to close the English ports to war vessels from the northern states, which was an act of indirect hostility. Sympathy was extended to the confederates, not because their cause was considered just, but because their cotton was needed. We can not foresee what use may be made one day of this *semi-recognition*, the only example of which we have just cited, but we instinctively regard the precedent as a thing to be regretted. It may more than once encourage malcontents to revolt, without its being deemed expedient to come to their assistance otherwise

than by this indirect aid, which we can not help regarding as a sort of intervention, perhaps without danger, but more generally without honor or profit.

—When one state does not recognize a change in the constitution of another, diplomatic relations cease, as in war, and the subjects of the disaffected states are commended to the good offices of an allied state; they are thus officiously (*officieusement*), using the term in a good sense, instead of officially, protected.

## RECONSTRUCTION

RECONSTRUCTION (IN U. S. HISTORY), the political problem of the restoration of the seceding states to their normal relations with the Union after the suppression of armed resistance therein to the constitution and the laws. Such a problem would have been easy of solution under a simple and direct acting government; in a highly complicated system like that of the United States, in which the parts and their action are so delicately adjusted, any derangement shows its effects everywhere; and a derangement so great as was introduced by secession, since it can not check the national force, is almost certain to throw all the wheels out of gear, convert the national machine into a blind and guideless power, and make a bad master out of a good servant. In the matter of reconstruction the difficulty was increased, 1. By the length and bitterness of the war. The terms of reconstruction which were possible in 1862, 1863, 1864, or 1866, were each of them impossible within a year thereafter. Every battle lost and won, every vessel sunk, every house burned, every case of mistreatment of prisoners, was in its way a factor not only in anti-slavery action, but in final reconstruction. 2. By the status of the freedmen. It was impossible that the successful party should feel no interest whatever in the fate of the beings who had been converted by its success from chattels into persons. It was natural that the disposition of the conquered toward the freedmen should be keenly and suspiciously scrutinized; and thus every act of individual violence, every appearance of organized repression, which came to light before the work of reconstruction was completed, became a silent factor in the work. 3. By the existence of a written constitution which provided for no such state of affairs. An omnipotent British parliament would have soon hit on a formal settlement, though its success in solving the Irish problem has not been so swift or sure as to make us wish for a change of régime. The American government could only engage in a series of experiments, more or less successful, and finally rest content with that solution which seemed to offer the least difficulty and the greatest advantages to the nation. "Happily for the nation," says Brownson, "few blunders are committed that with our young life and elasticity are irreparable, and that are greater than are ordinarily committed by older and more experienced nations. They are not of the most fatal character, and need excite no serious alarm for the future."

—In considering the question, it is proposed, 1, to give, as briefly as possible, the successive theories of reconstruction; 2, to detail the work as it was finally done; and 3, 4, to consider its failures and its successes. In so doing, there are certain precedents which are often referred to by all of them, and these may as well be given now, for reference. —*The Guarantee Clause.* The constitution (Art. IV., § 4) speaks as follows: "The United States shall guarantee to every state in this Union a republican form of government." To this was often added the following paragraph from the powers of congress (Art. I., § 8): "To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this constitution in the government of the United States or in any department or officer thereof." This, it was claimed, gave congress power to pass all laws which it should consider "necessary and proper" for carrying into effect the guarantee clause.

This would have been undeniable if the language of the clause had been "congress shall guarantee," or "the government shall guarantee," or even any "department or officer shall guarantee"; but the peculiar phraseology, "the United States shall guarantee," seems to exclude all these interpretations, and give the power concurrently to all the governmental agents, executive, legislative and judicial. Even in this view, however, the case of *Luther vs. Borden* would seem to show that congress has the power to enact laws to carry into execution its concurrent power in the premises, and that the president is bound to execute them.

—*The Resolutions of 1861*. At the special session of 1861 joint resolutions were introduced to define the objects of the war. That which was pertinent to this subject was as follows: "\* \* That this war is not prosecuted upon our part in any spirit of oppression, nor for any purpose of conquest or subjugation, nor for the purpose of overthrowing or interfering with the rights or established institutions of those states, but to defend and maintain the supremacy of the constitution and all laws made in pursuance thereof, and to preserve the Union with all the dignity, equality and rights of the several states unimpaired; that as soon as these objects are accomplished, the war ought to cease." It passed the house, July 22, 1861, 117 to 2; and the senate, July 26, 30 to 5.

—*The Law of 1861*. The act of July 13, 1861, authorized the president, when he should have called out the militia against insurgents claiming, without dispute, to "act under the authority of any state or states," to proclaim the inhabitants of the insurgent states to be in insurrection against the United States; and ordered commercial intercourse with the insurgent states to cease. Accordingly the president issued a proclamation, Aug. 16, declaring the inhabitants of Georgia, South Carolina, Virginia (except those west of the Alleghanies), North Carolina, Tennessee, Alabama, Louisiana, Texas, Arkansas, Mississippi, and Florida, to be in insurrection.

—For the blockade of 1861 see ALABAMA CLAIMS.

—I. THEORIES OF RECONSTRUCTION. As a summary of the changes of theory, we may say that the war was begun under the theory of "restoration," and that this theory was persistently maintained by the democrats to the end; that the presidential theory was developed by Lincoln in 1863, and carried out by Johnson in 1865, but fell back under the hands of the latter into a modification of the restoration theory; that the Sumner and Stevens theories received no formal ratification from any quarter; but that congress, having advanced so far as the Davis-Wade plan of 1864, was pressed by the force of contest with the presidential theory into a plan of its own in 1867, consisting of the Davis-Wade plan, increased by the suffrage features of the Sumner theory, and the whole based on a modification of the Stevens theory of the suspension of the constitution.

—1. *Restoration*. The war began under the influence of the idea that there was "not one of these states in which there were not ample numbers of Union men to maintain a state government after the rebellion shall have been put down." There were some warnings to the contrary. "It may be," said Baker, of Oregon, in the senate, "that instead of finding, within a year, loyal states sending members to congress and

replacing their senators upon this floor, we may have to reduce them to the condition of territories, and send from Massachusetts and Illinois governors to control them; and, if there were need to do so, I would risk even the stigma of being despotic and oppressive rather than risk the perpetuity of the union of these states." But such warnings were unheeded, and the general feeling was well represented by the resolutions of 1861. The actual shock of war, and the evidently universal transfer of allegiance in the south to the confederate states (see that title), at once worked a change. In December, 1861, the resolutions of July were again offered in the house, but were laid on the table by a vote of 71 to 65. The same result with increasing majorities met subsequent reintroductions of the resolutions. In December, 1862, these resolutions took another shape, that of a simple declaration that the war was prosecuted only to maintain the integrity of the Union and of the states as they were at the beginning of the war. In this form they were ruled out of order, or laid on the table, by majorities small at first but steadily increasing. They owed their defeat mainly to the fact that they squinted at slavery and the admission of West Virginia if confined to the question of restoration, they could as yet hardly have been defeated. Even Vallandigham's resolutions, long, cumbrous, and containing the invidious word "professedly" in reference to the original object of the war, were only defeated by a vote of 79 to 50. Generally, however, democratic members hardly felt it to be necessary to defend their position vigorously until reconstruction began to loom up plainly in 1863-4. Pendleton's statement of democratic views may then be taken as authoritative. "These acts of secession were either valid or invalid. If they are valid, they separated the state from the Union. If they are invalid, they are void; they have no effect; the state officers who act upon them are rebels to the federal government; the states are not destroyed; their constitutions are not abrogated; their officers are committing illegal acts, for which they are liable to punishment; the states have never left the Union, but so soon as their officers shall perform their duties, or other officers shall assume their places, will again perform the duties imposed, and enjoy the privileges conferred, by the federal compact, and this, not by virtue of a new ratification of the constitution, nor a new admission by the federal government, but by virtue of the original ratification, and the constant, uninterrupted maintenance of position in the federal Union since that date. Acts of secession are not invalid to destroy the Union, and yet valid to destroy the state governments and the political privileges of their citizens." This ground was held thereafter by the democratic conventions of all the states, and by the national convention of 1868, but it was unsuccessful. Indeed, it was worse. Nothing is more curious in the congressional votes on this question than the manner in which democratic consistency and persistency thwarted all propositions for mild terms to the insurrectionary states. The names of democrats and "radical" republicans, of Fernando Wood and Thaddeus Stevens, appear side by side in voting down the successive and increasingly severe propositions for reconstruction, until, after 1865, the "radical" republicans, falling back a step, united with the moderate republicans and swamped the democrats.

—Kindred to this general principle were the constant demands of the democrats for a national convention of states. They began July 15, 1861, when Benjamin Wood, of New York, offered a resolution recommending such a convention, which was tabled by a party vote of 92 to 51; and they continued until the democratic national convention of 1864 demanded "a cessation of hostilities with a view to an ultimate

convention of all the states." Toward the end of the war, and particularly just before the presidential election of 1864, many southern authorities inclined to accept this scheme, if offered to the seceding states; but they still insisted that the states were not to be bound by the action of the convention.

—Another kindred proposition, offered in December, 1861, and several times thereafter, was to appoint ex-Presidents Fillmore and Pierce, Chief Justice Taney, Edward Everett, and seven other commissioners, to confer with a like number from the seceding states for the preservation of the Union. It was either left unconsidered or tabled.

—In the conference at Hampton Roads, Feb. 2, 1865, between Alex. H. Stephens, R. M. T. Hunter, John A. Campbell, President Lincoln, and Secretary Seward, Mr. Stephens says that he asked "what position the confederate states would occupy toward the others, if they were then to abandon the war? Would they be admitted to congress? Mr. Lincoln very promptly replied that his own individual opinion was that they ought to be. He also thought they would be, but he could not enter into any stipulations upon the subject. His own opinion was, that, when the resistance ceased and the national authority was recognized, the states would be immediately restored to their practical relations to the Union." This statement, however, is opposed to the known fact that the president was then fairly committed to the presidential theory of reconstruction.

—The last attempt at "restoration" was the memorandum of April 18, 1865, between Generals W. T. Sherman and Joseph E. Johnston. It provided for the disbandment of the confederate forces at their state capitals, the re-establishment of the federal courts, and "the recognition by the executive of the United States of the several state governments on their officers and legislatures taking the oath prescribed by the constitution of the United States; and, where conflicting state governments have resulted from the war, the legitimacy of all shall be submitted to the supreme court of the United States." The agreement was repudiated by President Johnson, and an unconditional surrender took its place, April 26.

—2. *The Presidential Theory.* President Lincoln seems to have held from the beginning, that while, as commander-in-chief, he was bound to carry the war into the heart of the seceding states, he was also bound, as civil executive, to endeavor to restore civil relations with the states themselves. His theory is detailed in his proclamation of Dec. 8, 1863, and his defense of it in his annual message of the same date. The proclamation, 1, offered amnesty to all but specified classes of leading men; 2, declared, that a state government might be reconstructed as soon as one-tenth of the voters of 1860, qualified by state laws, "excluding all others," should take the prescribed oath (see its form under AMNESTY, I.); 3, declared that, if such state government were republican in form, it should "receive the benefits" of the guarantee clause; 4, excepted states where loyal governments had always been maintained; but 5, added the caution that the admission of senators and representatives was a matter exclusively "resting with the two houses, and not to any extent with the executive." The proclamation further remarked, that "any provision which may be adopted by such state government in relation to the freed people of such state, which shall

recognize and declare their permanent freedom, provide for their education, and which may yet be consistent, as a temporary arrangement, with their present condition as a laboring, landless, homeless class, will not be objected to by the national executive." The message says: "There must be a test by which to separate the opposing elements, so as to build only from the sound, and that test is a sufficiently liberal one which accepts as sound whoever will make a sworn recantation of his former unsoundness." The presidential programme thus included but four points: cessation of resistance, the appointment of a provisional governor, the taking of the oath of amnesty by at least one-tenth of the white voters, and the formation of a republican government; there was no negro suffrage or supervision by congress in it, and the only action of congress was to be the separate decision of the two houses on the admission of members. It is impossible to see any difference between this and Johnson's "policy." The features are identical. Johnson always declared that they were the same, and in his speech of Feb. 22, 1866, asserted that Lincoln had told him, a year before that time, that he was "pretty nearly or quite done with amendments to the constitution," provided the 13th amendment were ratified. Seward and other intimate friends of President Lincoln maintained the identity of the systems. Gen. Grant, in his testimony before the house judiciary committee, July 18, 1867, said that the first of Johnson's reconstruction proclamations (for North Carolina) was the same, and he thought the same *verbatim*, as one which had been read to him twice in a cabinet meeting before Lincoln's assassination. We may safely take the two systems as identical, as the "presidential theory."

—So long as slavery was not a point of attack, it is evident that restoration and the presidential theory were very much the same thing, the only new point in the latter being the exclusion of white voters unable or unwilling to take the oath. In this sense, Virginia (see that state) was restored or reconstructed from the beginning: the Pierpont government was recognized by the president at first as the government of all Virginia, then of the conquered portion of Virginia proper (after the separation of West Virginia), and at the close of the war it superseded the rebellious government of Virginia, without objection from any quarter. Nor did it lack congressional recognition, in both its aspects: congress admitted West Virginia by virtue of the formal assent of the "Virginia government" of Pierpont; and the separate action of the two houses, according to the presidential theory, was illustrated by the refusal of the house to admit Pierpont members after 1863, while the Pierpont senators held their seats, one until 1865, and the other until his death, in 1864, when the senate refused to admit his successor.

—A new feature came in with the president's adoption of an antislavery policy, in September, 1862. Thereafter, the presidential theory included the abolition of slavery, and a recognition of the anti-slavery laws and proclamations in the amnesty oath. In other points, it remained the same: no legislation by congress, and separate action of the houses on the admission of members. In this way, Louisiana, Arkansas and Tennessee (see those states) were reconstructed, in 1863-5. The legality of these governments was always stoutly maintained by President Lincoln. In his proclamation of 1864, hereafter referred to, in regard to the Davis- Wade bill, he says that he is "also unprepared to declare that the free-state constitutions and governments already adopted and installed in Arkansas and Louisiana shall be set aside and held for

naught, thereby repelling and discouraging, as to further effort, the loyal citizens who have set up the same."

—The counter-proclamation of Davis and Wade alleged that an unsuccessful expedition into Florida had the same object, to organize a presidential government. However true that may be, the operation of the presidential theory, in its second aspect under Lincoln, stopped with Virginia, Arkansas, Louisiana and Tennessee. Even these examples were fortified by the separate action of the houses upon them: the Louisiana representatives were admitted in February, 1863, while the senators were refused admission, as were the representatives also after March 4, 1863; the Arkansas senators and representatives did not apply for admission until 1864, and then the temper of congress had risen so high that they were refused; the admission of the Tennessee senators and representatives, in July, 1866, was, as is hereafter noted, the point where the congressional theory superseded its predecessor.

—Congress adjourned, March 3, 1865, until Dec. 4 following; Lincoln died April 15, 1865; and Johnson succeeded to his theory, with far inferior prospects of success. Precedents were in his favor, the admission of West Virginia, the presence of senators from Virginia 1861-5, of representatives from Virginia 1861-3, and of representatives from Louisiana in 1863; he was supported by Lincoln's name and cabinet; and, above all, he had a clear field for nine months before congress could meet. Against him were his unfortunate temper, his inability to temporize, and his controlling sympathy with non-slaveholding southerners. It was certain, that, at the first sign of failure in the presidential theory, popular opinion would strike at Johnson far more willingly than at Lincoln, and that Johnson was far less qualified than Lincoln to meet or evade the attack.

—Gen. Johnston surrendered April 26, 1865, and May 29 following, President Johnson began to put into operation the presidential theory, accompanying it with a new amnesty proclamation (see AMNESTY, II.), such a measure being an integral feature of the plan. In each state, the sequence of events was, 1, the appointment of a provisional governor; 2, the summoning of a convention, composed of, and voted for, by whites able to take the amnesty oath; 3, the adoption of a constitution, or ordinances, forbidding slavery, repealing or declaring null and void the ordinance of secession, prohibiting persons in the "excepted classes" from voting or holding office, and repudiating the rebel debt; 4, the ratification of these by popular vote; and, 5, the election of legislatures, state governments, and members of congress. There seems to have been absolutely no check upon the action of the conventions, except the president's proclamations, and telegraphic information from him that their action seemed to him satisfactory, or the reverse. Excluding the states (Virginia, Arkansas, Tennessee and Louisiana) already reconstructed, there remained but seven states. In each of these, provisional governors were appointed, as follows: North Carolina, Wm. W. Holden, May 29; Mississippi, William L. Sharkey, June 13; Texas, Andrew J. Hamilton, June 17; Georgia, James Johnson, June 17; Alabama, Lewis E. Parsons, June 21; South Carolina, Benj. F. Perry, June 30; Florida, William Marvin, July 13. The first proclamation of the series, as to North Carolina, may stand for all: its preamble recited that the United States guarantee to each state a republican form of government, that the president is bound to take care that the laws be faithfully

executed, that the rebellion had deprived the state of all civil government, and that it was now necessary and proper to carry out the guarantee of the United States to North Carolina. In Mississippi, Georgia and South Carolina, the late governors attempted to convoke the legislatures, and anticipate reconstruction, but the attempts were promptly suppressed by the military commanders. The governments of Virginia, Louisiana, Arkansas and Tennessee were left undisturbed. In all the others the work of reconstruction was so actively carried on during the summer and autumn of 1865, that, when congress met in December, claimants for seats in the house and senate were ready from all the seceding states, except Texas. The work of reconstruction was then ended, so far as the presidential theory could carry it; and, as if to clinch and fasten it permanently, Secretary Seward issued his proclamation, Dec. 18, 1865, announcing the ratification of the 13th amendment. In its adoption, the ratifications of the legislatures of the seceding states had been essential, and it seemed as if no one could now reject the presidential theory, without impugning the validity of the amendment.

—3. *The Sumner Theory.* Mr. Sumner offered a series of resolutions in the senate, Feb. 11, 1862, "declaratory of the relations between the United States and the territory once occupied by certain states." The preamble recited the action of the several seceding states, through their governments, in abjuring their duties, renouncing their allegiance, levying war on the government, and forming a new confederacy. The resolutions were nine in number, as follows: 1, that an ordinance of secession is inoperative and void against the constitution, but is an abdication by the state of its rights under the constitution, and thence-forward the state, *felo de se*, ceases to exist, and its soil becomes a territory, under the exclusive jurisdiction of congress; 2, that secession is a usurpation, and action under it is without legal support; 3, that the suicide of a state puts an end to any peculiar institution upheld by the state's sole authority; 4, that slavery is such an institution; 5, that it is the duty of congress to put a practical as well as a legal end to slavery; 6, that any recognition of slavery is aid and comfort to the rebellion; 7, that it is also a denial of the rights of persons who have been made free; 8, that, as the allegiance of all the inhabitants of the seceding states is still due to the United States, the protection of the United States is equally due to all the inhabitants, regardless of color class, or previous condition of servitude; 9, that congress will proceed to establish republican forms of government in the "vacated territory," taking care to provide for the protection of *all* the inhabitants. The essence of the resolutions is the idea of "state suicide"; that no territory can be compelled to assume, and no state can be compelled to retain, the public rights and duties of a state against its will; that, as Brownson expresses it, "a territory by coming into the Union becomes a state, and a state by going out of the Union becomes a territory." The resolutions were never formally considered or adopted; but their theory remained, and undoubtedly colored to some extent the final work of reconstruction.

—4. *The Stevens Theory.* From the outbreak of the rebellion until the end of reconstruction but two parties consistently maintained a consistent theory, the democratic party and Thaddeus Stevens (see his name). The democratic theory has already been given. The Stevens theory may be briefly stated as the suspension of the constitution in any part of the country in which resistance to its execution was too strong to be suppressed by peaceful methods. He held that the mere fact of resistance

suspended the constitution for the time; that it could not truly be said that the constitution and laws were in force where they could not be enforced; that the termination of the suspension was to be decided by the victorious party; that, if the rebellion was successful, the suspension would evidently be permanent; and that, if the rebellion was suppressed, the suspension would continue until the law-making and war-making power should decide that the resistance had been honestly abandoned. Here the theory shaded into the indefinite "was-power" (see that title). But it differed more than it agreed. Republicans generally held that armies were marching and battles were fought and states were reconstructed throughout the south by virtue of the constitution and its was power, and they were forced to strain the written instrument into the most extraordinary shapes, and to take lines of action which were radically contradictory. To cite a single example: unless the Pierpont government was the legal government of Virginia in 1861, West Virginia is not, and never has been, a state of the Union; and yet, if the Pierpont government was legal in time of war, its reconstruction by congress in a time of profound peace was unwarranted by any law. But both these contradictions were accepted. West Virginia was retained as a state, and its members even voted on the reconstruction of the parent state of Virginia. All this, and countless other contradictions, were blotted out by Stevens' all-embracing theory. From it he never swerved. At the special session of July, 1861, he declared it as follows: "These rebels, who have disregarded and set at defiance that instrument, are by every rule of law, estopped from pleading it against our action. There must be a party in court to plead it; and that party, to be entitled to plead it, must first acknowledge its supremacy, or he has no business to be in court at all. Those who bring in this plea here, in bar of our action, are in a legal sense the advocates of rebels, their counselors at law; they are speaking for them, not for us, who are the plaintiffs in the action. I deny that they have any right to plead at all. I deny that they have any standing in court." For this reason he voted for the admission of West Virginia, while he still considered the Richmond legislature the legislature of Virginia, and ridiculed unsparingly the action of "the highly respectable but very small number of the citizens of Virginia, the people of West Virginia," who had "assembled together, disapproved the acts of Virginia, and with the utmost self-complacency called themselves Virginia." In the same way he voted for every war measure without leaving any unpleasant precedents for the final work of reconstruction. Throughout the war his views were always repudiated by Colfax and other leading republicans, and he said in 1863: "I know perfectly well that I do not speak the sentiments of this side as a party. I know, that, for the last fifteen years, I have always been a step ahead of the party I have acted with in these matters; but I have never been so far ahead but that the members of the party have overtaken me and gone ahead, and they will again overtake me before this rebellion is ended. They will find that they can not execute the constitution in the seceding states; that it is a total nullity there; and that this war must be carried on upon principles wholly independent of it." Even in the final process of reconstruction he took no step backward. In his theory the guarantee clause and the other constitutional grounds of congressional action had no place. Congress had omnipotent power, because the seceding states had repudiated the constitution. If that body chose to offer mild terms, so much the better for the conquered; if harsh, no one had a right to complain. Democratic votes aided him in defeating the offer of any terms until his own party was so near him that he could rejoin it with the sacrifice of little in fact and nothing in theory. This result came about in December, 1865, when

he became the leader of the joint committee of fifteen on the rebellious states; and from that time much of the work of reconstruction was his own, modified by the restraining influence of his colleagues. The fundamental condition of negro suffrage was one of his purposes, but he persistently advocated even harsher terms of peace. In a speech at Lancaster, Pa., in September, 1865, he proposed the confiscation of the estates of rebels worth more than \$10,000 or 200 acres of land, forty acres of land to be given to each freedman, and the balance, estimated at \$3,500,000,000, to go toward paying off the national debt. He supposed that only one-tenth of the whites would lose their property, while nearly all southern property would be confiscated. This proposition was never formally considered, but it made Stevens the incarnation of all evil in the eyes of southerners. His name and his purposes occur in the debates of all the southern conventions of 1865, and are introduced as incentives to the prompt acceptance of the presidential policy.

—5. *The Davis-Wade Plan.* The adoption of an anti-slavery policy during the war made necessary the imposition of some condition on reconstruction; and this condition was first stated in the presidential plan of 1863, in the form of the oath to support the anti-slavery proclamations and laws, as well as the constitution. But, if any such condition could be imposed, there was practically no limit in theory to the conditions which might be imposed: there was no middle ground between unconditional restoration and the discretion of the conquering government. The appearance of a condition in the presidential policy was therefore the signal for the appearance of a condition in congress also. In the president's policy no security was asked for the faithful execution of reconstruction, beyond the taking of the oath, the oversight of the president, and the separate action of the houses in admitting members. To fill this defect, a bill was privately drafted in 1863, reported to congress by the committee on rebellious states, of which Henry Winter Davis and Benj. F. Wade were the leaders, and came fairly before the house, March 22, 1864. By its terms the president was to appoint provisional governors, who were to enroll the white citizens through the aid of United States marshals. When a majority of these citizens in any state should take the oath of allegiance, they were to hold a state convention, excluding from voting or being delegates, all confederate officeholders and all who had voluntarily borne arms against the United States. The constitution was to repudiate the rebel debt, abolish slavery, and prohibit the higher military and civil office-holders of the state and confederacy from voting for or serving as governors or members of the legislature. When this was done, the provisional governor was to notify the president; when the assent of congress was obtained, the president was to recognize the new government by proclamation; and then senators and representatives were to be admitted. It declared forever free the slaves in seceding states, and made the holding of any such person in slavery an offense punishable by fine and imprisonment; but there was still no attempt to introduce negro suffrage. The bill was defended on the ground that "we are now engaged in suppressing a military usurpation of the authority of state governments, and our success will be the overthrow of all semblance of government in the rebel states. The government of the United States will then be in fact the only government existing in those states, and it will be charged to guarantee them republican governments. When military opposition shall have been suppressed, not merely paralyzed, driven into a corner, and pushed back, but gone, then call upon the people to reorganize in their own way a republican

government in the form that the people of the United States can agree to, subject to the conditions that we think essential to our permanent peace, and to prevent the revival hereafter of the rebellion." Its basis was therefore the same as that of the final congressional plan: that of a war measure passed, if not *bello flagrante*, at least *bellonon cessante*. Its advocates objected to the president's plan for the reason that the latter "proposed no guardianship of the United States over the reorganization of state governments, no law to prescribe who shall vote, no civil functionaries to see that the law is faithfully executed, no supervising authority to control and judge of the elections." These defects the Davis-Wade bill proposed to rectify by the introduction of the local machinery of marshals, and the final authority and assent or rejection of congress. But who or what was to prevent reconstructed governments, after the admission of their senators and representatives, from amending their constitutions and eliminating the conditions of reconstruction? Here was the weak point of the bill, which congress finally endeavored to strengthen in 1867 by negro suffrage and constitutional amendment.

—The bill was passed by the house, May 4, by a vote of 73 to 59, but did not come up in the senate until July 1. On the last day of the session it was passed by the senate, but the president refused to sign it for the reason that he had not sufficient time to examine it. July 8, 1864, he issued a proclamation explaining and defending his reasons for not signing the bill. Messrs. Davis and Wade replied in a counter proclamation "to the supporters of the government." They had read the president's proclamation "without surprise, but not without indignation." They asserted, on the contrary, that the substance of this bill had been before the president for more than a year for consideration; that he himself had intrigued to delay the passage of the bill so as to obtain an excuse for refusing to sign it; that senator Doolittle, of Wisconsin, had written to the Louisiana authorities that the house bill would be held as long as possible in the senate, and finally killed by a pocket veto; that the president's persistence in his own plan, and his hostility to that of congress, were both inspired by the desire to use, if necessary, the electoral votes of Louisiana and Arkansas to secure his own election in November, and that an abortive military expedition into Florida had the same object; and they ask, "if those votes turn the balance in his favor, is it to be supposed that his competitor, defeated by such means, will acquiesce?" In conclusion they warn the president that their support "is of a cause, and not of a man; that the authority of congress is paramount and must be respected; and that, if he wishes their support, he must confine himself to his executive duties, to obey and execute, not make the laws, to suppress armed rebellion by arms, and leave political reorganization to congress." In the following session the bill was again introduced in the house, but it was already obsolete, and was laid on the table. Instead of it, the bill of 1865 (see ELECTORS, V.) forbade the counting of electoral votes from any of the seceding states, for the reason that their inhabitants had rebelled, and that the states were "in such condition" that no valid election could be held. The phrase quoted was a compromise between the views of those who wished to except Louisiana from the list of states excluded, and of those who wished to declare explicitly that all the states (including Louisiana, Arkansas, Tennessee and Virginia) were "still in such state of rebellion" in November, 1864. Electoral votes were sent by Louisiana and Tennessee, but were rejected under the law. Thus the whole question was still left in suspension,

and the war ended with no other preparation for reconstruction than the policy which Lincoln had inaugurated, and Johnson was to carry into general effect.

—6. *The Congressional Plan.* The acceptance of the presidential policy by the state conventions of southern whites was so swift that northern democrats, before the end of July, 1865, generally supported the whole scheme as the best practical form of "restoration," taking the changes in state constitutions as the voluntary act of the states, not as conditions imposed by the president. The resolutions of successive state conventions of 1865 show constant change. Democratic resolutions grow steadily stronger in their approval of the presidential policy. Republican resolutions grow steadily more reserved in their approval of the president and his policy, and steadily stronger in their approval of "impartial suffrage" as a condition precedent to the reconstruction and recognition of seceding state governments. For this change in the republican position, there was undoubtedly party reason. Stevens said frankly in 1867: "White union men are in a minority in each of those states. With them the blacks would act in a body, form a majority, control the states, and protect themselves. It would insure the ascendancy of the union party, for I believe, on my conscience, that on the continued ascendancy of that party depends the safety of this great nation." But this reason alone, however it might have controlled the policy of the party, could never have made that policy a success: it could never have carried as it did the elections of 1866, the very crisis of congressional reconstruction. The controlling reason will be found in the constant irritation kept up by the general cast of the legislation in regard to freedmen by the reconstructed legislatures of 1865-6, supplemented by the indiscreet, unconciliating and inflammatory tone of the president himself.

—In regard to marriage and testimony or standing in court, most of the southern legislation was alike. Former slaves, who had cohabited as man and wife were to be deemed and taken as married, but marriage between the two races was forbidden under penalties. Negroes were to sue and be sued like whites. The testimony of a negro was only to be received in cases where a negro should sue a white, where a white had injured a negro, or where the rights of a negro were in question, always provided that the testimony offered was essential to the case. Contracts between blacks and whites were to be void unless put in writing and witnessed by a white man. A benevolent exception should be noticed in the law of Virginia, that contracts between blacks and whites were not to be binding *upon the black* unless put in writing before a magistrate and fully explained by him. The criminal laws were generally fair and equal, except that rape of a white woman by a negro was made punishable by death. In many minor points this species of legislation was no doubt objectionable. Taken as a whole, and considered as the work of men who had within a year been absolute masters of the freedmen, and who had been dispossessed of their control by war and conquest, it must be conceded that it exhibits remarkable self-control, public spirit and equity.

—The case was very different with the vagrancy and stay laws passed by most of the southern legislatures. We have already noticed that the proclamation of 1863 made "no objection" to a temporary regulation of the status of the freedmen, "as a laboring, landless, homeless class." On this subject the legislation of North Carolina, Tennessee

and Texas, was comparatively unobjectionable. The Virginia act declared all persons vagrants who refused to work for the wages common and usual in the place where they lived, or who broke a contract with an employer, and in the latter case authorized the employer to work the runaway an additional month, with ball and chain, if necessary. The act was revoked by Gen. Terry, Jan. 24, 1866, for the reason that combinations of employers were reducing wages below a fair rate, and then punishing as vagrants the laborers who refused to accept them. The most comprehensive system was that of Mississippi, passed at various times during the last two weeks of November, 1865. Negroes who were orphans or unsupported were to be apprenticed until the ages of twenty-one for males and eighteen for females, and the masters were to have power to inflict "moderate corporal chastisement," and to recapture fugitives. Negroes, or whites habitually associating with negroes, were declared vagrants if they had no lawful employment, or assembled themselves together unlawfully. They were to be arrested and fined, and, if unable to pay the fine, were to be hired out to the bidder who would pay the fine for the shortest term of service. The evidence of a "lawful employment" was to be the negro's written contract for labor, or his license from a mayor or police board to do job work. These, renewed annually, were to serve as a pass: without them the negro was a self-confessed vagrant. All the laws respecting crimes committed by "slaves, free negroes or mulattoes," were reenacted, and declared to be in full force and effect against "freedmen, free negroes and mulattoes." Any negro who "carried arms without a license, committed riots, routs, affrays, trespasses, malicious mischiefs or cruel treatment to animals, seditious speeches, insulting gestures, language or acts, or assaults on any person, or disturbance of the peace, or who exercised the functions of a minister of the gospel without a license from some regularly ordained church," was to be fined, and hired out if unable to pay. Any laborer who should break his contract, and leave his employer, was to be arrested and returned to his labor, and the expenses of the arrest were to be deducted from the runaway's wages. Any attempt to entice a contract laborer from his employer was made a finable misdemeanor. The fundamental features of the Mississippi code, its application of the vagrant laws to recalcitrant laborers, its hiring out of those unable to pay fines, and its prohibition of the enticing away of laborers, were adopted by Florida, Alabama and Georgia; but none of them had by any means so comprehensive a negro code. In December, 1865, South Carolina adopted a vagrant code much like that of Mississippi, but with some features of its own. Persons of color (defined as persons with more than one-eighth negro blood) were not to pursue any trade, business or occupation, other than that of husbandry or contract service, without paying a fee of \$100 a year if a shopkeeper or peddler, or \$10 a year if a mechanic, for a license; and they were not to sell any farm product without written license to sell any farm product without written license to sell. It was made felony for any person of color to attempt rape upon a white woman; for any person under sentence of transportation from the state to return before the end of his term; or for any person to steal a horse, a mule, or cotton packed in a bale ready for market. No negro was to enter the state to reside there without giving bonds for his good behavior and support. The whole code of laws was revoked by Gen. Sickles, Jan. 17, 1866. The Louisiana law, in December, 1865, required "agricultural laborers" to make written contracts for a year's labor before Jan. 10 in each year, and forbade the laborer to leave his place of employment before the end of his time of service, unless by consent of his employer, or on account of harsh treatment or breach of

contract by the employer. Refusal to work out the time of contract was to be punished by forced labor on public works, unless the offender should consent to return to his labor. Runaways from an employer were declared vagrants, and were to be hired out for not more than twelve months, the employer having the preference, and the wages to go to the poor fund. An aggravation of the contrast between the status of the two races was presented in those states in which suits of the employer against the laborer were decided summarily by arrest and hiring out: at the same time "stay laws" operated to postpone execution of judgment in suits at law for one, two, three or more years for different fractions of the judgment debt, so that a laborer had little prospect of satisfaction from a suit against an employer.

—Such legislation as this is mainly responsible for the reconstruction of the seceding states by congress. It forced a very fair observer to conclude, in 1865, that, if they should "get the troops away and the states into congress, three-fourths of the counties in the state [Georgia] would vote for such a penal code as would practically reduce half the negroes to slavery in less than a year." In the northern states it came to be generally believed that this was the deliberate southern policy; and this belief carried with it a majority ready to support congress in any counteracting policy whatever, no matter how radical. Not that the vagrant laws worked any great harm in practice: when they were not formally suspended by the strong arm of military power, the officers of the freedmen's bureau (see that title) withheld from state courts the cognizance of cases in which freedmen were interested. They served, then, only as an irritation; and the utter futility of the irritation only makes its folly the more glaring. And it was accompanied by other irritations, smaller, indeed, but perhaps as effective. Almost the first business of the reconstructed legislatures, still existing only under military sufferance, was to pass acts laying special taxes, or setting aside portions of the state's income, for pensioning confederate soldiers, widows and orphans; to pass resolutions demanding the pardon of leading confederates; and to change the names of counties to honor their captured chieftains. In the state conventions, highly injudicious language had been used by a few of the more violent delegates; and, though few of these delegates had been warlike during the war, their utterances were quotable. Further, the peculiar action of the North Carolina, South Carolina and Georgia conventions, which "repealed" the ordinance of secession, instead of declaring it null and void, was imprudent, to say the least. If it is prudent to build a bridge of gold for a flying enemy, it is infinitely more advisable to avoid irritating a victorious enemy who is disposed to be at peace.

—Before congress met, in December, 1865, the mass of legislation above summarized had fairly taken shape; and, as it seemed to look toward the re-establishment of an *imperium in imperio*, it had already swung the whole republican party into opposition to the presidential policy. The elections of 1864 had given the republicans a majority of 40 to 11 in the senate, and 145 to 40 in the house; and southern vagrant laws and similar legislation had at last brought this majority abreast of Stevens and made him its leader, as he remained until his death, in 1868. The first step was taken on the opening day in the house, when the clerk, McPherson, in calling the roll, declined to call the names of any of the seceding states, even of Tennessee, Louisiana and Virginia. He refused to state his reasons, unless by desire of the house. Immediately after the election of a speaker, Stevens offered the concurrent resolution which

contained the essence of reconstruction: that a joint committee of nine representatives and six senators should inquire into the condition of the seceding states, and report whether any of them were entitled to be represented in either house; that, until the committee should report and their report should be finally acted on by congress, no member should be received by either house from any of said states; and that all papers relating to the matter should be referred to the committee without debate. On this pregnant resolution he called for the previous question; debate was shut off, and the resolution was carried by a party vote. This was a declaration of war against the presidential policy, under which the two houses were only to decide separately upon admission of members; and the more cautious senate, Dec. 12, struck out the last two of its three features. The house agreed, Dec. 14, but pledged itself against any admissions until the committee should report. Jan. 8, 1866, the house further resolved that the troops should not be withdrawn from the seceding states until the two houses should direct their withdrawal. The chasm between the president and the majority in congress rapidly grew wider. Feb. 20, Stevens again brought up his fundamental idea in a "concurrent resolution concerning the insurrectionary states." It resolved, in order to close agitation and quiet the uncertainty in the south, that no senator or representative should be admitted by either house until congress should declare the state entitled to representation. This was passed at once under the previous question. March 2, the senate passed it, and the manner, though not the exact method, of reconstruction, was settled, so far as congress could then settle it.

—It was by this time an open secret that there was a very decided disagreement between President Johnson and the party which had elected him. Had Lincoln been one of the parties to the disagreement, there can be no doubt that an adjustment of ideas would have been arranged: Johnson preferred to declare war. The occasion was found, Feb. 22, two days after the passage of the definitive resolution by the house. A Washington mass meeting sent a committee to the president with resolutions approving his policy. In his reply he passed beyond the arguments to which he had hitherto confined himself in public speeches, the necessity for conciliation, the impossibility of any withdrawal from the Union, and the right of states to representation. He now proceeded to attack congress, as having transferred its powers to "an irresponsible central directory" (the leaders of the republican caucus); he named Stevens, Sumner and Wendell Phillips as the leading northern disunionists; and he even taunted his opponents with their cowardly unwillingness "to effect the removal of the presidential obstacle otherwise than through the hands of the assassin." There is no excuse for such language in the provocative speeches of several of the radical republicans in and out of congress. By replying in this fashion, the president only played into the hands of opponents who never gave away a point in the game. He aimed at the Stevens faction, but he only succeeded in alienating the whole mass of the republican representation. Thereafter, there was no possibility of co-operation between the president and this congress.

—At the beginning of the session many amendments to the constitution had been proposed, intended to void the rebel debt, and secure the rights of freedmen, that is, to counteract the southern legislation of 1865-6. One of them, afterward elaborated into section two of the 14th amendment, was passed by the house, Jan. 31, 1866, but failed to receive a two-thirds vote in the senate. The speech of Feb. 22 not only brought the

senate to agree to the concurrent resolution: it made constitutional amendment possible as well. April 30, Stevens introduced an amendment to the constitution, and a bill providing, that, when this amendment should become a part of the constitution, any seceding state which had ratified the amendment, and altered its constitution in conformity therewith, should be entitled to representation at once. The amendment was that which in June became the 14th amendment. (See CONSTITUTION.) It differed from the latter in three essential points: 1, it had not the first sentence of section one, declaring who are "citizens of the United States"; 2, section three forbade all persons who had voluntarily taken part in the rebellion from voting for members of congress or for electors before July 4, 1870; and 3, it had not the first sentence of section four, declaring the validity of the national debt. But the substance of section three of the amendment, as finally adopted, disqualifying certain classes of leaders from holding office, was contained in a separate bill reported by Stevens at the same time, as an essential part of the whole plan. In the house the amendment was passed March 10, by a party vote, under the previous question. In the senate it was debated until June 8, when it was passed, having been altered into its present form, and the substance of the house disqualifying bill having been substituted for the original third section. June 13, the house concurred with the senate's alterations, and the amendment was proposed. This may be considered as closing the first stage of reconstruction by congress. The terms now offered to the seceding states were the ratification of the 14th amendment, repudiation of the rebel debt, disqualification of the specified classes of confederate leaders until they should be pardoned by congress, and a grant to congress of power to maintain the civil rights of the freedmen. There was no effort to control suffrage within the state; only an effort to induce the states to grant universal suffrage, and thus increase their representation in congress—While this perfecting of the first congressional plan was going on, the conflict between the president and congress had gradually become open and bitter. A bill to strengthen the hands of the officers of the freedmen's bureau (see that title) in resisting southern legislation, was passed and vetoed; and as the second vote upon the vetoed bill took place, in the senate, Feb. 21, before the president's declaration of war, it did not secure a two-thirds vote. The veto of the civil rights bill (see that title) in March met a different fate: the bill was passed at once in both houses by the necessary two-thirds vote, and became law. A similar result took place upon the veto of a second and still more stringent freedmen's bureau bill in July; and, when congress adjourned, it was very certain that the southern vagrant laws had as yet no chance of practical enforcement. Before the adjournment, Tennessee (see that state) was restored to representation by joint resolution, July 24, the senate so amending the preamble as to state that "said state can only be restored to its former political relations in the Union by consent of the law-making power of the United States." Evidently, the president had been so poor a strategist that he had only succeeded in putting himself, for the present, outside of the "law-making power" which was to do the work of reconstruction. Everything depended on the result of the congressional elections of the autumn, which were to decide whether the two-thirds republican majority in congress would be continued after March 3 following.

—As one of the means of preparation for the autumn campaign, the majority of the committee of fifteen presented a report, June 18, 1866, with a great mass of testimony going to show the prevalence of disloyalty in the seceding states. The report asserted

that the seceding states in 1860-61 had deliberately abolished their state governments and constitutions, so far as these connected them with the Union; had repudiated the constitution, and renounced their representation; that as the constitution acted on individuals, not on states, the people were still bound to obedience to the laws, though they had abolished their state governments; that the war could not be considered as terminated when the people of the seceding states yielded "an unwilling admission of the unwelcome fact" of their inability to resist longer; and that it was an essential condition that such guarantees of future security should be given as would be satisfactory to the law-making power, which, in the law of 1861, had recognized the existence of rebellion. This, it will be seen, was not quite the theory of either Sumner or Stevens: unlike the former it considered the states as existing, though their governments were in a condition of suspended animation; unlike the latter, it maintained the continued existence and force of the constitution in the seceding states. Practically, however, it agreed with both, in that it made congress the final arbiter of the guarantees of peace.

—The president and his supporters had not spent the winter in idleness. Early in the year a "national union club" had been formed in Washington, composed mainly of republican supporters of the presidential policy. Its executive committee, June 25, issued a call for a national convention to meet at Philadelphia, Aug. 14, to be composed of northern delegates, representing the Lincoln and Johnson vote of 1864, and of southern delegates who would unite with the former in supporting the presidential policy. July 4, the democratic members of congress issued an address approving the proposed convention. A request to the members of the cabinet for their approval was followed by the resignation of three of them (see ADMINISTRATIONS, XX.) the rest were as yet a unit in support of the president. The convention met as proposed, John A. Dix, of New York, being temporary chairman, senator Doolittle, of Wisconsin, president, and Henry J. Raymond, of New York (chairman of the republican national committee), chairman of the committee on resolutions. The resolutions fully sustained the president and his policy. The somewhat theatrical entrance of the delegates to the building, headed by the delegates from Massachusetts and South Carolina, enabled its opponents to give it the nickname of the "arm-in-arm convention." But it was certainly a well-contrived political movement, and the first prospects of its effectiveness are shown by the anger aroused against its supposed contrivers, Seward and Raymond. The latter was expelled by the republican national committee, and the former was specially denounced in almost every republican platform.

—With the first prospects of success, however, the president's public language became more indiscreet than ever. In his answer to the committee which brought him the Philadelphia resolutions he said: "We have witnessed in one department of the government every effort, as it were, to prevent the restoration of peace and harmony in the Union. We have seen hanging on the verge of the government, as it were, a body called, or which assumes to be, the congress of the United States, but in fact a congress of only part of the states. We have seen this congress assume and pretend to be for the Union, when its every step and act tended to perpetuate disunion, and make a disruption of the states inevitable." Indeed, his pugnacity had so far gained the upper hand of his discretion that he even gratified his congressional opponents by

descending personally into the arena. He chose this most inopportune of all seasons for an excursion to Chicago, for the purpose of laying the corner-stone of the Douglas monument. Starting Aug. 28, with a large party, including three of his cabinet, General Grant, Admiral Farragut, and others, he made speeches at various points from New York city to Chicago, and thence to St. Louis, Sept. 8; and the matter and manner of his speeches grew worse from the beginning. It was alleged that his opponents hired men to irritate and provoke him to indiscretions; but such a political manœuvre was entirely unnecessary. An extract from his Cleveland speech of Sept. 3 will serve as evidence that the president's own temper was the source of a large part of the scandalous interchange of vituperation between himself and his audiences, which disgraced his progress: "I came here as I was passing along, and have been called upon for the purpose of exchanging views, and ascertaining, if we could, who was wrong. [Cries of 'It's you.'] Who can come and place his finger on one pledge I ever violated, or one principle I ever proved false to? [A voice, 'How about New Orleans?' Another voice, 'Hang Jeff. Davis.'] Hang Jeff. Davis, he says. [Cries of 'No,' and 'Down with him.'] Hang Jeff. Davis, he says. [A voice, 'Hang Thad. Stevens and Wendell Phillips.'] Hang Jeff. Davis. Why do n't *you* hang him? [Cries of 'Give us the opportunity.'] Have n't you got the court? Have n't you got the attorney general? [A voice, 'Who is your chief justice who has refused to sit upon the trial?'] I am not the chief justice. I am not the prosecuting attorney. [Cheers.] I am not the jury. I will tell you what I did do. I called upon your congress that is trying to break up the government—[cheers, mingled with oaths and hisses. Great confusion. 'Do n't get mad, Andy.'] Well, I will tell you who is mad. 'Whom the gods wish to destroy, they first make mad.' Did your congress order any of them to be tried? [Three cheers for congress.] \* \* [A voice, 'Traitor.'] I wish I could see that man. I would bet you now, that, if the light fell on your face, cowardice and treachery would be seen in it. Show yourself. Come out here where I can see you. [Shouts of laughter.]" The colloquies between the president and his hearers grew more unpleasant as the trip went on, but, nothing daunted, the president continued speaking, and playing into the hands of his opponents to the end.

—July 30, 1866, the report of the majority of the reconstruction committee received an unexpected indorsement. An attempt was made on that day to revise the constitution of Louisiana (see that state) by reassembling the adjourned convention of 1864, in New Orleans. The convention's leaders are described by the military commander, Sheridan, as "intemperate political agitators and revolutionary men," whom he himself intended to arrest on the first overt act against the public peace. But the city authorities saved him the trouble, dispersing the convention "with firearms, clubs and knives, in a manner," says Sheridan, "so unnecessary and atrocious as to compel me to say that it was murder." About forty whites and blacks were thus killed, and 160 wounded. When the smoke of the congressional elections had cleared away, it was found that the republican majority had hardly been changed in numbers: in the next congress it would be 42 to 12 in the senate, and 143 to 49 in the house. This was more than sufficient to override the president's veto and continue to keep the president out of reckoning as part of the "law-making power." In *personnel* the new majority was still more pronounced and united than the old majority in opposition to the presidential policy.

—When congress met in December, 1866, the majority came as victors, not as combatants; and their first and natural impulse was to superadd punitive damages. Their first terms, of June, had been rejected: the defeated party was now to pay the penalty of the refusal in the imposition of negro suffrage upon reconstruction. This had always been an essential feature of the Sumner and Stevens programmes, but now for the first time the party majority was united by stress of conflict in support of it. An effort was at once made to impeach the president, but it at first was abortive. (See IMPEACHMENTS, VI.) The republican caucus at once took place as the practical governing body of the nation. It requested the senate to reject the appointments made by the president for political reasons during the recess. and its executive committee was directed to prepare business for congress. The committee rapidly reported several bills, which were passed under the previous question. 1. The act of Jan. 22, 1867, directed succeeding congresses to meet at noon of March 4. This was to prevent the president from enjoying any nine months interregnum in future. 2. The act of Feb. 19 directed the clerk of the house to make out the roll of representatives elected to the next congress, and to place thereon the names of only such states as were represented in the next preceding congress. This was to anticipate the possible formation of *apseudo* congress, composed of northern democrats and southern claimants, which might be formed and recognized by the president. 3. The tenure of office act (see TENURE OF OFFICE) limited the president's power of removal, which had been made a political weapon during the campaign. 4. The advanced feeling on the subject of suffrage was shown in the passage of acts establishing universal suffrage in the District of Columbia, Jan. 8, in the territories, Jan. 24, and in the admission of the state of Nebraska, Feb. 9, the first and third being passed over the veto. (See also COLORADO.) 5. In passing the army appropriation bill, in February, a section was added which practically took the command of the army from the president, gave it to Gen. Grant, and made him irremovable. (See RIDERS.) This step was indefensible on any theory. All these measures, however, were only adjuncts of the real business of the session, the consummation of the work of reconstruction.

—Between October, 1866, and February, 1867, the legislatures of all the seceding states, except Tennessee, rejected the 14th amendment by votes nearly or quite unanimous. This action had a double result: as a final rejection of the first terms of reconstruction, it made subsequent terms more severe; and, as it showed the absolute impossibility of obtaining the ratification of the 14th amendment by three-fourths of the (then) thirty-six states while the ten southern states remained *in statu quo*, it forced congress to choose between the presidential policy and negro suffrage. So evidently ready was congress to make the choice, that, in February, 1867, an official effort, indorsed by the president, was made to induce the southern legislatures to propose an amendment of their own. It was the 14th amendment without the disqualifying clause, but with a new clause forbidding a state to secede, or the federal government to eject a state or deprive it of its representation in congress. The plan also included the amendment of each state constitution by giving the right of suffrage to all male citizens who could read and write, and owned \$250 worth of taxable property. The amendment was offered in the legislatures of Alabama and North Carolina, but their refusal to consider it put an end to the proposal. In the meantime, congress had gone on with its work. Dec. 13, 1866, Stevens introduced a bill to reconstruct the government of North Carolina, giving the right of suffrage to males

able to read and write. Jan. 3, 1867, he called up, in place of the former, a general reconstruction bill. It was sent to the reconstruction committee, which reported, Feb. 6. the bill finally adopted. Here there was some republican hesitation. Blaine offered an amendment promising representation on the terms of June, 1866; but this was voted down by democrats and radical republicans, and the bill was passed by a vote of 109 to 55. In the senate the Blaine amendment was offered by Sherman, and carried; but the house refused to concur, the democrats and radical republicans again voting in company. The only result of this temporary republican division was that the majority now reunited, and passed the bill, given below, without the Blaine amendment, and with the far more stringent fifth and sixth sections. which were not in the original bill. The final votes, Feb. 20, were 128 to 46 in the house, and 35 to 7 in the senate.

—7. *First Reconstruction Bill.* The preamble of the "act to provide for the more efficient government of the rebel states," recited that no legal state governments, or adequate protection for life and property, now existed in those states, and that it was necessary that peace and good order should be enforced in them until loyal and republican state governments could be legally established. The six sections were as follows: 1. The states were to be made subject to the military authority of the United States, and divided into the following districts: I., Virginia; II., North and South Carolina; III., Georgia, Florida and Alabama; IV., Mississippi and Arkansas; V., Louisiana and Texas. 2. The president was to appoint the commanding officer of each district, not to be below the rank of brigadier general, and furnish him sufficient military force. 3. The commanding officer was "to protect all persons in their rights of person and property, to suppress insurrection, disorder and violence," either by military commission, or by allowing local courts to act; "and all interference, under color of state authority, with the exercise of military authority under this act, shall be null and void." 4. Trials were to be without unnecessary delay; punishments were not to be cruel or unusual; and sentences of military commissions were to be approved by the commanding officer, or, if they involved death, by the president. 5. The people of any state might hold a delegate convention, elected by the male citizens of the state on one year's residence, excluding only those disfranchised for participation in the rebellion, or for felony at common law; but no person excluded from holding office by the proposed 14th amendment was to vote for delegates or become a delegate. The constitution framed by the convention was to give the elective franchise to those citizens who were allowed to vote for delegates, and was to be ratified by a popular vote under the same conditions of suffrage. When these conditions were fulfilled, when congress had approved the constitution, when the new legislature had ratified the 14th amendment, and when that amendment should become part of the constitution, the state was to be entitled to representation in congress. 6. Until thus reconstructed, the civil governments of the rebel states were to be "deemed provisional only, and in all respects subject to the paramount authority of the United States at any time to abolish, modify, control or supersede the same;" and, "in all elections under such provisional governments, "the only voters or office-holders were to be those entitled by this act to vote or hold office.

—The bill was vetoed, March 2. The message denied the truth of the preamble; protested against the bill as a needless and utterly unconstitutional attempt to establish an unrestrained military despotism over part of the country in a time of profound

peace; and appealed to congress to admit loyal and qualified members from all the states. The bill was passed over the veto the same day, the vote being a strictly party vote, except that Senator Reverdy Johnson voted in the affirmative. It may be considered the second stage of reconstruction. Military government was to be established, but the reconstruction was still to be done by the state, subject to the final approval of congress. In order to induce such action by the state, its citizens were given the option of a surrender of civil government or voluntary reconstruction; for the sixth section, applying the principle of the bill to "all elections," made reconstruction ultimately inevitable, if elections were to take place. It is certain that several states were moving in the direction of voluntary reconstruction when the new congress, which met March 4, 1867, anticipated them and hastened the process.

—8. *Supplementary Reconstruction Bill*. March 19, the new congress passed an act in nine sections, as follows: 1. Before Sept. 1, 1867, district commanders were to register male citizens qualified to vote under the act, taking from each registered voter an oath that he was qualified by residence and age, and that he had never engaged in rebellion after taking the oath of allegiance as member of any state legislature or of congress, or as an officer, executive or judicial, of the United States or of any state. 2. The district commander was to hold an election for delegates, equal in number to the lower house of the state legislature, and apportioned according to registration. 3. The question of holding a convention was to be decided at the same election. 4. If a majority of registered voters consent to the convention, the district commander was to give the delegates sixty days' notice of the time and place of meeting; and when the constitution was framed he was to give thirty days' notice of an election to ratify or reject it. 5. When the constitution was ratified, it was to be sent to the president, and by him sent to congress. If congress approved it as in conformity with the reconstruction acts, the state was to be declared entitled to representation, and her senators and representatives were to be admitted. 6. All elections were to be by ballot, and false swearing was to be punished as perjury. 7. The expenses of the commanding officer were provided for. 8. The convention in each state was to have the power of taxation to meet its own expenses. 9. A verbal mistake in the original act was corrected.

—This may be considered the third stage of reconstruction by congress. Its essential point of difference was that the work of reconstruction was now taken out of the hands of the state, and given to the military commander. In brief, it was, so far as the state was concerned, involuntary reconstruction.

—II. THE WORK OF RECONSTRUCTION. March 11, 1867, the president appointed the district commanders; and the appointees, Generals Schofield, Sickles, Thomas, Ord and Sheridan at once took command of the five districts in the order given. March 15, Thomas was replaced by Pope. In all the districts the first order was generally an announcement of the assumption of command; and a general direction to the "officers under the existing provisional government" of the state to perform their duties as usual until otherwise directed, though the legislatures were forbidden to meet in the following autumn. Then came a notice that whipping and maiming in punishment of crime must cease, and that the militia must be disbanded. Then came the appointment of boards of registration, and the notification of the test oath; the

election of delegates; the meeting of the convention; and the framing of the new state constitution. The machinery worked with comparatively little friction. The whites were in no condition for forcible resistance; and when state treasurers or other officers attempted to balk the work in any way, they were promptly removed, and replaced by civilians or military appointees. The state of Mississippi attempted to obtain from the supreme court an injunction forbidding the president and Gen. Ord from executing the reconstruction acts, but the court refused it, April 15, on the ground that it could not thus interfere with the purely political acts of another department of the government. (See EXECUTIVE, IV.) The attorney general gave an opinion, which practically bound the boards of registration to take the oath of an applicant as good evidence of his right to register. This and other impediments to reconstruction were removed by the supplementary act of July 19, 1867. It gave district commanders and Gen. Grant power to suspend, remove and replace any state officers who should hinder reconstruction; empowered boards of registration to take evidence, strike off names fraudulently entered, and add names entitled to registry; and provided that no district commander or his appointees should be "bound in his action by the opinion of any civil officer of the United States." The Alabama constitution was ratified by less than half of the registered vote. The supplementary act of March 11, 1868, therefore, provided that reconstruction elections should be decided by a majority of the votes actually cast.

—In all the states the local work of reconstruction went on rapidly. The first of the conventions, in Alabama, met Nov. 5, 1867, and the others followed at various intervals. (Their time of meeting, action, and the ratifications, will be found under the several states.) The constitutions agreed in abolishing slavery, repudiating the rebel debt, renouncing the claim of a right to secede, declaring the ordinance of secession null and void, giving the right of suffrage to all male citizens over twenty-one years of age on a residence qualification, and prohibiting the passage of laws to abridge the privileges of any class of citizens. Further, all the constitutions, except those of North Carolina, Florida and Georgia, disfranchised all who were disqualified from holding office by the (proposed) 14th amendment. This disfranchising clause caused the rejection of the constitution in Mississippi, while in Texas and Virginia the popular sentiment was so adverse that no submission to popular vote was ventured on as yet. In the other states, as rapidly as possible, legislatures and governors were elected. The former met and ratified the 14th amendment; and the latter were formally appointed military governors until reconstruction could be completed. June 22, 1868, an act of congress approved the constitution of Arkansas as republican, and admitted the state to representation on the fundamental condition that the grant of universal suffrage should never be revoked. June 25, a similar act admitted North Carolina, South Carolina, Florida, Georgia, Alabama and Louisiana. July 20, 1868, an act to exclude electoral votes from unreconstructed states was passed over the veto.

—The 14th amendment thus secured the requisite number of state ratifications, and an act of June 25, 1868, directed the president to announce the fact by proclamation. July 11, he issued a laboriously ambiguous proclamation, announcing *seriatim* the reception of "papers purporting to be resolutions of the legislatures" of the various states, attested by the names of various persons "who therein sign themselves" governor, president of the senate, etc.; and July 20, Secretary Seward issued an

equally ambiguous proclamation, detailing the ratifications and the withdrawals of Ohio and New Jersey, and announcing that, if these withdrawals were invalid, the amendment was a part of the constitution. Subsequently (see CONSTITUTION, III.) he issued another proclamation, free from ambiguity. In the presidential election of 1868 the two parties, of course, took opposite grounds. The republican platform congratulated the country on the assured success of the reconstruction policy of congress. The democratic platform, while it recognized the questions of slavery and secession as settled by the war, declared "the reconstruction acts (so called) of congress to be usurpations and unconstitutional, revolutionary and void." This declaration was emphasized by the Brodhead letter, June 30, 1868, of the democratic nominee for vice-president, Blair: "There is but one way to restore the constitution and the government, and that is, for the president elect to declare these acts null and void, compel the army to undo its usurpations at the south, disperse the carpet-bag state governments, and allow the white people to reorganize their own governments, and elect senators and representatives." The country was not ready for such a programme, and the presidential and congressional elections of 1868 resulted in renewed republican success.

—Much suspicion had been felt by congressional leaders as to the action which the supreme court would take if the constitutionality of reconstruction should come legitimately before it. (See JUDICIARY, II.) Early in 1868 such an occasion seemed probable on an appeal from Mississippi on a writ of *habeas corpus* sued out by one McArdle, who had been convicted by a reconstruction military commission. To meet this danger, Stevens at first reported from the reconstruction committee a bill declaring that the jurisdiction of the supreme court should not extend to reconstruction legislation. This met little favor, and instead of it the act of March 27, 1868, passed over the veto, repealed the supreme court's statutory jurisdiction over appeals on *habeas corpus*. The question, however, could not be kept down, and in the December term of 1868, in the case of Texas *vs.* White, the court decided in favor of congress. During the rebellion Texas had sold a number of the bonds given her by the United States in 1850 (see COMPROMISES, V.), and the new state government sought an injunction to prevent payment to the purchasers. As Texas was still unreconstructed, the court agreed, that, if she was not a state, the suit must be dismissed, so that the whole suit turned on this point. The court held that the Union was "an indestructible Union of indestructible states"; that ordinances of secession were null and void, but that the states which passed them did not cease to be states of the Union; that their own act of rebellion had suspended their governmental relations to the United States; that congress must decide, as in the Rhode Island case (see DORR REBELLION), what government is established, before it can decide whether it is republican or not; that reconstruction by congress was valid; and that the governments instituted by the president were provisional only, to continue until congress could act in the premises. This was not the Sumner nor the Stevens, but the congressional, theory. It is fully summed up in an opinion of attorney general E. R. Hoar, of May 31, 1869: "The same authority which recognized the existence of the war is the only authority having the constitutional right to determine when, for all purposes, the war has ceased. The act of March 2, 1867, was a legislative declaration that the war which sprang from the rebellion was not, to all intents and purposes, ended; and that it should be held to continue until state governments, republican in form, and subordinate to the

constitution and laws, should be established." It is, therefore, not correct to say that the precedents of reconstruction give congress the right to reconstruct any state government at pleasure. Such a reconstruction can only come as the result of a rebellion recognized as such by the national authority, and ending in the overthrow of the state government with the rebellion. For example, the republican state convention of Maryland, Feb. 27, 1867, denounced the proposed state convention (see MARYLAND), and threatened, if it were persisted in, to appeal to congress for a reconstruction of the state government. The threat was carried into effect, March 25, when a reconstruction memorial from the republican members of the state legislature was offered in congress; but congress very consistently declined to interfere.

—Some additional work remained to be done, for reconstruction still hung fire in Texas, Mississippi and Virginia. The act of April 10, 1869, therefore authorized the president to call elections in those states for the ratification or rejection of their new state constitutions, submitting such sections as he pleased to a separate vote; but, as punitive terms for their delay, the new legislatures were required to ratify the proposed 15th as well as the 14th amendment. This may be considered the fourth and final stage of reconstruction by congress. In the states named, the objectionable clauses were voted down, the rest of the constitution was ratified, the legislatures fulfilled the conditions required, and the states were admitted by the acts of Jan. 26 (Virginia), Feb. 23 (Mississippi), and March 30, 1870 (Texas). In the same year, however, an attempted evasion of conditions by Georgia (see that state) brought her into the same position as the three states last named; and it was not until Jan. 30, 1871, that all the states were represented in both houses of congress, for the first time since 1860. Reconstruction by congress was then completed.

—For the impeachment of President Johnson, see IMPEACHMENTS, VI.; for the 15th amendment, see SUFFRAGE.

—III. THE FAILURES OF RECONSTRUCTION. Prophets were not wanting who predicted the speedy collapse of the highly artificial governmental edifices erected by congress in the southern states. Certainly he must have been a very short-sighted person who expected from them an immediate and permanent establishment of the freedmen in all the new privileges granted to them. If the weapon of suffrage, which the white race had secured only after centuries of arduous struggle, could be safely and surely wielded by a race which had hardly ever known any condition other than slavery, we must certainly rank slavery, as an educating process, higher than we have been accustomed to place it. And, on the other hand, if the pyramid must be supported on its apex by national power, it was not to be expected that the country would allow all other business to lapse, and wage an eternal war of irritations on behalf of a helpless race. Plainly, if southern resistance should be open, the south would be reconquered every decade; and if southern resistance was guarded but persistent, negro suffrage was destined, sooner or later, to at least a temporary eclipse.

—In almost all the states the downward career of the reconstructed governments was short and swift. Until the negro legislators learned the machinery of politics, they submitted with patience to the guidance of white leaders, generally northern immigrants, or "carpet-baggers," and these endeavored with considerable success to

keep up at least a semblance of the decent methods to which they had been accustomed. But the negro showed an astonishing quickness in learning the tactics of politics, in grasping the shell while ignoring the kernel. Points of order, parliamentary rulings, filibustering methods, the means of putting fraud into a fair legislative form, almost immediately became as familiar to the negroes as to any other experts in legislation; and then the state treasuries lay at the mercy of a race whose incorrigible and notorious vice, during slavery, had always been theft. No storming force ever made quicker work of a captured city. Most of the "carpetbag" leaders yielded to the current, and took a share of the spoils. The impoverished treasuries were instantly swept clean. The issue of bonds was then resorted to, except in states like Mississippi, whose bonds were unsalable through previous repudiation; and in this process the lion's share fell to the more expert white leaders. In one state, South Carolina, the debt rose from about \$5,000,000 in 1868 to nearly \$30,000,000 in 1872; and about \$20,000,000 of this amount were issued by the governor by virtue of a legislative permission to issue \$2,000,000. In almost any state, a lobby rich enough to purchase the legislators could secure the passage of an act issuing state bonds in aid of a railroad, supplemented by a subsequent act releasing the state's lien on the road, the whole making up an absolute gift of the money. But the land, which must ultimately be taxed for the payment of such gifts, remained in the hands of the whites. Under universal suffrage, made harsher by a partial white disfranchisement, the whites were helpless, so long as they observed the forms of law; and in the conflict of interests the forms of law went down.

—At first the struggle was mainly peaceful. Negro voters were paid to remain at home on election day, or were induced to do so by threats of loss of work; negro leaders were bribed to wink at false counting or registration; and when the whites had thus carried the legislature, measures were enacted to secure white control of the government in future. In this manner the government fell into white hands in Tennessee in 1869. in North Carolina in 1870, and in Texas, Georgia and Virginia from their first reconstruction in 1870-71. All these were states in which the white vote (see CONSERVATIVES) only needed union to become dominant. Alabama and Arkansas were much more difficult states, but here the reconstructed governments went down in 1874, after a struggle of some two years, in the course of which actual violence became a political factor. Four states were now left, South Carolina, Florida, Mississippi and Louisiana, in which the reconstructed governments held their ground. In apparent despair of other means, the "Mississippi plan" was begun in that state in 1875. It was only an amplification of the violent means which had never been left entirely out of calculation. (See INSURRECTION, II.) Much of its success was no doubt due to a change of the negro vote. H. R. Revels, the colored United States senator of the state, thus wrote to President Grant in 1876: "Since reconstruction, the masses of my people have been enslaved in mind by unprincipled adventurers. My people are naturally republicans, but, as they grow older in freedom, so do they in wisdom. A great portion of them have learned that they were being used as tools, and, as in the late election, they determined, by casting their ballots against these unprincipled adventurers, to overthrow them." On the other hand, the evidence that violence was the finally effective factor is not only overwhelming, but confessed. Bands of horsemen, armed and in uniform, attended and overawed negro meetings; and the roads were picketed to prevent the free transit of negro organizers. Actual

violence to the mass of voters was unnecessary, beyond a few midnight whippings. The negro vote was helpless without its leaders and organizers, and the Mississippi plan was to strike only at the tallest. Actual murders do not seem to have been numerous, but they were tremendous in their effects from the position of the victims. There were now left but three states, and in these the Mississippi plan was put into practice in 1876 with a similar success. But in these the "returning boards" (see that title) prolonged the struggle beyond the election, and threw the whole presidential election of that year into confusion. (See ELECTORAL COMMISSION, FLORIDA, LOUISIANA. SOUTH CAROLINA.) As soon as President Hayes was seated, in 1877, the last vestige of the congressional scheme of reconstruction disappeared from the surface.

—In each state the negro vote was practically suppressed after the overthrow of the reconstructed government. The violence did not necessarily continue in active operation: the negro vote was in part cast and counted, and negro local officers and even congressmen were occasionally elected. But every one knew that the negro vote would be tolerated just far enough to insure a permanent union of the white vote. and no further. The results are seen in the significant smallness of the vote in most of the reconstructed states. In 1880, for example, the congressional districts were each supposed to contain at least 131,400 inhabitants, which should have furnished over 30,000 voters. Alabama and Wisconsin correspond very closely in population, and each has eight congressmen. In 1880 the votes in these districts were as follows: Alabama, 18,645; 22,207; 16,319; 17,644; 11,219; 10,043; 19,146; 25,573: Wisconsin, 31,167; 30,875; 29,226; 32,737; 32,926; 38,435; 35,855; 33,894. It thus appears, that, on the same census population. Wisconsin furnishes 265,115 voters, an average of 33,139 to a district, while Alabama has but 140,796 voters, an average of 17,599 to a district. It is difficult to find more than one controlling explanation for this essential difference.

—It must not be understood that the "subversion of the reconstructed governments" included any essential change in the reconstructed constitutions. These remained formally unaltered, so far as the fundamental conditions of readmission were concerned, though most of the states have revised their constitutions in non-essentials. The supreme court has decided that the state, on accepting readmission. is estopped from denying the validity of the conditions; and the federal judiciary, with the enlarged powers given to it since 1860, would undoubtedly make short work with any attempt to repudiate the conditions of reconstruction. The organic law is unchanged: the revolution has taken place beneath the surface.

—*Force Bills.* At the first indication of attack by violence upon the reconstructed governments, congress took steps to defeat the attempt. A bill for the enforcement of the last two amendments, commonly called the force bill, was introduced, passed by strict party votes, and became law May 31, 1870. It made punishable by fine and imprisonment, or both, with exclusive cognizance to the United States courts, the following offenses: hindering any person in the performance of registration or any other qualification for voting; refusing to give full effect to any person's vote: preventing, or confederating with others to prevent, by force, threats or bribery, any person from qualifying or voting; conspiring to go in disguise upon the highway, or

upon the premises of another with intent to deprive any citizen of his constitutional rights; personating other voters, voting or registering illegally, or interfering with election officers at congressional elections or the registration therefor, violations of state or federal election laws by state or federal officials: and violations of the civil rights act (see that title) of 1866, which was expressly re-enacted. April 20, 1871, a far stronger force bill was enacted. (See INSURRECTION, II.; KU-KLUX KLAN; HABEAS CORPUS; SUFFRAGE.) It was directed particularly at conspiracies against the civil rights legislation: its second (or conspiracy) section, however, was decided to be unconstitutional by the supreme court, Jan. 22, 1883. Its fourth section, providing that such conspiracies, when connived at by the state authorities, should be "deemed a rebellion against the government of the United States," and be suppressed by the president by the suspension of the writ of *habeas corpus* and the use of the army and navy, was to expire at the end of the next session of congress. In May, 1872, an attempt was made to extend it for another session. It passed the senate, but the house refused to consider it. The refusal seems to have been largely due to a belief in the house that the ku-klux disorders had subsided. It must be noticed that this section of the act of 1871 was really a first step toward a recognition of a new rebellion, and the result would have been, as before stated, a new reconstruction, if the *casus belli* had not been removed. This standing rule of American constitutional law, the necessary consequence of the reconstruction precedents, makes a singular paradox: we must repudiate state sovereignty; and yet we must hold that a state can practically declare and wage war, be warred against by the nation, and, if conquered, be subjected to the laws of war.

—IV. THE SUCCESSES OF RECONSTRUCTION. We have described the southern legislation of 1866-7. The infinitely milder and more equitable legislation which followed the successful seizure of power by the white race in the different states, in 1869-77, is of itself a proof that reconstruction was, in an essential point, a success. It gave the freedmen a status as men which, if not altogether satisfactory, is more than they could have hoped for in a century under the simple restoration policy. If the ballot is a nullity to the negro, his other rights are not; and he owes this to reconstruction. Further, the ballot itself will not always be a nullity. There stands the unchanged and unchangeable organic law of the states, waiting for the time when the negro shall be ready for the right of suffrage; and we may be sure that the recognition of his readiness will come far sooner and more easily by reason of the fact that it has nothing to fight against in the state constitutions.

—We have noticed, also, the portentous reappearance of the seceding states, after their reconstruction by the president, as an *imperium in imperio*. It would have been an impossibility for southern representatives under that régime, however honest their intentions, to divest themselves suddenly of the prejudices and traditions of a lifetime's training, and come back in full sympathy with the economic laws which were thenceforth to attach to their own section as well as to the rest of the country. They must, then, have returned as a compact phalanx of irreconcilables, sure of their ground at home, and a permanent source of irritation, sectional strife and positive danger to the rest of the country. All this was ended by reconstruction. This process, to speak simply, and perhaps brutally, gave the southern whites enough to attend to at home, until a new generation should grow up with more sympathy for the new, and

less for the old. The energies which might have endangered the national peace were drawn off to a permanent local struggle for good government and security of property. Whatever may be alleged on humanitarian grounds against a policy which for a time converted some of the states into political hells, it must be confessed that the policy was a success, and that it secured the greatest good of the greatest number.

## REFUGE

REFUGE, Right of. (See ASYLUM.)

[\[Back to Table of Contents\]](#)

## REFUNDING OF THE PUBLIC DEBT OF THE UNITED STATES

REFUNDING OF THE PUBLIC DEBT OF THE UNITED STATES. On July 1, 1860, the national debt was \$64,769,703. It consisted of a loan of \$20,000,000 authorized June 14, 1858. and payable in 1874; a nearly equal sum of treasury notes, issued to meet the conditions resulting from the monetary crisis of 1857, and redeemable at pleasure; and a number of old loans issued between 1842 and 1848, all of which fell due within the next eight years. During the year 1860 a loan for \$21,000,000 had been authorized, for the purpose of redeeming the outstanding treasury notes, and, bearing 5 per cent. interest, was sold at about par. The economic condition of the country was excellent. The crops were good, and the exports of domestic produce large. The federal system of taxation was extremely simple, duties on imports and sales of public lands being the two important sources of revenue, while any deficits that might occur were covered by loans. Excise, stamp, income and direct property taxes under the federal government were absolutely unknown. The outbreak of the rebellion changed all this, and the simple system then in vogue was ill-fitted to bear the strain thrown upon it. Economic questions had received but little attention, and the existing tax methods were capable of only a moderate extension, and principally in one line. The policy of the government was timid and tentative, and instead of a clear conception of the crisis the secretary of the treasury had a vague idea, which was shared by many, that the contest would be brief, and that it would not be necessary to resort to extreme measures to bridge over the severe present needs of the administration. The fall of Sumner, the suspension of the banks, and the open secession of the southern states, did not extent the influence that they should upon Mr. Chase, and it was by loans and issues of notes, instead of by a resort to taxation, that he sought to meet the enormous and continually increasing demands made upon the treasury. The debt of the nation increased from \$90,867,828 on July 1, 1861, to \$267,540,035 in December of that year, without any effort being made to furnish a revenue sufficient to meet at once a part of the expenditures. In order to alleviate the burden of the debt already contracted, and to pay certain of the future expenses of the war, a forced loan was taken from the people through treasury notes on which had been conferred a legal tender quality. Having made this beginning, further steps were taken in the same direction. Loans and issues of legal tenders followed one another. Some futile efforts to frame tax systems were made, but resulted only in disappointment, and what they were intended to accomplish were met with new loans. The internal revenue law of 1862 was badly framed and badly administered; the people were unaccustomed to excise duties, the machinery was complicated, and the officers inexperienced. It was modified many times before the annual revenue derived under it reached the \$300,000,000 that was justly believed could be drawn from internal sources. From time to time tariff measures were passed, the duties being continually raised, until a vast and intricate customs service was formed in which all sound theory and practice had been sacrificed ostensibly to revenue, but in reality to private interests. The tariff and internal revenue laws grew up separately, and their provisions clashed with one another. Some industries were taxed out of existence,

while others were benefited beyond all precedent. With every new issue of legal tenders prices rose, and the vast expenditures of government, uniting with the inflation of values and the uncertain condition of general business, created a spirit of gambling and speculation which spread to every branch of production and exchange, and wrought incalculable mischief and loss. No scheme for raising money was too wild, but the treasury department and congress were blind to the one step that would restore a certain degree of confidence and maintain in a measure the public credit. The fiscal errors enormously increased the expenditures of the government. While loans were being nominally taken at par and over, in reality they were selling at 50 and even at 34, as that marked the depreciation of the paper money. Prices of war material had increased three and four hundred per cent. Mr. Chase refused to believe that his issues were responsible for this, and could only recommend further loans and further issues. His policy was, in a measure, adopted by Mr. Fessenden, but with Mr. McCulloch a new and more just policy was inaugurated.

—The growth of the debt during the war need not be detailed here, as it is but a constant succession of loans. In June, 1862, the outstanding principal of the debt was \$524,176,412; in 1863, \$1,119,772,138; in 1864 \$1,815,784,370; and in 1865, \$2,680,647,869. On Aug. 31, 1865, the debt had attained its highest point, \$2,845,907,626. Of the ordinary sources of income, customs and internal revenue were the most important, and the course of the receipts in these two branches in the years 1861-6 clearly showed how weak and futile were the first endeavors to frame adequate tax systems, and how little taxation contributed toward meeting the current expenditures of government.

YEARS.	Customs.	Internal Revenue	Loans and Treasury Notes
1861 .....	\$ 39,582,125	.....	\$ 41,881,709
1862 .....	49,056,397	.....	529,692,460
1863 .....	69,059,642	\$ 37,640,787	776,682,361
1864 .....	102,316,152	109,741,134	1,128,873,945
1865 .....	84,928,260	209,464,215	1,472,224,740
1866 .....	179,046,651	309,226,813	712,351,553

—There had been no settled policy on which this vast load of debt had been created, other than the recognized necessity of meeting all requisitions made upon the treasury. In his report for 1863, Mr. Chase said that in the creation of debt he had kept four objects in view: 1, moderate interest; 2, general distribution; 3, future controllability; and 4, incidental utility. The close of the war, however, found the debt in a very unsatisfactory condition. On Aug. 31, 1865, it was made up of the following items:

Funded debt...	\$1,109,568,191.80
Matured debt...	1,503,020.09
Temporary loans...	107,148,713.16
Certificates of indebtedness...	85,093,000.00
5 per cent. legal tender notes...	33,954,230.00
Compound interest legal tender notes...	217,024,160.00
Seven-thirty notes...	830,000,000.00
United States notes (legal tenders)...	433,160,569.00
Fractional currency...	26,344,742.51
Suspended requisitions...	2,111,060.00
Total...	\$2,845,907,626.56

Of the above items, the United States notes, the 5 per cent. notes and the compound interest notes, in all, \$648,138,959, were a legal tender, and were for the most part in circulation as currency. The temporary loans were payable in thirty days from the time of deposit, after a notice of ten days. The 5 per cent. notes were payable in lawful money, in one and two years from Dec. 1, 1863. The compound interest notes were payable in three years from their respective dates, all becoming due between June, 1867, and October, 1868. The 7-30 notes were payable before July, 1808, in lawful money, or were convertible at maturity into 5-20 bonds. The certificates of indebtedness would mature between 1865 and 1867. So that, besides the United States notes, there were nearly \$1,300,000,000 of debts in various forms, all of which (with the exception of the temporary loans) must be converted into bonds or paid in money before October, 1868.

—Secretary McCulloch at once entered upon the difficult task of restoring the disordered finances of the nation to a more normal condition, and of introducing some semblance of system in the management of the debt. The revenues of the government were now sufficient to meet the current expenditure, including the debt charges, so that an opportunity was afforded for dealing with the debt. The secretary announced as his policy, the contraction of the paper issued by the government, which had been in a great measure responsible for the financial disorder and almost ruin. In order to secure this contraction the secretary recommended: 1, that congress declare that the compound interest notes should not be legal tender after their maturity: and 2, that the secretary be authorized to sell 6 per cent. bonds for the purpose of retiring not only compound interest notes, but also the United States notes. As to the rest of the debt, it was shown that more than one million was already overdue; that \$187,549,646 must be provided for before 1867, and that \$1,021,335,732 fell due in 1867-8, no account being taken of the notes and fractional currency. The main point was to place the whole debt in such a form that only the interest could be demanded until the government was in a condition to meet the principal. It must therefore be funded. He asked authority to sell 6 per cent. bonds to pay the certificates of indebtedness as they matured, to meet any deficiencies that might occur in the current fiscal year (1866), and to take up any portion of the debt maturing prior to 1869 that could be advantageously retired. Of the debt falling due in 1867-8, \$830,000,000 consisted of 7-30 notes, which were convertible into bonds at the pleasure of the holders, and the secretary believed that a part of this amount would be at once funded were an

opportunity offered. The portions of the debt accruing before 1869 it was the intention of the secretary to fund into 5 per cent. stocks, and a like method could be used in 1871 when other portions fell due. Two results would be accomplished by such a policy: the treasury could be put and kept in such condition as not only to be prepared to pay all claims upon presentation, and also to take up in advance of their maturity, by payment or conversion, such portions of the temporary debt as would obviate the necessity of accumulating large currency balances in the treasury, and at the same time relieve it from the danger of being forced to a further issue of legal tender notes, or to a sale of bonds, at whatever price they might command.

—The second section of the loan act of March 3, 1865, authorized the secretary to "dispose of any of the bonds or other obligations issued under this act, either in the United States or elsewhere, in such manner, and at such rates, and under such conditions, as he may think advisable, for coin, or for other lawful money of the United States, or for any treasury notes, certificates of indebtedness, or certificates of deposit, or other representatives of value, which have been or may be issued under any act of Congress." In February, 1866, a bill was reported from the committee of ways and means, which proposed to construe the law of 1865 as allowing the secretary to receive any of the issues of the government in exchange for the description of bonds contained in the first section of the act, provided there should result no increase in the amount of the public debt. This would amount to an authority to fund all outstanding obligations of the government into bonds. The debates that occurred on this bill practically covered the whole financial policy of the government, but turned particularly upon the question of retiring in this manner the United States notes, at that time below par, giving to the secretary, it was claimed, full control of the currency of the country, and, by direct inference, of the market values of every description of property. Those who believed in a depreciated paper issue, or who thought that there was a short and easy road to specie payments by which the greenback could be brought up to par, feared the results of conferring such a great power upon Mr. McCulloch, who was known to be no friend to a circulating medium that was shifting in value and constantly below par. While the necessities of the war lasted, it was well enough, they argued, to confer such unlimited powers, but not in a time of peace. It was further urged, that it would be folly to withdraw a non-interest bearing debt, such as the legal tender note was, and substitute for it an obligation that paid 5 or 6 per cent. annually. On the other hand, it was shown that the bill was no real innovation, as the secretary could then do indirectly, under existing loan acts, what it was proposed to authorize directly. He could exchange one kind of paper for another, but only with the consent of the holder. In fact, some \$50,000,000 of outstanding obligations had been already funded before any doubt respecting the legality of such a proceeding had been raised. The bill was finally passed April 12, but, to limit the power of the secretary over the currency contained the provision that "of the United States notes not more than \$10,000,000 may be retired and canceled within six months from the passage of this act, and thereafter not more than \$4,000,000 in any one month." This measure enabled the secretary to deal with the debt as it matured by selling bonds bearing 6 per cent. interest, the principal of which was redeemable at any time after five and before the expiration of twenty years from the date of issue. Under this act the following issues were made: Consols, 1865, \$332,998,950; consols, 1867, \$379,618,000, consols, 1868, \$42,539,350. In May,

1866 Mr. Sherman introduced a bill into the senate, providing for reducing the interest on the national debt, and for funding the same. It provided for the funding of all of the outstanding debt save the greenbacks into 5 per cent. thirty-year bonds; and in consideration of the lower rate of interest, the bonds were to be exempted from the income tax levied by the United States. The amount of interest saved by the conversion was to be applied to the payment of the principal of the national debt; and it was estimated that the debt would be extinguished by this process in about thirty-six years. The debt was composed of so many different classes of securities and obligations that no one save a skilled financier could comprehend the details; it would, therefore, be a gain to make the rate of interest and the kind of security uniform. The rate of interest paid, too, was higher than that paid by any other nation; and though, while the war lasted, there was some excuse for such rates, they ought not to be continued in peace, when the credit of the government was beyond question. Moreover, it was a very fitting time to make the change, as a large portion of the debt was then or about to be under the control of the treasury. The main business of the secretary was to provide new loans for such as were maturing. But great objection was made to the clause exempting the bonds from taxation, and following the lead of one Mr. Hayes, of the revenue commission, many believed that the federal securities should be taxed equally with other property by state authority—a foolish proposition, and one that would practically give to the states the right to nullify by taxation the power of the national government to borrow money. Besides reducing the rate of interest by funding the debt, the bill proposed to establish a sinking fund. In 1862 the loan act provided for such a fund, but so long as the expenditures of government exceeded the receipts, it would have been a clumsy and costly instrument to maintain. The bill passed the senate, but could not be considered by the house. The debate showed that while the general opinion was in favor of funding the debt at a lower rate of interest, yet objections were urged against such a measure, not only on economic but also on administrative grounds. A like measure was introduced in the next session of congress, but was not acted upon.

—The secretary of the treasury touched upon the subject of refunding when treating of the foreign debt in his annual report of 1866. "The question now to be considered is not, how shall our bonds be prevented from going abroad? for a large amount has already gone, and others will follow as long as our credit is good and we continue to buy more than we can pay for in any other way, but, how shall they be prevented from being thrown upon the home market, to thwart our efforts in restoring the specie standard? The secretary sees no practicable method of doing this at an early day, but by substituting for them bonds which, being payable principal and interest in Europe, will be less likely to be returned when their return is the least to be desired." He therefore advised the issue of a bond payable in Europe, and bearing 5 or 4½ per cent. interest, which was to be substituted for the foreign bonds. In March, 1867, he was directed to issue 3 per cent. loan certificates with which to retire the outstanding compound interest notes, but he received no authority to deal generally with the debt. In his next report (1867) he again approaches the subject, and, in discussing the exemption of national securities from state taxation, recommends that all obligations of the government be funded into bonds bearing 6 per cent. interest, and having twenty years to run; "one-sixth part of the interest at each semi-annual payment to be reserved by the government and paid over to the states, according to their population."

A bill embodying the recommendations of the secretary was introduced into congress, but not taken up. A long debate occurred upon the funding of the debt, which was now largely composed of 5-20 bonds. An aggregate of \$1,613,442,650, of which about \$200,000,000 were in the form of seven-thirties, might be regarded as of 5-20 bonds; and including the debts that would mature in the summer of 1867, upward of \$1,700,000,000 were due within a period of five years. and the larger part was redeemable in 1867 and 1868. A law had been already passed to check any further contraction of the currency as proposed by the secretary, but a measure looking to "free banking" had been drawn up, one of the provisions it contained being that when the combined issues of the national banks and government should exceed \$700,000,000 the government notes in excess of this sum should be retired and canceled, until the amount of the latter outstanding should be reduced to \$250,000,000. As it was, the first law interfered greatly with Mr. McCulloch's plans, for these depended in a great measure upon his proposed contraction of the currency. The time was, however, favorable for the conversion of the debt into 5 per cent. bonds, as at the prices then obtained for 6 per cents, such bonds could be negotiated at par. The republicans were adopting resolutions which demanded a reduction in the rate of interest on the public debt. so that the burdens of taxation might be lessened; while the democrats, looking upon the debt as held chiefly by capitalists and bloated bondholders, wished to tax the bonds and thus diminish the revenue obtained from them, a measure that the loan acts expressly prohibited. The lengthy debate that followed covered a large number of irrelevant topics, and came to nought. Meantime, however, the secretary had been using the power already given him, and in December, 1867, was able to report that since September, 1865, the temporary loans, the 5 per cent. notes and the certificates of indebtedness had all been paid; the compound interest notes had been reduced from \$217,024,160 to \$71,875,040; the 7-30 notes from \$830,000,000 to \$337,978,800; the United States notes, including the fractional currency, from \$459,505,311.51 to \$387,871,477.39; while the funded debt had been increased \$686,584,800. The act suspending the further reduction of the currency was passed Feb. 4, 1868.

—There would be little interest in tracing the recommendations of the secretary and the abortive action of congress with respect to this question of funding the debt, which were annually gone through with, it would almost appear, for form's sake alone. It was admitted that the rate of interest which the government paid on the debt was higher than it ought to be, and while one party viewing the bondholders with suspicion wished to reduce their income, and the other for the purpose of removing burdens from the tax payers desired to refund the debt at a lower interest, no agreement could be reached. Some half measures were adopted, like that of July 25. 1868, which provided for a further issue of temporary loan certificates, for the purpose of redeeming and retiring the outstanding compound interest notes; and of July, 1870, which provided for the redemption of these certificates. It was in May, 1869, that the sinking fund was established, and the payment of a part of the debt each year thus insured. In December, 1869, the funded debt stood as follows: "Of the loan of Jan. 1, 1861, the sum of \$7,022,000 is outstanding, and payable on Jan. 1, 1871. The loan of 1858, of \$20,000,000, is payable in 1873. The bonds known as 10-40's, amounting to \$194,567,300, are not payable until 1874. The 6 per cent. bonds, payable in 1881, amount to \$283,677,600. The 5-20 bonds, amounting in the

aggregate to \$1,602,671,100, are either redeemable or will soon become redeemable," and must therefore be provided for. This led up to the refunding act of July 14, 1870. It authorized the secretary to issue not more than \$200,000,000 5 per cent. bonds, redeemable after ten years; also not over \$300,000,000 4½ per cent. bonds, redeemable after fifteen years; also not over \$1,000,000,000 4 per cent. bonds, redeemable after thirty years—all to be exempt from United States or state taxes. As the bonded debt was not to be increased, these different classes of securities were to be floated at par. In January, 1871, an amending act was passed, which increased the amount of 5 per cent. bonds authorized to \$500,000,000, but the total amount of bonds to be issued under the act of 1870 was not thus increased. As was customary, the whole financial policy of the government, past and present, was reviewed in the debates on this measure, which extended over six months. As this is the most important act relating to the funded debt that had been passed up to the year 1870, it will be interesting to examine in detail the condition of the bonded debt. The following is a statement of the amount of the coin-interest-bearing debt outstanding March 1, 1871, the nearest date prior to the opening of subscriptions under the refunding act:

TITLE OF LOAN.	Rate Per Cent.	When Redeemable.	When Payable.	Amount.
Loan of 1868.....	5		January, 1874	\$ 90,000,000
Loan of February, 1861.....	5		December, 1860	18,415,000
Oregon war debt.....	5		July, 1861	945,000
Loan of July, 1861.....	5		June, 1861	180,318,100
5-20's of 1862.....	5	After May, 1867	May, 1862	493,728,350
Loan of 1863.....	5		June, 1861	75,000,000
10-40's of 1864.....	5	After March, 1874	March, 1904	194,567,300
5-20's of March, 1864.....	5	After November, 1869	November, 1864	3,102,600
5-20's of June, 1864.....	5	After November, 1860	November, 1864	102,028,900
5-20's of 1865.....	5	After November, 1870	November, 1865	182,112,450
Consols of 1865.....	5	After July, 1870	July, 1865	264,619,700
Consols of 1867.....	5	After July, 1872	July, 1867	388,822,550
Consols of 1868.....	5	After July, 1873	July, 1868	39,663,750
<b>Total</b> .....				<b>\$1,922,343,700</b>

The 10-40's of 1864, which bore 5 per cent. interest, were then selling in the market for about 112 currency (or 93 in gold), so that it was expected that the new 4 per cent. bonds could be sold at par; and this belief was strengthened by the fact that the government was collecting a revenue greatly in excess of its expenditures for ordinary purposes, thus giving a large sum (about \$100,000,000 annually) to be applied to the debt. Moreover, there had already occurred a large reduction of the principal of the debt, being more than \$303,000,000 in four years, or an average annual payment of \$75,000,000, thus demonstrating the ability of the nation to control its indebtedness.

—On March 6, 1871, the books were opened for subscriptions to the new loan, both in this country and in Europe; and all the national banks here, and a large number of private bankers in the United States and abroad, were authorized to receive subscriptions. On the first of August the subscriptions amounted to \$65,775,550, the larger share being taken by the banks. In July certain bankers in Europe offered to take the balance of the \$200,000,000 offered, and it is very likely that the whole loan could with advantage have been negotiated abroad had not the war between France and Prussia broken out. A French loan bearing 5 per cent. interest was being disposed of at about 80, and this interfered with the sale at par of a United States bond bearing the same rate of interest. The paper currency of this country also introduced an

uncertainty respecting the dividend that would be received when the interest was paid, as the rate of exchange was liable to fluctuate widely. In spite of these features the whole of the loan was taken up by the last of August. From 1871 to 1877 bonds were disposed of under the act of July 14, 1870, not only for refunding purposes, but also for other charges on the government, like the purchase of coin for a resumption fund, the payment of the cost of constructing the Mississippi river improvements, etc. The amount of 5 per cent. bonds issued each year was: 1871, \$59,669,150; 1872, \$140,330,850; 1874, \$115,800, 750; 1875, \$96,505,700; 1876, \$104,553,050; 1877, \$1,134,850. Total, \$517,994,150. No 4½ per cent. bonds were taken before August, 1876, and after this no 5 per cent. bonds could be issued. The secretary was able to negotiate these bonds bearing a lower rate of interest at par, by reason of a favorable change in the money market, and in May, 1877, the condition of the market allowed of the floating at par in coin of a 4 per cent. bond. Within a period of thirty days the subscription for this class of bonds reached more than \$75,000,000. The success indicated by this auspicious beginning was, however, checked later on, when it was proposed to repeal the resumption act and to remonetize silver, measures which threw doubt upon the credit of the government, and threatened to put an end to all future refunding operations by disabling the government from borrowing. The result of any such set-back would be to throw away an opportunity to reduce the rate of interest on the \$1,452,000,000 of the debt which was redeemable by May, 1881, by one-third—or a saving of \$22,006,205 in yearly interest. Fortunately this attack upon the public credit failed in its object, and while the resumption law remained in force, the remonetization of silver was so accomplished as to conceal its real effects, and postpone the disastrous financial crisis that might at once have been precipitated.

—In the early part of 1879 a measure passed the house, authorizing the issue of certificates of deposit in aid of the refunding of the national debt. It proposed to authorize the issue, in exchange for lawful money, of certificates of deposit of the denomination of \$10, bearing interest at the rate of 3 per cent. per annum, and convertible at any time into 4 per cent. bonds. The main object to be attained by this bill was to place these bonds within easy reach of every citizen who desired to invest his savings in these securities. It had been recommended by the president in his annual message, and also by the secretary of the treasury. It met, however, with great opposition in the house, as its result was represented to be nothing less than to convert the treasury into a savings bank. The bill passed the house, and in the senate the rate of interest was changed to 4 per cent. In order to make this form of loan as popular as possible, and to facilitate and distribute the sale of these certificates, national banks and public officers were designated depositories. The intention of the law was, however, defeated, as the premium on the 4 per cent. bonds offered a good investment, and the certificates, while purchased in small amounts, were obtained chiefly in large blocks by speculators; the attempt to offer an investment for small savings proved a farce. The main object of these measures, the refunding of the 6 per cent. bonds, was accomplished. By April 5 all of the outstanding 5-20's had been refunded, and as no other 6 per cent. bonds remained, attention was directed to the 10-40's. On April 16, \$150,000,000 4 per cents were offered at a premium of ½ per cent. On the following day subscriptions to the amount of \$149,389,650 were received and accepted, and upward of \$35,000,000 received and declined. By October, 1879, \$40,012,750 of the refunding certificates had been sold, and all but

\$2,809,400 had been exchanged for 4 per cent. bonds. Between November, 1878, and November, 1879, there had been refunded \$370,848,750 6 per cent. and \$193,890,230 5 per cent. bonds of the United States, into bonds bearing interest at 4 per cent., making an annual saving of interest of \$9,355,877.

—It will now be convenient to take a general survey of the refunding operations accomplished since 1870, as their magnitude will become more apparent. In 1870 there were outstanding of debt controllable within a short period by the government, an aggregate of \$1,395,345,950, on which 5 and 6 per cent. were being paid, and more than five-sixths of the total was paying 6 per cent. The annual interest charge was \$81,639,684. In place of these bonds bearing high rates of interest had been issued, up to 1880, \$500,000,000 at 5 per cent., \$185,000,000 at 4½ per cent., and \$710,345,950 at 4 per cent., on which the annual interest charge was \$61,738,838; being a saving in interest of \$19,900,846. Within the same period nearly \$300,000,000 of the principal of the debt had been discharged. The apparent ease with which these great financial changes were accomplished, is in a great measure to be explained by the general condition of trade and industry as shown in the money market. The bulk of the bonds were floated after 1878, and before 1873. The years 1871-3 were marked by speculative movements which gave an unnatural and in the end an evil stimulus to all forms of enterprise and investments, and the securities offered by the government were no exception to the general rule. Subscriptions were freely made both here and abroad, until the crisis of 1873, which was followed by a long period of retrenchment, the inevitable consequence of over-speculation and inflated values. The table we have last quoted makes no return of sales for 1873, and shows a decided falling off in those for 1874-5. Had the loan been offered two years later than it was, it could not have been negotiated as readily. From 1873 to 1878 commercial depression and stagnation weighed upon the trade and industry of the country, one of the most severe of such periods, if not the most severe, that the nation has ever experienced. For lack of other safe and profitable investments, capital was turned toward the government bonds, and the glut of capital seeking investment in the money centres gave an opportunity to place at par a bond bearing a low rate of interest. There was in these years an immense amount of legitimate trading being done, which, conducted on a sound basis, at least yielded average profit; and, as there was very little spent and wasted in speculation and in uncertain ventures, the country was adding to its available wealth at a very rapid rate. This prepared the way for the great operations of 1878, 1879 and 1880. Although trade had revived, and industry was fully employed, the immense amount of capital seeking for profit allowed the floating of a 4 per cent. bond when the security was so unquestioned. The government had collected from twenty to thirty millions each year in excess of its expenditure, the year 1879 forming an exception; and, as the better condition of trade was felt, the national revenues increased to such an extent that in 1880 the surplus revenue reached the sum of \$65,883,653, and gave every sign of going far above that amount in the succeeding year, should the favorable conditions continue to exist. It followed, therefore, that the credit of the government was high, and the fact that the resumption of specie payments had been accomplished in 1879 with almost no friction, and without creating even a ripple in the money markets, only served to increase confidence in the ability of the government to handle its indebtedness. The only disquieting circumstance—the enforced coinage of a silver dollar that was worth

much less than its face—was not sufficient to raise any question on the public faith, although notes of warning regarding the ultimate effects of this questionable policy were raised by those who had made a study of economic questions. The fact that the great refunding operations were accomplished, and that, too, without creating any financial disturbance, impressed the people with the enormous wealth-producing power of the nation, and gave promise of as great, if not greater, financial operations in the future, should the government again be compelled to draw upon the resources of the people. Every dollar of debt that the government paid, and every dollar of interest that was as much as paid by being saved through the refunding into low interest bonds, represented ten or a hundred dollars that could be borrowed in the future, when the necessities of the nation should require.

—This operation, however, did not complete the work to be done, as \$273,631,350 6 per cent. bonds, issued during the years 1861 and 1863, and \$508,440,350 5 per cent. bonds, issued in 1870 and 1871, were about to become due. Of these, all but \$18,415,000 would mature in May, June and July, 1881. These bonds must be provided for, and under existing laws there remained available for refunding operations, \$104,654,050, or less than one-seventh of the total to be refunded. The secretary of the treasury recommended that authority be conferred upon him to issue 4 per cent. bonds and refunding certificates convertible into such bonds as before, and owing to the favorable situation he believed that such a bond could be sold at a premium. Although a refunding measure was introduced in the house, and debated, no vote was reached. In his report for 1880 the secretary again called attention to the necessity of passing some measure, and recommended that this portion of the debt be provided for by treasury notes, running from one to ten years, and issued so that they may be paid as they mature. This would obviate the necessity of paying a premium on the bonds purchased by the government for the sinking fund, as had often happened, and would leave a large portion of the debt so placed that it could be easily controlled by the government. He asked authority to issue \$400,000,000 of such notes, which he thought need not carry a higher rate of interest than 3 per cent., and also to issue a like amount of bonds, to bear 3.65 per cent. interest. The government fours were then selling at 113. A bill was brought into the house, which provided for a long-time bond (at first a 50-year bond, afterward modified to 20-40's), to bear 3 per cent. interest. Objection was at once made, and with reason, that such a measure would practically place this refunded portion of the debt beyond the control of the government, and at a time when large reductions in the principal were possible. While the surplus revenue in 1879 was but about seven millions, in 1880 it was nearly sixty-six millions, and it was estimated that in 1881 a surplus of more than fifty millions could be counted upon with certainty, and this amount might be greatly exceeded. That such a proceeding could not be defended, was proved by plain figures. In January, 1881, there remained \$671,207,050 redeemable at the pleasure of the government before July, and the surplus revenue to be collected before that date would, by the estimate of the secretary of the treasury, reduce this sum to \$640,000,000. The requirements of the sinking fund for the next ten years, or until the \$250,000,000 of the 4½ per cent. bonds became due, would amount to \$520,000,000, and this took no account of the surplus revenue applied to the debt in that time. So that there could be no justice in converting this \$630,000,000 into a long-term debt. Yet, it was on the rate of interest and the term of the bond that the debate was centred. There was such a scarcity of

sound investments that the returns were small on such as were freely bought. "Only a few years ago the French rentes yielded over 5 per cent. on the market price, and not very long since United States government bonds could be bought, to return 7 and 8 per cent. Consols are now no longer at par, but they are so little under it that practically they may be said to yield only 3 per cent.; United States fours yield about 3½ per cent., French rentes, about 4 per cent.; Indian sterling bonds, not quite 4 per cent.; and colonial government securities, generally about the same rate. Even Russian and Hungarian bonds, great as is the risk attached to them, pay an investor only 5½ or 6½ per cent., respectively. And if we pass from the securities of states to those of private companies, we find that those in good credit give usually from 3 to 4 per cent., but seldom more." It was with reason urged that the credit of the government of the United States ought to be as high as that of any other nation, and that a 3 per cent. bond could be floated at par; the only question was, how long a time such a bond ought to run. The English consol, which bore 3 per cent, was practically perpetual, but a perpetual debt was opposed to all the traditions of American policy, and not to be thought of under any circumstances. As finally passed, the bill provided for the issue of \$400,000,000 of bonds, bearing 3 per cent. interest, and payable in twenty years, or redeemable in five years after the date of issue, and also treasury notes to an amount not exceeding \$300,000,000, bearing interest at 3 per cent., redeemable at the pleasure of government after one year, and payable in ten years from the date of issue.

—But while passing through congress, a provision was introduced into the measure, which was not only decidedly objectionable in itself, but was opposed to the spirit of a funding act, which should be a purely voluntary transaction: the government ought not, in such a case, to attempt to force a sale. either upon the people or upon any particular class of institutions. The securities of the government had been made a basis for the circulation of the national banks, and these useful institutions had experienced a great reduction in their profits, through the previous funding operations of the government. The comptroller of the currency, in his report for 1879, said: "The refunding of the national debt commenced in 1871, at which time the national banks held nearly \$400,000,000 of the 5 and 6 per cent. bonds; and from that date to the present time they have held more than one-fifth of the interest-bearing debt of the United States. This class of bonds has since been greatly reduced, and is now less than one-sixth of all the bonds pledged for circulation, while more than one-third of the amount consists of bonds bearing interest at 4 per cent." At the time that this funding bill was pending (1881) the amounts of 6 and 5 per cents had been still more reduced. It was now proposed to make the new bonds the only government securities that could in future be used by the banks as a basis for their circulation, and, as an inducement to the banks to accept this proposition, the taxes on capital, deposits and circulation were to be repealed. But these measures of compensation were not included in the bill which passed the house, and the finance committee of the senate proposed to strike out this coercive section, thus removing the objectionable feature of the bill. It had been shown by the comptroller of the currency that such a section would strike a very serious blow at the national bank system, as the \$211,000,000 of bonds then deposited by the banks would mature in that year (1881), and this amount of the new 3 per cents would have to be substituted, or the notes issued on it would have to be retired, and the banks probably be compelled to go into liquidation. But the section was restored, and the bill went to the president. The result of this provision was to create great

distrust among the banks, and in the short period of thirteen days they contracted their issues by \$18,722,340, and nearly precipitated a panic. In fact, a crisis was averted only by the action of the secretary of the treasury, who paid out an equal amount of legal tenders in the purchase of bonds. This movement was, however, caused in a measure by other provisions of the bill, which were, that "section four, of the act of June 20, 1874, entitled 'an act fixing the amount of United States notes,' be and the same is hereby repealed; and sections 5159 and 5160 of the Revised Statutes of the United States be, and the same are hereby, re-enacted." This would deprive the banks of the right to take up by a deposit of legal tenders their bonds held by the treasurer as a security for their circulation, and would compel them to keep bonds to the amount of one-third of their capital, and this, whether they issued circulating notes or not. This panic, however uncalled for, showed that the banks believed their existence to be endangered, and the president, taking the same position, vetoed the bill, giving as a reason the inexpediency, not to say the injustice, of the coercive section. "Under this section it is obvious that no additional banks will hereafter be organized, \* \* and no increase of the capital of existing banks can be obtained except by the purchase and deposit of 3 per cent. bonds. No other bonds of the United States can be used for the purpose. \* \* This is a radical change in the banking law. It takes from the banks the right they have heretofore had under the law to purchase and deposit, as security for their circulation, any of the bonds issued by the United States, and deprives the bill holder of the best security which the banks are able to give, by requiring them to deposit bonds having the least value of any bonds issued by the government. \* \* In short, I can not but regard the fifth section of the bill as a step in the direction of the destruction of the national banking system." The veto message was submitted on the day before congress adjourned, so that no action could be taken on it.

—In this way was a refunding measure defeated. But the debt was maturing, and some provision for meeting it must be made. Congress had adjourned and the responsibility was thrown upon the secretary of the treasury. On March 1, 1881, or three days before the adjournment of congress, the maturing debt was.

TITLE OF LOAN.	Rate per ct.	Redeemable.	Amount.
Loan of July and Aug., 1861	6	June 30, 1881	\$ 144,339,900
Loan of 1863 . . . . .	6	June 30, 1881	57,216,100
Funded loan of 1881 . . . . .	5	May 1, 1881	469,320,650

The only resources of the government to meet these obligations were the surplus revenue, and about \$104,630,000 of 4 per cent. bonds that had been authorized by the acts of 1870 and 1871, but had not been disposed of. To pay off the maturing bonds with the revenue was clearly out of the question; and to have issued the 4 per cents would have placed so much of the debt beyond the control of the government, owing to the length of time they had to run before redemption, a step that it was not expedient to take. The secretary, Mr. Windom, therefore assumed the responsibility and adopted the following plan: "On April 11 there was called for absolute payment

on July 1, 1881, the small loan of \$688,200, bearing 6 per cent. interest, and known as the Oregon war debt, and at the same time, for payment on the same date, the 6 per cent. loans, acts of July 17 and Aug. 5, 1861, amounting to \$140,544,650, and act of March 3, 1863, amounting to \$55,145,750; but to the holders of the bonds of the two latter loans permission was given to have their bonds continued at the pleasure of the government, provided they should so request." This plan proved entirely successful, and a like privilege was extended to the holders of the funded loan of 1881. The bonds were presented freely, because the new continued bonds (known as "Windoms") bore a small premium, and the amounts that were not so presented were easily met by the surplus revenue. The annual saving in interest accomplished by this simple operation was \$10,473,952, and on Nov. 1 there remained outstanding of bonds bearing 3½ per cent. interest, payable at the pleasure of the government, \$563,380,950. The step taken by the secretary was severely criticised as being an assumption of legislative powers by an executive officer, but he really had no alternative, and, as events proved, his expedient was better than the one proposed by congress, which would have placed it beyond the power of the government to pay a larger portion of the debt by postponing payment of it for a term of years. Although this was not, properly speaking, a refunding measure, it accomplished what such a measure proposed to accomplish, and so satisfactory was the result that Secretary Folger made "no recommendation of legislation for the refunding of the bonds now outstanding bearing interest at 3½ per centum."

—A bill to refund \$200,000,000 of the continued bonds into 3 per cent. stock was debated in the senate, but failed in the house, and the whole matter would have been allowed to rest had it not been for the necessity of allowing the national banks to renew their charters. The eleventh section of this act (July 12, 1882) authorized the secretary to receive continued bonds, and to issue instead 3 per cent. securities; and provided "that the bonds herein authorized shall not be called in and paid so long as any bonds of the United States heretofore issued bearing a higher rate of interest than 3 per centum, and which shall be redeemable at the pleasure of the United States, shall be outstanding and uncalled. The last of the said bonds originally issued under this act, and their substitutes, shall be first called in, and this order of payment shall be followed, until all shall have been paid." This measure completed the funding operations of the government, and while more than \$300,000,000 of the 3½ per cents were exchanged for 3 per cents, the surplus revenues were so great that, by November, 1883, the 3 per cents were being called in for payment. It was, in fact, then a question as to what should be done with the revenues of the government when all the threes were redeemed, as no other bonds became due until 1891, and the attempts to reduce the revenue had proved abortive.

—For the purpose of showing more completely the changes that have occurred in the debt, the following table, from official records, is given:

YEAR ENDED—	3 Per Cts.	4 Per Cents.	4½ Per Cts.	5 Per Cents.	6 Per Cents.	7-10 Per Cents.	Total Interest-bearing Debt.	Annual Interest Charge
	Dollars.	Dollars.	Dollars.	Dollars.	Dollars.	Dollars.	Dollars.	Dollars.
1860—July 1.				43,476,300.00	21,164,538.11		64,640,838.11	3,443,687.29
1861				83,022,300.00	57,358,673.95		90,380,973.95	5,092,630.43

## REICHSRATH

REICHSRATH (council of the empire) is the name of the parliament of Austria. It is divided into two chambers, the members of the lower house being elective. (See AUSTRIA-HUNGARY.)

[\[Back to Table of Contents\]](#)

## REICHSTAG

REICHSTAG. The Reichstag is the elective chamber of the German parliament. Thus was resumed the name of the assembly of the estates of the German empire, which, from 1663, up to 1806, convened regularly at Regensburg, under the presidency of the emperor, or of the arch-chancellor of the empire, the elector-archbishop of Mayence. That assembly was divided into three chambers: 1, of electors; 2, of princes, divided into the temporal and the ecclesiastical bench (the neutral bench between them was occupied by the Protestant bishops of Lübeck and of Osnabruck); 3, of cities, subdivided into the bench of the Rhine and the Suabian bench. Each of the three chambers deliberated separately; after a separate vote had been taken, the chambers sought to come to an understanding, for the purpose of presenting to the emperor a common decision, called *conclusum imperii*.

## REMOVALS FROM OFFICE

REMOVALS FROM OFFICE. The subject of *Appointments* has been reserved, to be considered here with *Removals*. An appointment, in a political sense, is the designation and authorization, by the proper authority, of some person to be a public officer or agent, with the powers and duties conferred by law. A removal is an act, on the part of some competent authority, by which the holding of a public office or agency is brought to an end. Very generally the power of appointment and that of removal are vested in the same officer or body. Under enlightened governments this power, save in so far as it relates to the subordinates of the judicial and legislative departments, is, with few exceptions, treated as an executive power. Under the very defective confederacy which preceded the American constitution, the appointing power was in congress, there having been no executive branch; and in several of the states a greater or less portion of that power has been retained or usurped by the legislature. Sometimes, however, the power of appointment is divided between two authorities, as in the case of about 3,500 of the higher non-elective officers of the United States, who are nominated by the president and confirmed by the senate. (See CONFIRMATION.) The same mode of appointment generally prevails in the states; but Massachusetts gives the power of confirmation; generally, to a council of eight members elected by the people in districts, and perhaps some other states have followed her example.

—The federal constitution, the theory of which is followed by the states, confers the appointing power upon the president in these words: "He shall nominate, and by and with the advice and consent of the senate, shall appoint, ambassadors, other public ministers and consuls, judges of the supreme court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the congress may by law vest the appointment of such inferior officers as they may think proper in the president alone, in the courts of law, or in the heads of departments." This power extends to army and navy appointments, as well as to those for the civil service. No power of removal is formally conferred, and the only provisions expressly affecting that power are these: 1. "The president, vice-president, and all civil officers of the United States, shall be removed from office on impeachment for a conviction of treason, bribery, or other high crimes and misdemeanors." 2. "The judges, both of the supreme and inferior courts, shall hold their offices during good behavior," and their compensation shall not be diminished during continuance in office. 3. "The house of representatives shall elect their speaker and other officers; \* \* the senate shall choose their other officers, and also a president *pro tempore* in the absence of the vice-president." Each of these provisions plainly leaves the important authority and duty of removal of federal officials, in case they are not guilty of high crimes or misdemeanors, utterly unprovided for, and therefore to mere implication.

—The appointment has been held complete when the commission is filled out and signed by the president, even though not delivered. (*Marbury vs. Madison*, 1 Cranch,

137, and 19 Howard Rep., 4, 74.) But President Jefferson dissented from this view, and treated a delivery of the commission as essential to complete an appointment.

—Congress has vested in the courts of law the appointment of nearly or quite all the subordinates of those tribunals. With considerable exceptions (for which see CONFIRMATION and TERM AND TENURE OF OFFICE), it has vested in each of the heads of departments the appointment of its own subordinates. And legislative bodies in the United States, as in all other really free countries, appoint and remove their own subordinates.

—Under the federal constitution, it would seem plain, that, with the exception of officers of congress, no appointment of civil officers can be made, except, first, by the president, by and with the advice and consent of the senate; or, second, of inferior officers, 1, by the president alone. 2, by one of the heads of a department, or, 3, by a court of law.

—There seems to be no clear definition of an "inferior officer" in the sense of the constitution, and it would be very difficult to frame one of much definiteness. What, then, is the extent of the power of congress to vest appointments? It is by no means easy to determine what persons in the public service are, in any sense, officers within the purview of the constitution. There are at all times thousands in that service whom the law, with little precision, designates as employés. In legal phrase, they are employed, but not appointed, and are dismissed, or discharged, but not removed. Their selection for, and severance from, the public service, is, therefore, technically no exercise of the appointing power. Mere laborers in the navy yards, arsenals, and elsewhere, are clearly only employés. But many persons, in continuous service at custom houses and other offices, as well as the clerks of committees and commissions, and all like officials, whose relations and duties are nearly identical with those of others classed as officers, are designated and treated as if only employés. Such, too, is the case of nearly all of the tens of thousands of the subordinates of postmasters throughout the Union, they being employed and discharged by the postmasters themselves, without any action by the postmaster general; yet the subordinates of collectors, naval officers, surveyors, etc. with slight exception—though having analogous functions and authority, and being in no respect more official and permanent—are treated as officers. They are appointed and removed by the secretary of the treasury; the direct superiors of the latter "inferior officers" only making recommendations concerning them to that "head of department." On no sound principle can such discrimination be made. The clerk of the postmaster, on the basis of principle, dignity and justice, is as much an officer as the clerk of the collector. The question may well arise as to which of these two classes of public servants are now being selected and discharged in an unconstitutional manner.

—Confusion on the subject has existed from the beginning of the government. A law of 1789 (1 Stat. at Large, chap. xx., § 27), authorizes "marshals to appoint one or more deputies," and a court or judge to remove them. It has been decided (*United States vs. Finkle*, 3 Blatchford Rep., 425), that "these deputies are officers." But if they are officers, it is plain that they can not be appointed by a marshal, he not being

an official upon whom congress can confer the appointing power. (See *United States vs. Hertwell*, 6 Wallace Rep., 385, for an analogous case.)

—The authority of congress, in regard to vesting the appointing power, may obviously be so exercised as to greatly affect not only the executive department itself, but the relations between it and the senate. The appointment of the vast number of subordinates now made by the heads of the departments alone might either be vested in the president alone or, on the other extreme, be made subject to the confirmation of the senate. So the appointment of all who can be classed as "inferior officers" of the about 3,500 officers now nominated by the president and confirmed by the senate, might be given to the president alone or to heads of departments. And it is by no means clear how far congress may go in regulating the power of removal. Even as early as 1826, a committee of the senate made a report in favor of requiring the president, in making nominations to that body, to fill a vacancy caused by a removal, to state the reasons for which the removal had been made. There is a statute forbidding the head of a department removing certain officers "except for cause stated in writing, which shall be submitted to congress at the session following such removal." (U. S. Rev. Stat., sec. 1705; and see CONFIRMATION, for effect of tenure of office acts.)

—The question where the right of removal was vested arose almost upon the government going into effect. Closely connected with that, was the question as to the theory and basis of removals. These questions were discussed in the house of representatives at its first session, of which Madison was a member. A considerable majority—contrary to a view expressed in the "Federalist," and approved by Mr. Webster—finally held that the power of removal was in the president alone, and that he could remove in his discretion. (*Annals of Congress*, vol. i., pp. 369-384.) The senate approved this view, but only by the casting vote of the vice-president, Mr. Adams. (*Ex parte Hennin*, 13 Peters Rep., 237, 240.) In conformity to this view, the act establishing the treasury department declares that "the secretary may be removed by the president." Ever since, this vast implied power—the greatest perhaps ever conferred by mere construction—has been accorded to the president, without its ever having been made an issue in the courts. (1 Kent's Commentaries, 311.) The debate in the house was elaborate, and disclosed great diversity of opinion. The rule for which Mr. Madison, who took a leading part, contended, was that the power of removal was an incident to or really a part of the power of appointments, and that it therefore belonged to the president alone. The senate was to have no part in its exercise. He also maintained, with unanswerable cogency, that removals can be made only for cause, and that a failure to remove for good cause and a removal without such cause, would alike be malfeasance on the part of the president, (and consequently on the part of any official having the appointing power). which would justly subject him to impeachment. It was strongly urged by others, that, as the senate had the power of confirmation (see CONFIRMATION), and hence in a sense shared the appointing power, it should also be consulted as to removals. Mr. Benson, of New York, (where the spoils system was first and most fully developed), advanced the doctrine that the president could "remove *at pleasure*"; and consequently that he was under no such legal or moral responsibility as Mr. Madison insisted upon. Others urged the equally radical view, on the other extreme, that appointed officers were removable only by

impeachment and conviction, which would, of course, give a tenure of good behavior. The only decision reached was, that the power of removal was in the president alone, until some part of it should (with the power of appointment) be vested by congress elsewhere, as the constitution authorizes. Yet, with strange inconsistency, the first congress, in one case, by law vested the power of appointing certain officers in one subordinate official (not the head of a department), and the power of removing them in another. (1 Stat. at Large, chap. xx., § 27.)

—Despite the conflicting action of congress, the rule of the courts is, that the power of removal is an incident of the power of appointment. (*Ex parte Hennin*, 13 Peters Rep., 261.) It is the general rule, consequently, that when a power of appointment is conferred, the power of removal accompanies it as an incident; the conditions on which the removal may be made depending on the tenure of the office, as defined by law. (See TERM AND TENURE OF OFFICE.) Where there is a tenure of good behavior, it is plain there must be a good cause arising from the bad conduct of the official. Removal, in such a case, must be preceded by such action as is equivalent to a conviction for misbehavior; of which there must have been a charge, and upon that charge a trial and opportunity of defense. (*Page vs. Hoedin*, 8 B. Munroe, 672.) There are few cases of such tenure, except the judiciary. Under a power to remove "for cause" there is a limitation of the power of a mere discretionary removal, and there must be a legal cause—malfeasance, misfeasance or nonfeasance—constituting a breach of the trust of the office, of which the courts can take notice; and they will restore the officer removed without such cause. (*State, etc., vs. Common Council*, 9 Wisconsin Rep., 254; *Ex parte King*, 35 Texas Rep., 657; *Field vs. Com., etc.*, 32 Penn. Rep., 478, 484; *The People vs. Munday*, 72 New York Rep., 445; *The People vs. The Mayor*, 79 New York Rep., 582.) If there is some evidence of cause for removal, the courts will not review that evidence, though they might in the first instance have reached a different conclusion. (*The People vs. Campbell*, 82 New York Rep., 247.)

—Nearly all appointed officials, save those having a fixed term, hold during the discretion of the official having the appointing power, or, in common phrase, "during his pleasure." A similar right of removal during the term exists in the case of appointed officials having a fixed term of year.

—Contrary to the general opinion until recently, the power of the president to remove (or dismiss) an officer of the army or navy is the same as his power to remove a civil officer; but congress has so regulated that authority, that, without the concurrence of the senate, the power of summarily discharging army or navy officers "in time of peace" can not be exercised "except in pursuance of the sentence of a court martial, or in commutation thereof." (*Blake vs. The United States*, 13 Ott Rep., 227, 237.) This liability of all officers of the army and navy, confirmed by the senate, to be removed at any time by the mere concurrent act of the president and the party majority of that body, has, unquestionably, a vicious tendency; drawing those officers into politics, and causing them to more and more dread political influence and to court the favor of parties and their leaders. This power of removal is held in partisan circles, and very generally on the part of the politician class, to mean a right to remove in order to promote the interests of the dominant party or faction, and even if not, yet in order to realize the political ambition of the appointing officer. The threat or fear of such use

of it is made effective for extorting political assessments, and for compelling the officials of the government to become the henchmen of parties and chieftains. This prostitution of the power of removal, like that of the power of appointment, has been one of the most potent agencies by which the public service has been demoralized and degraded, and the spoils system has been made potential. There can be little doubt that there has been a mischievous and unwarranted suggestion drawn from the phrase "removable at *pleasure*," sometimes used by the courts. It has too often, ever by honest citizens, been accepted as meaning an authority under no moral obligations; when, in fact, nothing can be clearer than the duty of using it, conscientiously, for the promotion of the public interests in the broadest sense in which they may be affected. Whatever may be said of a technical, legal *power*, no officer can have a right to remove a worthy public servant, except for adequate public reasons, nor any right to for-bear to remove an unworthy one, unless the removal would, for peculiar reasons, be at the moment a public detriment. This was the rule laid down by Madison, and enforced during his generation.

—The moral obligations attending the exercise of the appointing power are clear enough to any candid mind, however party zeal and vicious usages may have obscured them in the minds of the mere politician. The same rules of duty which forbid the use of the people's money for private and party purposes, also forbid the exercise of any branch of the appointing power for the same purpose. The fact that the public conscience is outraged at every falsification of the public accounts and every peculation of the public moneys, yet takes but languid notice of the appointment of the friends of thieves to be constables and marshals, of ignorant politicians to be justices, or of second or third class lawyers to be judges, though abuses and disqualifications on the part of these latter officials may be ten times the most disastrous, only illustrates the lack of political education and the need of reflection upon all that pertains to one of the most vital and potential powers of government. We allow, all over the land, officers to appoint, almost without criticism, an incompetent relative, or an ignorant electioneering partisan, to official places, by reason of which the public business greatly suffers and official life is made disreputable: though we should be justly astir for a conviction, if a single dollar had been taken by a letter carrier, or a pair of gloves—on which we, perhaps, had paid no duties—had been abstracted by a baggage inspector. It will be a great advance of public education and of the public welfare in many ways, when we shall have an intelligent public opinion which will be indignant and outspoken upon every prostitution of the high trust of the appointing power for party or selfish ends. And it may not be without use to invite special attention to the study and reflection required for comprehending how profoundly, and in what manifold ways, in federal, state and municipal affairs, the honest use of that power, for the selection of the wisest, purest and most efficient, could be made potential for the purification of politics and elevation of official life. Such teaching should find a place in our schools and colleges. It is now the accepted opinion of a great proportion of our people, if not that this power may justifiably be used to advance the personal friends of the officer, yet that it may be used to strengthen his party and his faction. Upon that theory it is now generally exercised. (See SPOILS SYSTEM, PATRONAGE, PROMOTION.)

—The abuses in connection with the power of removal are by no means all on the side of its selfish or partisan exercise. The same malign influences which cause worthy officials to be sent away, are as powerfully exerted to keep the unworthy in their places. Those who have been able to make the public service a hospital for their dependents, combine to resent all attempts to remove them. It may cost a postmaster or a head of a department his place to send away the incompetent electioneering agent of a great party chieftain, or even "the young lady" recommended "by a congressman." Offices are frequently burdened with supernumeraries, whom those having the power have not the courage to remove. President Grant, in one of his messages, referred to the fact that it was far easier to remove the unworthy who came in through competition, and were therefore without influence to keep them, than it was to remove the inefficient favorites of great politicians.

—Under despotic forms of government—or where corruption, as in Turkey, is habitually resorted to as an agency of administration—there is of course no more pretense of justice, or regard for moral obligation, in exercising the power of removal, than of that of appointment. It is, without scruple, used to reward favorites, to gain money, to suppress independence, to strengthen dynasties and hierarchies. Cromwell used it, almost as freely as did James and Charles, to uphold political and religious partisans. Even as late as George III. it was used for nearly or quite all those purposes, and in the army and navy as well as in the civil service. When liberty and justice were enough advanced to enable party majorities to rule, the dominant party began by prostituting that power for selfish ends in much the same spirit that the corrupt tyrants of earlier days had done.

—Soon after the formation of the American constitution, there arose a public opinion in Great Britain too strong for the king to confront, which condemned removals without cause, and such removals ceased. Parties, there, have long since reached the sound conclusion that even their own strength is not increased by mere partisan appointments or proscriptive removals. (See CIVIL, SERVICE REFORM, PROMOTIONS.)

—From the beginning of our national administration until Jackson came to the presidency, it was the accepted theory and the constant practice that removals were not to be made without good cause; and that, unless in the cases of the legal advisers of the president and perhaps a few others, political opinion did not constitute such a cause. Under Jefferson and the second Adams especially, there was great pressure for removals for political reasons. But they, and each of the first six presidents, standing upon principle and a sense of public duty, nobly resisted that partisan demand; altogether making only seventy-three removals in the forty years covered by their terms. Of these, Washington made nine, and all for cause; John Adams, nine, and none on mere political grounds; Jefferson, thirty-nine, of which he said none were for party reasons; Madison, five; Monroe, nine; and John Q. Adams only two, and both for cause. It is certain that not one of these presidents made a proscription or partisan removal according to the later practice. With Jackson's accession to the presidency a new spirit triumphed. Offices were treated rather as party spoils than as public trusts. Removals were made for the treble purpose of punishing political opponents, of rewarding subservient supporters, and "of strengthening the party." In the year from

March 4, 1829, to March 4, 1830, President Jackson appears to have made 734 removals. Throughout his two terms his use of the appointing power was in the same intolerant and despotic spirit. In all the lower grades of the public service, the president's example was soon followed. The theory that patronage is essential to the vitality and usefulness of parties, and that "to the victor belong the spoils," was generally enforced. The higher sentiment of the nation was outraged, and all official life was humiliated and debased. We have no space for enlarging upon the disastrous effects of the spoils system then first established in the national administration. (See SPOILS SYSTEM, PATRONAGE.)

—How thoroughly the theory enforced at Washington was also enforced in the local offices is well illustrated a few years later at the New York custom house. One collector, there, in the four years from 1858 to 1862, removed 389 of his 690 subordinates; another, of the opposite party, in the three and a half years next following, removed 525 out of 702 of those serving under him. Nearly all these removals were for partisan reasons. The duty of removing for cause was, by reason of vicious political influence, but rarely performed. And this reckless, demoralizing proscription, fatal alike to efficiency in the customs service, to purity in politics, and to all manly selfrespect in the public service, continued there, and generally prevailed in the whole civil administration, until the demand for a reform policy began to be effective soon after 1871. In the five years, or 1,565 secular days, preceding the year 1871, there were 1,678 removals, and nearly all for mere partisan reasons, in the New York custom house—or, more than at the rate of one every secular day of the five years!

—From the introduction of the reform methods, in July, 1878, (under which competitive examinations for admission to the New York custom house have been since enforced). until the 8th of September of that year, no removal was there made. From the last-named date to Feb. 20, 1881, (nearly two and a half years), only forty-four removals were made in the office, and all for cause, and hence none for political reasons. From the last-named date to this time (November, 1882), the removals have been upon the same basis and in almost the same ratio, as in the two and a half years preceding 1881.

—The effects of the new system upon removals, as enforced in the New York postoffice during the same periods, have been almost identical with those at the custom house. And at the several other offices where competitive examinations, with various defects and limitations, have been enforced, there has been a corresponding reduction in the number of proscriptive removals Like results attended the enforcement of such examination at Washington under President Grant.

—Proscriptive and partisan removals (or, in other words, removals without cause), are almost invariably made in order to furnish a vacancy for some influential or strongly backed office seeker. And if it were necessary that every such office seeker should win the first place in a competitive examination before he could be appointed, there would be few unjust removals, and the question as to a reasonably permanent tenure of office would present little difficulty, if it was not practically settled. The class of men who are being pushed, or who beg and intrigue for office, are rarely those who

can win a place in an honest rivalry or competition of merit. The reasons why members of congress refused to vote money to enable President Grant to continue competitive examinations at Washington, and why congress has given no aid in support of the competitive or *merit* system at the New York offices, are largely to be found in the simple facts that the new system was fatal to all arbitrary and proscriptive removals, and hence destructive of the vast congressional patronage, by the aid of which so many members secure their own elections, augment their influence and importance, and get places for their henchmen and favorites. Members of congress, whose duty it is to make laws in aid of keeping the most useful public servants in their places, have exerted a very great part of that pernicious influence which has so generally made our public servants the dependents and servile agents of scheming officials and unscrupulous chieftains.

—During the last few years there has been a rapid development of a sentiment which condemns all removals without cause. The people are beginning to take notice of the abuse which is becoming more and more an issue in the elections. If the more sagacious party leaders already see the need of arresting this form of proscription and despotism, it is yet true that very lately, and even within a few months, the most arbitrary and indefensible removals have been made. Upon each of the late changes in the party majorities in the houses of congress, mere ministerial subordinates have been changed in order to gain partisan patronage. The time of the national senate, during the past and present year, has been largely given to mere factional contentions, growing out of the attempted removals of postmasters and collectors whose political opinions all true statesmen must hold to be unimportant, if not utterly immaterial. At the last session the house was forced to a vote in order to retain a skilled and invaluable clerk against a pressure of many members who sought to put an inexperienced partisan of their own faction into his place. The speaker of the present house of representatives, merely for political reasons, has arbitrarily removed one or more of its most efficient stenographic reporters, in violation of the spirit if not the letter of its own rules and usages, which allow removals only for cause, and has appointed a successor, unequal in capacity, by reason of which the business of the house appears to have been embarrassed. (See speech of Mr. Springer, "Congressional Record," July 27, 1882.) And while we are writing, the facts are laid before the public of a removal of a female postmaster, very recently made in Virginia, only for the reason that a senator treats the sympathy of her brother with the political faction which opposes him as a sufficient cause for demanding such removal! In state and municipal administration, removals are constantly being made for no better cause; by reason of which, men of high self-respect and capacity scorn the public service; those in it are humiliated; administration is made inefficient and needlessly expensive; and the intensity, intrigue and corruption of party politics, and the strife for places, are greatly increased. It is not possible to exaggerate the discouraging, humiliating effects upon the great body of the civil servants, produced by the constant sense that no merits of their own, but an influence and interests foreign to their sphere of duties, are most potential for keeping them in their places; or to overstate the demoralizing influence upon all official and political life of so vast a power as that of appointment and removal habitually used in defiance of the highest obligations of morality, patriotism, and the official oath.

DORMAN B. EATON.

## RENT

RENT. This is the term recognized in political economy, to denote the *net product of the land, i.e.*, that portion of the total product, which, after deducting what covers the expense of production, remains, and constitutes a surplus. This surplus naturally reverts to the owners of the soil; they gather it themselves when they work their own lands; they receive it from the hands of farmers, or metayers when they leave to others the care of making them productive; in all cases. the rent forms part of the property. We must not, however, confound it with the price paid by one who hires a farm, (called sometimes farm rent), although it is one of the elements of the latter. Every case of farm rent, every leasing price, whether payable in money or in kind, includes something additional, viz., the remuneration due the land owners for expenditures made by them at various times in the past, to facilitate labor or increase its results. The buildings for farm service or for residence, the fences, ditches and plantations which the farm embraces, have often cost considerable sums, and it is just that those who enjoy the advantages connected with their existence, should pay all or a part of the interest on the capital that had to be devoted to them. On the other hand, the conditions of the lease of lands have been discussed by the contracting parties, and may have been so determined as to favor either. Nevertheless, wherever the price for the use of the farm is payable in money, there is a constant tendency for it to include the entire rent. Rent is a net product, it is only realized when active industry has been fully remunerated, and it is not less difficult for farmers to reserve any of it for themselves, than for proprietors to induce farmers to sacrifice to them a part of the profits due to their improvements. But, whatever may be the nature of the circumstances which determine the apportionment of the rent of land between the owner and farmer, they can neither permanently effect its real amount nor alter its original character.

—Among the great facts to which the attention of economists has been drawn, few have given rise to so many controversies as the rent of lands. What it is, its origin, its proportions, its effects, its legitimacy even, everything connected with its existence, has been the object of long and patient investigations, and still harmony has not yet been established between the differing opinions. This is the more to be regretted, because, in this very question of rent are involved many other problems of deep social import, and the effects of its solution naturally extend far beyond the limits which scientific investigation has attained.

—We will here commence by pointing out the order in which the opinions on the matter of rent originated; we will note their characteristic differences; then we will take up the question in its whole extent, and, in our course, we shall find occasion to show how far each of the theories before us seems to depart from or to approach the truth, so far as the best established facts permit us to discern it.

—It was the physiocratic school who first enunciated an opinion on the nature of rent. They characterized it as the net product of the land, and in this they were not in error; but soon, attributing to it an extreme and exclusive importance, they made it the only

source of public and private wealth. We know how erroneous a doctrine must be, which is based on the idea that no other labor than that on land can obtain more than the equivalent of the values it consumes, a doctrine denying productive power to employments without which most things produced from the land would themselves remain unsuited to use, and not admitting that men could realize any other riches than that which the natural fertility of the soil put at their disposal. However, in spite of this fundamental error which vitiated all their conclusions, we can not deny the physiocrats the merit of having apprehended well the character of rent and having given a pretty accurate definition of it. Among their observations on the natural increase of rent, there are also some which are both just and important. The net product, rent, in the excess which is left from the crops after the expenses of cultivation are reimbursed; it is the portion of the fruits of the earth from which the non-agricultural classes subsist; and, doubtless, in the normal and regular order of things, the greater or less amount of this excess has a strong influence on the degree of power and prosperity in reserve for nations.

—With and by the illustrious Adam Smith, began what may rightfully be called true economic science. The opinion of Smith on the subject of rent is much like that of the physiocrats. It is substantially as follows. In labor on land, nature acts conjointly with man, and rent is the product of its co-operative power. It is this co-operative power of the earth, the enjoyment of which landholders grant in consideration of a price for the lease based upon a proportional share of the sum at which it figures in the results of production.

—The opinion of Adam Smith has obtained the assent of most economists. J. B. Say, Storch, Rossi and Rau adopted it, or varied little from it. Dr. Anderson, however, had previously presented a harmonious series of ideas on the subject, which were at the same time more complex and better developed. [68](#) But his system did not attract attention until after having been reproduced again in the writings of Malthus and Ricardo, and it is under the name of the latter that he has taken a place in economic science.

—The starting point of Ricardo is in reality the same as that of Adam Smith. What the latter calls the co-operative power of land, Ricardo calls natural fertility, or original powers; but what he has added to the fundamental notion is, an exposition of the rules which, in his opinion, govern the formation and progressive increase of rent. According to Ricardo, rent is not solely the result of a natural fertility which permits the land to return, to those who cultivate it, harvests superior to their needs; it arises from the unequal distribution of this fertility. So long as the population, having plenty of room, can work only the best lands at their disposal, there is no rent: but just as soon as, on account of their increase in numbers, the same population are compelled, in order to procure means of subsistence, to attack lands of inferior quality, rent arises and becomes the share of the proprietors of the portions of the soil that were first cultivated. And the following is his explanation. Being less fertile than the others, the lands on which the labor is expended can not return, for a like expenditure in cultivation, as great a product. The crops they yield require additional expense and labor, and as it has become impossible for society to do without its complement of supplies, it is compelled to pay for provisions whatever price is necessary to insure

production on land that has just been cleared. In this inevitable movement, it is the net cost of the produce on the worst land to which recourse must be had, which fixes the general price, and consequently determines the profits of the proprietors of the land first cultivated, the realization of which secures them a rent. They sell at a higher price what they obtain without increased cost or advances, and find themselves masters of a greater surplus than they had before prices had risen. A like effect is again produced whenever the necessity of increasing the arable domain is felt. Worse lands are continually being brought under cultivation; the price of produce rises because of the increased outlay they require; and, at each advance in prices which takes place, rent is seen to arise where it did not previously exist, and to increase where it had already arisen. Such are the ideas on which the theory is based which is called by Ricardo's name. This theory affirms, or at least appears to affirm, that rent has no other source than the difference in the degree of fertility between different portions of the soil: it attributes its origin and development to no other principle than the continual rise in the market price of food, and it makes the difference between a general price current, regulated by the expenses connected with production in localities where these expenses are greatest, and the particular net cost in the other portions of the soil, the measure of the rent that each of the latter affords or is adapted to afford.

—Ricardo's theory was of course widely taken into consideration by the economic world. It gave, or seemed to give, the explanation of a certain number of facts, which, at the time when it originated, were receiving much attention from the public. Moreover, many writers accepted it fully; and it was not until our day that it found decided opponents. Attacked first in England by Prof. Jones, of Hailebury, it was afterward assailed by adversaries whose denials extended even to the principle to which Smith had given his adhesion.

—A very distinguished American economist, Mr. Carey, has denied that the natural fertility of the soil is among the causes productive of rent. In his view, rent has no other source than the expenses successively incurred in the interest of production. And among these expenses he includes, besides those of which the lands under cultivation have been the direct object, the construction of roads, canals, and any means of communication designed to facilitate transportation and to render the markets accessible to products which, if they could not have reached them, would not have been demanded of the soil. Mr. Carey, moreover, has endeavored to demonstrate that Ricardo was entirely wrong in regard to the order in which cultivation has taken place, and that it has not begun with the most fertile lands, but with those most easily cleared, or the nearest to centres of consumption. Taking Mr. Carey's opinions in their plain signification, they consist in denying to the land itself any participation in the formation of rent, in attempting to prove that all this rent represents only the remuneration for advances made to render the soil amenable to culture; in a word, that rent is and can be only a simple creation of human industry.

—Such is also the point of view from which rent was regarded by a man whose premature loss science can not too deeply deplore. M. Bastiat, dreading the consequences of any doctrine which seemed to authorize the admission that wealth could exist which was not exclusively the product of services or of human efforts,

started with the same idea as Mr. Carey. According to him, rent is and can be only the interest on the capital invested in clearing the soil and preparing it for production. Only M. Bastiat recognizes that rent may occur without the proprietor having to make any sacrifice to reap the benefit of an unexpected increase: and this case he explains by remarking that there is nothing peculiar in landed property; that what creates the value of the services rendered by every employment of human industry, whatever agent it may use, is not alone the efforts made by the producer, but also the efforts spared to the consumer; and that the latter, whenever his wants increase, pays more for the service rendered him in saving him the more costly efforts he would have to make to provide for himself without such aid. It is much to be regretted that M. Bastiat did not have time to make a precise and well-arranged statement of his ideas before his death. It was in connection with the treatment of real estate that he announced them, in the clever book he published under the title of "Economic Harmonies." The special chapter that he proposed to devote to rent was scarcely outlined, and what has been preserved of it consists only of incomplete fragments, in which the author's ideas are not clearly discernible.

—Such are the principal opinions to which the existence of rent has given rise. Their antagonism is very marked. While some attribute the formation of rent to the co-operative action of nature in agricultural labor, others, denying all influence to this action, consider rent only as the remuneration for the expenses and efforts by which mankind have succeeded in transforming the earth into an instrument of production. We will review the whole subject, and attempt to ascertain the truth amid the obscurities and complications which have hitherto hindered its successful investigation.

—*Origin of Rent.* There are, in the first place, two things which it seems to us impossible to contest. One is, that the earth is endowed with fertility; the other, that it is not equally so in all parts. It is a fact no less evident, that this fertility does not even need the co-operation of man in order to manifest itself. In the most uncultivated condition the land never fails to be covered with vegetable growths, some of which can supply food and support animals whose flesh may be eaten; and it is the land which, by insuring to the human race at the beginning harvests already produced, has permitted it to escape the destructive effects of famine. Of course, men had to be at the trouble of gathering the fruit, pulling up the roots, and catching the game and the fish on which they subsisted; but if such efforts had alone the power of conferring value on the products which the earth of itself put within their reach, it is none the less true that where these products were more abundant or more easily obtainable, less effort was needed to appropriate them, to adapt them to use; in a word, to convert them into exchangeable wealth. Well, it is to this natural fertility of the earth, which has from the beginning put its inhabitants in the way of obtaining means of subsistence which were not wholly the fruit of their labor even, that rent owes its origin. Rent is the surplus realized over the expense of production, and wherever it was possible to those who, in any way whatever, labored to gather the fruits of the earth, to amass more of them than their personal necessities required, there was a surplus to their advantage, which was rent, and rent very evidently due to the fertility of the portion of the soil on which their industry had been employed.

—The most savage tribes have nothing to learn in this regard. They contest with each other the occupation of places where the waters most abound in fish, or where the land furnishes the most game or fruit; and this is because they well know that as long as they keep exclusive possession of it, they will derive from a given amount of effort, time and fatigue, a quantity of the means of subsistence superior to what they would obtain on less favored portions of the soil; in a word, an actual excess over the expenses of production, which would be everywhere else less amply repaid.

—We will say more. From the first, the earth must, in certain places, have conferred a rent on those who as yet knew only how to gather its spontaneous productions, as otherwise civilization could not have arisen and commenced to advance. While most of the savage tribes were exhausting themselves in efforts to find enough to prevent them from dying of starvation, others, more favored, obtained, without any more skill or effort, resources more than sufficient to supply their necessities; and the latter were not long in bettering their condition. Free to provide in advance for future consumption, it became possible for them to devote leisure to occupations other than the mere search for food. They could make weapons, the implements needed in fishing and hunting, and the means of deriving more profit from their labor; and in the end, they could amass the provisions or capital whose possession would enable them to undertake the breaking up and cultivating the land. We may safely assert, that, if Providence had not so disposed things that the earth offered in some places, to its earliest inhabitants, products which it did not take all their time and care to obtain, the savage manner of life would never have come to an end: men would to-day be still wandering naked and hungry, a prey to invincible poverty, distinguished in no respect from the animals called into existence at the same time with themselves.

—The invention of the art of agriculture did not alter the nature of the primordial fact. There had been, during previous periods, lands which had yielded to those who sought their products, more than they needed for subsistence: there were, under the new order of things, lands which yielded to those who cultivated them, more than was necessary to compensate them for their trouble and expense. Wherever, after deducting the amount of the advances they required, lands left a surplus, this surplus constituted a rent. Wherever, for example, two workmen succeeded in realizing, beyond the returns due to capital immobilized with a view to production, products in a quantity sufficient to provide for the consumption of three, the rent was equivalent to the part of the resources necessary for the subsistence of a man and to pay for his services; and this rent was the result of the fertility of the soil; for, at points less favored, the same amount of work would not have obtained a like surplus; and at certain points it would not, had it been employed, have even obtained enough to indemnify those who had made the expenditure.

—The reader will see, that, like Adam Smith, we attribute the origin of rent to the existence in the soil itself of forces or properties naturally productive. Thanks to the assistance these forces give men whenever they require it, their efforts obtain, besides the remuneration which is their due, an excess which may be so disposed of as to favor other kinds of consumption than that of agricultural laborers. Never has this aid been lacking to those who have sought it. It was this which, even before agriculture was commonly resorted to, supplied unfortunate savage tribes, in possession of good

fishing and hunting districts, with means of subsistence sufficiently abundant for them not to be compelled to sacrifice all the time at their disposal in search for food: this it was, too, which, in ages more advanced, by permitting proprietors of cultivated land to harvest more products than they expended in production, gave them the power to remunerate labors other than those expended on the soil, and to call into existence manufacturing and commercial classes and give them a position of continually increasing importance in the ranks of the population.

—Before examining the systems which are not in harmony with this opinion, or which differ from it, there is one assertion in reference to which we must enter into some explanation; for if it were well founded, rent could be regarded as having no other original cause than the power of the earth co-operating with the labor devoted to obtaining its products. This assertion is, that there is no rent in countries where land is so abundant that every one is free to appropriate to himself such a portion as he likes without compensation, or for a trifle. Rossi and some other economists have freely admitted the fact, and M. Bastiat has found in it a point of support for his system. Let us see where the truth lies. It is certain, that, where land is abundant, its products have little sale value, because they have few consumers and lack a market; but does it follow, that, on the few portions where cultivation exists, those who employ it do not find in the original properties of the soil an aid eminently profitable, and do not obtain crops out of proportion to their efforts for subsistence? Suppose a country where all the people cultivated land, and where they could not sell provisions to neighbors because the latter were as well provided for as themselves: the beneficent effects resulting from the co-operative action of the soil would still be felt. In such a country, no one would try to realize a surplus which could find no purchasers: every one would only demand of the soil the means of subsistence required for his own family: but, as little labor would be necessary to obtain this, the husbandman would enjoy long periods of leisure; and leisure is always, to those who know how to employ it, a source of wealth. The time not required in cultivating land, they would employ in making articles adapted to satisfy other demands than those of hunger. They would make clothing, furniture and dwellings; and these are products whose acquisition would be due to the co-operation of the land with their efforts. A relief from incessant labor, and leisure that can be employed in reproductive occupations, are what the earth gives those who cultivate it, whenever they do not know what to do with the surplus it yields. This is, in reality, rent, under a form sufficiently characterized.

—But, let us observe, things have never occurred altogether in this manner. Wherever cultivation of the soil has become established, it has never alone attracted all persons, and it has always found consumers who did not share in its labors. So far back as we can trace in history, we find no social aggregation without magistrates, priests, soldiers and artisans, all supported from the portion of the crops which the agricultural population could spare; and this portion was no other than the excess produced by the land. It has often been affirmed that rent long was, and still is, unknown in some parts of North America. "But lately," says M. Rossi, in speaking of the ideas of the physiocrats on the net product of the land, "there was no rent or scarcely any rent in America, and yet there was a great abundance of all the necessaries of life, and the course of society was toward great prosperity and rapid development." It is true that the conditions under which the colonization of North America has been effected,

differ in all respects from those which governed the formation of social bodies in the old world; but the opinion of M. Rossi is, nevertheless, incorrect. One thing which does not exist in America, or exists there only in a very few localities, is the practice of hiring farms, and the reason for it is simply this: As land there costs very little, those who wish to till it, buy the ground on which they settle; and the acquisition counts but little in the list of expenses incurred in their industry; but there is in America a town population, who buy, either for consumption or export, the surplus which the local circumstances bring into market, and the agriculturists retain, by their right as proprietors, an actual rent. It is also true that nowhere in America does the surplus bear a definite relation to the expense of production; nowhere in that country does the agricultural class, after having recovered its advances, offer the other classes as much of the means of subsistence and remunerate as well their services; and it is just this which causes such an abundance and so many elements of life and prosperity in the Union. Some writers have thought that the surplus which American cultivators have to dispose of should not be considered as the result of the natural fertility of the soil, but simply a return for the capital invested in their operations. One need but examine the matter closely to see that it is quite otherwise. It is not because the general rate of profit is very high in America, that the land there brings in a good return to those who take advantage of its fertility: it is, on the contrary, because the land cultivated, which is still wholly choice land, returns much, that the rate of profits is high. Capital goes where it brings most. In America, as everywhere else, it is not invested in manufactures or commerce, except when it will yield as much as if employed in agriculture; and it is the amount of the net income from the soil which largely repays cultivation, that secures to all investments of savings, and to every employment of human activity, the ample remuneration they receive. Assuredly, if the vast territory of America were only composed of lands of a low degree of fertility, the expense necessarily incurred to obtain subsistence from them, would be more considerable, agricultural capital would produce less, and neither the general rate of profits nor that of wages would be maintained at the height they have now attained and are continuing to keep.

—Europe does not lack countries where land is abundant, and has only a low sale value. It is incontestable that rent exists in these places; and as the facts which give it a distinguishing characteristic are of a nature to throw much light on the question, we will say a few words in regard to them. In Hungary, Russia, and many parts of the original Poland and the principalities of the Danube, the rural population, held in servitude, or but recently having ceased to be so held, are, in general, too poor and too ignorant to purchase the land and subject themselves to the risks and perils consequent upon settlement. What is the result? It is that the proprietors, like American agriculturists, cultivate and harvest on their own account. Ordinarily, they leave the laborers, as their wages, the use of a piece of land, which the latter cultivate for the support of their families, and for which they are bound to give two or three days' labor per week to the rest of the estate. This arrangement clearly shows wherein consists the rent of the proprietor. It is the result of the employment, on his land, of the time which the laborers can spare from that which gives them their own subsistence. And let it be observed, that this time can be attributed by the laborers to nothing else than the natural fertility of the soil whose cultivation furnishes them their whole living. Whenever the laborers devote to other fields than those which they are

permitted to enjoy, two days' work per week, the surplus over the general expenses of production, the rent is but little inferior to two-thirds of the total product.

—Now, there are, in these same countries, some places where reside either colonists of foreign origin, or peasants in full possession of the lands they cultivate, who often have more land than they can till. This is the case in America. Does any one think that rent does not exist in such places, as well as in the rest of the country? If so, he is greatly mistaken. The part which reverts to the proprietors, in cases where the laborers give their fields two days' labor every week, the cultivators retain for themselves when they are absolute masters of the soil, and if they do not harvest it, it is because they find they can more profitably employ the time which they refrain from devoting to agriculture.

—In whatever way we look at the question, on whatever side we take hold of it, we must always end by recognizing that the earth gives rise to rent, and that, even where the conditions of society are such as to prevent all being derived from land which it might produce, there is a compensation for this in the leisure it affords that can be employed in other avocations.

—Let us come to the theory adopted by both Carey and Bastiat. They deny that the earth can add anything of its own to the results of labor. In their view, land is only an instrument, an agent, of production, which man employs, and not a single element can be found in rent which is not wholly the product of the expense incurred to render the land fertile. M. Bastiat thought, that to admit the co-operative action of the soil in the benefits connected with production, would be to recognize that wealth might exist which was not due to labor, and that the earth had the power to create such wealth. Let us look at this point. No one, surely, of any repute among economists, has maintained that anything which nature has prepared for the use of human beings, has value before having been the object of some kind of labor;<sup>69</sup> but, positing this principle, is it the less true that the earth, if it does not furnish things which already have value, does afford those adapted to receive it, and that, whenever it furnishes these things in such abundance or so easily obtainable that the labor employed in communicating value<sup>70</sup> to them costs less than it produces, there results an excess over the expense incurred, which is not found when the efforts of man are otherwise exerted? Here is the fundamental point of the discussion, the point of fact. To affirm that this surplus would not be realized without taking the trouble to obtain it, is to say little; for that is not contested. What should be proved is, that it would be possible without the co-operation of the earth, and that there are industries not agricultural or extractive which have also the power to produce rent.<sup>71</sup> Now, this proof is wanting, and surely never will be given. As to the objection that it is demand, which, by assuring a value to the agricultural surplus, has alone the power to create it and to convert it into wealth, and that demand constitutes an action purely human, it has its response<sup>72</sup> in what has just been said in reference to the assertion, that there is no rent in regions where the land, while waiting for a more complete private appropriation, has as yet little or no exchange value.

—It is in vain for one to seek to delude himself. The land alone returns more than is needed to pay wages, interest and profit on the capital required to cultivate it; and as

there is no other way in which labor can be applied to obtain a like surplus, we must recognize in the existence of rent the result of a co-operative action exercised by the earth itself. It would be wrong that the fear of having to admit that there is a gift from God, new the exclusive share of a certain number of his creatures, should influence our opinions; for this gift is an evident fact; and besides, without it, it would have been utterly impossible for humanity to fulfill its destiny in this world; and, if this gift has not continued the common domain, it is because it has pleased its author that it should produce its beneficent effect only on condition of becoming an object of private appropriation. All this it would be very easy to demonstrate, were this the place to do so.

—It remains for us to make a few observations on the particular points which characterize the theory called Ricardo's. This theory fully admits the existence of productive properties in the soil, which belong to it; but it accords to it the power of creating rent only in virtue of the fact that these qualities are not equally distributed through it. This is taking one of the circumstances which concur in producing the differences in the price of rents for the cause which gives rise to them. The origin of rent, as we have said, is the power of the land to return to those who cultivate it more products than they need for their subsistence and the recovery of the amount of their advances; and wherever the lands are adapted to do that, any one who desires can obtain from them this excess that is to say, a rent. Nor is there any need, as Ricardo supposes, of a rise in prices in order for rent to begin; rent appears the moment when the gathered crops leave a part disposable, and it is realized when those who harvest, finding consumers for that part, devote more time to their work than they would have to sacrifice if they limited their efforts to gathering only for themselves. Finally, it is a very simple matter to state how far Ricardo's theory conforms to the reality. One has only to examine what would happen in a country where the lands were all of the same quality, all adapted to remunerate labor liberally, and all so situated as to enjoy the same advantages for the sale of their products. Well, in this case, see what would happen! As everywhere else, the population would obey the laws which urged them to multiply, and as everywhere else, they would rise to the level of the subsistence that agricultural labor could procure for them. There would be an increasing demand, and the cultivators, certain of a market for that portion of the harvest which they would not themselves need, would devote enough time to their labors to gather it, enough time to obtain a rent. The more the town population or industrial classes increase in number, the more would be demanded of the soil by cultivation, the wider would be the extent cultivated, and the more would rent increase. In such a country leasing of farms would appear; there would be found at the same time proprietors possessing more lands than they could themselves cultivate, or desirous of ridding themselves of the whole or some part of their burden of personal labor, and workmen disposed to take their place or to offer prices for a lease, proportioned to the amount of net income which they judged the soil capable of furnishing. The principal error of Ricardo's theory consisted in ascribing a decisive influence to the rise in the exchange value of the means of subsistence, which he thought inevitable.

—*Causes which influence the Value of Rent.* It is an incontestable fact that the price of rent has risen in proportion as civilization and the comforts of life have increased in

human society. It is essential to state clearly the causes under the influence of which this has been effected.

—There are three causes of which account has been taken. One is the incorporation into the soil of the capital necessary to render it more and more productive; the second is the gradual extension of cultivation, over lands either less fertile or more difficult to bring under cultivation than those which had already been applied to for crops; the third is the continual improvements in the application of agricultural labor and skill. We will point out their effects. and, as far as possible, estimate the extent of each.

—As we have said, rent is the portion of the fruits of the earth obtained over the expenses of production or quantities necessary to satisfy the demands of those who work the land, and, in the savage state, the most fertile lands leave some surplus at the disposal of their masters. But as soon as a population, in stead of confining itself to gathering the spontaneous productions of the soil, undertook to direct its active forces, to the primitive profit were added other portions of the product, these latter being due to the immobilization of capital or advances made in the interest of production. Before sowing seed, it was necessary to break and clear the land, and the work, almost always long and toilsome, cost much. This done, they had to level and prepare a soil full of hollows and humps, in consequence of the extraction of the roots; and then, to execute numerous works, some of which were designed to facilitate labor, others to insure the preservation of the crops; and, by degrees, a considerable amount of capital was incorporated into the fields brought under cultivation. What is to be remarked, is, that this capital, for the most part, returned not only the amount of the interest and profits acquired by its employment, but, thanks to the impulse it gave to the co-operative power of the earth, it made to spring up, besides, a new surplus, to increase that which existed previous to its consumption. Consequently, in the present condition of rents, the latter combine three elements having a distinct origin. It would be idle, moreover, to attempt to state exactly the proportionate part of any one of these elements, or even to decide what is only a suitable return for outlays embodied in material improvements all that can be affirmed is, that what holds the least place is the primitive element and it is very easy for any one to assure himself of this if he will merely notice wherein consists that which uncultivated lands yield to the wild tribes who live on their natural products. The two others, on their natural products. The two others, on the contrary, are by far the more powerful. Clearing of land, in our day, is very costly, and certainly must have been far more so originally, because of the coarseness and imperfection of the processes and the instruments in use. On the other hand, there are farms and metairies [*i.e.*, small farms in France let on halves to the cultivator.

—*Trans.*] where the value expended in constructions and buildings for use, fences, ditches, and permanent works, is equivalent to from a third to a half of that of the land cultivated. This explains why there are economists who, impressed by the great and constant sacrifices made with a view to production, will not see in rent anything but the amount of the indemnity to which these sacrifices entitle those who make them.

—The necessity for a people who are increasing in numbers, to extend cultivation over lands lying fallow, has been ranked among the causes which exert a decisive

influence on the price of rent. The reader has seen. in what we have said of Ricardo's theory, what consequences that writer attributes to it. In his opinion, prices rise gradually as labor has to take up with lands less adapted to recompense its efforts it is the expense incurred where it is least remunerated, which fixes the exchange value of the means of subsistence, and hence the rise and progressive increase of rent.

—People certainly consult, in the choice of lands to bring under cultivation, the degree of productiveness which these lands present at the time; and, in the natural order of the development of labor, they only attack the poorer lands when the others have ceased to provide sufficiently for the exigencies of consumption. It is an evil that all lands are not at the same time better and of like quality. Humanity would be better off for a different distribution of the natural fertility of the soil from which it is fed: but has this evil all the effects attributed to it? Does the upward movement which it tends to give the prices of products really take place as people suppose? Are there not causes of decline at work, which on their side are sufficient to maintain such relations between the expense and the results of production, as to prevent suffering in the community? This is a question of the utmost importance, and demands a serious examination.

—We have not thus far taken sufficient account of the influence on rent and prices, of the progressive development of knowledge of agricultural affairs. Of all causes this acts most energetically and constantly, and its effects are the most decisive. Sometimes it reduces the expenses of production by a given quantity of provisions. Sometimes it increases the quantity harvested at the same outlay; and, in both cases, it raises the rent by increasing the surplus obtained after deducting expenses; and, at the same time, it arrests the rise in price while multiplying the amount of provisions destined to meet the demands of consumption.

—One single thing might take away, from progress in the art of agriculture, the power of raising the rent. This would be if the sale value of the products diminished in proportion as labor, having become more enlightened and more powerful, succeeded in deriving more produce from the lands. But, as we know, the means of subsistence have the privilege of never waiting long for a demand. As soon as they become more abundant, the population is not long in multiplying, and soon wants rise to the level of the supply. And is there not also a saving realized in the expense of cultivation, an improvement in the application of the efforts of labor, which does not increase the part of the product which remains *net* after expenses are deducted, and which consequently does not add to the rent of the proprietors?

—In what measure has the diminution in the expense of production due to the improved application of labor, served to raise rent, and to preserve the higher prices which the extension of cultivation to new lands tended to produce? It would be impossible to state positively; but there is no doubt that this double effect has been fully produced.

—See, in the first place, what an economy in manual labor the gradual improvement of the instruments of production has brought about. Not only good modern plowshares perform in one day twice as much work at least as the best plows of the

ancients, but they break lands formerly impenetrable to the share, and they plow the others more deeply. To reaping-hooks of brass or beaten iron have succeeded scythes highly tempered, under the blade of which crops fall rapidly and without loss, which, before their invention, required a much larger number of hands. All the tools and machines which were known in the middle ages have been improved, and, thanks to new inventions, there is no country even but little advanced in agriculture, which does not contain a good number of others of quite superior efficiency.

—This is, however, but the smallest part of the improvements realized. For the productions originally demanded of the earth, similar ones, which are both more hardy and of better yield, have been gradually substituted. By the side of the vegetables then cultivated, or in their place, have come new species from the most distant parts of the globe, which have been admitted in the rotations of crops, because of the increase of product they give on a like surface. This is not all: science has not ceased to reveal new means of fertilization. Materials whose power was unknown have added to the effect of fertilizers; substances that had been left unused have been mixed with arable beds, and have communicated to them the productive qualities which were lacking; and cultivation has been more widely developed and made increasingly productive. In consequence, lands that were despised at the close of the last century, for want of knowledge how to utilize them, have, with small outlay, taken rank among the most fertile, and some, like those characterized in England as *poor lands*, and in France as *lean* and *dry*, are to-day considered the most easily worked, and are farmed out at the highest price. And as to the other lands, we might show some in France, which, sixty years ago, yielded scarcely ten or eleven hectolitres to a hectare (*i.e.*, less than twelve bushels to an acre), which now yield eighteen to twenty hectolitres. This is an addition of about 140 francs (about \$27); and it is important to observe that this addition has only involved an increase of less than 70 francs in expense. Also, farm rents which did not reach 35 francs have risen to 70 or 80 francs, while yielding to those who paid them larger and surer profits. Certainly this is a case where the increased power of art has done more, of itself alone, to raise rent, than all other causes combined.

—Such facts (and it would not be difficult to cite many others) attest sufficiently the effects of the successive conquests of human intelligence, and how, by gradually reducing both the toil and the outlay appropriated to production, they must have increased the net product of the land, and consequently the rent. That they have sufficed at the same time, to prevent the price of provisions from rising, and to restrain the effect of the inconveniences connected with the extension of cultivation to lands of inferior quality, is so much the more certain because there has been effected in Europe another improvement, which, by itself alone, would have permitted the population to double, without recourse being had to new portions of the soil. and without any increasing demand for grain. This improvement is in the grinding of grain. the quantity of grain, which during the sixteenth century, only yielded 100 lbs. of flour at the mill, now yields more than 190, owing to the successive improvements in the processes employed.

—It should also be remarked, that, during the middle ages, the improvements in agriculture were both slow and little marked: the agricultural classes were ignorant,

and their occupations were regarded with contempt. In our day, on the contrary, they are more enlightened; and on the other side, the natural sciences have put within their reach a multitude of inventions which it has become possible for them to utilize. Moreover, for the last fifty years especially, two well-attested facts have been noticeable: one is the stability or the decline in the price of cereals in most of the advanced countries; the other is a rise in rent and the leasing price of farms with a rapidity unknown at previous periods.

—There is, however, one fact of considerable consequence, which seems irreconcilable with the statement we have just given, and which, on that account, calls for an explanation. This fact is the decline in the price of wheat in the least populous countries of Europe. Thus, wheat is worth only 10 to 11 francs a hectolitre in Hungary, and only 9 to 15 in Russia and Poland, according to the provinces. On the contrary, it has been worth, on an average, for the last ten years, 16 francs 40 centimes in Prussia, 16 fr. 60 c. in Spain, 18 fr. 74 c. in France, and a little more than 22 francs in England. Surely, these figures differ enough to attest that abundance of land permits wheat to be produced on conditions which cease to be as advantageous in proportion as the land becomes limited. Doubtless it is indeed so. A thinly scattered population are free to sow only the better portions of the soil they occupy, and to leave each of the parts which have just furnished a harvest, to rest; and it is certain, that, owing to this mode of changing the localities cultivated, wheat is obtained at less expense than if they were obliged, in order to supply the more urgent necessities, to confine their labors more persistently and continuously to the same arable fields. But it is essential to remark that western Europe has passed through ages during which this mode of culture sufficed for the exigencies of consumption, and yet everything combines to strengthen the belief that it was not then provided with food in the same abundance nor at as low a price as it now is. The following reasons support this assertion. Doubtless it would be impossible to prove exactly what was the price of wheat in France five or six centuries ago. The measures of capacity, notwithstanding the identity of name, differed enormously in their contents, not only in different provinces, but even in different parishes in the same province. In the second place, the average prices, when obtained, confounded, under the designation of wheat, cereals of all sorts: finally, the purchasing power of money was greatly in excess of what it is in our day, when the coin and paper in circulation are abundant; but it is sufficient to read, in the authentic acts which have escaped destruction, the figures relative to the price of days' work, as well as of provisions, as they were at the same times and in the same places, to recognize that the exchange value of wheat was at least equal to what it is at present. Thus, in Normandy, agricultural wages at the end of the twelfth century, were equivalent to less than six litres (about 5¼ qts.) of wheat. From that time, we see them rise by degrees to seven; and only within thirty years have they exceeded eight. We are forced to conclude, from these facts, that the real price of wheat, *i.e.*, its exchange value, has not increased in that part of France.

—Now, this is what facts attest since it has been possible to ascertain them. Fifty years ago the current rates of cereals in France began to be quoted with all the accuracy desirable. During this long space of time the population has not ceased to increase in number and in comfort, and nevertheless the price of wheat is far from having risen. Thus, starting at 1800, the five decennial averages succeeded each other

in the following order 19 fr. 87 c., 24 fr. 79 c., 18 fr. 36c., 19 fr. 4 c., 18 fr. 74 c. The particularly high average of the years 1810-20 is attributable to the wars of the empire, the invasion of 1814 and of 1815, and the scarcity of 1816 and 1817: but after 1820, prices fell below the figures previous to 1810 and 1800; and it is a matter well worth attention that never has rent, in the advanced portions of France, increased so much as since 1820, when the sale price of grain diminished or remained stationary.

—In England also, prices, within thirty years, have not ceased to decline. Inconsiderate legislation, monetary circumstances, and the effects of war, had combined to render them exorbitant; and, during the ten years from 1810 to 1820, the average per hectolitre rose to a little more than 38 francs; but from that time they declined, first to 30 francs for the decennial average, then to 25, and finally, before the reform in the corn laws, to a little less than 22; that is to say, below their figure between 1790 and 1800.

—Why is it that the price of wheat has not risen in the most populous part of Europe to-day in proportion as more land has had to be brought under cultivation, and that we find it as low in that the least populous? It is because, in past centuries, art was still in its infancy. for lack of intelligence and knowledge, as well as for lack of properly conditioned working material, the laborers could gather their harvests only by the strength of their arms, and the expenses of labor, compared with its results, were much greater than they are to-day. If, in the United States of North America, or in the regions beyond the Oder, the abundance of land has, on the contrary, its effect, it is because the people derive an advantage from it by means of implements, methods and processes, of which communities in former times learned the use only when they had already begun to press upon one another in the territory at their disposal. American agriculturists, aided by implements which were lacking to the people in the middle ages, can turn to profit their natural advantages of space. Those of the north of Europe are still too ignorant or too poor to be able to make as general use of these improved implements; but they nevertheless do use them; and to be convinced of it, one has but to observe that there exist in Poland, Hungary, and even Russia, a goodly number of large seigniorial estates, under the management of men educated in the best agricultural schools of Germany, who carry into the details of the work the most recent acquisitions of their science and arts.

—Finally, it is wrong to adopt the practice of considering the price of wheat as giving the measure of the difference in the expense of agricultural production in the various countries. What we should examine is, the general price of provisions, and not that of particular articles which do not figure equally everywhere in consumption. Wheat is cheap in the half-untilled countries of Europe; and yet it is much too dear for the poor people who harvest it. They subsist almost wholly on rye; and, while in France rye does not occupy more than a third as much arable surface as wheat, and in England not more than a fourth, in Russia, Poland and Hungary, it takes from seven- to nine-tenths as much. What is the result? In these countries, wheat, for which a small number of particularly fertile lands are reserved, is not worth, relatively to rye, as much as in more advanced countries, and the price of the common means of subsistence there is really higher than the price of wheat, considered by itself, would indicate. On the other hand, it should be observed, that, by the side of the products the

extension of whose cultivation tends to increase the price, man continually manures the soil, which, at less outlay, insures him the complement of his subsistence. In France, at the time when the average harvest was 80,100,000 hectolitres of wheat, 12,260,000 hectolitres of meslin (a mixture of wheat and rye), or 30,700,000 hectolitres of rye, there were also gathered 89,580,000 hectolitres of potatoes, more than 21,000,000 hectolitres of maize, buckwheat and millet, nearly 10,000,000 hectolitres of small grain and dry vegetables, and, besides, an immense quantity of garden products. Evidently, if the price of wheat had tended to rise, there would have been found, in the increasing abundance of other means of subsistence, a supplement which would have prevented living becoming more dear.

—These considerations and these facts authorize us to affirm that there is in the natural progress of the applications of labor a power equal or superior to that of the causes which tend to augment the charges of production. It is this power which, notwithstanding the necessity of extending the clearing to lands less adapted to produce, has prevented the price of products from rising, and which, by continually increasing the proportion in which the surplus is realized, has contributed most to the rise in rent.

—It is well to pay serious attention to this point. If such had not been the present course of things, everything would be inexplicable in the least contestable results of the progressive movement of the arts and of civilization. It is a fact beyond doubt, that the more enlightened any population is, the more they increase in number and comfort, and the more the means of subsistence at their disposal become abundant and improve in quality. No fact is better attested. The day laborers of England, France, Holland and Switzerland, are not only better lodged and clothed than they were in the fifteenth and sixteenth centuries, or than those of Russia, Hungary and Poland as yet are, they are also much better fed. Their bread is now composed in part of wheat, and not alone of rye. They eat meal and vegetables; they use less coarse and more varied food. Now, how could it be thus, if it were true that the necessity of increasing the area of cultivated land had resulted in rendering production more and more difficult and expensive? Under the fatal control of the law to which Ricardo's school accord an invincible predominance, we should have seen the remuneration of the efforts of labor gradually diminish; every addition to the quantity harvested would have been obtained only by means of sacrifices comparatively greater; the agricultural class would have increased its ranks as it became necessary to require more of the land; and the time would have come when the other classes, restrained by the obligation to surrender too large a portion of the fruit of their industry, in return for their usual subsistence, would have been arrested in their development. Well, quite the contrary of all that has happened. Starting with the centuries of ignorance and poverty, those centuries when land was so plenty that only the best was cultivated, it has been the manufacturing and commercial classes which have multiplied the most in proportion, and which have at the same time amassed the most capital and wealth. Surely, nothing like it would have been possible if the continual progress in agricultural knowledge had not put the laborers in the rural districts in the way of deriving more ample resources from the soil, and of supplying the rest of the community with food without having to demand prices continually higher.

—One other erroneous supposition is, that the market price of provisions must necessarily tend to rise, in order that the area of cultivation be enlarged. The entire history of agriculture attests, on the contrary, that everything in that regard has been only the fruit of happy discoveries. Thus, it was the invention of a plow with a broad share which determined the breaking up of many aluminous and compact lands previously refractory to the efforts of labor. The employment of lime and marl in places where they were unknown, has permitted the land to be sown to wheat; and it was the discovery of the fertilizing properties of animal charcoal, pulverized bones, and a good number of other substances belonging to the various kingdoms of nature, which revealed the possibility of obtaining rich crops from ground reputed too poor to repay the efforts of continued culture. Similarly, it was the introduction of sainfoin on chalky lands that rendered them productive; and it was an idea which occurred to a sutler in the Spanish army, during the long siege of Antwerp, of attempting to adapt the barren sand of the country to the cultivation of a few fresh vegetables, by burying in it the old, cast-off clothing of the soldiers, which revealed the secret of converting this sand into a soil which now ripens the best crops of Belgium. We have one more fine example of the manner in which discoveries and inventions operate. It is drainage. Is it the high price of food which led to its application? Assuredly not; for it came to take its place among the agricultural agencies and expenditures in England, at the very time when proprietors and farmers thought they had before them only a prospect of a decline. Thus have things happened, and thus will they continue to happen. Man has been cast upon this world, endowed with a faculty for improving his condition here. He has arrived armed, so as to be able gradually to extend the success of his struggles against nature, and the earth, very far from having been given to him as ground on which he would have to expend toil with constantly increasing ingratitude, has been given to him as an agent of production, for the direct assistance of which, when it should come to grow less, it would be easy for him to supply its place advantageously by the acquisition of intelligence destined to add more and more to the results of the application of his labor.

—*Some Opinions originating in Accredited Theories on the Subject of Rent.* The existence of the rent of the soil, and the rise it has gradually taken, have given birth to some assertions, of which we must here say a few words. Adam Smith, after having shown that rent was a natural result of the co-operative action of the earth in agricultural labor, refrained from pushing farther the analysis of facts, and the examination of their consequences. Taking the principle as he presented it, its result, nevertheless, seemed to be, that the entire rent proceeded wholly from the presence in the soil of productive qualities, which would at all times have operated equally, and created from the beginning a wealth which some had taken possession of, without leaving anything to the others. This opinion was not long, in fact, in acquiring some consistency, and several writers, through embarrassments and ambiguities of language, which betrayed the indecision of their mind, did not fail to conclude that the existence of rent emanated from an exclusive fact of nature. and constituted a sort of monopoly, having no other claim to duration than its utility. The system of Dr Anderson, taken up, commented upon, and formulated mathematically by Ricardo, came to add new motives to those which had given currency to these assertions. In this system, rent, besides originating in an evil, had the disadvantage of increasing only in consequence of a real public misfortune. It was the inevitable rise in the price

of provisions which almost alone decided the progressive increase. The more the necessity of extending cultivation over lands as yet untilled contributed to change the pre-existing proportion between the expenditure and the results of production, the larger the incomes of the proprietors became, and it was, in fact, by the impoverishment of consumers that they had the privilege of increasing their wealth. Most of the English economists received these ideas admiringly, and promulgated them. To some, rent was a monopoly, which forced those who did not possess land to pay those who possessed it more for provisions than their cost; to others, it was, to use the expression of Scrope, a restriction on the usufruct of the gifts which the Creator has bestowed on men for the satisfaction of their wants. From this position to that implied in the celebrated saying, *Property is robbery*, is but a step; and this step was speedily taken. Now, it is for us to bring within the limits of truth, conclusions that are either extremely exaggerated or palpably false. If we had to treat here of the question of the right of property, it would be easy for us to demonstrate that this right is based no less upon justice than upon social utility, and to prove afterward, that without its application to land, all the human race, condemned to a pitiless servitude to hunger, would never, in any part of the globe, have succeeded in escaping from the miseries of a savage life; but, to keep to what especially concerns rent, there are several points which it will be sufficient to mention. The first is, that those who first began to cultivate, did not in reality receive for themselves any other rent than the raw product which it was possible to obtain from the little portion of untilled soil they had cleared, that is to say, a product so small that its withdrawal from the common domain could injure no one; the second is, that by obtaining their subsistence by cultivation, they restored to their fellow human beings infinitely more than they took from them. A family of savages require not less than four square kilometres to succeed in obtaining their support; and those who first devoted themselves to agriculture, being incapable of extending their labor over the one-hundredth part of such a space, added in reality to the resources of the community, by leaving it the product of the rest. The third is, that at the time when agriculture began, there were so many vacant lands that it was optional for each to appropriate to his own use such a part as he chose, and that, if there were families who refrained from doing so, it was because they preferred either to live by hunting, fishing and gathering fruits, or to devote themselves to some manufacturing business. Such were the circumstances which controlled the agricultural *regime*. Certainly, nothing in what took place was prejudicial to the rights of any one whatever; everything, on the contrary, in the ancient memorials of human races, attests, that, far from considering as despoilers those who first taught them agriculture, they regarded them as benefactors.

—What has caused an illusion in a matter of this kind, is want of knowledge wherein rent consisted, at the time when agriculture began. Looking at the income which land secures for those who possess it, wherever civilization is advanced, people assume that it has always given such returns, and forget the labor and sacrifice it has cost a long succession of generations to make its income what it is. Certainly, if it were possible to decompose rent, and to separate its constituent elements in a rich and flourishing country, one would be surprised at the little the portion derived from the soil would count for in the whole; it would be scarcely perceptible beside what the capital expended in the interest of production, and the savings of labor due to the progress of agricultural science, have added to it. On another side, the errors

propagated by the school of Ricardo have not ceased to exercise an unfortunate influence on many minds. Without doubt, the necessity of having recourse to lands less fertile than those which had been first brought under cultivation, would have enhanced the price of food, if the better application of human activity had not come in to restrain or overcome its effects; but, as we have shown, such was the course of things; and, if that necessity acted as an obstacle to the best which might have been realized, never was it a cause of diminishing the wealth already acquired.

—Everything, after all, in the part of the question which occupies us, may be reduced to a knowledge whether the existence and development of rent imposes on the consumers of the fruits of the earth sacrifices which might be spared them. Now, this would be true only in case the rate of rent exercised some influence on prices; and this case, as we know, can not occur. Admit, for example, in its whole extent, the theory which shows rent under the most unfavorable light, viz., the theory of Ricardo. Whither will you be led? To recognize that rent, arising from the necessity of extending cultivation to ground of less fertility, is only an inevitable result of the enhanced price of products whose attainment becomes more and more difficult. In this theory, it is not because rent arises and increases that prices rise; it is, on the contrary, because prices rise, that rent is created and increases. Society is obliged, under penalty of dearth, to pay a price for the necessities of life which secures the producers remuneration for the charge imposed upon them by the cultivation of the worst lands whose culture is indispensable; and hence arise benefits to the possessors of the other portions of the soil, which secure to them a rent so much the larger as their expenses of production are relatively less. Admit the doctrine contained in this article, which is in our opinion much more simple and true, and you will arrive at conclusions still more decisive. It is the peculiar fitness of the earth for production, which, by permitting it to return to those who cultivate it more products than they need in order to subsist and receive a return for their advances, which brings about rent. The more perfect labor becomes, the more is the amount of the expenses incurred in it, in proportion to the quantities harvested. reduced, and the more the excess which is converted into rent increases. If it is true that the necessity of enlarging the arable domain tends to increase the price of production, this tendency encounters, in the advantages connected with the successive improvements due to human ingenuity and skill, a counterbalancing power more than sufficient to restrain it, and this is why the consumption of provisions becomes at the same time extended and improved in all countries when the people become more advanced and enlightened Thus, rent is nothing else than the product of a gift of nature which men are permitted to turn to more and more profit, and whose increase is only an effect of the general development of prosperity. And this is so true, that if it had pleased Providence to increase the fertility of the soil a few degrees more, the price of provisions would have been less, and of rent, more. In the beginning it must have required less labor to obtain subsistence, and, after defraying expenses, there would have remained a surplus, a net product, much greater than that which is now realized under the name of rent.

—The reader will now see how little foundation there is for the charges brought and lamentations made against the existence of rent. Under whatever aspect the question is viewed, whatever theory we adopt, rent appears only as the result of circumstances

which it is not in the power of man to change, and not as a portion deducted, to the exclusive advantage of some, from the resources acquired by others. Monopoly is then a very singularly chosen word when applied to the existence of rent. To be sure, the earth is limited in extent, and men can neither increase its surface nor extend to all its parts labor equally productive; but does it follow from this that there is anything in common between the appropriation of land and the concurrence of circumstances which constitutes a monopoly? All have not a lot of land, it is true; but have all a share in the possession of things which, like the earth, own their sale value and the possibility of producing a revenue, to the development of the productive capacity of human society? Land, unless iniquitous and hurtful laws immobilize it in the hands of privileged classes, is transmitted and exchanged like houses, manufactories, contracts for stated payments, or stock in any industrial enterprise. Whoever has savings at his disposal, is free to acquire a greater or less portion of it, and those who possess it are so far from deriving exclusive advantages from it, that some among them may always be found who are ready to give up what they have, for capital from which they hope for a better revenue. The possession of land or of any other sort of wealth, is so simply a matter of taste or convenience, that there are times when, even with a like product, it is not the kind of investment most sought after. To go to the essence of things, there is nothing in the assertions we have just examined, which might not apply to the inequality of fortunes even; for property in land is only one of the forms under which exists this inequality, which, born with society itself, will assuredly last as long as society.

#### H. PASSY.

—Besides the questions treated of in the above article, there is one which has been mentioned in the articles **COST OF PRODUCTION** and **DEMAND AND SUPPLY**: it is, whether rent constitutes a part of the cost of production. We think we can not do better than to quote the opinion so clearly stated by Mill. (*Principles of Polit. Econ.*, book iii., chap. v.): "Rent, therefore, forms no part of the cost of production which determines the value of agricultural produce. Circumstances no doubt may be conceived in which it might do so, and very largely, too. We can imagine a country so fully peopled, and with all its cultivable soil so completely occupied, that to produce any additional quantity would require more labor than the produce would feed: and if we suppose this to be the condition of the whole world, or of a country debarred from foreign supply, then, if population continued increasing, both the land and its produce would really rise to a monopoly or scarcity price. But this state of things never can have really existed anywhere, unless possibly in some small island cut off from the rest of the world; nor is there any danger whatever that it should exist. It certainly exists in no known region at present. Monopoly, we have seen, can take effect on value only through limitation of supply. In all countries of any extent, there is more cultivable land than is yet cultivated; and, while there is any such surplus, it is the same thing, so far as that quality of land is concerned, as if there were an infinite quantity. What is practically limited in supply is only the better qualities; and even for those, so much rent can not be demanded as would bring in the competition of the lands not yet in cultivation; the rent of a piece of land must be somewhat less than the whole excess of its productiveness over that of the best land which it is not yet profitable to cultivate; that is, must be about equal to the excess above the worst land

which it is profitable to cultivate. The land or the capital most unfavorably circumstanced among those actually employed, pays no rent; and that land or capital determines the cost of production which regulates the value of the whole produce. Thus, rent is, as we have already seen, no cause of value, but the price of the privilege which the inequality of the returns to different portions of agricultural produce confers on all except the least favored portion. Rent, in short, merely equalizes the profits of different farming capitals, by enabling the landlord to appropriate all extra gains occasioned by superiority of natural advantages. If all landlords were unanimously to forego their rent, they would but transfer it to the farmers, without benefiting the consumer; for the existing price of corn would still be an indispensable condition of the production of part of the existing supply, and if a part obtained that price the whole would obtain it. Rent, therefore, unless artificially increased by restrictive laws, is no burden on the consumer: it does not raise the price of corn, and is no otherwise a detriment to the public, than inasmuch as if the state had retained it, or imposed an equivalent in the shape of a land tax, it would then have been a fund applicable to general instead of private advantage."

## REPRESENTATION

REPRESENTATION. In the political sense of the term, representation is the deputing of the political rights of the many into the hands of a few, who, in the name of the commonwealth, enact and oftentimes execute the laws which are to govern the community. It has also in practice grown to be a recognition of localities independent of population, which are supposed to be a necessary part in law making, so as to make the governing body a reduced picture of all the varied interests of society, geographical and personal, the political rights of which have been recognized.

—The act of voting is not a necessary element of representation. It is a mere proof that the representative is the deputed authority for those who elect him. Judges who are not elected, administrators who are not elected, are in many respects as truly representative in the power they wield as the members of the legislative body who are directly deputed by the people. Even in monarchies the king may represent, and in most instances does represent, as to his right to reign, the actual will of the people, although the existing generation may have had no instrumentality to express its will on his right to rule.

—The developed modern state everywhere, where civilized conditions exist, acts in a representative capacity. Only in the case of governments which are still in an undeveloped condition is the will of the monarch the ostensible rule of action on his part. In the constitutional state the will of the monarch, as expressed in the laws and in administrative decrees, acts in the name of the people, and he bases his justification of conduct on the assumption that it is expressive of that will, and that his kingly office is representative of the whole people. In that sense the history of representation is part and parcel of the history and development of the idea of the state as contradistinguished from personal government. Even Louis XIV., when he said *l'état c'est moi*, recognized the fact, that the state and the person of the king were two different things, but expressed his conviction that he represented both in one.

—In a narrower sense, and the sense in which the term is used in this article, representation is confined to the consideration of that form of the developed modern state which gives to electors in the community the right directly to depute persons, in whom they have confidence and trust, to represent them in a legislative body, and to give, in advance, their sanction to the laws they may enact. In this sense representation is quite a modern idea. The ancients knew it not. Although Aristotle, in his "Politics," speaks of a certain census, who shall elect a council intrusted with deliberative power, who shall be bound to exercise this power agreeably to established laws, he speaks of a hypothetical state, and not of any which down to his period of time he had any knowledge of. Freeman says, in speaking of the Amphictyonic council, the Achaian league, and the Lycian league, in which the cities had a certain proportion of votes in accordance with their size, "that the ancient world trampled on the very verge of representative government without actually crossing the boundary, and that in ancient Greece the assembly which acted upon proposed laws and gave them their sanction was composed of the freemen themselves meeting in

their personal capacity, and representation was in the adoption and passage of laws unknown." The votes that were taken in Rome were, as a general rule, votes for executive officers. The tribunes and ædiles of the Roman republic were not law makers, but they had the power to call assemblies of the people, who assumed to vote exceptional laws known as plebiscite. The ædiles were judges, and even *comitia curiata* were assemblies of people, not representatives, for the election of magistrates, and laws were enacted by the senate and by the centuries who were patricians or noblemen, men bound to military service, and had nothing of the representative character in the narrower acceptance of the term.

—Montesquieu was right when he found the germ of modern representative systems in the forests of Germany. The Teutons, who became the conquerors of Rome, were the originators of the thought "no taxation without representation"; they had their *volkmote*, where the wisest among the tribes, by a process of natural selection, instead of by ballot, sat to determine on the more important measures which were to govern the tribe. They had constant popular assemblies, where the popular will was expressed, and the spirit of personal freedom was so strong among them that they elected their elders, heretogs and kings.

—The *witenagemote* of early English history was not a strictly representative body in the modern sense. Langmead, in his "History of the English Constitution," says that it was an aristocratic body. Its members were the king, the ealdormen, or governors of shires, the king's thegns, the bishops, abbots, and generally the *principes sapientes* of the kingdom. *Sapientes witan*, wise men, was the common title of those who attended it. Its size showed that it was not a popular assembly, as the largest amount of signatures which have been observed was not above 106. The powers of the *witenagemote* were as supreme and even of wider scope than those of parliament. It had the power of deposing the king for misgovernment, and English history gives several instances of the exercise of that power. It had the power of electing the king. It took a direct share in every act of government. With the Norman conquest came a period of obscurity of the power of this early representative body, if so it may be called, and thenceforth, down to 1265, no body that might be termed representative was in existence in England. During the contest between John and the barons a parliament was convoked, wherein sat four knights from each shire, to be returned by the sheriff. There is no evidence that these knights were elected, but as there was already machinery for election in existence in the various shires, of knights to nominate recognitors in civil suits and a grand jury for the presentment of criminals, we may reasonably conclude, says Langmead, that the accustomed machinery was now made use of for the first time for the novel purpose of country representation in the general assembly. The next instance, is in 1254, when two knights of the shire were to be called to the king's council at Westminster. These were directed to be chosen by the country.

—The next great step in advance in representative institutions was made by Simon de Montfort, earl of Leicester, and although he probably was not the founder of representative government in England, he certainly was, says the same authority, "the founder of the house of commons," because it was the first parliament which was convoked in England in which sat the burgher class, which, together with the

freeholders of the counties, constituted the newly developed third estates of the realm. The writs were issued Dec. 14, 1264, whereby the sheriffs were directed to return two knights from each shire, two citizens from each city, and two burgesses from each borough. From that period until 1295, was what may be termed a transitional period, parliament being summoned with and without burgesses; but in that year, the 23d of Edward I., the king summoned a parliament to meet at Westminster in November following, so constituted as to represent the whole nation. The writs which summoned this parliament were directed, as in 1264, to the sheriff, ordering an election and return of two knights from each county, two citizens from each city, and two burgesses from each borough. The inferior clergy were also required to attend, so as to make this assembly, whereby the king's necessities for money were to be relieved, the most general one that had yet been convoked.

—The division of parliament into two houses was effected early in the fourteenth century. The commons was composed of two elements, the commons of the shires and the burgesses. The knights voted with the barons. Representatives of the boroughs formed a distinct assembly, deliberating and voting apart. These were strictly called the commons. The knights joined with the commons, and this fusion, says the authority last quoted, was the result of the existence in the English constitution of a condition which distinguished it from every kindred constitution in Europe, the absence of an exclusive noble caste.

—In the continental states the nobles formed a distinct class, distinguished, by privileges inherent in their blood, from ordinary freemen, and transmitting their privileges, and in some countries their titles also, to all their descendants in perpetuity. In England, on the contrary, the privileges of nobility were confined to one only of the family, the actual possessor of the peerage. Sons of peers from the time of the Norman conquest were commoners, and on a perfect equality, as regards legal and political privileges, with the humblest citizen. Even the heir to the peerage, though he might bear a title by courtesy, was still, so long as his father was alive, a commoner like his younger brothers. No restraint was laid upon free intermarriage in all ranks, and the highest offices of state were always legally open to all freemen. "This made the knight the connecting link between the baron and the shopkeeper." The oldest son even of the earl of Bedford, one of the proudest titles of nobility in England, offered himself, in the reign of Henry VIII., for a seat in the house of commons. The house of commons in that way became the representative not only of a single order in the state, says Langmead, but, with the exception of the peerage titles, represented the whole nation, and, as a natural consequence, has drawn to itself the predominant authority in the state.

—During the reign of Edward III. the commons established these three great rights: first, that all taxation without the consent of parliament was illegal; second, the necessity for the concurrence of both houses in legislation; and third, the right of the commons to inquire into and amend abuses of the administration.

—The Tudor sovereigns, arbitrary rulers that they were, did not feel strong enough to dispense with the representative body, but they sought to obtain control over it by creating a large number of insignificant boroughs for the purpose of increasing the

influence of the crown in the house of commons. The same authority says, that between the reigns of Henry VII. and Charles II. no less than 180 members were added to the house of commons by royal charter alone. The last instance of this abuse of prerogative was the creation of the borough of Newark by Charles II. Thenceforth the house of commons took the issue of writs into its own hands, and no new borough was created in England and Wales until the reform act of 1832.

—At the date of the union with Scotland the number of members was 513, this act of union having added 45 Scottish representatives. and the act of union with Ireland added 100 Irish members. Since that time Scotland has added to its contingent fifteen members, and Ireland five. The house of commons has now about 656 members.

—To England the world owes the development of representative institutions, as it did, at an earlier period than any other modern government, confer upon its representative body the sovereign power of the state. The development of the principle of representation proceeded with less continuity and upon different lines in other countries.

—A representative system is the only one by which large communities can enjoy the advantages of self-government. The ancient system of direct participation in law-making was possible only in a very circumscribed domain. The moment the domain became larger than that of a single city, representation necessarily had to take the place of direct participation, and the alternative was representation or despotism. Every fructifying institution of a social character takes unto itself different forms, in conformity with the habits and nature of the people. Even the Christian religion produced very different results in Spain from that which it produced in England, and so it is with representative government. The habits and genius of the people in continental Europe produced from representation a very different result from that which was achieved in England. The cities of the middle ages were governed by a form of representation materially different from the modern manifestation of the same political development. The nobles of the city generally composed its senate, in imitation of the Roman system, and councils were chosen in the main by the guilds, of which in Florence there were twenty-one; but at a later period only twelve of these possessed governmental powers. What corresponds to the mayor of the city was in Florence the *gonfalonier*. So jealous was Florence of its magistrates that it selected them by lot, and gave them power but for two months. The citizens met in the great square and voted directly upon measures. The selfishness of the nobility and the turbulence of the guilds' train bands, the jealousies of the guilds of each other, the corrupting influence of the wealth of the great merchants, all conspired to undermine this form of government. The great wars between the powerful monarchies, which trained their soldiers to feats of arms, of which the militia of free cities were utterly incapable, gradually made it impossible for the independent mediæval cities to put a force into the field to contend against the warriors of the great monarchs. Charles V. and Philip II., and, before them, the rulers of the Roman empire and the popes, gradually destroyed the freedom of such Lombardian cities as still had the vestiges of self-government left.

—The constitutions of these municipal states are, however, interesting studies to the investigator of representative government, as they present a form of representation which has a merit ignored in the modern representative system. and which, in one way or another, should be sought to be re-established, and that is, the representation of the community in conformity with its actual natural affinities when acting independently of governmental interference. Society classifies itself even under its most democratic form, and these classes have to the community and commonwealth different values. A complete representation would take some note of such natural classifications of society. and seek to incorporate them as natural constituencies for representation. In the Florentine republic, and, indeed, in all the cities in the Lombardian and Hanseatic league, the representation of the trade guilds, in proportion to their numerical strength and their importance to the common-wealth, was conforming the theory of representation to the natural classification of the community, and therefore, in that particular, representation was more thorough in those cities than it is in the modern state. Creating artificial entities by drawing geographical lines around them, and giving to a majority in such entities the sole right of representation, is utterly to disregard these natural affinities of a community, and to base representation upon geographical lines instead of the interests of the community, and makes a representative body so constituted far from being what Mirabeau says it should be, a reduced photograph of the whole community.

—In Switzerland and in France representation took unto itself again a different form. From the time of the overthrow of the Roman empire the mountain cantons of Switzerland maintained forms of self-government, and without the intervention of chiefs, these mountaineers assembled in the open air, voted their own laws, and elected their own magistrates to execute them. The larger towns of Switzerland, being favored more especially by Count Rudolph of Hapsburg, were made municipalities early in the thirteenth century. On his death, the apprehension that his successors might attempt to impair the liberty of the cantons and the self-government of the towns, caused an alliance to be entered into by them for the freedom of Switzerland. The Swiss confederation was formed in 1351, and from that time the Swiss uninterruptedly maintained a republic, with a considerably developed system of representation. In the rural and mountain cantons there was but little representation. The town meeting was assembled whenever occasion required. Every inhabitant above sixteen years of age was permitted to vote, and they acted directly upon the laws which were to govern them. The federal constitution of the Swiss government down to 1848 was that of a confederation but loosely banded together. The Sonderbund revolution, which sought to dismember the Swiss confederation in the interest of the Jesuits, was the means to strengthen it, and it caused the adoption of a new constitution wherein the supreme legislative power was intrusted to a federal assembly consisting of two deliberative bodies, the national council and the council of state, the one representing the entire Swiss nation, and the other the sovereign bodies of the Swiss cantons. No federal law could be made without the concurrence of both of these chambers. These bodies nominate the federal authorities; they declare peace and war; they regulate the postoffice and the coinage. The executive power was confided to a federal council of several members elected by the assembly, its president being the president of the confederation. Every man aged twenty not expressly deprived of the rights of a voter by the laws of his own canton, was entitled

to vote, and was himself eligible to the national council. (May's "Democracy in Europe," vol ii., p. 410.) The Swiss do not fully confide matters of legislation to their representatives, but, by the instrumentality of the *referendum*, reserve a veto power in the following form. Whenever 30,000 qualified voters demand it, any law passed by the Swiss congress must be submitted for ratification or rejection to the people, and many instances have occurred in the recent history of that republic where the people rejected laws which the legislature had adopted. In the several cantons the *referendum* has also been made part of the organic law, so that upon all the more important measures affecting the cantons the people have repeatedly vetoed the measures enacted by the representative bodies of the cantons. This system of *referendum* has its inconveniences, but so long as representation is limited to majorities only, and those of arbitrary geographical divisions, which makes of modern representative bodies an artificial and unnatural representative body, the *referendum* is perhaps the only corrective of so faulty a method of representation.

—In France the estates of the realm of the middle ages were councils of barons and prelates. In 1302 Philip the Fair summoned the third estate, who were delegates from the towns, to meet the nobles and prelates of Notre Dame. This was the first convention of the states general. They were afterward assembled irregularly in times of national difficulty and danger, or when the necessities of the kings drove them to demand extraordinary subsidies. (May, vol. i., p. 95.) Again, in 1484 the states general were convoked so as to insure a national representation, and embraced delegates from the country as well as from the towns. These deliberations were conducted, not by orders, but in six bureaus, which comprised the representatives of all the orders according to their territorial divisions. (May, vol. i., p. 96.) The municipalities of France could not long survive the centralizing spirit of the French monarchy. So little of the spirit of self government existed in France that when, in 1692, Louis XIV. abolished all municipal elections and sold the right of governing towns to the rich citizens, there was scarcely a murmur heard. The states general, although from time to time convoked, never had and never asserted any rights as against the crown. They laid their complaints at the foot of the throne, which were treated as the throne saw fit, to be spurned, or to be enacted into law. The states general had no rights which they could maintain against the crown. The French parliaments were not representative bodies. They were nominated by the crown, and were really high courts of justice. For several hundred years representative government was unknown in France; when, by the reforms under Turgot, at the time of Louis XVI., the provincial assemblies were once more revived, and local self-government was again endowed with life and vigor. At the suggestion of the parliament of Paris the states general were again convoked, which was the beginning of the French revolution, and led to the national assembly; the national assembly led to the convention, which was elected by universal suffrage; the convention led to a directory, and the directory again to an empire.

—The theory of representation became, however, formally established from the period of the French revolution in the constitutions of France, and, under one form of government or another, representative bodies were thenceforth permanent institutions of the nation. Under the first empire the citizens of each arrondissement designated a tenth of them as electors. These were the communal notabilities. From this list the

public functionaries of the arrondissement were chosen. These, in turn, selected a tenth of their number for the purpose of furnishing the functionaries of the departments. These new tenths selected on their part again a tenth, which formed a list of the national notabilities, from which the public functionaries for the nation were taken. The presidents of all electoral colleges, all grand officers, commanders, and officers of the legion of honor, and all heads of departments, the emperor selected without reference to an election.

—Under the restoration a chamber of deputies of 430 members was constituted, of which 258 were elected by the colleges of arrondissement, and 172 by the colleges of departments. A census of a very high order limited the voting power to a small proportion of the French people. This was all swept away by the July (1830) government. The electoral system under the republic of 1848 suppressed all property qualification, and every Frenchman twenty-one years of age, subject only to the condition of a residence of six months, was invested with the right of voting. The vote was taken by ballot. Subsequently, modifications were made in this universal suffrage by raising the time of residence to three years, and imposing again a property qualification. It was the combination between President Napoleon and the class of citizens who were disfranchised by the act of the republic, which made Napoleon at first dictator and then placed him upon the throne of France as Napoleon III.

—In The Netherlands, ever since 1815, the laws have been enacted by representative bodies, who are elected by the inhabitants above twenty-three years of age, and who pay some small direct tax.

—In Germany, Austria, Italy, Spain and Portugal the representative bodies were mainly representative of special interests, such as nobles, clergy, towns, etc., and were not true representatives until a very recent period, when, by the amended constitutions of those countries, some approximation was made to representation upon the English and American model.

—Representative institutions are everywhere gaining ground. England has been the pattern, and America the most prominent example, of the successful operation of representative government. The organization of the people for purposes of representation, adopted by these two nations, forms the model on which reforms in representation in other countries are gradually introduced. Government by representatives is much more than a makeshift, adopted, in consequence of the extent of modern communities, to secure power to the people and yet not take their direct votes on the laws which are to govern them, inasmuch as this method is obviously impracticable where the community is larger than that of a single town.

—It has been observed by Lieber, that representation for the state at large constitutes one of the essential differences between the deputative mediæval estates and the modern representation by legislatures. The representative is not substituted for something which would be better were it practicable, but has its own substantive value. It is a bar against absolutism of the executive on the one hand, and of the domination of the demos on the other. It is the only contrivance by which it is possible to introduce at the same time an essentially popular government and the

supremacy of the law, or the union of liberty and order. It is an invaluable high school to teach the handling of the instruments of free institutions. It is the one most efficacious preventive of the growth of centralization and bureaucratic government, without which no clear division of the functions of government can exist. Many examples may be cited from Grecian history to show how little the sense of responsibility was connected with the direct voting, and how easily the general populace could be misled by the demagogues, and at the assembly at the *agora* be cheated or cajoled out of their votes in favor of measures which they regretted almost as soon as enacted. The representative system checks and prevents such hasty action, and is, therefore, an institution which in itself secures good government. The representation makes the fact of government being a trust a vital and realizable truth. It is, however, of vital importance that a representative organization of the community be properly made, and that the representative body should be truly the best exponent of the popular will, because otherwise the majority of the people would not possess the reins of government, and the administration would fall into the hands of cabals, juntas or political organizations, which misrepresent it.

—The American model of representation is twofold. I. *National*. The president of the United States under the American system is elected by a supposed electoral college, constituted in a manner to be designated by the legislatures of the various states. It meets in the several states, and is composed of the same number that the state has representatives in congress, who determine in these several states upon their choice for president of the United States. These electoral colleges have in time become mere registering machines of party will, and are not deliberative bodies in any sense. Immediately after the electoral colleges are constituted at the general election with reference to which they are to perform their function, the election is practically determined in advance of their meeting. There is but a single instance in the history of the United States of an elector refusing to cast his vote in conformity with the party dictate which elected him.

—The senators of the United States are elected by the legislatures of the states. Members of congress of the United States are elected by the voters in contiguous representative districts artificially created, one from each district, each district containing, as nearly as possible, about 131,000 inhabitants. The apportionment of these districts is left to the legislature of the state, to be fixed after each decennial census. The state representative bodies are generally a senate and an assembly or house of representatives. The senate, the smaller body, is elected by larger districts, also geographically contiguous, and the house of representatives by smaller districts. In different states different provisions exist, making the term of service of senators a longer period than that of the members of the lower house. With the exception of Illinois, which has adopted the plan of the three-cornered constituencies, electing three members from each district—as a rule, but one member is elected from each district—the majority or plurality, as the case may be, of the district elects a member. Local representative bodies, like town or city councils, are elected by smaller districts, composed of contiguous territory equal in population, one from each district; and the majority or plurality, as the case may be, in the district elects such representative. Where executive officers are to be elected, whether municipal or state, they are elected by the whole city or by the whole state, and the majority of the voters, or a

plurality, if there be more than two candidates, secures the election of its candidate. The French system of double election has never taken root either in England or America, and seems to be but ill adapted to the genius of our people. The only instance attempted is the one of the electoral college, which has proved abortive, and has become a mere simulacrum.

—The qualifications for a voter in the United States are, as a general rule, that he must be twenty-one years of age; if not born in this country he must have resided therein five years, within the state one year, and within the district about thirty days. Such as have come to this country during minority are admitted to the suffrage in a shorter period. The few qualifications that survive from colonial times, either of education or of property, have been and are being to a considerable extent gradually swept away. This, in theory, places the elective franchise in the United States, for all officers whose actions affect the commonwealth either as lawmakers or executors of the law, into the hands of all the male population above twenty-one years of age. Universal manhood suffrage has been the rule in this country.

—Even the selection of judges (who, in the history of the United States, were, down to 1846, as a general rule, appointed by the governor of the state, in order to secure more intelligent officers and more direct responsibility in such selection) has, by the growth of the democratic spirit, been taken out of the hands of the governor, and their elevation to the bench, except United States judges, given to the people, and their terms of service shortened from life tenure to a few years. Elective officers have been unduly multiplied, to such a degree that it becomes almost impossible for the voter busily occupied with the demands upon him of his business, to determine intelligently upon the merits of the numerous candidates presented for different offices by political organizations. This highly artificial system of arbitrary districts for purposes of political activity which wholly disregard the natural affiliations of the people arising from their vocations, their political convictions or their status in society, has resulted in giving to the political organization an abnormally strong power in determining the personnel of the government of the United States.

—In a very intelligent arraignment of existing political conditions in the United States, written by Mr. Charles C. P. Clark, in a work entitled, "The Commonwealth Reconstructed," the author says that the plan of direct popular election in large constituencies results in three frauds: first, that the elector knows whom he is voting for; second, that he comprehends what he is voting about; and third, that his vote will have its proper weight without preliminary consultation and arrangement with other voters; each of which assumptions, he says, in the vast majority of cases is absolutely false. The present actual fact is, that at the dictate of leaders whom we have not chosen, we vote for candidates whom we do not know, to discharge duties that we do not understand. And as the law pays no heed to natural political organization, and gives it no direct encouragement nor recognition, the consequence has been that the political organization has taken possession of the machinery of legislation and is substantially the only thing that is represented. Unless he is the member of a caucus, has a seat in the convention. or takes an active part in the nominating committee, the individual voter is a cipher in politics, and the only function he has to perform is to

register his eye or nay as to the individuals who have been put forward by the political organizations.

—When this system was originally constituted, in a community of farmers, both the caucus and the conventions were voluntary forms of gathering the public will to make an intelligent choice of candidates. They were unrecognized, informal meetings of citizens to discuss public affairs and to select their neighbors for public office. In the early history of the United States public office was a burden which men accepted in consequence of the honor and dignity of the station, for which honor and dignity they were willing to sacrifice the more material advantages of private life. The division of employments, the growth of wealth, the great tide of emigration and consequent existence of a proletariat class, and the diversified interests and intensity of occupation which have been evoked by the modern industrial system, have made of the homogeneous community of a century ago one of the most diversified peoples in industrial employment and occupation, as well as disparity of means, that exist on the face of the earth. By the testimony of every close observer, it is a community of which the more intelligent elements are more intently occupied and have less hours of leisure than that which exists anywhere on the face of the earth. The consequence is, that the men who are most deeply interested in the welfare of society no longer have time to meet and discuss the political situation with their neighbors, and to talk over and determine which of their neighbors they desire to select for public office. The division of employments has created a politician class to attend to that business for them, as it has a class of lawyers and divines to expound the law and look after the spiritual welfare of the community. The caucus and the convention, therefore, have, from being the mere aids to political organization, grown in time to be the organization itself.

—The law which secures the political rights of the citizens is still the same that it was in the early history of the United States; indeed it has become more liberal in admitting a larger circle of human beings within the domain of political enfranchisement than in the early history of the United States. The power, however, has become so centralized in political organizations that a development has taken place in that function similar to that which has taken place in the railway interests by amalgamations and consolidations, so that, notwithstanding the rapid increase of population in the United States, fewer and fewer men, in both political organizations, determine who shall be elected by the people, precisely as, in railway transportation, fewer and fewer men determine, notwithstanding increased mileage, what rates shall prevail. The amount of time which must be given, and the money it requires successfully to establish a political machine, are both so great that, in the absence of a large leisure class in the United States which is emancipated from the necessity of daily toil by the inheritance of ancestral wealth, it has become practically impossible for the industrial and commercial classes in the community to give that time or money. In municipalities and in states the owners of property therein feel that there is a constant increase of the ratio of taxation without an equivalent in better service performed by the government for the individual in return for such taxation. The increase of municipal taxes has been within a generation upward of 200 per cent., and yet the tax payer prefers to submit to the exactions of the tax gatherer rather than to impose upon himself the greater immediate tax, which would be involved in the

devotion of the necessary time and money to emancipate himself from the control of the political organization which he knows to be tyrannous and feels to be mischievous. Political patronage is the reward in the business of creating a political machine, and the politician finds in the control of the public office a return for the labor and money investment which he is compelled to make in establishing and perfecting his machine. As this system of political organization has grown, within the past thirty years, to gigantic proportions, it becomes a serious question whether the representative institutions of this country do not contain in themselves a fatal defect by reason of their not being adapted to the present organization of society in the United States. Independent political action is still possible where conditions prevail such as they did prevail in the early history of the United States, in such centres of population as may be termed strictly agricultural communities. In great cities, however, where the division of employment has been carried to its extreme development, representative institutions have become mere shams. The governments of those cities are in the hands of officers selected from the various political organizations which for the time being obtain control. The political organizations form a very small minority of the whole people, but the members thereof have devoted themselves to the building up of a political organization as a matter of business, as others of their fellow-citizens devote themselves to the business of banking, to manufacturing boots or shoes or hats. This situation becomes aggravated with increased population, and its mischief increased by the large criminal and pauper classes which exist in every densely populated centre. They are the camp followers of political organizations, precisely as they would have been the camp followers of a mediæval army for purposes of plunder only, and assume the name of the political organization, not because of any belief in principles, but because of their conviction that that particular organization will take care of them in the distribution of office.

—As the United States look forward with much confidence to the early attaining of a population of a hundred million of souls, it will readily be seen that some change must be made adapting representative government to the needs of a community wherein the division of employment will be still further developed with every increase of population, and wherein life is not likely, within any short period of time, to be less onerous and exacting in its demands upon the whole attention of the person who devotes himself to a particular vocation. It must be quite clear, therefore, that evils which have already made themselves apparent, arising from the inadaptiveness of the existing political organizations to the natural development of the community, must become intensified and intolerable if the cause which has produced them not only continues but is increased in activity, so that there must come a greater and wider divergence between the people who supply the taxes and those who have control of the governmental machinery to expend the taxes. These evils have been recognized by every thoughtful writer upon the more recent manifestations of American institutions. They have by some been regarded as an evil attending the influx of emigration; by such it is claimed that the community has taken in more of the foreign element than it can comfortably absorb, and that, therefore, there is a large voting constituency in every community in the United States not thoroughly trained on the American model as to the rights and duties of citizenship, and who are, therefore, a hindrance to good government. Others have supposed the evil to result from excluding one-half of the population—women—from the exercise of political suffrage, and have supposed that

the cure of malrepresentation will lie in the direction of the adoption of woman suffrage. Others have recommended a return to smaller constituencies resembling some-what the old Saxon hundred, as units of political power, so as to give an instrumentality for interchange of opinion in artificial entities sufficiently small to allow of meeting and deliberation. Others, at the head of whom stands Mr. Clark, have proposed the remedy of primary representative electoral colleges for the purpose of selecting electors simply, who, in their turn, shall elect other electors, so as to produce a condition of graded representation, or, in other words, double or treble elections. Again, others have sought refuge from the existing evils by recommending limitation of the suffrage upon a property basis. Another class of thinkers have advocated the rigorous adoption of a high qualification for voters, of intelligence and even of actual learning. Another class of reformers have sought a refuge from existing evils by advocating the extension of the term of residence in the community as a condition of citizenship, so as to exclude the emigrant from all participation in the political affairs of the nation until he shall have been substantially a lifetime on American soil. This idea captured, a generation ago, a sufficient number of adherents to create a formidable party, which obtained a phenomenal success in several states. Another class of reformers have recommended the legalizing and methodizing by law of primary meetings, so as to give a legal status and recognition to the caucus and primary nominations, and thus to make frauds practiced in these bodies amenable to legal redress and subject to legal punishment. Others, and notably Robert von Mohl, have recommended the re-establishment, in modern form, of the representation of the guild, by giving to each organization of the community, be it a trade, profession or voluntary association of political opinion, and also to all large classes, such as agriculturists, manufacturers, merchants and the professions, special delegates to represent their special interests, and general delegates to be elected at large or appointed by the crown, such special delegates to be chosen by them, in certain proportions corresponding to the importance of such interests to the commonwealth. Lastly, there is a class of publicists and political economists who have suggested minority or totality representation as the means best adapted to redress the evils of the existing political conditions in relation to representative government. Thus they would, indirectly but naturally, introduce into the modern state something analogous to the guild or trade representation which existed in the mediæval communities, by recognizing as units of representation voluntary constituencies framed to represent electoral quotas. These units are to be substituted for existing arbitrary geographical divisions, and, by enfranchising the minority and giving each man his due proportion of political power in representation, reconstitute political organizations, acting as a solvent of existing machines, so that there shall no longer be majorities and minorities, but an entire reformation of political entities for purposes of representation.

—We shall now pass in review these several methods of reform of an undoubted existing evil, to see which will answer best the purpose to meet the exigencies of a modern democratic community.

—The objection to the foreign vote is one that increases in intensity as we descend in the scale of the dignity of the legislative or representative body, from the national to the municipal organization. The federal legislature has no distinctive foreign element

in it, and the opinions of congress have been so little tinged with the emigration influences, that with the exception of a few demagogues who desire to curry favor with the Fenian element, by inveighing against the English government, there is no danger, which requires the enforcement of reformatory measures, of bad national legislation arising from the ignorance or prejudices of the naturalized voter. In state governments the foreign element makes itself more strongly felt. On questions affecting temperance legislation and excise laws. in matters relating to taxation and in labor legislation, the German and the Irish voters have exercised influences which may be deemed by some pernicious. On the relation of labor to capital, the employment of convicts in competition with the trades, in the regulation of the hours of labor, and in the authority given to municipalities to contract for labor, ideas have been transplanted from the trades-unionism of other countries upon our statute books directly traceable to foreign ideas. In municipal administration the evil of the foreign vote has been more strongly felt. It so happens that the foreign elements of large cities also comprise a very large proportion of the poorest inhabitants of the cities, and there is, therefore, not an unnatural association of ideas in coupling the foreign element with the lowest class of voters. As a city administration deals almost wholly with property interests, the application of universal suffrage to administrations of that character has resulted in throwing the power to levy taxes into the hands of the men who are the largest consumers of taxes and the smallest direct contributors to the city treasury. Consequently, the objection to what is called the foreign vote has been strongest felt and most strongly expressed in municipalities wherein it is coupled with the vote of the poor, who have so managed that in less than a generation the city debts of the United States have been trebled and their taxes doubled.

—The advocacy of female suffrage as a remedy for the evils of representation, arises from an entire misconception of the nature and character of the suffrage and of representation. It is treated by these advocates as an inborn right instead of a trust. They regard the refusal to allow an individual to vote, as a deprivation of something which is in the nature of his property, and the denial of representation, therefore, as an injustice. All institutions of government are practical establishments for the purpose of securing the well-being of society. To secure the well-being of society, it is necessary that the most intelligent and best instructed members of it should, in so far as regulation is necessary, regulate those affairs. If universal, including female, suffrage secures that end, then it is wholesome. If it fails to secure that end, it is mischievous. The difficulty with universal suffrage and majority representation is, that it enables the least instructed, who are the most numerous, to swamp and silence the better instructed, who are in every community the fewest. Doubling the number of voters by adding voters of precisely the same class, individual for individual, can not, by any possibility, remove that difficulty, but inevitably will have the tendency to strengthen it. Assuming, what is open to debate, that women are intellectually as strong as men, and assuming also, contrary to the fact, that they have as large an experience as men have in affairs with which legislation has to deal. the adding of all the women of the United States to the poll lists, is simply adding to the enormous numerical preponderance of the lower-class vote, intellectually considered, over the better-class vote, intellectually considered. The laborer's wife, sharing the laborer's household and the laborer's interests, will inevitably share his prejudices and his influences. She is also sure to be driven to the polls, or will voluntarily go there, under

the pressure of some supposed personal benefit to be derived from the exercise of the vote, particularly in cities where large expenditures directly interest so large a proportion of the working classes. As a matter of fact for many years to come, were female suffrage introduced, the most refined women would, for stronger reasons than those which influence the men of the household and cause them to abstain from going to the polls, also induce the women to refrain from going to the polls, and compulsion would not be exercised upon them to overcome their disinclination. Therefore, as to this class of voters, the proportion of the lower-class votes would be even larger than it is among the men; and in a community which simply counts votes without weighing them, all the evils that arise from an absence of discrimination as to who casts the votes, will be very naturally intensified by the adoption of the suggestions of the female suffragists.

—The reform which seeks to make the nominating convention and the caucus amenable to the restraining influence of the criminal law, is one which is wholesome and necessary, so far as it goes. It is only not sufficiently far reaching successfully to cope with the deeper-seated ills of the body politic. It is not only the exclusive devotion to the business of politics which gives to the politician his great advantage over the average citizen, but also that he is willing to resort to trick, device and fraud for the purpose of perpetuating his power. Primary meetings, therefore, where each citizen is supposed to enact the initiative steps for the calling of a convention, and the appointing of representatives to a convention which shall express the party will, both as to platforms and as to individuals for office, have become mere hotbeds of fraud and intimidation. It is a melancholy truth, which is attested by the history of party organizations in every densely crowded centre of the United States, that the primaries are called simply to register foregone conclusions, and to delegate as the so-called representatives of certain districts, men who have been previously agreed upon by a junta of politicians. These politicians call the primaries and appoint inspectors of elections, and the few people who are not deterred from attendance by the disreputable character of the place where the primary is held, or by the character of those who are expected to do the work of the primary, may vote as they see fit; the counting is done by inspectors previously appointed, who will inevitably return the names that were given them to be returned, whether such names receive a majority or minority of the votes. To protect, therefore, these actions of citizens, or the supposed actions of citizens, exercising their capacity as freemen, to set in motion the necessary machinery to secure the selection of candidates, is a duty which is imposed upon the law, and which has been hitherto neglected by the ignoring of these meetings as necessary elements of constitutional government. If it is necessary to protect a citizen from having his name forged to a piece of paper jeopardizing a hundred dollars of his property, it is as clearly the duty of the law maker to prevent falsification or forgery of his will in the expression of political opinion or preference when he has been invited to attend a meeting, and his opinion or preference is likely to produce tangible practical results. Already in the state of New York a law, with limited application, has been made to protect primaries in certain localities, in the same manner as the voter's preferences are protected at the polls, and this principle is likely to prevail until there is spread upon the statute books of all the states of the Union, and of the nation, laws protecting the citizen's exercise of rights in that regard.

—The ideas of Robert von Mohl, on re-establishing, in modern democratic society, the forms of representation which prevailed in the middle ages, in which interests and not persons were represented, are worthy of more regard and attention than has been given to them. The English parliament has grown up in so incongruous a fashion, that, down to a very recent period, when the rotten boroughs were disfranchised and some towns given a fair representation, Chief Justice Story's description was literally and exactly true. He says: "It might be urged that it is far from being secure, upon reason of experience, that uniformity in the composition of a representative body is either desirable or expedient, founded in sounder policy, or more promotive of the general good, than a mixed system embracing and representing and combining distinct interests, classes and opinions. In England the house of commons is a representative body founded upon no uniform principle either of numbers or classes or places. The representation is made up of persons chosen by electors having very different and sometimes very discordant qualifications. In some cases property is exclusively represented; in others, particular trades and pursuits; in others, inhabitancy and corporate privileges; in others, the reverse." (The universities have representatives.) "In some cases the representatives are chosen by very numerous voters; in others, by very few. In some cases a single patron possesses the single power of choosing representatives, as in nomination boroughs; in others, very populous cities have no right to choose, and have no representatives at all. In some cases a select body forming but a very small part of the inhabitants has the exclusive right of choice; in others, non-residents can control the whole election. In some places half a million of inhabitants possess the right to choose no more representatives than are assigned to the most insignificant borough with scarcely an inhabitant to point out its local limits. Yet this inequality has never, of itself, been deemed an exclusive evil in Great Britain. And in every system of reform which has found public favor in that country, many of these diversities have been embodied from choice, as important checks upon undue legislation, as facilitating the representation of different interests and different opinions, and as thus securing, by a well-balanced and intelligent representation of all the various classes of society, a permanent protection of the public liberties of the people, and a firm security of the private rights of persons and of property." (Story on the Constitution, sec. 585.) Now, what is done in this prescriptive and crude fashion by the gradual growth of the English constitution, and which is embodied in the house of commons, which not merely represents geographical districts, but represents all the various interests of society in Great Britain, Robert von Mohl proposes to do in a community in a systematic and logical form. Taking the classifications of society as they exist, as landowners, as agriculturists, as merchants, shippers and manufacturers, he would give to each class, representation in proportion, first, to their numerical strength, and secondly, to their importance to the state. To the religious organizations, to the political organizations, he would assign representation. To the association or organization of the manufacturer, as well as to the trades union of his employés, representation would be given according to his plan in certain qualitative proportions. He would have these organizations, like the guilds of the middle ages, depute their delegates to a central body. Speaking, as he does, in a community in which the crown was to his mind an integral part of the state, he would give to the crown the appointment of general delegates in a certain proportion to represent the commonwealth. Eliminating this royal intervention from his plan, as not a necessary part of it, general delegates might be elected by general ticket on the part of the whole

community to sit with these delegates of the special trades combinations and industries of the community. Indeed, he himself is in doubt whether general delegates are at all necessary, because, he says, all these special delegates have an interest in the general public weal, but are to be considered as more truly representative, than geographical divisions constitute them, of the actual living interests of the whole community. He draws attention to the fact that whenever a trade or special organization places at its head its representative man by an election for president or director, it is generally the strongest man among them; and that in no community in which geographical subdivisions and majority votes are taken, is such a result brought about. He, therefore, would have these special interests recognized by law. When these deputed spokesmen are gathered together into a general assembly, in due proportions, they would together represent all the interests as they exist outside of the representative chamber, and thereby be, in point of fact, a reduced photograph of the whole community. The professions would be represented by their ablest men; the trades by their ablest men; and upon every question affecting any special interests, the highest technical skill would, within the representative body, be instantly available for information as to how proposed legislation will affect such interests.

—Those who have recommended reverting to the smaller constituencies, like the old Saxon hundred, so as to give opportunity for deliberation, and to place this deliberative community of a hundred under the protection of the law, so that its will as expressed in conventions or meetings shall not be fraudulently falsified, are working in the same direction with those who seek to legalize the nominating conventions. The adherents of this plan are yet too feeble in numbers, and their scheme is too remote from the practical habits of the people, to be thought of as a scheme likely to prove acceptable, and hence it can be dismissed for the present from this discussion.

—The double-election scheme has very much to commend it. Of this view Mr. Clark, whose work has already been cited, is the ablest exponent. He says, that the difficulty is, first, the actual and necessary ignorance of the great majority of voters, both as to whom they are voting for and what they are voting about; second, their utter inability to unite of and among themselves upon representative candidates for office and third political organizations, which started to help the people in this embarrassment have, by the logic of the situation, become their corrupt and corrupting masters. To remedy this, he proposes that in every town ward or other civil division that exceeds two thousand in population, the registered votes be divided by lot into five, nine, or any other number, of equal sections or squads. that they shall be drawn as jurors are drawn, and that each of these lists or squads shall constitute a primary electoral constituency; that the respective squads shall vote for a representation of electors for their own constituency; that these representative electors shall appoint the ward officers: that these electoral colleges of the ward shall again designate one or more electors to represent them and the people for whom they act in a higher rank of colleges for the appointment of mayors, county officers, members of the state legislature and the house of representatives. He thus calls out the voter; he compels the performance of the duty of voting on pain of disfranchisement, and compels the performance of services as elector by heavy penalties. The experience of France is strongly in favor of double voting. Mr. Taine, in his book "On the Suffrage," has expressed his preference for this form of election over that of any other, and supports

it with cogent philosophical and logical reasoning. The failure of the electoral college is in itself no cogent reason against double elections, because it can easily be shown that it was so defectively organized as to take from it at the outset all character as a deliberative body.

—Those who favor a property qualification are mainly reformers of municipal organizations. The few qualifications in the way of ownership of property which existed under the constitutions of the various states of the Union as conditions for the vote for state officers, have gradually been swept away, and the question seems to be on subjects relating to state and national administration no longer open to debate. With reference to municipal administration, however, a different question is presented. Upon that point even Mr. Mill, than whom no stronger advocate for the extension of the suffrage and for the liberty of the people existed, says, on page 176 of his "Considerations on Representative Government," that, "it is important that the assembly which votes the taxes, either general or local, should be elected exclusively by those who pay something toward the tax imposed. Those who pay no taxes, disposing by their votes of other people's money, have every motive to be lavish and none to economize. As far as money matters are concerned, any power of voting possessed by them is a violation of the fundamental principle of free government, a severance of the power of control from the interest in its beneficial exercise. It amounts to allowing them to put their hands into other people's pockets for any purpose which they think fit to call a public one. which in great towns of the United States is known to have produced a scale of local taxation onerous beyond example, and wholly borne by the wealthier classes. That representation should be coextensive with taxation, not stopping short of it, but also not going beyond it, is in accordance with the theory of British institutions." It is generally forgotten that municipal administration is but to a very limited degree a governmental, and to a very large extent the mere co-operative management of property; that the suffrage is a sword as well as a shield, and that the power which enables the holder of the suffrage to protect himself from the aggressions of others is likewise a power by which he may aggress upon the rights of others, the two being inseparable; that, therefore, giving, under the forms of universal suffrage, the vast mass of people in a densely populated city the power to place mortgages upon the properties of its wealthier class, the proceeds of which are to be expended for the personal enjoyment of the masses who have not saved property, is, under the guise of law, to organize communism and confiscation. So jealous, however, are the American people of the right of universal suffrage in all matters relating to government, that they will not make the distinction which in the nature of things is proper to be made, by withdrawing in part, at least, municipal administration from the widest application of universal suffrage, lest, by such a precedent, danger may creep in and the people gradually become accustomed to the withdrawal of political power, in matters in which all have a like interest, to wit, their state and national administrations.

—Those who found their hope of reform upon the limitation of the suffrage arising from the application of a standard of qualifications of an intellectual or an educational character, are fighting against the tendencies of the times, and are but little likely to prevail. They also can base their well-grounded objections to counting instead of weighing votes upon the authority of Mr. Mill, who, in the work already cited, says:

"In all human affairs every person directly interested, and not under positive tutelage, has an admitted claim to a voice, and, when his exercise of it is not inconsistent with the safety of the whole, can not justly be excluded from it. But (though every one ought to have a voice) that every one should have an equal voice is a totally different proposition. When two persons who have a joint interest in any business differ in opinion, does justice require that both opinions shall be held of exactly equal value? The opinion, the judgment of the higher moral or intellectual being is worth more than that of the inferior, and if the institutions of the country virtually assert that they are of the same value, they assert the thing which is not." He therefore says, that "two or more votes might be allowed to every person who exercises any superior function. The liberal professions imply a still higher degree of instruction, and whenever a sufficient examination or any serious conditions of education are required before entering upon a profession, its members could be admitted at once to a plurality of votes. The same rule might be applied to graduates of universities. All these suggestions," he says, "are open to discussion as to details, but," he concludes, "it is to me evident that in this direction lies the true ideal of representative government, and that to work toward it by the best practical contrivances which can be found, is the path of real political improvement." The extent to which he would carry this plurality of votes he does not commit himself to, but insists that it should not be carried to any point which would enable a few to outnumber the great mass of the community, but that it shall be carried far enough to prevent the more intelligent from being overlaughed at the polls by the less instructed.

—We now come to treat of the most radical, while at the same time the most natural, reform of the evils of representative government—that which is known as totality or minority representation. When a single person is to appoint an agent, there is no difficulty except as to a wise selection. When two people are to appoint an agent, there may be divergence of opinion as to the agent to be appointed, and except by agreement there is no possibility to make an appointment. When three people are to appoint an agent, if there is but one agent to be appointed, then must necessarily be given to the majority of the three the right to appoint. It is true that the minority might as well have no voice at all after the agent is appointed against his wishes, because his views are not likely to prevail with the agent. If a hundred men are to appoint a single agent, again must be given to the majority of fifty-one or more the right to appoint that agent, as the only practical solution for the difficulty of the situation. But if the hundred men have five agents to appoint, to give to fifty-one the power to appoint all five, and to leave the forty-nine wholly and completely unrepresented in the agency, is an injustice which is gratuitous, and not in the least justified by the necessity of the situation. It is just as easy to take the vote of the constituency of a hundred upon a plan which shall secure to each quota, of twenty men each, the right to a representative, as to take the vote upon the existing plan of majorities and minorities. The result, however, in one case is to make the representation of five, when elected by squads of twenty each, an actual reduced photograph of the wishes and will of the hundred as far as practically ascertainable, and in the other case the representation will merely represent the wishes and will of the majority, and probably, from the excitement of the election in which the minority were beaten, oppose the views of such minority with vehemence and bitterness. Therefore the minority are not only not represented, but are frequently maliciously pursued by the representatives of their

constituency for their effort to defeat the representatives; and as their constant agitation to become the majority endangers the representatives' seats, they will attempt in every way to thwart the minority of their own constituency. A perpetual antagonism is, therefore, created in constituencies, and between constituencies and their representatives, which ought not in the nature of things to exist, and for which there is no necessity. Dividing the number of voters by the number of representatives to be elected, and giving to the quotient an absolute right to return one member, is it is true, a great revolution in modern political practice, but is, nevertheless, absolutely the only means by which some of the most flagrant evils incident to representative institutions can be cured.

—Whoever may be entitled to the merit of first devising this great improvement in the machinery of representative institutions, whether it be Earl Gray, Mr. Craig of England, or Mr. Fisher of Pennsylvania, its ablest and foremost exponent, who has devoted a lifetime to its explanation and exposition, is Mr. Thomas Hare, of England. The draft of a new law of parliamentary representation contained in his work, "On Representation," is commented on by John Stuart Mill as having "the unparalleled merit of carrying out a great principle of government in a manner approaching to ideal perfection as regards the special object in view, while it attains incidentally several other ends of scarcely inferior importance" His plan is, through the instrumentality of the voter's own choice as expressed upon an election ticket, to secure the transfer of his votes, whenever the voter's first choice has already been elected, or in the event of the voter's first choice not securing enough votes for an election; so that no votes are wasted. In a constituency which is to return say, eight members of congress, the voters declare, in the order in which they prefer to be represented, their preference for eight or as many more persons as they see fit to put upon their tickets. When the election officers come to count the votes, they will find a certain number of persons as first choices, whose election is secured by obtaining the requisite quota—the quota to be ascertained by dividing the number of seats to be filled, plus one, by the number of votes cast at the election. The object of making the divisor larger by one than the actual number of seats to be filled, is to diminish the chances of an equal number of votes or ties, and to increase the chances of filling seats without resorting to approximate or transferred quotas. The votes are thereupon transferred to the other choices in the manner designated by Mr. Hare. To this plan it is not necessary further to advert in this article.

—A still greater simplification to secure minority representation is to allow voters to vote but for single names in large districts, and to give to the representative in the representative body one vote for every hundred or thousand or ten thousand votes cast for him. To prevent the representative body from being too large an organization, a minimum must be established, that no one shall be considered elected who has not received 5,000 votes. To prevent too small a body, a maximum must be fixed beyond which a representative's additional votes shall not give him additional votes in the house. If 5,000 votes is the minimum, the representative might be regarded as having one vote for the first 5,000, and an additional vote for every 5,000 that have been cast in addition for him. This would enable communities to select popular men in whom they have confidence, and give to them a plurality of votes, and yet prevent the minority from being excluded from the representative chamber. Many other plans

have been suggested by other writers. The list plan of Geneva, elaborated mainly by Ernst Naville; the minority representation plan of Mr. Andrac; the plans of Messrs. Droop, Bailey and Dobbs, and the cumulative plan, all seek to attain the same object in different ways, and each has its special merit and defects; but the great object to be attained by minority representation is the breaking up of the existing political machinery, the tyranny and the power of which exists simply because machinery of some kind is a necessity to organize a majority in the district, by making bargains and dickers and arrangements to capture votes here and votes there, so as to secure representation. To be in the minority is to be disfranchised. With minority representation all this elaborate machinery becomes needless. Citizens will be represented in proportion to their numerical strength, through the instrumentality of the very slightest organization, and they are encouraged to organize, as the task set before them is not an almost hopeless one, as it is made under existing conditions to the non-political class, whereby it is compelled to put forth a powerful effort, which may result in no success at all, which is extremely costly in time and money, and which is wholly lost unless a majority of all the votes is secured. Giving political power in proportion to the effort put forth, is one of the first beneficial results arising from minority representation.

—The second advantageous result arising from this system of election, is the facility it will afford to the intellectual part of the community to secure a representation in town councils, legislative chambers and the halls of congress, which is now absolutely denied to them. Every form of public opinion, as it grows in strength, would have its strength actually measured and its growth watched by the increase of representatives, and the representatives would, under those circumstances, always be the strongest and ablest men holding such opinions. Had such a system, by any fortunate accident, existed prior to the civil war, the south would have discovered the growth of the anti-slavery sentiment in the north before it was overwhelmed by it, and even a hopeless minority in the south who were opposed to slavery, and the minority in the south who were in favor of the Union at all hazards, would have had their representatives in Congress, and the controversy on slavery would have been less sectional than, under a false system of taking votes, it was made to appear to be. Free traders would have their representatives in congress; the antimonopolist's voice would be heard long before it became that of a majority, and parties would again become standard bearers of principle, instead of, as now, mere followers of political principles, in the expectation of catching votes—a demoralized condition, created by the false importance in a majority system of the floating vote, which induces parties quite as often to deny their own cherished political principles from the fear of losing votes by the advocacy of what for the time the leaders suppose to be obnoxious to the popular will, just as they frequently insincerely adopt political principles in the expectation of catching small sections of voters. "Nothing but habit and old associations," says Mr. Mill, "can reconcile any reasonable being to the needless injustice of this mere majority representation. In a really equal democracy every order in the section would be represented, not disproportionately but proportionately. A majority of the electors would always have a majority of the representatives, but a minority of the electors would always have a minority of the representatives. Unless this be so, there is no equal government, but a government of inequality and privilege. One part of the people rule over the rest. There is a part whose fair and equal share of influence in

representation is withheld from them, contrary to all just government, but above all, contrary to the principle of democracy, which professes equality as its very root and foundation." Incidentally be it mentioned that this plan would secure to a capable man a career in political life as secure as in any profession. as he would not be dependent on the accidental majority of his district, but could always rely upon obtaining a quota vote.

—The cowardice of modern political parties is best indicated by the fact that no party in the United States dares, in modern days, ever present its strongest man for the presidency, because, having been long in the public eye, he is sure to have offended a great number of voters whose adherence is necessary to make a majority. Availability, therefore, takes the place of true ability. The adoption of minority representation also solves, in advance, all the objections to the extension of the suffrage, and would secure to the tax payer by combination, what it is impossible for him to secure now in relation to municipal administration—a strong contingent of representatives of the tax payer in the city councils, to act as a check and brake on extravagant expenditures. If the scheme of minority representation is extended, by making large districts and numerous representatives from such districts, it would also give within party lines such independent action as to create a balance-of-power party within the party, and would thus forever destroy the supremacy of halls and juntas, who hold their power simply because the alternative presented to the voter is to accept their candidate or the candidate of a hall or organization equally bad but belonging to the opposing political organization.

—To the objection that may be urged, that minority representation would secure to the sinister elements of a community a representation if they saw fit to combine, the answer is, that it is better that the representative of the sinister elements should be known as such, than that a private arrangement be made with the sinister elements of a community by which they secure surreptitiously and secretly several representatives on condition of their support, and thus obtain by bargain a very much larger share than they could obtain by right.

—The one formidable objection to the whole scheme of minority representation, and which is really the price that the community must pay for the total representation of the community, is, that it has a tendency to prevent the spirit of compromise and mutual forbearance, which party has a tendency to create. The community would possibly split up into too many segments. Opportunity of representation being afforded to small quotas, the Catholic, the Jew, the infidel, might secure separate representation, and thus intensify religious feeling. Workingmen and capitalists might secure separate representation; and thus the same reason which would make minority representation act as a solvent of political parties, might result in its acting as a solvent on constituencies which ought to be held together in the bands of party, thereby cultivating mutual good will, which probably would not exist were their parts to be exclusively committed to their own class for political action. The only answer to this position is the universal experience of mankind, that the instant men are clothed with the responsibility of government, acerbity is lessened, and the intolerance which characterizes them as sectaries or partisans without political power is diminished. To give to minorities, therefore, who now have no chance of representation, an

opportunity to have their voices heard, coupled with the responsibility that their recommendations must be put in practicable shape for legislation, and that the responsibility of such legislation rests upon their shoulders if adopted by the majority, has in itself a very sobering influence on all violent and extreme opinions, and subjects them to the severest tests to which opinions can be subjected, that of discussion with well-trained adverse opinions, and that of practicability to frame statutes to enforce such opinions.

—Admitting Catholics and Jews to parliament was opposed, on the ground that, in the one case, a superior allegiance was considered due from the Catholic to the pope, and in the other case, that the Jew regarded every country in which he lived as but a mere resting place, that his true home was in Palestine, and that these convictions made both sects unpatriotic. Their admission, however, has proved how utterly groundless was this objection; that there are no more patriotic members of parliament than the Catholics and the Jews, is now past controversy. Indeed, in all matters of legislation the religious conviction scarcely ever comes to the surface, except where it is necessary for the purpose of preventing some act of intolerance to formulate itself into law.

—In boards of direction of corporations the adoption of a minority scheme of representation would be the most absolute security to insure continuity of direction and purpose in a less objectionable form than the adoption of a classification scheme, by which only a few of the directors go out each year, and would also prevent the possibility of a capture of a corporation through the instrumentality of proxies representing fictitious holdings, borrowings of stock, etc., by which great corporations have been depleted and the interests of the stockholders wholly disregarded. Even if the majority of the board of direction would truly represent the majority of the stockholding interest, a watchful and alert minority would prevent the diverting of the property and management of the road to sinister purposes, and be a check more efficacious than are courts or laws to prevent corporate mismanagement.

—Finally, we must recognize, with reference to governmental machinery, that it, like all machinery devised by men, must be progressively improved to adapt it to the varying needs of society. The devices to prevent tyranny and oppression which answered the purposes of the people against the kingly power of a John, a Charles or a George are as little adapted to modern society as is the crude machinery of those periods to the necessities of man in civilized life at the present day. For the satisfaction of all physical wants immense progress has been made in every direction. The art of government, however, has not been so progressive. The safe maker has kept pace with, and is a little in advance of, the skill of the burglar. The art of government has not kept pace with the skill, and ingenuity of those who require its restraining influences. The oppression which in former periods exhibited itself on the banks of the Rhine, by a robber baron sweeping down upon a rich neighboring community and depleting it of its movable property, or by his kin in spirit, locking up in his dungeon keep some rich Jew, and drawing his teeth until he disgorged his wealth, now manifests itself in corporate management in stock waterings, and in confiscation under the guise of taxation, in river and harbor bills, in protective tariffs, and thousands of other forms which are tyranny and exaction disguised under

specious names to hide their nature, and clothed with the machinery of government itself to make the imposture complete. To destroy these malignant abuses of governmental machinery, effort must be made to give the government back to the people, freed from the organization which assumes to act for the people, but which misrepresents and abuses them. There is, therefore, no art or science to which the human intellect can devote itself of a more practical and immediately beneficial nature than reforms in representation, which lie at the bottom and root of modern government, so as to make representative bodies the true exponents of popular interests instead of fraudulent representatives of the popular will. "Representation should effect for the nation," says Mirabeau, "what a chart does for the physical configuration of the soil—producing not only a reduced picture of the whole of the people, but also representing their classes, their aspirations, wishes and opinions." The body of representatives should produce on the mind of the student of a nation's social constituencies an effect similar to that produced on its territory, in representing its mountains and dales, its rivers and lakes, forests and plains, cities and towns. The finer should not be crushed out by the more massive substances, and the latter not be excluded. The proportions are organic, the scale is national.

## REPUBLIC.

REPUBLIC. This form of government is no more independent than the monarchical of the historical, geographical, ethnographical, and, above all, moral conditions, which seem to predestine a people to one or the other, by not leaving it the liberty of choice between them except within rather restricted limits. From this point of view, all abstract comparison of the intrinsic merits of monarchies and republics might seem superfluous, and there would be occasion to ask one's self whether the platonic love of a monarchy in countries with republican manners and customs, or of the republican enthusiasm which possesses some young minds or some generous imaginations in countries called by their inmost nature and their past to hereditary monarchy, are not chimeras which should be dispelled, and dangers which we should endeavor to avert.

—Without contesting whatever truth there may be in such a conclusion, we think that the forms of government may and should be compared with each other and considered in themselves, and that it is the task of the publicist, all due reservation being made in consideration of what is possible in time and place, to investigate their value, and to point out that which constitutes their merits and their defects. Thus the publicist, the least likely to be misled by deceptive appearances, and the most determined to settle, in the choice of his political opinions, upon what he judges to be actually practicable, will not scorn the enthusiasm which a republic awakens in noble minds, and he will examine whether it does not partake of an ideal beauty for which he should have some regard both as one of the elements of the judgment which he passes on the republic, and of the influence which it exercises. He will thus discover that elevated thought, lofty and powerful sentiments, are connected with the idea of a republic. In monarchies the devotion of man to man occupies a large place, and far be it from us to deny what it presents of the touching, and sometimes of the heroic, or to question what it has in it compatible with a love of the public welfare; but it is less pure and less sublime than that devotion which is directed to something superior to man himself, that is, to the fatherland, to the law, to the state. All selfish prejudice, all personal calculation, every fancy foreign to the general interest, seems to disappear in this generous sacrifice of each to all, and of the littleness of the individual to the greatness of justice. To the idea of devotedness, to that of an entirely stoical disinterestedness, is added another idea not less severe, and more attractive because it is more natural, that of equality united to liberty. Equality is to such an extent the passion of republican minds that the most aristocratic republics are no exception to it; only the practice and the worship of equality are concentrated within a limited circle, instead of extending to all the citizens. It is to equality that all, in a republican aristocracy, sacrifice themselves; it is to it that they do not hesitate to sacrifice the most illustrious heads; it is equality which impels, in spite of himself, in a manner, a Brutus to arm himself against a Cæsar. This shows us the nature and the end of the republic; it is a government founded upon general interest and equality, the motive power of which are disinterestedness, devotedness, and, let us add, popularity, with the honors which it confers. If all think they find their advantage in this form of government, it is on the supreme condition of defending, at the cost of the greatest struggles, a good, precious from the double point of view of individual dignity and of

utility. This is why the most generous dreamers as well as the most rigorous logicians come, by some sort of instinct, to the idea of a republic. This is why it has produced so many virtues, of the sublimest kind, offered by history to the admiration of future generations.

—But what constitutes the greatness of this form of government is also the source of its difficulties and dangers, which no clear-sighted republican can deny. Equality, which is the soul of republics, encounters two formidable enemies: ambition, which conspires against it, and envy, which exaggerates it. The former can not be resigned to accept the yoke of a law, the same for all; the latter rebels against the superiority of fortune and of merit; it tries to level the one, and devotes itself to railing at the other. Taxation directed against the rich, schemes of agrarian law, privileges in favor of the poor, suspicions of the well-to-do and enlightened part of the population—all these spring up in republics. "For," says the old publicist, Jean Bodin, with a severity which is not exaggerated if applied to the past, "the real natural disposition of a people is to have full liberty without any restraint or curb whatever, to have all equal in goods, in honors, in punishments, in rewards, without any regard to rank, or knowledge, or virtue." Who does not know that, up to the present time, great citizens in republics have always had to defend themselves (and sometimes without success) against calumny? If favor has its vicissitudes in a monarchy, how few reputations in republics withstand the exercise of power for however short a time. To what contumely in the most irreproachable of republics, the United States, so often cited as a model, were their Washingtons, Hamiltons and Madisons not exposed? What accusations against their generals in the ancient republics of Greece! What terrible changes of popularity and what bloody sacrifices to that capricious power, in the short and stormy attempt at a republic made by France in 1793; The moderate republic of 1848 did not sully herself with blood; she spilt it only in the arena of civil war, when that of the best citizens flowed voluntarily in the service of public order. But did any one's popularity last longer than three months? Was this the fault solely of the men who governed? Be that as it may, there is not a historian, not an enlightened publicist, who has not declared that jealousy, suspicion, and the spirit of change, are the especial dangers of republics, as favoritism and intrigue are those of monarchies. But the first-named vices are those of the majority; the second belong to only a small number. Thence comes the expression which is never applied to a monarchy, that a people is not *ripe* for a republic. In fact, equality requires customs and manners, a character and an education suited to it. The same may be said of liberty which every republic proclaims as being of its very essence, and without which there would be no equality but the sad and shameful equality of servitude. No doubt a form of government which constantly involves individual responsibility, and often subjects it to severe tests, presents especial difficulties. To govern one's self and to take part in public affairs, an amount of intelligence and a mixture of firmness and moderation are needed which are not everywhere distributed in sufficient quantity to establish a regular and stable state of affairs. Number being, in the name of equality, one of the essential elements of republican institutions, if the corrupt, the incapable, those who are easily reduced and led away, get the ascendancy, all is lost. There must then be either anarchy or a master; there is no middle path. These are so fully understood to be the dangers of a republic that there is no republican constitution which does not undertake, to a greater or less degree, to foresee and in some measure guard against them. But republican

constitutions do not always do this sufficiently, or else they are themselves but powerless dikes, swept away by the impetuous current of human passions.

—It is of the essence of a democratic republic to fill by election a portion of the offices which monarchy fills by hereditary transmission. It is reason alone which is regarded as governing in a republic. Now, reason excludes chance and those artificial privileges instituted in the interest of conservation. Monarchies, even constitutional monarchies, are full of fictions and conventions. A republic judges them unworthy of men arrived at political maturity, and useless to preserve society from revolution. Consequently it eliminates them, being replete with confidence in the upright will and enlightened capacity of the people. If this confidence is justified, the republican form is maintained and prospers. If not, the republican form is impaired and destroyed, either by slow dissolution or by a violent downfall.

—Says Montesquieu, "Government is like all other things in the world: to preserve it, it must be loved. No one has ever heard it said that kings do not love monarchy, or that despots hate despotism." A republic can be no exception; to establish it in a country, it does not suffice that a minority desire it, or even wish to impose it; *there must be a nation of republicans as willing to receive it as capable of upholding it.*

—It has been sometimes said that the difficulty consists in reconciling a monarchy with liberty and a republic with order. There would be at least as much truth in the reverse proposition. A non-absolute monarchy, giving satisfaction by lifelong and hereditary power to the want of conservation, is less fearful of liberty, if liberty enters into and keeps its pledge to respect the royal establishment. That establishment has no interest to threaten liberty; it has, on the contrary, every interest to take care of it. This care is the price of the force of public opinion which sustains it. In republics, liberty, recognized as sovereign in principle, runs serious risks. The power, under the form which best represents order in the eyes of the nation, is temporary. Hence the necessity of arming it in an exceptional way, or of arming one's self against its possible encroachments, or by precautions which are embarrassing to all. The majority oppresses the minority, or else the minority governs through terror. If we can not see in this a fatal and inevitable law, it has at least been, up to the present time, the history of the greater number of republics. Another cause threatens liberty: its own excesses. Too frequently have we seen republics knowing no alternative but excessive or suspended liberty. Happy were they when this suspension of liberty did not end in its suppression, and when temporary dictatorships were not changed into a lasting tyranny!

—The error of the greater part of the republican schools has until now consisted in believing that a republic had not to solve the problem of equilibrium; that it is a government of absolute simplicity, and has no need of being tempered. This thought has led some to the idea of a direct government of the people, excluding even a representative government; an idea which caused the author of *L'Esprit des lois* to say: "There was one great defect in most of the ancient republics; that in them the people believed they had the right to make *active* resolutions requiring some sort of execution, a thing of which the people is utterly incapable. The people should not enter into the government except to choose their representatives, which is quite within

their power. For, if there are but few people who know the precise degree of men's capacity each one is nevertheless capable of knowing in general if the one whom he choose is more enlightened than most others." The same opinion as to absolute simplicity has led other politicians to the idea of a civic assembly. Experience, as well as reason, teaches that republics can not, save at the risk of death, abandon themselves to the descending plane or declivity of a civic principle or element. There is no society which does not contain natural aristocracies of experience, learning, age, etc., within it. And, on the other hand, there is no society, however strongly organized its privileges may be, in which the masses are not important, and do not count for something in the state. Notwithstanding their inclination to exaggerate simplicity and to crush out whatever obstructed the full expansion of their principle, the constitutions of antiquity felt this. Aristocratic as was the Roman republic, it modified the power of the senate by means of the tribunes and popular suffrage. Democratic as was Athens, it had the Areopagus. It is true that the wise precautions taken by Solon did not prevent the country of Aristides and Socrates from succumbing to the propensities which hurried it on. The more and more exclusive predominance of the popular element produced disorders there, the undying remembrance of which is preserved by history, as a lesson to democracies, present or future, which choose not to recognize any restraint.

—The United States itself has endeavored to combine the different powers in such a manner as to secure respect for the law against the changeable will of the multitude. The president possesses extensive powers, and, in spite of pure ultra-republican theory, there is a moderating senate side by side with the popular assembly, or house of representatives. Any *constitution*, monarchical, republican, aristocratic or democratic, *which does not distrust its own principle*, at the same time that it does all it can to establish it on a solid basis, *is a bad constitution*.

—The excessively unitarian and centralizing propensities which govern in some countries, make this observation especially opportune. A republic which should have only a very centralized power, with no independent powers to act as a counterpoise, would run the risk of becoming more oppressive than a monarchy. If to this cause of oppression should be added the necessity of being on the defensive in order to resist either hostile parties within, or menaces from without, it is clear that liberty would be exposed to painful disappointment. Every liberal republic involves a certain amount of administration. What were the republics of Greece and the Italian republics of the middle ages? Brilliant municipalities. American federalism is not necessarily the form of a free republic, but a certain amount of decentralization seems to us to be an indispensable condition for such a republic. A free republic can be understood only where much is left to individuals and to associations. Otherwise, what result would have been obtained by so many revolutions? A change of name! But of what consequence is it to the world whether an omnipotent government call itself a monarchy or a republic?

HENRI BAUDRILLART.

## REPUBLICAN PARTY

REPUBLICAN PARTY (IN U. S. HISTORY), the name, 1, of the original democratic party (see DEMOCRATIC PARTY, I.), and, 2, of the most powerful opponent of the democratic party, 1854-82. In the latter case, it seems to have been assumed, in great measure, for the purpose of making use of the still lingering reverence for the name in the northern states; and yet it seems far more appropriate to its modern than to its original claimant. The original republicans looked upon the Union as a democracy, whose constituent units were not persons, but states; and, hence, the name democratic party, which they finally accepted almost to the exclusion of the name republican, was their proper title. The modern republicans looked upon the Union as a republic of itself, apart from all the states, and able to assert the integrity of its territory against any of the states; and though, like every other American minority, they were ready upon occasion to assert the sovereignty of the states (see STATE SOVEREIGNTY, PERSONAL LIBERTY LAWS), their essential characteristic was that belief in the political existence of the nation which has controlled their whole party history, and given them their claim to the name republican. (See NATION.) From 1854 until 1861 the party was engaged in opposing the extension of slavery to the territories. Since 1861 it has controlled the national government, and has been successful in maintaining the power of the nation to suppress resistance to the laws, even when marshaled under state authority; to establish and control a system of national banks; to compel individuals to contribute money and military service to national defense in time of war, the former by the issue of legal-tender paper money, the latter by drafts; to abolish slavery; to reconstruct the governments of seceding states; to maintain and defend the security of the emancipated race against state laws; to regulate those state elections which directly influence the national government; and to suppress polygamy in the territories. No other political party has, therefore, exerted so enormous an influence upon the essential nature of the government in so short a time.

—I.: 1854-61. But one party, the democratic, emerged unbroken, and even increased, from the storm which was settled by the compromise of 1850. For the next five years there were only feeble and discordant efforts to oppose it, by the free-soilers on the slavery question, by the whigs on economic issues, and by the know-nothings on the question of suffrage. The dominant party itself struck the sudden and sharp blow which, in 1854, crystallized the jarring elements of opposition into a single party. The passage of the Kansas-Nebraska bill (see that title), not imperatively demanded by the southern democracy, a quixotic adherence to party dogma by the northern democracy, only served to rouse a general alarm throughout the north. The summer and autumn of 1854 became an era of coalitions in most of the northern states; and the result of the congressional elections of that year was that the "anti-Nebraska men," as the coalitionists were called, obtained a plurality in the house over the democrats and the distinct know-nothings, and elected the speaker. A few members, elected as anti-Nebraska men, turned out to be consistent know-nothings; the remainder, however, still controlled the house.

—The elements which went to make up the new party were very various and numerous. 1. Its immediate ancestor was the free-soil party which joined it bodily. Of its first leaders, Hale, Julian, Chase, C. F. Adams, Sumner, Wilmot, F. P. Blair, and Preston King of New York, were of this class. Many of these like Chase, were naturally democrats, but had been forced into opposition to their party by its unnecessary deference to the feelings of its southern wing. 2. But these alone could not have formed the basis of a new party. This was supplied by former whigs, either originally antislavery, or forced into that attitude by the compromise of 1850. Of this class, Lincoln, Seward, Greeley, Fessenden, Thaddeus Stevens, Sherman, Dayton, Corwin of Ohio, and Collamer of Vermont, were fair examples. This element, being much the more numerous and influential, controlled the policy of the new party on other points than slavery, and made it a broad-construction party, inclined toward a protective tariff, internal improvements, and government control over banking. 3. Much less numerous was the class, which, originally whig or democratic, had at first entered the know-nothing organization, but drifted into the new party as the struggle against slavery grew hotter. Of this class, Wilson, Banks, Burlingame, Colfax, and Henry Winter Davis, were examples, though some of them had been free-soilers as well as know-nothings. 4. In, but not of, the new party, were the original abolitionists, led by Giddings and Lovejoy in congress, and Garrison and Wendell Phillips out of congress. These were the guerrillas of the party, for whose utterances it did not hold itself responsible, and who were yet always leading it into a stronger opposition to slavery. 5. A fifth class, not so numerous as the second, but fully as important from a party point of view, came directly from the democratic party, Hamlin, Cameron of Pennsylvania, Trumbull of Illinois, Doolittle of Wisconsin, Montgomery Blair, Wm. C. Bryant of New York, and Gideon Wells of Connecticut, being examples. These, and the rank and file represented by them, brought into the new party that feeling of dependence upon the people, and of consideration for the feelings, and even the prejudices, of the people, which the whig party had always lacked. They made the new party a popular party, as the original democrats had made the original republicans a popular party. 6. Last, and generally temporary in their connection, were the "war democrats," who united with the republicans during the war of the rebellion, such as Andrew Johnson, B. F. Butler, Stanton, Holt of Kentucky, McClernand and Logan of Illinois, and Dix, Dickinson, Lyman Tremain, Cochrane and Sickles of New York. Many of these dropped out again after the end of the rebellion; though some, as Butler, Stanton and Logan, were more permanent in their connection.

—The unification of all these elements was evidently a difficult and delicate operation, and was only made possible by the transcendent interest in the restriction of slavery; but the fortunate adoption of the name republican, endeared by tradition to former democrats, and not at all objectionable to former whigs, aided materially in the work. Wilson states that this name was settled upon by a meeting of some thirty members of the house, on the day after the passage of the Kansas-Nebraska bill, that is, May 23, 1854; and that the leader of the meeting, Israel Washburn, of Maine, began using the term immediately as a party name. Another contemporaneous movement was in Ripon, Wisconsin, where the name was suggested at a coalition meeting, March 20, 1854, and formally adopted at the state convention in July. The first official adoption of the name is believed to have been at the convention at Jackson, Michigan, July 6, 1854. During this and the next month it was also adopted

by state conventions in Maine Ohio, Indiana, Illinois and Iowa, and may be considered as fairly established, though it was not recognized in congress until the beginning of the next year.

—In its first year of existence the new party obtained popular majorities in fifteen of the thirty-one states, and elected eleven United States senators and a plurality of the house of representatives. But these successes were mainly in the west; the eastern states, and particularly New England, resisted the entrance of the new party with tenacity, and kept up the whig and know-nothing organizations through the presidential election of 1856. In December, 1855, the state committees of Ohio, Massachusetts, Pennsylvania, Vermont, Wisconsin and Michigan issued a call for a convention at Pittsburg, Feb. 22, 1856, to complete a national organization. This step was sufficient to show that the new party contained an element which distinguished it from the whig party. This convention selected a national committee, and called a national convention at Philadelphia, June 17. When this convention met, it was found to be a free-state body, with the exception of delegations from Delaware, Maryland and Kentucky. The platform adopted declared the party opposed to the repeal of the Missouri compromise, to the extension of slavery to free territory, and to the refusal to admit Kansas as a free state; it declared that the power of congress over the national territory was sovereign, and should be exerted "to prohibit in the territories those twin relics of barbarism, polygamy and slavery"; it denounced the Ostend manifesto (see that title); and declared in favor of a Pacific railroad, and of "appropriations by congress for the improvement of rivers and harbors of a national character" Nothing was said of the tariff. On the first ballot for a candidate for president, Fremont had 359 votes, McLean 196, Sumner 2, and Seward 1; and on the second ballot Fremont was nominated unanimously. On the informal ballot for a candidate for vice-president, Dayton received 259 votes. Lincoln 110, Banks 46, Wilmot 43; Sumner 35, and 53 were scattering; and on the formal ballot Dayton was unanimously nominated. Fremont's nomination was intended to gratify the free-soil and democratic elements of the party, to provide a popular rallying cry, "free soil, free speech, free men, and Fremont," to present a candidate free from antagonisms on the slavery question, and thus to win votes on all sides. Dayton's nomination was the whig share of the result. Fremont was defeated (see ELECTORAL VOTES, XVIII), but his defeat was a narrow one, and the votes of Illinois and Pennsylvania would have made him president. It is noteworthy that in 1860 provision was made for both these states, for the former by Lincoln's nomination, and for the latter by a protective tariff clause in the platform.

—The election of 1856 ended the party's first flood tide. The congressional elections of that year were so far unfavorable that there were but 92 republicans out of 237 members in the congress of 1857-9. In the development of a separate organization the coalition had sloughed off all its doubtful members, and had become fairly compacted and complete. Before the next congressional elections the disruption of the know-nothing organization in the northern states, the decision in the Dred Scott case (see that title), and the Lecompton bill (see KANSAS), gave it recruits enough to more than balance its losses. When the congress of 1859 met, the "black republican party" had become, to southern politicians, a portentous cloud covering all the northern sky. In the senate it now had twenty-five members to thirty-eight democrats; and not only

were the re-elections of the few northern democratic senators very doubtful, but new republican states were almost ready to demand admission. In the house all the northern members were republicans, except two from California, five from Illinois, three from Indiana, one from Michigan, four from New York, six from Ohio, three from Pennsylvania, and one each from Oregon and Wisconsin, and eight anti-Lecompton democrats, who were certain to vote against the southern claims to the territories. Party contest in congress at once assumed a virulence which it had not before been subject to. In both houses the republicans were charged with complicity in the Harper's Ferry rising, and in the publication of Helper's "Impending Crisis," a recently published abolitionist book. In the house, candidates for speaker were nominated by the republicans (113 in number), the democrats (93), the anti-Lecompton democrats (8), and the "Americans," or know-nothings (23). For eight weeks no candidate could command a majority. The opposition to the republicans could not be completely united in voting for any candidate, or in voting that any member who had indorsed Helper's book, as most of the republican members had done, was "not fit to be speaker of this house." Finally, the original republican candidate, Sherman, having been withdrawn, and Pennington of New Jersey, having been substituted, he was elected, Feb. 1, 1860, by the aid of a few "American" votes. But, despite the speaker's election, the republicans had no control of legislation, with the exception of the passage of a homestead bill, which was vetoed by the president.

—When the national convention met at Chicago, May 16, 1860, the hopes of the party were high. its organization complete, and its character for the future determined. Its elements had been so welded together that the division lines had almost disappeared; but so far as it remained, it was certain that the old whig element would now take the leading nomination and control the general policy of the party, while the old democratic element would be content with the second nomination and the comfortable consciousness of familiar methods in party management. The delegates were from the free states, with the exception of the delegates from Delaware, Maryland, Virginia and Kentucky, and a fraudulent delegation from Texas. The platform was much like that of 1856, except that the conjunction of polygamy and slavery, peculiarly exasperating to the south, was dropped; a homestead law, and protection for domestic manufactures in arranging the tariff, were demanded; and democratic threats of secession and disunion were denounced. For the first place on the ticket, Seward was strongly supported, and he was as strongly opposed, for the assigned reason that his anti-slavery struggle had made him an unavailable candidate; but much of the opposition to him came from the mysterious ramifications of factions in New York. On the first ballot, Seward had 173½ votes, Lincoln 102, Cameron 50½, Chase 49, Bates 48, and 42 were scattering; on the second, Seward 184½, Lincoln 181, Chase 42½, Bates 35, and 22 were scattering; and on the third, Lincoln 231½, Seward 180, and 53½ were scattering. Before another ballot could be taken, votes were so changed as to give Lincoln 354 votes, and he was nominated. For vice-president, on the first ballot, Hamlin had 194 votes, C. M. Clay 101½, and 165½ were scattering; on the second, Hamlin had 367 votes to 99 for others, and was nominated.

—In the campaign which followed, the party employed popular methods still more effectively than in 1856. With the exception of the ignominious success of 1840, no previous party had met the democratic party on its own ground. No appeal that could

be made to the attention of the people was neglected; monster wigwams, and long processions of "wide awakes" with torches, transparencies and music, attracted listeners to the political speeches; and for these the party could now command at least as high an order of ability as its opponents. Its candidates obtained the votes of all the free states, except three from New Jersey, and were elected. (See ELECTORAL VOTES. XIX.) From this time the work of the party for the next four years is told elsewhere. (See articles referred to under REBELLION.)

—II.: 1861-9. No dominant party ever passed through such a trying experience as did the republican party during the rebellion. Its majority in congress was only due to the absence of southern representatives; and, even with this aid, its majority in the house was hardly preserved in the congress of 1863-5. Nevertheless the management of the party was generally wise and successful. The extreme anti-slavery element was held in check; and, to secure the co-operation of the small but essential percentage of "war democrats," the name "Union party" was adopted, and other measures of conciliation were contrived. Lincoln, in particular, was obnoxious both to the extreme radicals, who disliked his temporizing policy, and to the more timid members of the party, who feared the effects of his emancipation proclamation. Efforts were made to obtain the nomination of Chase, partly as a vindication of the "one-term policy," partly as a rebuke of "presidential patronage," and partly to secure a more careful management of the currency; but the republican members of the Ohio legislature declared for Lincoln's renomination, and this seems to have ended the Chase movement. A more turbulent but less formidable reaction was a convention of "radical men" at Cleveland, May 31, 1864, which nominated Fremont and John Cochrane of New York, and demanded a more vigorous prosecution of the war, the confiscation of the estates of rebels, and their distribution among soldiers and actual settlers. The candidates accepted the nominations, but withdrew before the election.

—In the mass of the party there was no hesitation. When the "Union national convention" met at Baltimore, June 7, 1864, Lincoln was renominated by acclamation after an informal ballot of 492 votes for him and 22 for Grant. To conciliate the war democrats, one of their number was to be nominated for vice-president, and the choice lay between Andrew Johnson and Daniel S. Dickinson of New York. On the first ballot Johnson had 200 votes, Hamlin 145, and Dickinson 113; but votes were at once changed to Johnson, and his nomination was made unanimous. The platform approved the unconditional prosecution of the war, the acts and proclamations aimed at slavery, the proposed 13th amendment abolishing slavery, the policy of President Lincoln, the construction of the Pacific railroad, the redemption of the public debt, and the enforcement of the Monroe doctrine in Mexico. For a little space during the summer the constant slight checks to the national armies threw a cloud over the prospects of republican success; but before the election a general and triumphant forward movement of the army and navy made Lincoln's election a certainty (see ELECTORAL VOTES, XX.), and the war closed with the republican party at its very high tide of success, triumphant and united.

—And yet, immediately after the close of the rebellion, the party was to undergo a more severe, because more insidious, test of its steadiness. A succession of exciting events, the assassination of President Lincoln, the offer of rewards for the chiefs of

the confederacy and their hurried flight toward the seacoast, the long funeral of the dead president, and the trial of the conspirators in the assassination, appealed directly to the wild justice of revenge; and the appeal was to be resisted, if at all, by republican equilibrium of mind, for the opposition was almost silenced for the time. It is fair to say that the test was endured successfully, and that there was no general desire for sweeping vengeance upon the conquered. Men rather felt a strong sense of relief when the excitement subsided, business was allowed to take its wonted course again, and political problems were remanded to the federal government for consideration.

—This sense of relief was not to be permanent. Congress was not in session until December, 1865, and in the meantime the president actively began his policy of reconstruction. (See RECONSTRUCTION, I.) Every new expression of southern satisfaction with "the president's policy" was a fresh stimulus to suspicion in the minds of men who had for four years been engaged in suppressing a southern rebellion; but it was not until after the meeting of congress that the republicans were fully aroused to the disadvantages, and the opposition to the advantages, of the succession of a war democrat to President Lincoln's place. There were no important elections in 1865, and in those which were held the republicans were everywhere successful. The resolutions of their state conventions were evidently guarded in language, expressed approval of the president's policy so far as it had been developed; but demanded "the most substantial guarantees by congress" of the safety and rights of the southern negroes before the seceding states should be admitted to representation. In other words, the party was not disposed to a conflict with the president, but would keep its goods as a strong man armed: it would not object to his reconstruction of the state governments, if he would not object to the passage by congress of such acts as the civil rights bill and the freedmen's bureau bill (see those titles); but, at the first sign of bad faith in the president, it would strike at him and his policy with all its energy, through congress.

—It is evident now that this was the universal and deliberately formed programme of the party, and that the party was not forced into it by ultra leaders. These, on the contrary, were steadily held in check during the session of 1865-6, until the veto of the civil rights bill showed the president's intention to insist on the admission of the seceding states to representation without "substantial guarantees." Even then the party majority in congress were content with the passage over the veto of the two bills named above, and the passage of the 14th amendment, as a base of future operations; they then adjourned and left the issue between themselves and the president to the decision of the party.

—The decision was promptly given. The republican state conventions in Illinois, Indiana, Iowa, Kansas, Maine, Massachusetts, Michigan, Minnesota, New York, Ohio and Pennsylvania pronounced against the president's policy, and declared that reconstruction must be effected by "the law-making power of the government." The other republican states were mainly silent because no state conventions were held; in not one of them was the president's policy approved. On the contrary, the approval came from the democratic party, whose leaders united with the president's republican and war democratic supporters in a national convention at Philadelphia, Aug. 14, 1866, commonly called the "arm-in-arm convention," from the manner in which the

Massachusetts and South Carolina delegates entered it. In some states, as in Connecticut, the federal office-holders openly supported the democratic candidates, with the formal approval of the president, but the intact and vigorous republican organizations were successful. The result of the elections of 1866 left every state north of Mason and Dixon's line with a strong republican majority in the legislature, and a republican governor. Still more important, they gave the republicans in the next congress an unequivocal majority of all its members: 42 to 11 in the senate, and 143 to 49 in the house. If all the southern states had been represented by democrats, the republican majority would still have been 42 to 33 in the senate, and 143 to 99 in the house; until the southern states were represented, the republican majority was sufficient to override the president's veto in every case, and congress could shape legislation at its will for two years to come.

—The republican national committee expelled its president, Henry J. Raymond of New York, and two of its members, who had taken sides with the president, and war was fairly declared. The president's utter want of tact and discretion undoubtedly made the republican victory over him easier, but it would probably have been nearly as complete in any event. His obstinate refusal to make any terms only resulted in making the terms accorded to the seceding states more severe, and the work of reconstruction was carried out by congress with hardly any thought of the president, except as an obstructive. (See RECONSTRUCTION, I.)

—It has been said that the party forced its congressional majority into reconstruction, and was not forced into it by its ultra leaders. Nevertheless, it is certain that these leaders, during the struggle, used the president's denunciations of congress to carry counteraction unnecessarily far. The president had used without scruple his powers of appointment and removal to reward his friends and punish his enemies; and the civil service was thus made an instrument of offense against the dominant party. The course of events is elsewhere detailed. (See TENURE OF OFFICE; IMPEACHMENTS, VI.) How far the impeachment was desired by the mass of the party can hardly be known. The ensuing national convention pronounced the president to have "been justly impeached for high crimes and misdemeanors, and properly pronounced guilty thereof by the votes of thirty-five senators"; but it is still a question whether the party generally felt more regret or relief at the failure of the impeachment.

—The national convention at Chicago, May 20, 1868, fully approved the reconstruction policy of congress; declared that the public faith should be kept as to the national debt, not only according to the letter, but according to the spirit of the laws by which it was contracted, but that the rate of interest should be reduced whenever it could be done honestly; and condemned the acts of President Johnson in detail. Nothing was said of the tariff. For president, Grant was unanimously nominated on the first ballot. For vice-president, the struggle was mainly between Wade, Colfax, Wilson, and Fenton of New York. On the first ballot, Wade had 149 votes, Fenton 132, Wilson 119, Colfax 118, and all others 132. On the fifth ballot, Colfax had 224 votes, Wade 196, Fenton 137, Wilson 61, and all others 32. So many votes were then changed to Colfax that he had 541 to 109 for all others, and was

nominated. The candidates were elected without special difficulty. (See ELECTORAL VOTES, XXI.)

—III.: 1869-83. With Grant's election the party may at last be considered homogeneous and self-existent, with no trace of borrowed traditions. Distinctions within the party, arising from former political affiliations, had disappeared. Those who still felt their influence, like Seward, Chase, Welles, Trumbull and Doolittle, had generally dropped out during the reconstruction and impeachment struggles; and a new generation, not only of voters, but of leaders, had arisen, who knew only the tenets of the party, and were not embarrassed by former whig, democratic, free-soil or know-nothing bias. Among these new men were Morton, Blaine, Garfield, Conkling, Sherman, Schurz, Edmunds of Vermont, Dawes and Hoar of Massachusetts, Morgan of New York, Frelinghuysen of New Jersey, Kelley of Pennsylvania, Bingham, Shellabarger, Ashley and Schenck of Ohio, Chandler and Ferry of Michigan, Carpenter of Wisconsin, and Yates and Washburne of Illinois. These, and a host of others, while they had practically ousted the original leaders, retained the peculiar combination of whig principles and democratic methods which had resulted from the original amalgamation, and were now to show whether they could make the party a popular broad-construction party in internal administration, as well as in the suppression of slavery.

—The first problem which they were to meet was the condition of the southern states. The grant of the right of suffrage to the recently enfranchised negroes had been completed by the process of reconstruction. If it was to be maintained, it must be by the vigor of the negroes themselves in defending it, by federal support to the reconstructed state governments in defending it, or by a constitutional amendment authorizing negroes to defend it. The first method was impracticable; if it had been otherwise, it would itself have been a full vindication of the educating influences of the system of slavery. The second method was adopted by legislation and executive action (see INSURRECTION, II.; Ku-Klux Klan); and the third by the passage of the 15th amendment. (See CONSTITUTION, III., A.) In both these methods the party was practically unanimous at first; but, as the difficulties of their execution increased, those who still retained anything of former party bias were the first to grow weary of them. In addition to this, there was very much of the natural repugnance to the control of the party machinery by new leaders. The result was the "liberal republican bolt" of 1870-72 (see LIBERAL REPUBLICAN PARTY), in which the singular spectacle was presented of the party contending against an opposition led by the two great towers of its strength in 1854-5, Sumner and Greeley. Indeed, the contest may almost be described as one between the mass of the party, under its new leaders, and the remnants of those who had entered the party from former organizations; and the result was decisive of the party's integral consolidation.

—The national convention met at Philadelphia, June 5, 1872. Its platform reviewed the past achievements of the party; demanded the maintenance of "complete liberty and exact equality in the enjoyment of all civil, political and public rights throughout the Union"; commended congress and the president for their suppression of ku-klux disorders; and promised to adjust the tariff duties so as "to aid in securing remunerative wages to labor, and promote the growth, industries and prosperity of the

whole country." This latter paragraph was the first official announcement of protectionist doctrines since 1860, but its place had always been effectually filled by the resolutions of state conventions, and by the consistent policy of the party in congress. For president, Grant was renominated by acclamation. For vice-president, Wilson was nominated by 364½ votes to 321½ for Colfax. The candidates were elected with even less difficulty than in 1868. (See ELECTORAL VOTES, XXII.)

—Nevertheless, there was still considerable dissatisfaction in the party. The close of Grant's first term and the beginning of his second were marked by a succession of public scandals, arising mainly from his own inexperience in civil administration and the derelictions of many of his appointees. (See CREDIT MOBILIER; LOUISIANA; CAPITAL, NATIONAL; SUMNER, CHARLES; WHISKY RING; IMPEACHMENTS, VII.) The consequent dissatisfaction was shown by a general defeat of the party in the state and congressional elections of 1874-5. (See DEMOCRATIC PARTY, VI.) It was checked, however, immediately, and the check has often been ascribed to the political skill of the leaders in "waving the bloody shirt," that is, in stimulating a desire for the formation of a solid north to counterbalance the solid south formed by the violent suppression of the colored vote. But a more rational commendation of their political skill may be found in the manner in which they committed their party to the payment of the public debt in coin. The issue of legal-tender paper money had been a republican war measure, but the idea had since grown up that at least a part of the public debt should be paid in paper money. (See GREENBACK-LABOR PARTY.) In most of the western states this idea had completely gained control of the democratic party; it had made a smaller, but very considerable, progress in the republican party; and many of the subordinate republican politicians were inclined to look upon it as inevitable, and yield to it. So prominent a leader as Morton publicly yielded, and fathered the "ragbaby," as the paper money idea was popularly called. To disown that which seemed at first sight their own progeny, to hazard the party's supremacy in its original habitat, the northwest, certainly required no small amount of political foresight, nerve and skill in the republican leaders. Ohio was made the battle ground (see that state), and the gauntlet was thrown down in 1875. Success there was followed by the nomination of the successful candidate for president in 1876, and the committal of the party to specie resumption in 1879. A conflict of this nature did more to bring back the liberals of 1872, and the dissatisfied voters of 1874, than even the "bloody shirt" could do in repelling them.

—The national convent on met at Cincinnati, June 14, 1876. The platform differed from that of 1872 mainly in its stronger indorsement of civil service reform; in its demand for "a continuous and steady progress to specie payments": in its denunciation of polygamy in the territories, of "a united south," and of the democratic party in general; and in its declaration in favor of "the immediate and vigorous exercise of all the constitutional powers of the president and congress for removing any just causes of discontent on the part of any class, and for securing to every American citizen complete liberty and exact equality." Much apprehension had been expressed as to President Grant's supposed intention to use the party machinery to compass his own nomination for a third term, but when the convention met he was not a candidate. The leading candidates were Conkling and Morton, representing the

adherents of the administration; Bristow, representing the opposition to the administration; and Blaine, with a positive strength of his own, independent of all southern questions. On the first ballot, Blaine had 285 votes, Morton 124, Bristow 113, Conkling 99, Hayes 61, and all others 72. On the sixth ballot, Blaine had 308 votes, Hayes 113, Bristow 111, Morton 85, Conkling 81, and all others 56. On the seventh ballot, there was a general break. Of Bristow's votes, 21 adhered to him; Blaine's vote rose to 351; the adherents of all the other candidates transferred their votes to Hayes, and he was nominated by 384 votes out of 756. For vice-president, Wheeler had hardly any opposition. The candidates were elected, but only after a struggle which is elsewhere detailed. (See DISPUTED ELECTIONS, IV.; ELECTORAL COMMISSION; ELECTORAL VOTES, XXIII.)

—The discovery of the "cipher telegrams" (see TILDEN, S. J.) helped very materially to reconcile the party to the irregularities of the election of 1876. Nevertheless, the new president was left with very little party support until the extra session of 1879. (See HAYES, R. B.; RIDERS.) During this administration, for the first time in the party's history, the leaders failed to control its representatives in congress. Resumption of specie payments had been fixed for Jan. 1, 1879. But, since 1870, silver had been steadily falling, in relative value to gold, throughout the civilized world. The act of Feb. 12, 1873, had demonetized silver, and had made gold the only specie of the country, except for subsidiary coinage. The public debt would thus have been payable in gold alone. The idea at once spread that this action was a fraudulent effort to pay bondholders more than they were entitled to by law. Both of the great parties yielded to the storm. After several unsuccessful efforts, the Bland bill, to make the silver dollar (then worth about 92 cents) a legal tender for public and private debts, and to direct its coinage at the rate of not less than \$2,000,000, nor more than \$4,000,000, per month, passed both houses. It was vetoed, and passed over the veto by heavy majorities, Feb. 28, 1878. In both houses the leaders of the party voted in the negative, but the mass were either absent or in the affirmative.

—The national convention met at Chicago, June 10, 1880. As Grant had been out of office for four years, his nomination was now considered unexceptionable by many, and a plurality of the delegates came to the convention pledged to vote for him. (See NOMINATING CONVENTIONS) Blaine was next to him in strength, and Sherman, the secretary of the treasury, next. On the first ballot, Grant had 304 votes, Blaine 284, Sherman 93, Edmunds 34, Washburne of Illinois 30, and Windom of Minnesota 10. For thirty-five ballots this proportionate vote was hardly changed, except that on the thirty-fifth ballot, Grant's vote rose to 313, and Blaine's fell to 257. Garfield, a Sherman delegate from Ohio, had been steadily voted for by one or two delegates, since the second ballot. On the thirty-fourth ballot the Wisconsin delegation, against his protest, gave him 17 votes; on the thirty-fifth his vote rose to 50; and on the thirty-sixth, by a sudden stampede of all the anti-Grant elements, he was nominated by a vote of 399, to 307 for Grant, 42 for Blaine, 5 for Washburne, and 3 for Sherman. Arthur, to placate the Grant delegates, was nominated for vice-president on the first ballot, by 468 votes, to 193 for Washburne, and 90 for all others.

—The result of the election seems to show a very considerable party advantage in a policy of devotion to economic principles. In 1876, after eight years of a vigorous

repressive policy in southern disorders, the republican candidates were only successful by a single electoral vote, and the honesty of the success was denied by the whole opposition party. In 1880, after four years of simple endeavor to settle the economic problems which pressed for settlement, the party's candidates were elected beyond cavil, by 214 electoral votes to 155. And, further, a forged letter (the so-called Morey letter) appeared just before the election, purporting to come from Garfield, and advising the encouragement of Chinese immigration in order to bring American servants and mechanics to a more manageable condition. This forgery undoubtedly cost Garfield the five votes of California, the three votes of Nevada, and probably the nine votes of New Jersey. Without it, the result would have been 231 to 135, and the party would have had the entire northern and western vote, for the first time in its history. It is also noteworthy that the prospects of possible republican success in southern states, without federal coercion, date wholly from Hayes' administration. (See TENNESSEE, VIRGINIA, NORTH CAROLINA.)

—Before and after President Garfield's assassination, (see GARFIELD, J. A.), the terms "stalwart" and "anti-stalwart" came into common use. They can hardly be considered as designations of the Grant and anti-Grant factions, respectively, for one of the anti-Grant leaders claims the parentage of the term stalwart in politics; nor as representing the friends and opponents of the abandoned policy of repression in southern affairs. If a conjecture may be hazarded, the stalwarts represent the leaders of the party organization, as it stands in 1882, who have reached that position during the policy of repression, though they do not propose to attempt it any longer; and the anti-stalwarts, the coming leaders who will succeed gradually and naturally to the party leadership on altogether economic grounds. Neither name as yet indicates any disintegration in the party. It is, therefore, very proper to give the present, and probably permanent, basis of the party's existence. It is nowhere stated so clearly as in the second and fifth sections of the platform of 1880, as follows: "2. The constitution of the United States is a supreme law, and not a mere contract. Out of confederated states it made a sovereign nation. Some powers are denied the nation, while others are denied the states; but the boundary between powers delegated and those reserved is to be determined by the national and not the state tribunals." "5. We reaffirm the belief that the duties levied for the purpose of revenue should so discriminate as to favor American labor; that no further grant of the public domain should be made to any railroad or other corporation; that, slavery having perished in the states, its twin barbarity, polygamy, must die in the territories; that everywhere the protection accorded to a citizen of American birth must be secured to citizens by American adoption; that we esteem it the duty of congress to develop and improve our watercourses and harbors, but insist that further subsidies to private persons or corporations must cease." With a programme of this nature, developed as further occasion may require, there seems to be no reason to anticipate that dissolution of the party which was so confidently predicted in 1874.

## REPUDIATION.

REPUDIATION. The history of the bonded indebtedness of the various states of the Union goes back to the period 1830-40. At the beginning of that decade the aggregate debt of the states amounted to about \$13,000,000 only. Then began an era of extravagance, in which certain states entered upon a series of reckless undertakings that crippled the resources and ruined the credit of more than one commonwealth, whose name had formerly ranked high for commercial prudence and honesty. Two causes united to foster this spirit of prodigal expenditure: a natural demand for necessary internal improvements; and an easy means of raising large sums on long loans. By the act of congress of June 13, 1836, the surplus above \$5,000,000 arising from the sale of government lands was allowed to remain on deposit to the credit of, or loaned to, the different states. In this way nearly \$30,000,000 was put out, in three installments, a fourth, after some \$28,000,000 had been paid, being postponed by the act of October, 1847, because of a reduction in revenue, owing to the requirement that land payments be made in specie and not in notes of the state banks. The great incentive to incur a heavy state debt, the demand for internal improvements, sprang from a natural and healthy cause. The annually increasing tide of immigration began to pour over the vast and fertile areas of virgin soil, in the development of which lay prosperity and fortune. But as yet the means of communication between the granaries of the west and northwest, the rice and cotton plantations of the south and southwest, and the markets of trade, were wholly inadequate to meet the needs of the cultivators. Rich in the natural products of the soil, money was so scanty with them that, even for the purposes of ordinary trade between themselves, they had to resort to barter. To the active and industrious farmer, or the keen and ambitious planter, an opening to the markets of the world, by new means of transportation which should insure quick delivery on reasonable terms, meant individual success and the commercial prosperity of his state. Private ambition and public spirit were skillfully played upon to induce voters to ratify with eagerness what doubtless seemed to many a public duty as well as a private gain. Railways and canals were begun, turnpikes constructed, river beds widened and "improved," and every scheme which bore on its face the slightest resemblance to a public work claimed the aid of the public credit, and, in the absence of constitutional safeguards, generally got what it claimed. Our national credit abroad stood high. The affairs of government had been economically administered, the interest on our foreign commercial debt promptly paid, and state securities found an easy sale in foreign markets. Good credit, great natural advantages of soil and climate, offering unmistakable promise of limitless development, and, above all, a pay day far ahead in the dim future, with only the interest account to provide for from time to time, proved temptations too strong for the young and growing communities. Within the twelve years succeeding 1830 the aggregate debt of the states had risen to over \$200,000,000, an increment of more than 1600 per cent! It was distributed as follows:[73](#)

Eastern states...	\$ 7,158,274
Middle states...	73,348,072
Southern states...	73,340,017
Western states...	59,931,553
Total...	\$213,777,916

—In May, 1838, after the passage of the general banking law, authorizing the United States comptroller to issue bank notes on a pledge of the evidences of public debt of the several states, a circular was issued by the comptroller, Mr. Flagg, requesting the financial officer of each state to return its indebtedness under authorized loans. According to their replies, it appeared that even then the aggregate debt, inclusive of the sums deposited with the several states by the United States (\$28,101,644.97), amounted to \$198,907,824.32. This indebtedness had been incurred for the benefit of railroads, canals, banks, turnpike companies, and kindred speculations. "The operations of the states have been so extensive and varied," said Hunt's "Merchants' Magazine," in 1839 (vol. i., p. 174), "that it is not an easy matter to get at the precise amount of stock issued and authorized to be issued. It is probable, however, that the aggregate amount of stock authorized by all the states is even greater than the amount stated in the tables."

—By 1836 the state of Indiana had already loaned a large portion of the surplus revenue derived from the United States, and in that year an act was passed appropriating the sum of \$10,000,000 for a gigantic internal improvement scheme, covering no less than seven different enterprises, including canals, banks and railways. When we find that there were only 100,000 voters in the state at this time, the outlay, even if kept within the proposed limit, seems stupendous. Yet the expenditure was far beyond the expectations of the promoters. "The original plan of internal improvement was, as a matter of course, considerably extended, and it very soon became evident that \$20,000,000 would not more than *half* suffice to complete any portion, in consequence of the necessity of spending all the money that could be got in all parts of the state at once. The negotiation of the bonds was also a source of most fearful jobbing which resulted in serious losses to the state." ("Merchants' Magazine," 1847, p. 577.) One of the bond commissioners, a Dr. Coe, was also one of the largest stockholders in the Morris Canal bank, the heaviest customer for the state bonds. According to the report of a legislative investigating committee, Dr. Coe received from his own company over \$100,000 in commissions and profits; one item of which was 398 bonds, received by the company at par, when they were worth about fifteen cents on the dollar—a difference of about \$33,680! Within a very short time the pressure began to be felt. Depression in foreign commercial centres caused a tightness of the money market all over the world. By 1841 Indiana found herself without the means of defraying the running expenses of government. The money for the civil list had to be raised, and the state was again forced to go upon the market as a borrower, pledging her bonds at ruinously low rates. "The majority of the 100,000 voters then occupying Indiana," says a writer, six years later, "were small farmers living in log huts, depending on the sale of surplus pork and grain for the purchase of their necessaries; and the expectation of drawing \$1,000,000 per annum from such sources, to pay the interest or principal of debts contracted for legislative purposes,

was not realized. The capital employed in trade in Indiana was scarcely \$3,000,000, and it was proposed to draw 50 per cent. of that every year to pay interest!" In 1841 the interest account fell behind, and an attempt was made to settle by an issue of 7 per cent. five-year bonds, but these the creditors, who had already begun to distrust the state's pledges, refused to accept in exchange for their interest coupons, to any appreciable amount. The distress spread so that it seemed to affect every department of government. The assessment for tax purposes was wretchedly conducted on a wholly erroneous system of valuation, until finally the people became convinced that the taxes could not be paid. From this to hopeless and acknowledged insolvency the plunge was rapid. In June, 1839, the tax of thirty cents, levied in 1838 to meet the internal improvement interest, was reduced to fifteen cents, and by 1840, after various fruitless attempts at settlement and compromise, all effort to pay the state interest had been abandoned.

—Ohio began her borrowing in 1825, by pledging all the canal profits as security for loans authorized for the benefit of internal improvement schemes. Under the law of 1836-7 she had gone on increasing her expenditures, loaning the state credit to turnpike and other companies, subscribing for their stock and running into debt with contractors. Her credit fell, and yet it was impossible either to go ahead or to give up the work without money. In 1841 the legislature passed an appropriation bill of \$2,301,625. The commissioners of the canal fund were authorized to raise \$981,000 of this amount, with which to meet the demands of the contractors, *at any rate of interest*, and the remainder on 6 per cent. bonds, payable in 1860. The bankers of London and New York would not touch the loan, and it was finally proposed, at an extra session of the legislature convened for the purpose, to raise the rate of interest to 10 per cent. *and go into the foreign market on the best procurable terms!* Under this provision the state was squeezed like a sponge. Fortunately her immense resources proved equal to the terrible strain. The people were honest, the sophisms of repudiation gained little ground, and the legislature by various enactments provided for the interest and a sinking fund with which to meet the principal.

—Even the eastern states were affected by the universal mania for reckless expenditure which obtained throughout the country during the years 1834-6. Massachusetts pledged her credit without taking care to provide sure means of payment, and found herself in 1847 with over \$6,000,000 outstanding indebtedness on loans and subscriptions to railroads alone. The enterprises proved successful, however, and she was never heavily pressed to make good her guarantee.

—Maine, a lumber and fishing state, with a soil for the most part unadapted to raising grain, acting upon an absurd theory of encouragement to home producers, actually went into debt at the rate of \$3 per head of her population, to pay bounties for the cultivation of wheat and corn, and distributed in one year over \$150,000 in premiums on the production of less than three million bushels of grain!

—By 1840 the state debt of Pennsylvania had increased to \$31,000,000, about \$90,000,000 of which had been assumed in behalf of railroads and canals. Within two years the bank of Pennsylvania went down with a crash that echoed throughout the commercial world, and in August of that year the state failed to pay its interest. So

bitter was the feeling abroad against the people of the defaulting commonwealth, that the Rev. Sydney Smith declared he felt inclined, if he met a Pennsylvanian at dinner, to strip him of his clothes and boots for division among the guests, most of whom had probably suffered by his state's dishonor!

—It was during this period that the word "repudiation," in its present commercial and political signification, came into use. There was a default in the interest on the bonds which the state of Mississippi had issued in aid of the Union bank, and after the authorities had in vain cast about for various expedients to meet the difficulty, the governor of the state, in a message to the legislature, broached the now familiar doctrine of repudiation, and suggested, in undisguised terms, his state's dishonor. "The bank," he declared, "has hypothecated these bonds, and borrowed money upon them of the Baron Rothschild; the blood of Judas and Shylock flows in his veins, and he unites the qualities of both his countrymen. He has mortgages upon the silver mines of Mexico and the quicksilver mines of Spain. He has advanced money to the sublime porte and taken as security a mortgage upon the holy city of Jerusalem and the sepulchre of our Saviour. It is for this people to say whether he shall have a mortgage upon our cotton fields and make serfs of our children"! To the honor of the state legislature, be it said, they rejected, with scornful emphasis, the disgraceful suggestion, and declared that the governor's insinuation that Mississippi would violate her solemn pledge was "a calumny upon the justice, honor and dignity of the state." Subsequent Mississippi legislatures show no traces of the honest spirit of this session. *Post bellum* repudiators have no more shameless example of flagrant dishonesty than that afforded by the successors of the very men who, thirty years before, declared that the mere suggestion of repudiation was an insult to the state (*vide infra*).

—One after another the spendthrift commonwealths felt the pinch of want, and when the public debt became, from the taxation which it necessitated, a private burden, repudiation followed as a matter of course. Numerous plans for compromise were canvassed; legislative committees were appointed, bills reported and conferences held with the representatives of the bondholders at home and abroad, but from year to year the bankrupt states drifted along, plunging, at intervals, more and more hopelessly in debt. Finally, the civil war swept away for the time all vitality from the bond question as an issue. Its revival as a political question, and its historical development in certain communities, where it divided parties and became the most potent factor in state politics, is given under the headings of the different states below.

—*Georgia*. Under the rule of the "carpet-baggers" the state was plunged into debt for all sorts of alleged public improvements. When the "conservatives," as the democrats were fond of proclaiming themselves, regained control, they at once set to work to devise pretexts for avoiding the obligations by which the state had been burdened by their opponents. A committee appointed by the first legislature at which the conservatives found themselves in the majority, reported in favor of invalidating, on the ground of fraud at their issue, six million of state bonds. The suggestion was at once acted upon, and the securities promptly repudiated. A constitutional amendment was then adopted, wiping out the bonds altogether. At the constitutional convention the bondholders offered to submit their claims for adjudication to the supreme court of the state, but the proposition was rejected by an overwhelming vote at the May

election of 1877. To provide against any possible qualms of conscience on the part of succeeding legislators, a clause was inserted in the new constitution (sec. 11) prohibiting the general assembly from making any appropriation to meet interest or principal on the dishonored securities, with which were included all the war debts of the state. A sweeping majority carried this amendment at the election of December, 1877. The act of Feb. 25, 1874, had already deprived the governor of the power to lend the credit of the state by indorsement, except where the right to such had already vested. Soon after the passage of the repudiating amendments (in January, 1878), Gov. Colquitt was applied to for his official indorsement upon the debentures of the Northeastern railroad. After consulting the most eminent legal authorities in the state, who advised him that the right to such guarantee had vested in the company before the passage of the repealing act, he granted the application of the railroad authorities and indorsed their bonds to the amount of \$260,000. His act caused widespread complaints, which his political opponents took pains to fan into a burst of popular indignation, by representing that he had willfully transcended his authority, and deliberately nullified the will of the people in favor of the corporation. He at once demanded a legislative investigation, and a committee, which examined the question with great care, reported in the only way that it was possible for them to conclude, that the governor had no option in the matter, but had simply done what he was legally bound to do. Much the same treatment was given to the \$3,000,000 of bonds of the Brunswick & Albany railroad company, guaranteed by the state before the war, and disposed of mainly to capitalists at the north. The secession convention had granted immunity from confiscation to all public works. But in spite of this the road was seized upon as the property of alien foes. After the war the owners came forward to claim their property, and a compromise was effected upon their agreeing to complete the road, in return for which the state was to pay a subsidy of \$15,000 per mile. This compromise was ratified by a democratic legislature in 1869; yet in 1871 Gov. Bullock took possession of the road, though the state had failed to pay the subsidy, claiming that the agreement had not been fulfilled by the owners. Henry Clews, Esq., of New York, who represented a majority of the bondholders, sold the bonds to German bankers at Frankfort-on-the-Main. In August, 1872, the general assembly declared these bonds null and void, and a constitutional amendment forbidding the payment of either principal or interest was carried in 1874.

—*Louisiana.* At the constitutional convention of 1879 a committee appointed to examine and report upon the bond question, recommended the acknowledgment of about \$4,000,000 of these securities and the repudiation of nearly \$20,000,000. The report declared that it was a matter of history that the state house had been seized by United States soldiers in December and January, 1872-3, and the legal legislature overthrown. That, therefore, the body of men alleged to have passed the funding act of 1874 was not a constitutional legislature, and had no power to bind a free people. That there was no evidence on file of any ratification of the so-called amendments of 1874, except the mutilated copy of what purported to be a certificate to that effect, signed by J. Madison Wells and others. "They are unable to concede," reported the committee, "that the funding of any portion of the debt has given it any greater validity than it originally possessed, and, on the other hand, they do not admit that the absolute repudiation of 40 per cent. of the debt detracts in the least from the validity of that which was honest and legal." The report concludes by a reference to the fact

that the bondholders are mainly northern capitalists, and dismisses their claims in these remarkable words: "But may it not be in the order of the eternal fitness of things that those who directly or indirectly (unwittingly, it may be) aided to tear down the basis of our former prosperity, should share some of the ills that have so long and so powerfully borne down upon the once proud and wealthy people of Louisiana?" A minority report, protesting against the attempt to dishonor the state, was vainly offered, to stem the rising and angry tide of repudiation. "Every sentiment of honor and justice," said this paper, "demands that he who receives what does not belong to him should restore it. If the bonds are void, the state has received something for nothing. Law and justice concur in the enforcement of the duty on the part of the state to surrender that something to its true owner." This report declared that the state had received in cash \$6,893,507.31 for securities funded at \$7,294,744, all but \$500,000 of which was to be wiped out. The wanton bad faith of the legislators who agreed to the majority report, is the more strongly emphasized by a reference to the opinion of the supreme court of the state, delivered only a few months before: "We regard the faith of the state as irrevocably pledged to the payment of her consolidated bonds issued under the authority of that act (the funding act of 1874). \* \* The contract with the holders of these bonds is one which, in the language of the constitutional amendment, the state can by no means and in no wise impair." This act, the court held, was approved Jan. 24, 1874, and settled beyond possibility of question by a constitutional amendment upon the same day: "This amendment has become a part of the constitution by its subsequent ratification at the polls." (State *ex rel.* Pacific R. R. Co. *vs.* Nichols, Governor, 30 La. Ann. Rep., 980.) A reiteration of what the court had already declared in 1875, when it said: "This amendment was adopted, and it now forms part of the organic law of the state." (State *ex rel.* Forstall *vs.* Board of Liquidation, 27 La. Ann. Rep., 577.) Moreover, the declarations of the repudiating committee regarding the condition of the state's resources and its inability to meet its honest debts are flatly contradicted by the words of the governor in his message of 1881: "The outlook for the state is most hopeful. The advantages of soil and climate are nowhere else equaled. \* \* The future for Louisiana is a grand one. It does not seem chimerical, when we look at our extraordinary advantages, to anticipate a future maximum production of \$500,000,000 per annum. There is no reason for the continued cry of 'Poor Louisiana and her impoverished people'. We must realize the fact that she is rich, and force her to the front rank of states. \* \* Confidence will be restored; our bonds will be on the market at a reasonable interest, commanding a premium; capital will readily find its way here; and we will no longer be humiliated at the low credit of our state." Both reports were supported with vigor, but the repudiating element was too strong to be successfully combated, and after a hot debate an act, known as the debt ordinance, was adopted for submission to popular vote. This ordinance provided for retiring the bonds in exchange for a new issue, upon which the interest was scaled to 2 per cent. for five years, 3 per cent. for fifteen years, and 4 per cent. thereafter; with an option to the holders to exchange their bonds at seventy-five cents on the dollar for 4 per cent. semi-annual interest bonds. The consolidated bonds issued under the act of 1874, to be retired by this forced exchange, were pledged to pay 7 per cent. interest! The act was simply highway robbery by legislative sanction. The constitutionality of the debt ordinance was at once put to the test in two actions brought by John Elliott and others against the board of liquidation. The first was to enjoin the board from recognizing the ordinance and disregarding the

funding act of 1874 and the constitutional enactment of the same year; the other, to compel by *mandamus* the payment of the interest on the consolidated bonds, and the levy and collection of a tax for that purpose. The recent decision (March, 1883) of the United States supreme court, upon the points at issue, held that the state had entered upon a voluntary contract in 1874, which had been violated by the act of 1880. But that there were no means of compelling the state's officers to carry out this contract, for the reason that the state as a sovereign commonwealth could not be sued without its permission. Upon this point the opinion of Chief Justice Waite reads as follows: "Neither was there when the bonds were issued, nor is there now, any statute or judicial decision giving the bondholders a remedy in the state courts or elsewhere, either by *mandamus* or injunction against the state in its political capacity, to compel it to do what it has agreed should be done, but what it refuses to do." A proceeding suggested by a correspondent of the "New York Nation," in February, 1878, (No. 660), was the last effort made to coerce the defaulting commonwealth. Before the adoption of the 11th amendment to the constitution of the United States, the supreme court had rejected the doctrine that a state could not be sued upon its own contracts. In the case of *Chisholm vs. State of Georgia*, 2 Dall., decided in 1792, Chief Justice Jay said. "It would be strange indeed that the joint and equal sovereigns of this country should in the very constitution by which they professed to 'establish justice' so far deviate from the plain path of equality and impartiality as to give to the collective citizens of one state a right of suing individual citizens of another state, and yet deny to those citizens a right of suing them." To nullify the principle which this decision established, the 11th amendment was passed in 1794, declaring that "The judicial power of the United States shall not be construed to extend to any suit in law or equity commenced or prosecuted against one of the United States by citizens of another state or by citizens or subjects of any foreign state." To avoid this constitutional bar the legislatures of New York and New Hampshire authorized the transfer to them by their citizens of the defaulted securities, and actions were then begun in the name of each of these states against the state of Louisiana. The supreme court, however, held that to allow such suits would be simply to permit the practice of a palpable absurdity, and the evasion of the 11th amendment. In other words, the court very properly refused to countenance a mere subterfuge by which private individuals, the real parties in interest, might dodge a plain provision of the federal constitution, and practically sue a sovereign state. Such is the history of the vain attempts to induce the state of Louisiana to keep its solemn pledges. That public dishonor entails a loss of private credit may be inferred from what follows; the words are those of a writer treating of the financial condition of the state in 1882. "The unsettled condition of the finances of the state for several years past has seriously impaired her growth and prosperity, causing a universal distrust which has not merely affected the credit and honor of the commonwealth, but has also, to a great extent, affected injuriously individual credit, prevented investment of foreign capital, and excluded immigration." (Ann. Cyc., 1882, p. 480.)

—*Minnesota*. A legislative committee in 1876 attempted to show that the state was under no obligation, legal or moral, to pay the railroad bonds guaranteed by her in 1858. Public opinion, however, was opposed to wholesale repudiation. In his message to the legislature, Gov. Pillsbury, after referring to various decisions upon the bond question in the courts of the state and of the United States, said: "With such

unmistakable and imperative commands from the voice of law and equity and honesty, is the question not reduced to the simple one of our willingness to pay our honest debts?" There was at this time over two and a quarter millions of outstanding indebtedness of the \$5,000,000 bonds issued in aid of certain railroads, the validity of which was disputed on the ground that the railroads had failed to comply with the conditions of the issue. The amendment of 1858, under which the issue was made, had been wiped out by another amendment in 1860; which also declared that the legislature should make no provision for payment of the principal or interest without submitting the proposition to the people for ratification. A compromise proposed in 1871, and agreed to by the legislature, was rejected by a vote of 21,499 to 9,293, not half the average vote being cast. The "Grangers," or "Patrons of Husbandry," had taken up the bond issue, and protested against their acknowledgment by the state, threatening to "scratch" all candidates for judicial office who would not pledge themselves against the validity of the bonds. One representative of grangerism testified before a senate committee of the United States that his notion was to elect judges pledged to "wipe out the bonds." When asked what he would do if the supreme court of the United States sustained their validity, he replied, "Wipe out the supreme court"! In pursuance of Gov. Pillsbury's suggestion the legislature, on March 1, 1877, created a board of commissioners of the public debt, and authorized the issue of new bonds to holders of defaulted securities on terms of compromise. The act was subject to amendment, to be submitted to popular vote. It provided for the sale of a portion of the "internal improvement lands" in aid of the proposed settlement. The amendment and the compromise depending upon it were rejected by a large popular majority. Again the governor, with commendable spirit, declared that although the result "indicates that they are not prepared to make settlement of this vexed question, my convictions as heretofore expressed upon this subject have undergone no change, and I earnestly hope that in the near future the people of our state will take a different view of the matter." By this time the repudiators had secured a firm grip upon the politics of the state. The national greenback-labor party, at a convention held June 10, 1879, after declaring in favor of the unrestricted coinage of silver, and the immediate repeal of the resumption act, "believing that its passage at the time was an infamous sin and crime against the debtor classes," made the following declaration in regard to the state debt: "We regard the old Minnesota railroad bonds as dishonest and illegal in their whole origin and history; a measure conceived in sin and brought forth in iniquity, and one that is not morally binding on the people of this state." Once more, in 1880, the governor urged settlement, insisting that it was possible without commercial distress. "The discharge of this debt," said he, "is demanded as a simple act of justice, which would be none the less imperative were it to involve serious sacrifices. But these are not required. The task is plain and easy, and level to the simplest comprehension. The exhibit of the state auditor shows that with a wise use of the internal improvement lands (which cost the state nothing, being a grant from congress) this can be accomplished at the present rate of taxation, without any increase of taxation." For the fifth time an attempt at settlement was made. An act was passed providing for the submission of certain questions to the supreme court of the state. The court pronounced the act void, but declared, at the same time, the invalidity of the constitutional amendment of 1860, on the ground that it impaired the validity of the contract made with the bondholders of 1858. This left the responsibility upon the legislature to act without appealing for ratification to the popular vote. An extra

session was at once convened, which passed an act in accordance with the governor's suggestion. Under this act the bonds were scaled at 50 per cent. of their nominal value, with accrued interest, and exchanged for thirty-year 4½ per cent. "adjustment bonds." By the end of 1881, almost all the old bonds had been taken up. The people, at the general election of 1882, approved the proposition to apply a portion of the proceeds of the internal improvement lands sale to the bond sinking fund. These lands are said to be so valuable that only about \$1,250,000 will have to be provided for by taxation.

—*Mississippi*. In 1875 \$7,000,000 of "Union" and other bonds, issued before the war, were outstanding. No interest had been paid since 1842 (*vide ante*). The state made short work of the bondholders' rights. A republican legislature adopted and submitted an amendment, which was subsequently engrafted upon the constitution by a democratic legislature, and which read as follows: "Nor shall the state assume, redeem, secure or pay any indebtedness or pretended indebtedness claimed to be due by the state of Mississippi to any person, association or corporation whatsoever, claiming the same as owners, holders or assignees of any bond or bonds now generally known as Union railroad bonds or Planters bank bonds."

—*Tennessee*. At the close of the war the bonded indebtedness of the state amounted to about \$43,000,000, which was subsequently reduced by sales of railroad property to about \$23,000,000. Upon this amount the state found itself, in 1875, greatly in arrears for interest, and without provision for meeting the principal on those bonds which were already beginning to fall due. The heaviest creditors of the state proposed to the governor that he should suggest to the legislature the propriety of appointing commissioners to agree with them upon terms of settlement. In accordance with the governor's suggestion, a committee of five was appointed from the legislature, which, with five New York bankers, made up an arbitration board. A meeting held at the clearing house in New York, "to consider the embarrassment of the several southern states which are in default, and to devise a plan for the readjustment of their debts," appointed, as arbitrators on the part of the bondholders, Messrs. Geo. S. Coc, Jacob D. Vermilye, B. B. Sherman, B. B. Comegys, and Enoch Pratt. At the conference with the committee from the Tennessee legislature, the latter took pains to disclaim any power beyond that of conferring with the bondholders' representatives, and reporting such compromise as might be agreed upon to their legislature for ratification. The settlement adopted for recommendation was as follows: The debt, with arrears of interest to Jan. 1, 1877, should be readjusted at 60 per cent., and settled by a new issue of 6 per cent. bonds. In the meantime, on May 17, 1876, in response to an urgent appeal from Ex-Gov. Brownlow, the republican state convention at Nashville had passed resolutions denouncing repudiation in every form. The democrats, however, fought shy of the question, for the repudiators had already won some of their followers by urging the doctrine that the abolition of slavery amounted to a destruction of taxable property for which those who were responsible—meaning thereby the bondholders at the north—should suffer the loss. It was remarked at the time that this argument "wholly ignored the continued existence of the negroes and their production as making part of the resources of the state." (N. Y. "Nation," 1877, No. 636.) On Dec. 5, 1877, a special session was convened to consider the award of the arbitrators. A bill finally passed the senate, providing for an adjustment scheme by

which the old bonds were retired at 40 per cent. of their face value, in exchange for thirty-year bonds, with interest at 4 per cent. for five years, 5 per cent. for five years, and 6 per cent. thereafter. This act was rejected by the house, on the ground that any plan which contemplated scaling the old bonds at less than 60 per cent. would not be accepted by the creditors. The legislature adjourned, after a three weeks' session, without coming to any definite results. A year later, Gov. Porter, in his message, stated that there were over \$20,000,000 bonds outstanding, of which \$11,000,000 had been declared invalid.

—The bond question had now become a distinct political issue. Although the party lines were not strictly drawn on the question, the republicans were generally in favor of meeting the debt in one way or another. The parties or factions were divided into four distinct groups: 1, wholesale repudiators; 2, those who favored retiring the old bonds at 50 per cent. of their face in exchange for 6 per cent. bonds, 3, those who favored scaling the bonds, principal and interest, to a third of their nominal value, and, 4, a party which approved the settlement urged by the arbitration committee. On these issues party lines wavered, ordinary majorities were shaken, and members of the assembly were elected because of their known standing on one or the other of these four schemes of adjustment. The finance committee reported a bill retiring different classes of bonds at different rates: some at "60 and 4," *i.e.*, scaled to 60 per cent. of their nominal value, and exchanged for 4 per cent. bonds; some at "50 and 4," and some at "33 1/3 and 4." About \$2,250,000 (mineral house bonds) were absolutely repudiated. Another class were to be scaled at 33½ per cent., and exchanged for non-interest-bearing tax warrants, receivable for state taxes and other dues to the state. After a long debate, during which every scheme was modified in one way or another, an act was passed by a close vote, March 28, 1879, providing for the retirement of most of the bonds at 50 per cent. in exchange for state fours. The provisions of this bill were supported by the railroad companies, which agreed to waive immunity from taxation and to pay taxes to such an amount as would leave about 40 per cent. of the burden to be borne by the people at 4 per cent. interest. The committee went to New York in April, 1879, where the compromise was agreed to by the representatives of the creditors, and the state seemed on the verge of a final settlement. But repudiating sentiments had made too strong headway with the people, who refused to ratify the compromise by a large majority at the popular election on Aug. 7, 1879. At their convention in the year following, May 6, the republicans declared once more in favor of the validity of the debt, insisting that any attempt to avoid it would be "downright repudiation, and an act of high-handed dishonor," and that any voluntary proposition from the creditors to take less than their claim demanded ought to be accepted as a favor. On the other hand, the green backers showed plainly enough that the taint of their financial heresies had affected their regard for a question of common honesty. Their platform contained these planks: "Resolution 1. That neither the state of Tennessee nor its citizens are bound in law or morals to pay the bonds issued in aid of the railroads, amounting to \$25,000,000, and that such bonds are no part of the state debt. Resolution 2. That we are opposed to scaling the railroad bonds, and to any other act recognizing them, because the people of Tennessee do not owe them." The democrats, at their convention, June 8, 1880, recognized the liberal disposition of the state's creditors, and favored a settlement on the best terms possible for the state. Two minority reports, however, were so earnestly pushed as to show how large a portion of

the party had succumbed to repudiating theories. One (the "Johnson Report") favored a settlement after canvassing among the people to learn the terms to which the majority would agree; the other (the "Garner Report") urged out-and-out repudiation, as follows: "§ 4. We are unalterably opposed to any settlement of the state debt by the legislature." After the adoption of the majority report, so amended, however, as to provide that the new coupons should not be made receivable for taxes, etc., 160 delegates left the hall, organized a separate convention, nominated S. F. Wilson for governor, and adopted a resolution declaring against the railroad bonds, the war-interest bonds, and the receivability of coupons for taxes and other state dues. The result of this split was, that the republicans carried the election of Mr. Hawkins, their nominee for governor, by a large vote. In 1881 a funding act, which had been carried through the house, passed the senate by a bare majority of one. But popular opposition to the recognition of the debt was still strong. Henry J. Lynn and others, claiming to be citizens and tax payers, applied to the court of chancery for an injunction, on the ground that the funding act was procured by bribery and fraud. The bill was dismissed, and, on appeal, the supreme court decided that the act which provided for funding the entire debt at par by 3 per cent. 99-year bonds, redeemable at any time after five years, was legal, except as to the provision which made coupons receivable for taxes, etc.; on the ground that the legislature could not "contract away" the revenue or enter upon an agreement which a subsequent legislature might not repeal. On May 19 the "60 and 6" act was passed, providing for the issue of new bonds at 3 per cent. interest for two years, 4 per cent. for two years, 5 per cent. for two years, and 6 per cent. thereafter, to be given in exchange for the old bonds scaled at 60 per cent. This was in accordance with a proposition from Eugene Kelly, Esq., of New York, chairman of the bondholders' committee. On Jan. 1. following, the comptroller reported that less than half of the old bonds had been funded. The bond question remained, therefore, unsettled, the democrats having split into "state credit" and "low tax" factions, with the republicans, for the most part, favoring a settlement on the best possible terms. The democrats, owing to these dissensions in their ranks were forced to hold the bond issue in abeyance. At their convention, June 20, they resolved, "2. While we accord to all an honest difference of opinion, we regard the enactment of the '60 and 3, 4, 5, 6' as unwise, because it is, in our opinion, not in accordance with the views of the people." Their third plank recommended funding the "state debt proper," the validity of which had not been disputed, at par, less war interest; and their fourth urged a tender to the creditors of a settlement of the remaining debt by ten-year bonds on the "50 and 3, 4" plan. Their nominee was Gen. W. B. Bate. One hundred and fifty delegates promptly bolted, approved the "60 and 3, 4, 5, 6" settlement, and nominated Jos. H. Fussell on the "state credit" ticket. The greenbackers, after repudiating the railroad bonds, and all but a small portion of the state debt, declared against the settlement even of that portion until ratified by popular vote, and nominated Jno. R. Beasley. Gen. Bate, the nominee of the "low tax" democrats, was elected. The "60 and 3, 4, 5, 6" plan is therefore stamped with popular disapproval, and the politicians will hardly venture upon the consideration of as favorable terms for the state's creditors in the teeth of the popular feeling. It is believed that the "readjusters" will consent to a settlement of the "state debt proper," less war interest, in full; with a provision for compromising the remainder by funding it in 3 per cent. thirty-year bonds, scaled at 50 per cent.; and the swindled creditors will have to make the best of a very bad bargain. The federal government loses by Tennessee's

repudiation. At various times, from 1836 to 1851, the United States invested moneys held in trust for certain Indian tribes by the secretary of the interior, in Tennessee bonds. Up to Jan. 1, 1883, the amount due the government, with accrued interest, was \$493,270. As the United States held the money in trust, the interest has been paid to the beneficiaries from time to time by congressional appropriation. As the debt has been repudiated by Tennessee, the tax payers of the nation have been, and will be called upon periodically to settle the debt of that state. It is claimed by ex-congressman William R. Moore, (*vide* letter to "N. Y. Herald," March 13, 1883), that both political parties in the state have again and again, through their governors and legislators, recognized the validity of the bonds which United States senator Harris declared void in the campaign of 1882. "Propositions," said Secretary Teller, in a letter to Mr. Moore, March 3, 1883, "have been made by the state of Tennessee, to issue new bonds for accrued interest on the bonds held in trust by this department, but the records do not show that any offer has been made by said state to pay said interest."

—*Virginia*. At the close of the war the public debt of Virginia amounted to about \$41,000,000. In 1866 the auditor of the state reported that the interest account, to the amount of about \$2,250,000, could not be promptly met. In the session 1870-71 the funding scheme was passed, by which the coupons of the new issue were made receivable for taxes, etc. The next legislature repealed the act, as containing provisions too favorable for the creditors, but the repealing act was not sustained by the courts, so the legislature adopted the expedient of taxing the funded bonds, evidence of the state's own indebtedness,  $\frac{1}{2}$  per cent. In 1874-5 "these measures had reduced the interest account from \$2,500,000 to \$1,417,000, but the taste for repudiation, or 'adjustment,' as it is called in Virginia, had set in and was growing, so that, after several years of cheating, the question is still a prominent one in the politics of the state, and it was only after a vigorous and excited canvass that the nomination of an open repudiator for governor was prevented. His successful opponent is now obliged to treat the subject with great caution, and there is every prospect that in the end 'readjustment' will carry the day." ("N. Y. Nation," 1877, No. 636.) In 1875 the interest account was nearly \$3,000,000 in arrears, and the outstanding bonds in 1876 amounted to \$29,489,326.38. On March 11, 1878, the legislature passed the refunding act, providing for the issue of eighteen-year and thirty-two-year 3 per cent. and 4 per cent. non-taxable bonds. In his message to the legislature, Dec. 4, 1878, the governor said: "As long as the state debt continues unsettled, there is an incubus upon the spirit and a clog upon the movements of Virginia. When it is settled honorably and finally, she will start upon a career that will not be unworthy of her history." One of the bondholders, a citizen of the state, published a statement at this time to the effect that the only possible remedy for the financial condition of the commonwealth was readjustment, *i. e.*, scaling the old issue, and reducing the interest to 4 per cent. A bill was passed in February, 1878, but vetoed by the governor on the ground that it failed to meet the requirements of the situation, and was vague, unjust and unconstitutional. In the following December he urged a further attempt at adjustment with the creditors. By this time the issue was fairly before the people, and the state divided into "debt payers" and "readjusters"—a euphemism for repudiators. Early in 1879 the McCulloch bill, which provided for refunding \$8,491,961 by a new issue, to be dated Jan. 1, 1879, payable in 1919, with interest at 3 per cent. for ten years, 4 per cent. for

twenty years, and 5 per cent. for ten years, was passed. The state was to have the privilege of redeeming the new issue at any time after the first ten years, and the coupons were made receivable for taxes and other state dues. The readjusters, under the leadership of Gen. William Mahone, assembled in convention at Richmond on Feb. 25, 1879. After adopting a resolution professing adherence to democratic principles, they declared themselves formally separated from the democratic party, and resolved as follows: "3. That in any settlement with the state's creditors the annual interest of the recognized indebtedness must be brought within her revenues under the present rate of taxation. \* \* 6. That a settlement within the limitation designated is the utmost stretch of the people's ability to pay, and should be satisfactory to the creditor as the furthest exaction he can fairly insist on. \* \* 16. That full recognition of these principles and declarations by the people of Virginia and her creditors, is absolutely essential to any amicable readjustment, and no readjustment in which they, or any of them, shall have been neglected, can be final, certain and satisfactory." Gov. Holliday declared in his message that he did not believe a higher rate of taxation could not be borne when the object was to preserve the credit of the state. "Whatever may be the views of some," said he, "I feel that should the present funding bill be stopped in its execution, it would be a great misfortune. It has been regarded by the world as a fair and honest settlement between the commonwealth and her creditors. \* \* We have every reason to believe that, had no opposition been manifested and its repeal not been mooted, the bonds by this time would have been well nigh all brought in to be funded under its operation." The vote at the election of November, 1879, stood as follows: debt payers, 69,736; readjusters 77,070. 7,689 republicans voted with the debt payers, and 18,426 with the readjusters; a result which showed a large defection from the ranks of the regular republican party, and pointed unmistakably to the coming union. So-called republicans, who cared more for victory than principle, made haste to join in a coalition which insured them a place on the side of the successful faction, and their defection swelled the readjuster ranks to the dimensions of a working majority in the state. At the ensuing session of 1879-80 the notorious senate bill No. 176, impudently entitled "An act to restore the public credit," and known as the Riddleburger bill, was passed, repudiating over \$13,000,000 of the state debt. It was promptly vetoed by Gov. Holliday. "I can not put my signature in approval to this bill," said he, in his memorandum. "I respectfully return it to your honorable body in which it originated, because I believe it to be in violation of the constitution of the state, in violation of the constitution of the United States, in violation of the spirit which has ever moved and inspired the traditions of the commonwealth and made her name so honored among men." After referring to the credit of the state, pledged as far back as 1838, the governor added: "no sooner was peace proclaimed than a general assembly, composed of her best citizens, men of the old *régime*, unanimously reaffirmed that obligation. This was repeated, in one form or another, not less than four times." The readjuster convention met July 7, 1880, with the issues and prizes of a national campaign before them. They indorsed the vetoed bill "as constituting the extreme limit of legal and moral obligations upon the part of this commonwealth to the holders of her bonds." Both readjusters and democrats favored the national nominees of the democratic party, and were careful to declare their belief that in national politics only national issues should be regarded. An attempt at fusion was made but failed, because, it is alleged, the readjusters were too grasping in their claims for the lion's share of the spoils in event of success. The futile negotiations

only widened the breach, and finally the national democratic committee, seeing that a union was out of the question, and perceiving that this dickering with the repudiators was likely to lose the party votes elsewhere throughout the country, issued an address late in October, 1880, urging the democratic voters of Virginia to support the ticket of the regulars. Whereupon the chairman of the readjusters brought out a counter address, declaring that his faction were striving for a higher prize than "any abstract title to democracy," viz., the right of the people to govern their own state in their own way. The election resulted as follows: conservative democrats ("regulars"), 96,912; readjusters, 31,679; republicans, 84,020. Meanwhile the readjuster coalition had elected Gen. Mahone to succeed R. E. Withers as United States senator for the six years beginning March 4, 1881. In the national senate the parties were equally divided, thirty-seven republicans, thirty-seven democrats, and two independents, Mahone of Virginia, and Davis of Illinois. Gen. Mahone did not appear until the second day of the session, when the debate on the organization of the committees was at its height. The fact that he had taken no part in the democratic caucus, and proclaimed himself an independent, aroused the suspicions of the democratic senators who had counted upon him to give them a bare majority entitling their party to the rights of a majority in making up the senate committees, and upon his appearance he was at once attacked by Mr. Hill of Georgia, who accused him of treachery and bad faith. Gen. Mahone took the floor in his own defense and began a statement of his position. He declared himself a democrat in principle, but insisted that he did not owe his seat to the democratic party, and announced his intention of voting with the republicans in organizing the senate. Mr. Davis voting with the democrats, a tie was the result. Where-upon Vice-President Arthur cast the deciding vote in favor of his party and against the protest of the democratic senators, who endeavored to show that the vice-president had no vote upon a question of organization, even in a tie. Gorham was chosen secretary of the senate, and Riddleburger, the readjuster, sergeant-at-arms; a selection which gave rise to renewed charges of a "deal" between Mahone and the republicans. Their opponents made desperate efforts to stave off the election of officers by all sorts of dilatory measures, motions to adjourn, etc.; but Senator Davis then declared, that, having voted for the existing organization as he had felt bound to do, now that the majority, though a majority of but one, had changed, he would no longer stand in the way to block the business of the senate. This decided the matter, and the new organization was completed. Soon after the fall election of 1880 the United States supreme court decided, in January, 1881, in the case of *Hartmann vs. Greenhow, Treas, etc.*, 102 U. S. Rep., that the Virginia act of 1873-6, which provided that the state treasurer should retain as a state tax 50 per cent. of the market value of the interest coupons on the bonds, funded and unfunded, could not be applied to coupons separated from bonds and in the hands of different owners, with out impairing the obligation with such bondholders, contained in the funding act of 1871, and the contract with the holders of the coupons. At the readjuster convention, June 2 and 3, 1881, the Riddleburger bill was again indorsed, and Mr. Cameron nominated for governor. The second place on the ticket was given to Jno. F. Lewis, who at the time was chairman of the republican state central committee. The republican committee at once convened, deposed Lewis by a vote of 15 to 2, and elected Gen. W. C. Wickham in his stead. Lewis protested, and a struggle at once began between those who favored the coalition with the readjusters and the "straight out" republicans. Both factions adopted platforms, the former declaring their reasons for allying themselves

to the readjuster, or, as they called it, the "liberal" party, in opposition to the conservative democrats whom they dubbed "bourbons." Their manifesto upon the bond issue was as follows. "4. \* \* Abating no part of our determination to deal justly with all the creditors of Virginia, and to labor to pay every dollar she honestly owes her creditors, we deem it inexpedient and unwise to make separate nominations for state officers, and we declare in favor of hearty co-operation with all other citizens who support the candidates nominated by the anti-bourbon or liberal convention of June 2 and 3, 1881." The regular republicans, or "straight outs," also held a convention and put in nomination a separate ticket, with Gen. Wickham at the head. This was their bond plank: "3. That the republican party of Virginia hereby pledges itself to redeem the state from the discredit that now hangs over her in regard to her just obligations." On Aug. 4 the conservative democrats convened, denounced repudiation, and nominated for governor Jno. W. Daniel. The readjusters' fusion elected their candidates, Cameron and Lewis, and a majority of the state legislature. At the election for United States senator to succeed Gen. Johnson in 1883, the readjusters carried their candidate, H. H. Riddleburger, the author of the repudiation act, and with a working majority of six in each branch of the legislature, proceeded to carry out their schemes for repudiating the state debt by enacting the measures commonly known as "coupon-killers." The first of these laws, entitled "An act to prevent frauds upon the commonwealth and the holders of her securities," (passed Jan. 14, 1882), provided, under the plea of protecting the state against forged and spurious coupons, that no coupons should be received by the tax collectors in payment for dues to the state until tested by a legal tribunal. In other words, it required the receiving officer to whom coupons should be tendered under the act of 1871, for taxes or dues to the state, to give a receipt for the same as "held for identification," and then to collect the taxes in legal tender, coin, or national bank notes. He was then to mark the coupons so surrendered and deliver them to the court, with which the tax payer might file a petition to prove the genuineness of his securities, and if successful in his law suit have his money refunded! The other act practically refused *mandamus* in tax cases. The constitutionality of these enactments was at once put to the test. In March, 1882, Andrew Antoni tendered for taxes a coupon of 1871, and on the collectors' refusal to accept it as payment, applied to the state court for a *mandamus*. The court divided equally on the law of 1882; and, on appeal, the United States supreme court, Chief Justice Waite delivering the majority opinion, held (March, 1883) that the state was bound to accept these coupons as already laid down in *Hartmann vs. Greenhow*, (*supra*), but declared, as the supreme court had also held in *Hoffman vs. Quincy*, 4 Wall., 553, that so long as the state legislature did not impair any substantial contract it could change the form of the remedy, and that the right to appeal to the state court for adjudication upon the validity of the coupon left to the creditor an adequate remedy. "No attempt has been made," said Chief Justice Waite, "to fix definitely the line between alterations of the remedy which are deemed to be legitimate, and those which, under the form of modifying the remedy, impair substantial rights. \* \* In all such cases the question becomes, therefore, one of reasonableness, and of that the legislature is primarily the judge." After rehearsing the provisions of the act of 1882, and the steps which a tax payer had to take to enforce his rights, the chief justice said: "It matters not whether the coupons have been refused for the taxes, if full payment of the amount that they call for is actually made in money. A remedy, therefore, which is ample for the enforcement of the payment of the money, is ample for all the purposes

of the contract. That we think is given by the act of 1882 in both forms of proceeding." The court took especial pains to say that the question was not, whether the collector might not be held responsible in damages if he attempted to collect after refusing to accept the coupons. "We decide only the question which is actually before us,"—plainly intimating that an attempt on the part of the collector to levy after such tender and refusal would render him liable. This reasoning, which to many seems rather specious, was not concurred in by Justices Harlan and Field. "No greater calamity," said the former in his dissenting opinion, "could, in my judgment, befall the country than the general adoption of the doctrine that it is not a constitutional impairment of the obligation of contracts to embarrass their enforcement with onerous and destructive conditions, and thus to evade the performance of them."

—The people of the defaulting states have not always relied solely upon an appeal to popular vote, legislative enactment or judicial decision for aid in their efforts to avoid payment of their honest debts. Voters have been coerced, by threats of heavy taxation, to lend their countenance to the schemes of the readjuster and the repudiator. In more than one state judges have lost their seats upon the bench because their decisions in favor of state honesty have given offense to the popular demand; and even force has been resorted to in some communities where the heavy interest tax has threatened a serious burden. In one county of Missouri, against which an interest judgment had been obtained, and *mandamus* to compel the levy and collection of a tax secured, an organized mob seized the books and expunged the levy. As may be seen from the decisions already noted, pronounced by the highest tribunal of the land, the defaulting commonwealths have matters entirely in their own hands. Under the 11th amendment no power can legally coerce a state to keep its solemn pledge. Whether a sense of national dishonor will ever prove strong enough to demand and secure the repeal of that provision, is a thing of doubtful surmise. But while that inhibition stands, a sovereign state possesses the royal right of snapping its fingers in its creditor's face. To the creditor no remedy is left save to rely upon the innate honesty of the people, and to wait for the slow revival of a healthy and honest public opinion. Hope of such in some communities rests, it must be admitted, upon but slight foundation.

GEORGE WALTON GREEN.

## RESIGNATION.

RESIGNATION. Applied to an office in the American system of government, the proper meaning to be attached to this term is, the relinquishment—and the return by a formal act—of all claim to the position of honor or trust which had been conferred upon the individual to the power which originally bestowed it, or to its agent accredited by law to receive such formal surrender. The highest office known to the American system is that of president. The selection of president is by the ballots of electors (electoral college), who are themselves chosen by ballot by the people of the various states of the Union. The next highest office is that of vice-president, chosen in the same manner and at the same time as the president, and who, in case of the removal, death, resignation or inability of the president to perform the duties of the office, becomes president.

—Now, with respect to the resignation of these two important offices, the laws of the United States provide (Rev. Stat., sec. 151) that the only evidence of a refusal to accept or of a resignation of the office of president or vice-president shall be an instrument in writing declaring the same, and subscribed by the person refusing to accept or resigning, as the case may be, and delivered into the office of the secretary of state. In case of the removal, death, resignation or inability of both the president and vice-president, the president of the senate, or, if there be none, then the speaker of the house of representatives for the time being, shall act as president until the disability is removed or a president is elected in accordance with the forms of law.

—Each state is entitled to a representation of two senators in the senate of the United States, who are chosen by the legislature of the state in accordance with the provisions of the constitution, the laws of congress, and those of the state enacted for that purpose. In case of the resignation of a United States senator during the recess of the legislature of a state, the executive of such state is empowered by the constitution to fill the vacancy thus occurring, by making a temporary appointment until the next meeting of the legislature, which shall then fill such vacancy by the election of a successor.

—As it is the duty of the executive of a state from which a senator has been chosen, to certify his election, under the seal of the state, to the president of the senate of the United States; and as it is likewise the duty of the executive when vacancies happen in the representation of his state in the senate of the United States, that he shall notify the legislature that such vacancy exists, it is therefore incumbent that the resignation of a senator should be transmitted to the executive of such state as he has represented in the United States senate.

—The constitution also provides that when vacancies occur in the representation of any state, the executive authority thereof shall issue writs of election to fill such vacancies; therefore when a representative in congress from any state resigns his seat in that body, his resignation must be forwarded to the governor of his state, who will thereupon issue his writ ordering an election in such district to fill the vacancy created

by the resignation. But the governor of a state has no authority to appoint a member temporarily to fill the vacancy in the state's representation in the house of representatives, as he is empowered by the constitution to do when, under certain circumstances, a vacancy exists in the senate.

—Should a member of the cabinet resign his position as head of the department to which he was called by the president, the resignation of such officer must be addressed to the president of the United States from whom he received the appointment, and who at his early convenience, will appoint his successor by and with the advice and consent of the senate. Until his successor is appointed, the duties of the office are performed by the assistant secretary or assistant head of the department.

—Sometimes a president calls for the resignation of a single member of his cabinet when displeased with his course, or, upon a change of policy or for other cause, he may require the resignation of all the members of his cabinet; and it is usual for each member of the cabinet to tender his resignation to the president, to take effect at the expiration of his term of office; and likewise all members of the cabinet of a deceased president tender their resignations as such to the vice-president on his assuming the duties of president.

—Whenever the heads of bureaus or the subordinates of any of the heads of the departments resign their offices, if they have been appointed by the heads of such departments, their letters of resignation will be addressed to such heads of departments; but if their appointment proceeds from the president of the United States, the letter of resignation must be addressed to the president of the United States. The resignation of persons in the various branches of the diplomatic service come under this rule.

—Whenever the governor of a state resigns his position as such, the powers, duties and emoluments of the office for the residue of the term devolve upon the lieutenant governor. In case the lieutenant governor should resign also, or become incapable, from any other cause, of performing the duties of the office, the president of the state senate will act as governor until the vacancy is filled or the disability removed. And if the president of the senate, from any of the above-named causes, becomes incapable of performing the duties of governor, the same will then devolve upon the speaker of the house of representatives.

—If the office of auditor, treasurer, secretary of state, attorney general, superintendent of public instruction, or other state officer, becomes vacant by reason of resignation or otherwise, the laws of the states generally authorize the governor to fill the same temporarily until successors are elected in such manner as may be provided by law.

—Whenever members of either branch of the state legislature resign their positions as such, the executive of the state will immediately issue writs of election to fill the vacancies thus created, and the person thus resigning must direct his letter of resignation to the governor of the state, who will, upon this notification, proceed as directed by law.

—Whenever a vacancy occurs in the office of chief justice of the supreme court of the United States by reason of resignation or otherwise, the duties and powers of his office will devolve upon the associate justice who is first in precedence, until another chief justice is appointed and duly qualified. This provision applies to every associate justice who succeeds to the office of chief justice.

—Should a judge of a United States circuit court resign his position as such, the court for that circuit may be held by the circuit justice or by the district judge of that district, sitting alone, or by the two sitting together; but a district judge thus sitting can not give a vote in any case of appeal or error from his own decision: *Provided*, That such a cause may, by the consent of parties, be heard and disposed of by him when holding a circuit court, sitting alone. When sitting with the justice of the circuit, the judgment or decree in such cases must be rendered in conformity with the opinion of the presiding justice.

—If, by reason of resignation or otherwise, no justice is allotted to a circuit, the chief justice of the supreme court may request the justice of another circuit to preside at the court to be held therein, and exercise all the powers connected therewith, until a justice is allotted to such circuit.

—When the office of judge of any district court becomes vacant, by reason of resignation or otherwise, all process, pleadings and proceedings pending before such court must be continued until the next stated term after the appointment and qualification of his successor. But when the office is vacant in any district of a state containing two or more districts, the judge of the other or of either of the other districts may hold the said district court, and all proceedings before him will have the same effect and validity as if done by or before a judge appointed by such district.

—Section 714 of the Revised Statutes provides that, whenever any judge of any court of the United States resigns his office, after having held his commission as such at least ten years, and having attained the age of seventy years, he shall, during the residue of his natural life, receive the same salary which was by law payable to him at the time of his resignation.

—Whenever vacancies occur in the office of judges of state courts by resignation or otherwise, and such offices are elective, such vacancies must be filled by an election; but generally, when the unexpired term does not exceed one year, the vacancy is filled by an appointment by the governor of the state, to whom the letter of resignation is addressed, and by whom all judicial officers are commissioned.

—With respect to the resignation of officers of the army, the law provides that whenever a vacancy occurs, by resignation or otherwise, in the office of general or lieutenant general, such office shall cease, and all enactments creating or regulating such offices shall, respectively, be held to be repealed.

—The laws further provide that no officer of the army shall hold any civil office, whether by election or appointment, and every such officer who accepts or exercises the functions of a civil office, shall thereby cease to be an officer of the army, and his

commission shall be vacated, the same as if he had resigned from the service. Also, that any officer of the army who accepts or holds any appointment in the diplomatic or consular service of the government, shall be considered as having *resigned* his place in the army, and it shall be filled as a vacancy.

—Article 49, of the Articles of War, provides that any officer who, having tendered his resignation, quits his post or proper duties without leave, and with intent to remain permanently absent therefrom, prior to due notice of the acceptance of the same, shall be deemed and punished as a deserter.

—With respect to the resignation of officers in the naval service of the United States, the law provides that vacancies occurring in the grades of admiral and vice-admiral shall not be filled by promotion or in any other manner; and that when the offices of said grade shall become vacant, either by resignation or otherwise, the grade itself shall cease to exist.

—The laws further provide, that if any officer of the navy accepts or holds an appointment in the diplomatic or consular service of the United States, he shall be considered as having resigned his place in the navy, and it shall be filled as a vacancy. Also, that no officer of the navy who has been dismissed by the sentence of a court martial, or suffered to resign in order to escape such dismissal, shall ever again become an officer of the navy.

—Article 10, of section 1624, Rev. Stat., relating to the government of the navy, provides that any commissioned officer of the navy or marine corps, who, having tendered his resignation, quits his post or proper duties without leave, and with intent to remain permanently absent therefrom, prior to due notice of the acceptance of such resignation, shall be deemed and punished as a deserter.

## RETURNING BOARDS

RETURNING BOARDS (IN U. S. HISTORY). There is an infinite diversity in the laws of the different states which regulate the declaration of the results of popular elections; but they may be very roughly grouped under three classes. 1. The returns of elections for governor and other state officers are generally sent to the secretary of state. In some states they are sent by him to the presiding officers of the legislature, to be opened and canvassed in the presence of the two houses; in others they are canvassed and declared by the persons holding certain designated state offices. These latter are canvassing boards; and their powers are thus summed up by Cooley, as cited below: they "act for the most part ministerially only, and are not vested with judicial powers to correct errors and mistakes that may have occurred with any officer who preceded them in the performance of any duty connected with the election, or to pass upon any disputed fact which may decide the result." Nevertheless, some correction is always done, the extent and importance of it varying in different states, and sometimes according to party necessity. Indeed, much of the difficulty of 1879 in Maine (see that state) arose from the partisan application by the canvassing board of varying state precedents in the correction of errors or the refusal to correct them. 2. In the case of members of the legislature, the returns usually go at first to the secretary of state, though sometimes to a canvassing board or directly to the presiding officers of the two houses. Contests, however, are decided by the houses themselves. 3. In the case of other state and local officers, contested returns are generally settled by the courts, either by statute or by the issue and decision of common law writs in the nature of *quo warranto*. 4. In the mixed case of presidential electors, appointed "in such manner as the legislature of the state may direct," but acting in a national capacity, the final and absolute decision of contests properly belongs to the state also (see PENNSYLVANIA), with a general power in congress to make rules for the authentication of the state's decision. Congress, however, has never done its duty in the premises, but has reserved to itself a special power to decide arbitrarily upon special cases of contested elections of electors. (See ELECTORS.)

—The circumstances of the reconstructed state governments of the southern states after the rebellion (see RECONSTRUCTION, III.) were peculiar. The voting majority had been made ignorant, timid, poor and debased by a system of hereditary slavery; the minority, whether voting or disfranchised, was embittered by defeat, by a rankling sense of injustice, and by a hatred of negro rule. What was to prevent the minority, by organized or spontaneous fraud or violence, from ousting the majority as soon as the strong hand which had reversed their positions should be withdrawn? The first effort to solve this problem by the interposition of returning boards may be found in the Arkansas constitution of 1868. Hitherto the returns of elections to ratify or reject a state constitution had always been made to one or more of the old state officers, with only ministerial power, that is, power to compile, count and declare the results sent them by election officers. The Arkansas constitution designated three private persons by name as returning officers, with judicial powers. They were to receive returns from the judges of election, to compile and count them, to reject all fraudulent or illegal votes, and in case of fraud, fear, violence, improper influence or restraint, to set aside

the whole election and order a new one, or to reject or correct the result in any county or precinct. On the contrary, the constitution of the same state in 1874, while naming three returning officers, gave them no judicial powers.

—In Florida, South Carolina and Louisiana, returning boards with judicial powers were established by the reconstructed state governments by statute. In all three states the power to do so was claimed under very similar clauses in the state constitution: in Florida, that "laws shall be passed regulating elections, and prohibiting undue influence thereon from power, bribery, tumult, or other improper practice"; in Louisiana, that "the privilege of free suffrage shall be supported by laws regulating elections, and prohibiting, under adequate penalties, all undue influence thereon from bribery, tumult, or other improper practice"; in South Carolina, that "the right of suffrage shall be protected by laws regulating elections, and prohibiting, under adequate penalties, all undue influences from power, bribery, tumult, or improper conduct." Outside of these clauses there is absolutely no provision by which the powers given to the returning boards can be defended; and the clauses specified seem to be plainly intended for the regulation of the elections themselves, and not to empower the legislative or executive departments to assume judicial functions in counting the results of the elections. And, as one of the members of the electoral commission commented on the Louisiana provision as a novelty in state constitutions, it may be well to note that in Florida since 1838, and in Louisiana since 1812, these same provisions, *ipsissimis verbis*, had been inserted in all their state constitutions; but no one, until 1868-72, supposed that they authorized the creation of returning boards, with judicial powers, by the state legislatures. Indeed, such assumption is impliedly forbidden by the constitution of every state, and expressly forbidden in most of them, as it is in Florida and South Carolina: "The legislative, executive and judicial powers shall be separate and distinct from each other, and no person or persons exercising the functions of one of said departments shall assume or discharge the duties of any other." In Louisiana, also, it is provided that "no judicial powers, except as committing magistrates in criminal cases, shall be conferred on any officers other than those mentioned in this title [judges of various grades]." The powers given to a returning board, in state elections, seem to have been absolute usurpations by the legislature: a violent revolution, to be resisted by the individual just so far as he should choose to risk his personal safety. But, in the matter of presidential electors, in which the country at large was most interested in 1876-7, the power of the legislature to constitute returning boards with judicial powers rests on an entirely different basis, distinct from and higher than the state constitution itself. The national constitution directs the appointment of the electors of a state to be "in such manner as the legislature thereof may direct." The power of the legislature over the manner of appointment is thus absolute, and can not be restrained or abridged either by the state constitution or by congress. If the state constitution should expressly prohibit returning boards in the case of presidential electors, the prohibition would have no effect whatever on the legislature. The distinction is essential. It will explain why the Hayes administration in 1877 abandoned the defense of the state governments which were the creatures of the returning boards; and will show the sophistry of the plausible assertion that the administration had thereby impeached its own title.

—The Florida act of Feb. 27, 1872, constituted the secretary of state, the attorney general, and the comptroller, or any two of them with any other member of the state cabinet designated by them, a board to canvass returns of state elections, and elections for presidential electors, and to determine and declare who have been elected. "If any returns are so irregular, false or fraudulent that the board can not determine the true vote, they shall so certify, and shall not include such returns in their determination and declaration." In Louisiana (see that state) there was a continuous difficulty in ascertaining the true returning board; but the final act of Nov. 20, 1872, constituted "five persons, to be elected by the senate from all political parties," a board with power "to make the returns of all elections." A majority of the board was to be a quorum; and in case of any vacancy by death, resignation or otherwise, the vacancy was to be filled by the residue of the board. In case of any violence or bribery in any precinct, the local election commissioners were to certify the facts to the returning board through the secretary of state or the supervisors of registration, annexing their certificate to the returns, which were to be sent within twenty-four hours after the election. Within ten days after the election the returning board was to meet in New Orleans; canvass and compile those returns which had no certificates of bribery or violence annexed; then investigate the certificates which had been annexed, taking evidence thereon, and sending for persons and papers; and finally exclude the returns from any voting place, if satisfied that the commissioners' certificate was correct, and announce the result. Their determination was to be *prima facie* evidence of the right to hold office, "until set aside after contest according to law." If the constitutionality of the law be granted, its provisions, honestly executed, would seem to be very fair. The twenty-four hours' limitation on the sending of certificates by local commissioners would preclude any general collusion; open trial of evidence would ascertain the truth or falsity of the certificates of violence; and the power of setting aside their decisions, to be exercised by the legislature in the case of its own members and by the courts in the case of other officers, would have been a sufficient safeguard. Unfortunately, we can know little of the possible results of a righteous execution of the law; for the board systematically disobeyed most of its provisions, and perverted the rest. The essential point of the twenty-four hours' limitation was disregarded; the secret sessions of the board made the taking of "evidence" a farce; and by these two perversions it made both the courts and the legislature so entirely its creatures as to practically destroy any right of appeal.

—The South Carolina statute was a combination of both the preceding. Local canvassers sent their returns to the county canvassers, and these to the state returning board, composed of the secretary of state, the treasurer, the comptroller, the attorney general, and the adjutant general. These had judicial powers over the canvass, except as to the returns for governor and lieutenant governor, which they were to transmit to the speaker of the house, to be counted in the presence of both houses.

—Bitter complaints had often been made of the partisan and unfair action of the returning boards, particularly in Louisiana, but little attention was paid to them in northern states, where the boards were generally considered in some sense an antidote to southern lawlessness at elections. Immediately after the presidential election of 1876 it was found that the whole result hinged on the decision of the returning boards. (Oregon is not regarded here, since in that state the canvassing officer, the secretary of

state, had been given no judicial powers, either by the constitution or by the legislature.) In Florida the returning board consisted of Samuel B. McLin, secretary of state, Clayton A. Cowgill, comptroller, and Wm. A. Cocke, attorney general in Louisiana, of J. Madison Wells, T. C. Anderson, L. M. Kenner, and G. Casanave, all private citizens except Wells, who was federal naval officer at New Orleans; in South Carolina, of Henry E. Hayne, secretary of state, F. L. Cardozo, treasurer, Thos. C. Dunn, comptroller, Wm. H. Stone, attorney general, and H. W. Purvis, adjutant general, all colored except Dunn and Stone. Nov. 10, a large number of republican and democratic leaders in northern states, on the invitation of President Grant and the democratic national committee respectively, went to the three disputed states to watch the canvass; but they had no concert of action, and can not really be said to have acted at all. The boards met and organized in South Carolina Nov. 10, in Louisiana Nov. 16, and in Florida Nov. 27. In Louisiana the fifth member of the board, Oscar Arroyo, a democrat, had, for some unexplained reason, resigned immediately after the election, and the remaining four, all republicans, refused to fill his place. When the board, by its tenth rule, resolved to decide contests in secret session, the democrats protested, but without success. The board also refused to allow United States supervisors to be present at their secret sessions; to allow counsel for contestants to inspect the counting of the returns; or to count the ballots of four republican parishes, on which the names of five of the eight Hayes electors had been forgotten, only for the three electors specified on them. It is impossible to give the board's defense of its action in these cases, for it assigned no reasons. Dec. 6, it declared elected the republican candidates for state officers, 4 republican and 2 democratic congressmen, 19 republicans and 17 democrats in the state senate, and 71 republicans, 43 democrats, and 3 independents in the state lower house. Its principal changes had been made by counting for all the eight Hayes electors some 1,200 ballots bearing the names of only three; and by throwing out about 13,000 democratic and 2,000 republican votes, mainly in the parishes of East Baton Rouge, De Soto, East and West Feliciana, Grant, Iberia, Lafayette, Lafourche, Morehouse, and Ouachita. No attempt was made to control the board by the state courts.

—In Florida the state circuit court for Leon county, before the meeting of the board, had ordered it to canvass the votes forthwith. Dec. 5, the board declared the popular vote on presidential electors to be 23,849 republican, and 22,923 democratic, a republican majority of 926; all of Manatee county, and parts of several other counties had been rejected for violation of election laws. Dec. 22, the state supreme court ordered the board to canvass the votes for state officers only from the face of the returns. What the "face of the returns" was, is doubtful. Both parties agree that, taking all the counties but one (Baker), the vote in the state was almost an exact tie. From Baker county two returns had been sent: one, made up Nov. 10, by the county clerk and a justice of the peace, giving the vote as 143 republican, and 238 democratic, a democratic majority of 95; and another, made up Nov. 13, by the county judge, sheriff, and a justice of the peace, excluding two precincts, and giving the vote as 130 republican, and 89 democratic, a republican majority of 41. The gist of the difficulty was thus in the double return from Baker county. Taking the second return from Baker county, and throwing out Clay county (164 democratic majority), the board reported, Dec. 27, a republican majority of 206 for electors, and a democratic majority of 195 for governor. This report the court refused to receive; and, Jan. 1, 1877, the

board at last made return in accordance with the democratic claims, and the democratic state officers were inaugurated. But in the case of the electors it was too late. The Hayes electors had received the governor's certificate on the board's first return, had met and voted, Dec. 6, and were now dead in law. The Tilden electors had met and voted the same day, on a certificate given by a single member of the board. Jan. 17, 1877, the new legislature passed an act requiring the new state officers to canvass the returns for 1876. This they did, and declared the Tilden electors successful; but the electoral commission decided this action to be entirely *ex post facto*, and void.

—In South Carolina the state supreme court ordered the board to exercise no judicial functions in the state count, Nov. 17, and in the presidential count, Nov. 22; but on the same day that the latter action was taken, the board gave certificates to the republican electors and state officers, and adjourned *sine die*. They were arrested for contempt, but released by the federal circuit court on *habeas corpus*.

—In Louisiana and South Carolina new election laws were at once passed by the new democratic legislatures, under which the judicial functions of the returning boards were almost entirely cut off. The same result had almost been reached in Florida by the supreme court's construction of the board's powers; but in 1878 the board (now democratic) again threw out two counties for informality. The state supreme court again decided against the board. It may be taken for granted in future that Judge Cooley's definition of the powers of a canvassing board, heretofore cited, will be followed by all American courts; and that any attempt by a state legislature to give such a board judicial functions, without a plain authorization of the act by the state constitution, will be held by the courts to be unconstitutional and void.

—For further proceedings in regard to the votes of the presidential electors, see ELECTORAL COMMISSION; DISPUTED ELECTIONS, IV. See constitutions of the states referred to in Poore's *Federal and State Constitutions*; summary of provisions for election returns in the various states, 2 Hough's *American Constitutions*, 758; authorities under ELECTORAL COMMISSION; Cooley's *Constitutional Limitations*, 3d edit., 734, and law authorities there cited; *Louisiana Rev. Stat.*, 96 (act of Nov. 20, 1872); 25 *Louisiana Annual Rep.*, 14, 263, 267; 16 *Florida Reports*, 17; and later authorities under LOUISIANA.

## REVENUE

REVENUE, Public. Finance is declared by Bentham to be "an append and inseparable accompaniment of political economy." Economists are, however, divided in their opinions regarding the closeness and the legitimacy of this connection. Joseph Garnier remarks, that certain writers of general treatises on political economy have not even touched the subject: Malthus, Skarbek, Senior, and James Mill. Others have only dealt with it in a highly summary manner: Sismondi, Rossi, Storch, Cherbuliez, Courcelle-Seneuil and Stuart Mill, while treating the subject very briefly, have yet pointed out and discussed the fundamental questions of finance. Adam Smith, continues M. Garnier, devoted to this subject a fourth of his "Wealth of Nations." J. B. Say has given a like proportion of his "Treatise" and of his "Course" in political economy to the causes and effects of the public consumption of wealth. He did not, however, examine, as Smith had done, the different kinds of taxes. Ricardo has entitled his chief work, "The Principles of Political Economy and Taxation"; but that which relates to finance, proper, occupies no more than a fourth of his work. McCulloch has not treated of financial questions in his political economy, but has discussed them in a separate treatise, giving to them a very full consideration. Rau has, likewise, treated separately that which M. Garnier calls "this important branch of political economy."

—The causes which have thus led to the exclusion of finance from formal treatises on political economy, or to its very slight and partial recognition therein, may be stated as follows: First, According to the most frequent classification of the subject, the revenue of the state falls into that one of the old-fashioned "departments" of political economy, which is known as "consumption." The tendency of the writers of the present and of the last generation has been to omit all consideration of the consumption of wealth, whether as to its objects or as to its effects. Secondly, The revenue of the state falls outside the sphere of contract, which would be a sufficient reason for omitting to take note of it, in the case of the school of writers who make political economy to be purely "the science of exchanges." As Dr. Sturtevant remarks, "The wages of government are not determined by economic laws; it receives whatever it demands. In some cases it takes the position of a partner, and accepts for its compensation a certain percentage of the profits; but that share is not determined by an agreement between the partners, but by the will of this one partner." Thirdly, and chiefly, considerations purely political always enter in a great degree, and often in a controlling degree, into the decision of questions relating to the collection of public revenue. The statesman, as financier, may legitimately ask, not which is the best tax, or the most economical mode of assessment, but which is the most politic. He not only may, he must, consult the temper and habits of his people. He must consider the times and the circumstances, quite as heedfully as he does the normal operation of economic laws. Even the special race-quality imparted by descent must be respected in the collection of public revenue. "A land tax," wrote Sir James Steuart, in the last century, "excites the indignation of a Frenchman; an excise that of an Englishman." Thomas Jefferson observed a corresponding difference in the susceptibilities of the northern and the southern portions of this country, in his day. "In most of the middle and southern states," he says, "some land tax is now paid into the state treasury; and,

for this purpose, the lands have been classed and valued, and the tax is assessed according to that valuation. In these, an excise is most odious. In the eastern states land taxes are odious; excises, less unpopular."

—M. de Parieu, in his monumental work on "Taxation," thus expresses a striking characteristic difference between the Teutonic and the Latin nations in enduring taxes on property and income: "While countries inhabited by the pure Germanic race, or by its principal branches, Germany, Scandinavia, Great Britain and North America, support almost universally taxes of this kind, the financial history of the Neo-Latin peoples has made us acquainted with but a small number of isolated applications, temporary or abortive, of such a rule of contribution. Even in Switzerland, a country of mixed race, the field of general taxes upon property and income appears, with the exception of Geneva, to be confined within the frontiers which circumscribe the German race and language. This difference of moral aptitude in relation to the taxes under discussion, which appears in comparison of the Germanic and the Latin races, whether from history or from contemporary statistics, long since attracted the attention of certain Italian publicists. Machiavelli, Botero and Braggia have mentioned German customs in this regard as exceptional. \* \* That which characterizes the methods of applying general taxes to property and income, is the necessity of a certain degree of loyalty,<sup>74</sup> patience, and even of spontaneity,<sup>75</sup> among the tax payers. "Is it not," continues M. de Parieu, "easy to understand that, following the analogy of individuals, some nations may present, relatively to others, the character of greater sincerity, of a greater disposition spontaneously to burden themselves, and of a greater patience when in contemplation of a right object? Is it inconsistent with our observation of manners and morals to acknowledge that certain populations possess, with a temperament more cold, a stronger infusion of that natural sense of justice, so necessary in the application of an income tax equally among the contributors summoned to declare their fortunes, and among the assessors charged with supervising and correcting these declarations? I could not," he concludes, "assert that there is among the Germanic peoples more of authority or of liberty than among the Neo-Latin peoples. What seems certain is, that authority and liberty are there distributed and understood in a different manner. The Germanic peoples appear to accept more easily than do the Neo-Latins, authority coming close to the individual, at the hearth of the family, in the town or near at hand."

—It will readily appear that differences in race aptitudes for taxation, such as those indicated by M. de Parieu, may not only control the forms of assessment or contribution, as between one community and another, but may have power to appreciably affect the proportion of the aggregate income of a community which the treasury can command, whether for ordinary public purposes or in the great exigencies of state. Of two nations of equal wealth, one may, through the stronger sense of justice native in its people, through an excess of loyalty and spontaneity in the support of the government, possess a fiscal force twice or thrice that of the other.

—It is not, however, alone differences of a moral nature which affect the relative fiscal force of communities. Differences in the prevailing occupations of the people, in the rapidity of circulation, and in the distribution of wealth, irrespective of its aggregate amount, may have important effects upon the power of the treasury to

secure contributions to public uses. In a commercial or manufacturing nation, where capitals are concentrated, and where nearly the whole body of the annual product becomes the subject of exchange, perhaps is even exchanged several successive times between the hands of the producer and those of the consumer, the government can command a far higher proportion of the aggregate income of the people than can be done in a purely agricultural state.

—But while considerations like the foregoing may properly enter to influence the views of the financier, in matters which can hardly be termed matters of detail, the essential subjection of the fiscal interests of the treasury to the economic interests of the community,<sup>76</sup> can never safely be disregarded. Mr. R. H. Patterson, in his "Science of Finance," justly says, paraphrasing in his final sentence Burke's remark about justice as the great standing policy of nations, that "the statesman may, for reasons such as have been intimated, deal with the collection and disbursement of revenue on methods somewhat different from those which the strict application of economical principles would require; but it must always be as a conscious deviation from a right rule. He must never go very far from principles, or remain long away. Else, his policy will prove no policy at all." Mr. Patterson adds, as justly as piquantly, "there are many things in the world which have the knack of being as broad as they are long; and this is peculiarly the case with state finance."

—Taxes and public revenue are commonly used as interconvertible terms, and in popular speech, or for the purposes of approximate statement, this is well enough. Yet for scientific purposes, or in any careful survey of the fiscal history of a country, or in a comparative statement of the fiscal resources of two or more nations, the public revenue may include something more than, perhaps something very far in excess of, the aggregate of all sums received into the treasury as the result of official assessment and of compulsory collection. Among these may be named the sums received by gift or voluntary contribution of citizens, the value, known or estimated, of all prerogatives or privileges of requisition or of purveyance, respecting services or supplies, together with a fair rental of all domains, buildings or other property occupied or used for public purposes.

—The revenue of France, for instance, during the present year, when properly stated, will include, in addition to the actual receipts into the treasury, the market value of the services rendered by some hundreds of thousands of citizens of the republic, as soldiers under the conscription act, over and above that which the state actually pays as wages to these involuntary servants. This last item is of enormous consequence in all countries having a compulsory military system. Indeed, this, which by some has been called "the blood tax," is by far the greatest of all the taxes of modern times. Were it necessary for France, Germany or Russia to go into the market for labor, and pay wages sufficient to induce men, to the number of its present soldiery, to enter its service voluntarily, the expenses of the government would be enormously increased, probably to the result of early fiscal bankruptcy. It is fairly matter of question whether any one of the countries named could, by the utmost exertion of the power of taxation, short of producing universal revolt, raise money enough to hire the services of its existing army. Yet the market value of these services clearly belongs to the revenue of the state, whether those services are obtained by payments out of the treasury, or

through an exertion of legal authority in the form of conscription; while it is certain that the cost of those services to the people, obtained as they are by abruptly and violently withdrawing from industry and trade that number of workers, many of them of the higher grades of intelligence, and occupying positions of responsibility, is vastly greater than would be involved in obtaining an equal number of equally good soldiers through solicitation and voluntary enlistment. In like manner, if the government of France exercises rights of requisition or purveyance through officials, high or low, as to supplies, whether for peace or war, the amount saved to the treasury thereby, through avoiding purchase in an open market, is properly to be included in an account of the public revenue. In a word, the revenue of any state, for any given year, is constituted of each and every valuable thing which is, in that year, applied to governmental purposes.

—A classification of the several principal sources of public revenue has long been a desideratum. No such scheme could be free from objection, and many a scheme may, in some one respect, possess an advantage over that scheme which is, as a whole, the best. The following classification will be observed in this article: *Sources of Public Revenue*. I. Voluntary contributions. II. Public property, lucrative prerogatives and state enterprise. 1, rent charges in favor of the state, as the proprietor of all lands; 2, escheat; 3, fines and forfeitures for criminality and delinquency; 4, tributes from colonies, dependencies and conquered nations, including war fines, requisitions and indemnities; 5, sale of offices, honors and titles; 6, domains (*L'état capitaliste*); 7, state enterprise (*L'état entrepreneur*). III. Quasi taxes. 1, monopolies; 2, lotteries; 3, purveyance of supplies, and requisition of services; 4, fees; 5, seigniorage on coin; 6, paper money. IV. Taxation, in its various forms. Taxes may be assessed, 1, on the basis of realized wealth, commonly spoken of as capital; 2, on the basis of annual income or revenue; 3, on the basis of faculty, or native and acquired power of production; 4, on the basis of expenditure, or the individual consumption of wealth. Exemption from taxation may be claimed, 1, for noble and privileged classes; 2, for clerical persons and religious orders; 3, for charitable and educational institutions; 4, for the poorer classes of the community, either through the omission from assessment of a certain minimum income, or through an ascending scale of taxation upon higher incomes (progressivity in taxation). Taxes may be collected, 1, in services, 2, in products; 3, in money. Taxes are commonly, in discussion, divided as, 1, direct; 2, indirect. This distinction, however, is of only very general use, it being impossible to distribute the taxes actually levied in any state, under these two heads, without great confusion and much manifest error. The French writers further divide direct taxes into, 1, *taxes de répartition*, of which the produce is certain and known in advance; 2, *taxes de quotité*, of which the produce can not be known in advance, and varies with external conditions.

—The following classification of taxes, made by M. De Parieu, according to the objects they reach, or at least upon which they are assessed, is believed to be the most convenient and useful: 1. *Les impôts sur les personnes, ou capitations*—Taxes upon persons, or poll taxes; 2. *Les impôts sur la richesse, ou sur la possession des capitaux et revenues*—Taxes upon wealth, or upon the possession of capital or income; 3. *Les impôts sur les jouissances*—Taxes upon use or occupation [corresponding very closely to the English assessed taxes on carriages, horses, windows, lodgings, etc.]; 4.

*Les impôts sur les consommations*—Taxes upon consumption; 5. *Les impôts sur les actes* —Taxes upon transactions [sales, etc.] Of these five classes, M. de Parieu remarks, that the first three approximately conform to the general definition of direct taxes, the last two being indirect. Of the first group, taxes upon wealth, and of the second group, taxes upon consumption, are at once most characteristic and the most important. These constitute "the two poles of the general system of taxation."

—Having offered the foregoing classification of the sources of public revenue, we will proceed to speak briefly of each.

—I. *Voluntary Contributions*. It is difficult for the man of the present age to conceive of the state as supported by voluntary contributions; yet not only were these once, in theory, almost the sole resource of the ruler, except through personal services; but they, in fact, survive to this day, in a few isolated communities, in the form of the self-assessment of the citizen. To go no farther back than the feudal days, in England, while the chief military support of the kingdom was afforded by the muster of the vassals, it was the fiction of the law, that, so far as aids and subsidies were concerned, the tax payer made a voluntary offering to relieve the wants of the prince; and that the promise of a tax bound only the individual who made it. It was the practice of bringing personal property and income under contribution, which gave rise to the idea that taxation and representation must go together, and caused the formal grant of money. At the beginning of the system of poor relief, in the early years of Elizabeth, collections were taken in churches, and each person was left to be the judge of what for him constituted "a reasonable contribution."

—The papal revenues, also, may perhaps be brought under this head. The pope was by far the greatest capitalist of the middle ages. The British parliament at one time declared that the contributions made by their people to the pope were five times as great as those made to the sovereign.

—Adam Smith cites Hamburg, Basle, Zurich, Unterwald and Holland, among the communities where the self-valuation of the citizen was still, in his day, accepted. Riesbeck, in his "Travels in Germany," says of the first named city, "some taxes are voluntary, and the burghers have the right to put what they think their quota into the purse, which is shut, and the deputies dare not open it in their presence." Even within a few years there have remained free cities in Germany and cantons in Switzerland, where the rule of voluntary contribution still subsisted in all its purity.

—II. *Public Property, Lucrative Prerogatives and State Enterprise*. 1. Rent charges in favor of the state, as the proprietor of all lands. Throughout considerable portions of Asia and in Turkey in Europe, the rent of land, paid to the state, furnishes by far the greater part of the public revenues. That the soil originally belonged to the community or nation, private property in land being, indeed, a comparatively modern institution, and finding its justification only in political expediency, is admitted by nearly all publicists of authority. By vesting the title to the soil in individuals, the state sacrifices that large revenue resulting from the progressive enhancement of the value of land, which would otherwise have accrued to the treasury. It is equally beyond question that all the advantages of the private ownership of land might have been obtained, while

yet the state imposed fiscal charges and military or political obligations which would have secured for the community a considerable share of that progressive enhancement of values.

—The proposition to reassert the right and interest of the state in all the land which has become the subject of individual ownership, was made by Mr. John Stuart Mill, in the later days of his life, and the programme for this substitution of rent for taxation, with the arguments in its favor, will be found in his later speeches and essays. Mr. Mill pointed to the commutation of the feudal obligations of the English landowners, for the altogether insufficient consideration of a tax of four shillings in the pound upon the valuation of 1692, and also to the sacrifice of the interests of the crown in the lands of a portion of British India, by which the "unearned increment" was allowed to pass into the hands of individual proprietors, instead of being reserved to the public treasury. Mr. Mill's practical proposition was to appraise all estates according to their present market value, and thereafter to assess them to the full amount of all enhanced value which could not be shown to be due to applications of labor and capital. To this he looked as a fiscal resource which should relieve the community from the greater part if not all of the burden of taxation. More recently Mr. Henry George has proposed, in his "Progress and Poverty," to assert the right of the state, not only to all future increase of value in the land, but to its present value, asserting that all grants of exclusive property in land are and have always been void, and that the proprietors of land are not even entitled to reserve the value of their improvements.

—2. Escheat, the principle, viz., that the state is the proprietor of all estates, real or personal, to which individual titles or claims are lost. It will at once appear that the scope of this principle, from the point of view of revenue, will widen or contract in correspondence with the laws which regulate the descent and bequest of property, and prescribe the times and modes of proving claims, in which respect some countries are far more liberal than others. Under the feudal system, escheat constituted a most important source of revenue. In England the right of devising real property did not exist, after the conquest, until the time of Henry VIII.; and no small proportion of the lands of the kingdom passed to the crown under the operation of this principle. Modern society, however, whether out of sympathy with the instincts of property right,<sup>77</sup> or from a politic desire to promote the spirit of accumulation, has given continually wider and wider extension to the power of bequest and to the principle of inheritance, until escheat, as a source of revenue, has ceased to be of much importance.

—In 1795 Jeremy Bentham published a notable tract entitled "Escheat vs. Taxation," in which that daring reformer proposed an extension of the existing law of escheat, "a law coeval with the very first elements of the constitution," with a corresponding limitation of the power of bequest. The intended effect was "the appropriating to the use of the public all vacant successions, property of every denomination included, on the failure of near relatives, *will or no will*, subject only to the power of bequest, as hereinafter limited." By "near relatives" Bentham intends "such relatives as stand within the degrees termed prohibited, with reference to marriage." Furthermore, in the case of "such relatives" within the pale as are not only childless, but without prospect

of children, he proposes that, instead of taking their share in ready money, they should take only the interest of it, in the shape of an annuity for life. As to the latitude to be left to the power of bequest, he says, "I should propose that it be continued in respect to the half of whatsoever property would be at present subject to that power."

Bentham argues that the scheme he proposes for dispensing with taxation by limiting the power of bequest and restricting succession to near relatives, would work no wrong. Hardship, in the distribution of property, is in proportion to disappointment: expectation thwarted. If distant relatives were taught by the general provisions of the law that they could not succeed, no expectations would be excited, and such persons would suffer no wrong, being simply put into the case of others who have no rich distant relatives. Bentham's proposal received no special attention at the time; and, except in the way of taxes upon successions and bequests,<sup>78</sup> little progress has since been made in the direction indicated; but it is probable that among the earliest of the measures of a militant and triumphant democracy would be the limitation of the power of bequest and the restriction of succession, each in the interest of the state, as the proprietor of all estates to which individual titles or claims may be lost.

—3. Fines and forfeitures for criminality and delinquency. It might be supposed, that, since government exists largely for the protection of property and life, and for the punishment of offenses against society, the cost of maintaining government and administering justice might largely be thrown upon delinquents and criminals. In feudal times, fines and forfeitures constituted a very important source of revenue to the crown. This was the result of two causes. First, the relation of the tenant to the lord was a personal one, and failures in personal loyalty, although not rising to what in the present day would be deemed crimes against society, were punished by heavy fines or total forfeiture. Second, the crimes of those days were largely political, and great offenders were likely to be men of wealth and position who would be fat subjects for amercement.<sup>79</sup> The wars of the roses, for example, were so fruitful of forfeitures that a large proportion of the land of the realm became the property of the crown. In the present age, political crimes have become comparatively infrequent, and the criminal class are mainly drawn from the poor. Hence, this branch of the public revenue has shrunk to comparative insignificance. Fines and forfeitures still pay a part of the expenses of strictly judicial establishments, especially in the lower or police courts, but they add little to the general revenues of the state. Even the labor of condemned criminals is seldom found to be sufficiently remunerative to pay the cost of their maintenance under ward.

—4. Tributes from colonies, dependencies and conquered nations, including war fines, requisitions and indemnities. "In all ages," says Sir Erskine May, "taxes and tribute have been characteristic incidents of a dependency. The subject powers of Asiatic monarchies, in ancient and modern times, were despoiled by the rapacity of satraps and pashas, and the greed of the central government. The Greek colonies, which resembled those of England more than any other dependencies of antiquity, were forced to send contributions to the treasury of the parent state. Carthage exacted tribute from her subject towns and territories.<sup>80</sup> The Roman provinces 'paid tribute to Cæsar.' In modern times Spain received tribute from her European dependencies, and a revenue from the gold and silver mines of her American colonies. It was also the policy of France, Holland and Portugal to derive a tribute from their settlements." In

our own day, Holland has drawn a net revenue of £3,000,000 from the island of Java, the natives being required to cultivate defined portions of land in specified crops. That compulsory cultivation used to include many crops; subsequently, it was for a long time confined to sugar and coffee; since 1880, as I understand it, coffee has remained the sole crop so cultivated.

—I have quoted a passage from Sir E. May, relative to the forced contributions of colonies and dependencies: let me complete the sentence. "But England, satisfied with its colonial trade, by which her subjects at home were enriched, imposed upon them alone all the burdens of the state." This sentence expresses the essential characteristic of the English system of dealing with colonies. It must not be supposed, however, that the system was necessarily lighter in the burdens it imposed than would have been a system of taxation. The constraints which the navigation acts of England<sup>81</sup>—designed to give to British shippers and British merchants the profits of the colonial trade—placed upon the energies of those young and growing communities, were frequently more galling and depressing than heavy taxation would have been. Another incident of the British colonial system in the past was patronage, affording, as that system did, a wide field for the employment of the friends, connections and political partisans of the home government. Until the reform of the civil service this was of a real and great fiscal value, being worth more to the administration than an addition of millions to the revenue would have been. Even now it is asserted<sup>82</sup> that the Indian army is maintained and employed quite as much for the imperial interests of Great Britain as for the preservation of the peace and unity of India; that the salaries of British officials are there vastly greater than necessary or desirable; and that the construction of immense systems of public improvements, railways, canals and irrigating works, at the expense of India, has been controlled largely by the interests of British capitalists or by the demands of British cotton spinners.

—The Danish Sound dues, "the most important transit duties in the world," until 1857, constituted a striking example of this class of contributions. In the year named, these duties were finally abolished, Denmark receiving 30,476,325 rix dollars in final commutation, of which sum Great Britain paid a full third. The United States subsequently joined in this purchase of the rights of Denmark over the navigation of the Baltic, having, at a much earlier period of its national history, made successive contributions to the revenues of the piratical Barbary states, for the privilege of sailing the Mediterranean.

—The principle of making the enemy, as far as possible, pay the cost of war while in progress, and exacting an indemnity subsequently for such expenses as could not be met by requisitions and billeting, is of too wide historical usage to require mention here. The application of that principle is only limited by the power of belligerents. After the treaty of 1842, the Chinese government was compelled to pay England sums approaching thirty millions of dollars on account of opium seized, and for the expenses of the expedition. It was reserved for Germany, after the war with France in 1870-71, to exact the most gigantic war indemnity ever paid in the history of mankind.

—5. Still another source of revenue is found in the sale of offices, honors and titles. The accounts of such sales under the Roman empire, in the days of its decline; by the popes throughout the middle ages; by the kings of France, especially from Louis XII. to the time of the revolution; and in England, under the Stuarts; form a very interesting chapter in the history of finance;<sup>83</sup> but space will not allow us to enter upon it here. At times these sales were mere acts of extortion by the sovereign; at others they amounted to little else than the sales of annuities under the name of salaries attached to the offices conferred; at times these offices carried privileges and opportunities by which the purchaser might reimburse himself for his outlay, whether through a monopoly, or through the right to collect or disburse the public revenues, which was a very common incident of these sales.

—6. Domains (*L'état capitaliste.*) Even under the modern European principle of the private ownership of lands, the state is, in all countries, the possessor of larger or smaller domains, from which a revenue, in money or produce, may be derived, or which, while yielding no revenue in form, serve public uses which would otherwise require expenditures out of the treasury. M. Leroy-Beaulieu, the editor of the *Economiste Français*, author of an excellent work on "Finance," expresses the distinction between the property of the state which is left to the enjoyment of individuals, yielding no revenue, and that which is productive: the former he calls *domains public*, and the latter *domaine privé de l'état*. The former, he says, is almost everywhere vastly greater than the latter, and tends continually to increase; and he makes this striking statement regarding the extent of the property thus belonging to the state, given up to public uses, without yielding a revenue to the treasury: "In a country like France, it appears to us difficult to appraise at less than 300 millions of francs per annum, that which is so employed by the central government, the departments and the communes."

—The domains of the state from which money or produce is derived, make, of course, a much larger figure in the history of finance, though no mere truly, as we said at the beginning, constituting a part of the public revenue.

—In England the royal domains were, at first, very ample. Even in the time of Edward the Confessor it was said that the crown was possessed of 1,422 manors, besides other lands and quit rents. The Norman conquest largely increased the landed wealth of the sovereign. In the reign of Henry V. this was augmented by the appropriation of the alien priories, 110 in number. Yet notwithstanding this large endowment, successive alienations, sometimes in real exigencies of the state, but more commonly wasteful and often shameful in their origin, so reduced the crown lands that the income of Henry VI. was stated at but £5,000. In this impoverishment of the crown, several general resummptions of grants were authorized by parliament. The breach with Rome, and the plunder of the religious establishments by Henry VIII., placed vast wealth at the disposal of that disinterested reformer; but a similar course of improvident and wasteful alienations soon brought the income of the sovereign again below his urgent necessities. In the seventh year of James I. the entire land revenue of the crown and of the duchy of Lancaster amounted to only £66,870. James sold lands to the value of £775,000, and left debts to an equal amount.

—Prodigal, however, as had been the alienation of the crown lands under the Tudors and the Stuarts, it was William III., the author of the modern scheme of public finance, who did most to dissipate the hereditary property of the crown; nor is it likely that the two facts were without a vital connection. William, foreseeing the vast fiscal power of government, under the commercial as contrasted with the feudal organization of society, would seem to have regarded the traditional revenues of England with contempt. At the end of his reign, parliament, says Sir Erskine May, "having obtained accounts of the state of the land revenues, found that they had been reduced by grants, alienations, incumbrances, reversions and pensions, until they scarcely exceeded the rent roll of a squire."

—Whatever William may have thought of landed revenues, as compared with the proceeds of excises and customs, his immediate successors were not content with the situation, and an act was passed in the first year of Anne's reign, whereby all future grants or leases from the crown, for any longer term than thirty-one years, or three lives, were declared void, except with regard to houses, which may be granted for fifty years. "The misfortune is," says Blackstone, "that this act was made too late, after almost every valuable inheritance in possession of the crown had been granted away." "There are very few estates in the kingdom that have not, at some period or other since the Norman conquest, been vested in the hands of the king by forfeiture, escheat or otherwise. Fortunately for the liberty of the subject, this hereditary landed revenue, by a series of improvident mismanagement, is sunk almost to nothing."

—It was especially the contemplation of English experience in this respect, which drew from Adam Smith that strong assertion of the impolicy of seeking to derive revenue from public domains, which is so often quoted in discussion of this subject: "The servants of the most negligent master are better superintended than the servants of the most vigilant sovereign." "The crown lands of Great Britain do not at present afford the fourth part of the rent which could probably be drawn from them if they were the property of private persons. If the crown lands were more extensive, it is probable they would be still worse managed. \* \* In the present state of the greater part of the civilized monarchies of Europe, the rent of all the lands in the country, managed as they probably would be, would scarce, perhaps, amount to the ordinary revenue which they levy upon the people even in peaceful times." Perhaps had Dr. Smith the opportunity to observe the able, comprehensive, frugal and solicitous Prussian administration of public estates to-day, he might find reason to qualify the judgment expressed above.

—M. Cherbuliez, in his *Science Economique*, takes strong ground against making public domains an important element in the fiscal system. One remark is especially notable. Domains do not, he says, furnish an available resource in time of emergency. On the whole, this remark is both true and important; yet the recent examples of Chili and Peru, with their guano deposits,<sup>84</sup> Egypt, with the large sugar plantations of the khedive, Honduras, with her precious forests of mahogany, have shown that a tangible property of this kind may sometimes afford a certain advantage for quickly placing a large loan, for a state of small credit.

—We have seen how the crown lands of England were wasted by improvident alienations. Everywhere much the same story is told by the shrunken domains of the state. What was once the chief fiscal resource of many states, now remains even an important item in the budgets of but a few states. Russia, says M. Cherbuliez, is almost the only state of modern Europe which draws from its fiscal domain a notable share of its revenue. Yet Prussia, Bavaria, Würtemberg and Sweden still retain extensive and profitable domains. The same might be said of the crown lands of Hanover, if any one could find out to whom they belong.

—In the United States the possession of vast areas of fertile territory by the new government, was, at the beginning of our fiscal history, looked upon by almost all the statesmen of the republic as a resource to be cherished and improved. Gradually, however, as told under other titles of this work, the project of drawing revenue from the public lands was abandoned; and for the past two generations it has been the object of the government to promote the appropriation of the public lands by individual citizens, on the payment of a merely nominal price, or of merely the fees of registration. This policy was announced by President Jackson, in his message of 1832, in which he said, "It seems to me to be our true policy that the public lands shall cease, as soon as practicable, to be a source of revenue: and that they be sold to settlers, in limited parcels, at a price barely sufficient to reimburse the United States the expense of the present system, and the cost arising under our Indian contracts."

—In the respect of the proportion of revenue drawn from state domains and state enterprise, M. Leroy Beaulieu offers the following contrast between England and Prussia: "The one has, so to speak, no revenues from domains; what remains of such revenues constitutes but an infinitesimal part of its vast budget. Moreover, it does not appear desirous of creating such a revenue. The other nation, on the contrary, while relying upon taxation for the greater part of its revenue, nevertheless draws sums relatively enormous, in part from the private estates of the crown, in part from industries which it carries on subject to competition, and in part even from floating capital which it has placed at home or abroad. This nation, moreover, appears not the least in the world desirous of abandoning this system; it seems, on the contrary, to wish to extend it." Prussia, remarks this excellent writer on finance, is *agriculteur, industriel, entrepreneur de transports*. The following is his summary of the revenue of Prussia from this general class of resources, during the year under discussion:

	Francs.
Domains, properly so called, <i>i.e.</i> , estates under culture...	35,531,000
Produce of forests...	54,525,000
Gross revenue of the state railways...	173,500,000
Tolls upon roads...	5,720,000
Tolls upon canals...	2,250,000
From the profits of the bank of Prussia...	7,507,000
Produce of the mint...	1,290,100
Produce of the state printing establishment...	1,232,500
Produce of schools of agriculture, etc....	3,958,030
Produce of mines, factories and salt works belonging to the state...	112,343,555
Total...	397,857,185

Extending this comparison to the countries of Europe generally, M. Maurice Block presents the following instructive table:

COUNTRIES.	Revenue—Percentage derived from				Total
	Do-mains.	Direct Taxes.	Indirect Taxes.	Other Sources.	
France .....	5.5	19.4	55.1	20.0	100
Prussia .....	44.0	19.0	87.0	---	100
Great Britain .....	0.5	18.2	75.3	11.0	100
Austria, Cisleithan .....	7.5	23.5	29.9	39.1	100
Austria, Transleithan .....	8.1	55.1	20.4	21.4	100
Russia .....	14.2	11.8	45.4	28.6	100
Italy .....	2.6	30.0	28.4	39.0	100

—III. We reach, now, the class of public revenues which are derived from sources which we have indicated by the term *quasi taxes*. The distinction between these sources of revenue and taxes proper, on the one hand, or certain lucrative prerogatives, on the other, is not always clearly marked; yet, in general, it is believed that the classification adopted is a convenient one. Under this general title we note the following: 1. Monopolies. These have played a most important part in the history of public revenues, and, in spite of the spirit of the age, which is strongly opposed to exclusive privileges of production or of sale, still form a prominent feature in the budget of many of the most progressive nations of Europe. Monopolies may be commercial, industrial or financial. The distinction between the monopolies of the past and those of the present day is very marked. Formerly, monopolies were granted, for the profit of the government, to persons or corporations, to carry on a vast variety of operations, great and small alike,<sup>85</sup> most of which were susceptible of individual management.

—The study, not of finance but of political economy (for the distinction is one important to be observed), has freed industry and trade from monopolies of the order of those of the seventeenth and eighteenth centuries. The monopolies of to-day rest upon a few great industries, carefully selected for their fiscal capabilities; and these, by preference, such as naturally tend toward monopoly, for example, banking or railway traffic. A few articles of manufacture of exceptional "richness" as the subjects of monopoly, such as opium, tobacco, salt and matches, have been hit upon by the governments of several European countries. The manufacture of tobacco is a state monopoly in France, Italy, Spain and Austria. Even the imperious will of Prince Bismarck has, however, failed to introduce this monopoly into the fiscal system of the German empire. The government monopoly of this article was established in France in 1674. During the revolution, under the powerful impulse experienced toward the removal of all restrictions upon industry and society, the constituent assembly abolished the monopoly, and threw open the manufacture to competition; but sought still to retain the revenue previously derived from this source, by imposing a requirement of licenses for the manufacture. This measure was followed by the rapid diminution of receipts; and in 1810 Napoleon restored the monopoly, conferring upon the *régie* the combined rights of the purchase of tobacco in the leaf, and of the manufacture and sale of the article for consumption. In 1864 the gross receipts were, in francs, 220,000,000, and the expenses of administration, 66,000,000; net receipts, 154,000,000 francs. In 1877 the gross receipts had risen to 312,000,000 francs.

—A most instructive lesson in finance is furnished by the recent experience of the government of France in enforcing the monopoly of the manufacture of matches, the government having been completely baffled, in its earlier efforts, through the ease of illicit manufacture in the case of this article, nothing being required for the purpose but "a small quantity of phosphorous paste and a bundle of wood." The student of fiscal science will be well repaid by reading the Paris correspondence of the "London Economist" on this subject, extending through 1874, 1875 and 1876.

—2. Lotteries. These only require to be mentioned, as a source of revenue largely made use of in the past by nearly all governments, and still constituting a not unimportant feature of the budgets of many countries. "The profit which the public draws from lotteries," wrote Hamilton, "may be considered as a tax on the spirit of gaming, and added to the amount of other taxes." While lotteries afford a most effective means of securing revenue in the immediate instance, there can be no question that, in their ultimate effect, they reduce the fiscal capabilities of a people, by discouraging patient and steady industry, and by weakening the instincts of frugality and abstinence.

—3. Another quasi tax, once widely in exercise, but now restrained and confined, and in almost all civilized states wholly discontinued, except in the event of warlike operations, is purveyance, defined by Blackstone as the "right enjoyed by the crown, of buying up provisions and other necessaries, by the intervention of the king's purveyors, for the use of his royal household, at an appraised valuation, in preference to all others, and even without consent of the owner; and also of forcibly impressing the carriages and horses of the subject to do the king's business on the public roads, in the conveyance of timber, baggage and the like, however inconvenient to the

proprietor, upon paying him a fixed price." "A prerogative," adds the commentator, "which prevailed pretty generally throughout Europe during the scarcity of gold and silver, and the high valuation of money consequential thereupon."

—4. Another mode of raising a revenue, which partakes largely of the nature of a tax, without bearing its form, is through the exaction of fees for stated or occasional services, performed by the agents of the state. The mention of fees brings up an illustration of what was said at the beginning of this article regarding the difficulty of comparing the revenues of different states. Take the matter of tolls upon bridges and roads. In one community, travel is free; the great cost of maintaining this service goes into the budget of expenditures; and the amount to be collected in taxes is by just so much increased. In another, perhaps an adjacent, community, transport and transit pay tolls, which are employed to maintain the bridges and roads in repair, to pay interest on the cost of construction, and perhaps also to accumulate a sinking fund for the final discharge of the principal sum; and the tolls so paid do not enter at all into the budget. In the same way the expenses of judicial proceedings and of the administration of justice may be met out of the general treasury, in monthly or quarterly salaries, or may be paid, in minuter portions, by individual suitors. According as the one or the other method prevails, the apparent receipts and expenditures of the state will be increased or diminished, without regard to the real burden resting upon the community. The earlier abolition of tolls in the northern than in the southern states of the American Union, in England than in Ireland, for example, is a fact which no student of comparative revenue could safely leave out of account.

—The question of the equity or expediency of judicial fees may be studied with amusement and profit, in the vigorous writings of Jeremy Bentham. Almost in the degree in which communities advance in civilization, are roads and bridges made free to travel; and the expenses of their construction and maintenance assumed by the state, instead of being charged upon the individuals using them.

—5. Coinage.<sup>86</sup> Coinage has always been one of the most cherished attributes of sovereignty the world over. Of India, Dr. Hunter says: "Little potentates, who, in every other respect, acknowledged allegiance to Delhi, maintained their independent right of coining. As it was the last privilege to which fallen dynasties clung, so it was the first to which adventurers, rising into power, aspired. While the Mahrattas were still mountain robbers, they set up a mint; and in 1685 the East India company, at a period when it had only a few houses and gardens in Bengal, intrigued for the dignity of striking its own coin."

—But it was not only the right of striking the coin which kings asserted for themselves. The right of debasing the coin, was, says Hallam, "a flower of the crown." The imposition known as *moneyage*, after the Norman conquest of England, was a tax of one shilling paid every three years by each hearth in the kingdom specifically to induce the king not to use his prerogative in debasing the coin. By the charter of Henry I. this imposition was abolished, but not with any impeachment of the right of the crown to debase the coin at its pleasure. The antiquarian, Ruding, states that, at one period in the reign of Edward IV. the seigniorage on gold money was above 13 per cent. In France the debasement of the coin, under the royal

prerogative, was carried to a far greater extent. The seigniorage exacted by John II. rose at times, it is stated, to three-fifths, changing, says Le Blanc, almost every week, and sometimes oftener. Seigniorage, to the extent of the cost of rendering bullion into coin, has received the approval of almost all economists, from Adam Smith down; yet the English government has, since 1666, coined gold of full value free of charge. That government has, however, since 1816, exacted a heavy seigniorage on its silver coin, which is legal tender in only a limited amount. Such a seigniorage on the smaller coin of a country affords a proper source of revenue, either to cover the expense of minting the principal coin, wherever the English system of gratuitous coinage is adopted, or to be brought into the treasury, for the general purposes of government.

—6. The issue of paper money. Paper money is money in respect to which seigniorage is carried out to the full nominal value of the piece. Instead of taking out, say 1 per cent., to cover the cost of coinage; instead of taking out, say, 10 per cent., as tribute to the sovereign, the entire amount of bullion is abstracted, and a paper sign, token or promise is substituted.

—The issue of paper money having legal-tender power, offers a resource to government which has always been found most tempting in periods of great national exigency. Provided the circulation at the outbreak of a war, for instance, consisted of metal money, it would be possible for the government to issue paper to the same denominative amount, replacing the gold or silver in the circulation, whereupon the metal could be exported to buy goods and supplies abroad. According to Ricardo's doctrine of money, the paper, so issued, would not, so long as it did not exceed the full denominative amount of the metal money replaced, necessarily become subject to depreciation. Thereafter, the advantage to government would be limited to the profit of a forced loan, without interest. During the war of the revolution the continental congress had recourse to this expedient. "The United States," says Dr. Ramsey, "for a considerable time derived as much benefit from this paper creation of their own, though without any fixed funds for its support or redemption, as would have resulted to them from the gift of as many Mexican dollars." In 1862-4 the United States issued several hundred millions of dollars, in payment for services or supplies, of which it enjoyed the use without payment of interest until 1879. The value of the use of that amount of capital, for that term of years, was, in effect, levied upon the people of the United States, by a species of irregular and doubtless very mischievous taxation.

—The issue of paper money without legal-tender power, its circulation to be secured by the offer of government to receive it in payment of taxes, and to redeem it on demand, is quite a different thing. This is not open to any grave economical objections. Under the title of treasury notes, such issues frequently took place in the fiscal history of the United States, long before the exigencies of the war of secession caused the issue of the legal-tender "greenbacks."

—IV. *Taxation, in its Various Forms.* Public contributions may be exacted in three ways: in service, in products, or in money. 1. By services. This was the original form of taxation, and corresponds closely to the ideal tax upon faculty, as distinguished from the tax upon income, upon realized wealth or capital, or upon expenditure. In the early history of Greece and Rome the citizen served his country in the army, as a

matter of direct personal obligation, irrespective of payment. The custom of paying the soldiery was not introduced into Athens until the age of Pericles; and did not become general throughout Greece for more than a generation afterward. It was not until the siege of Veji that the practice was introduced into the Roman armies. After the downfall of the Roman empire, the institution of the feudal system created a national militia which was adequate to wars carried on with the lance, the sword, the pike and the crossbow. The introduction of gunpowder was soon followed by the creation of mercenary armies, and by the conversion of the military obligation of the mass of citizens into a fiscal obligation for the support of those armies. The historian Robertson attributes this general change in Europe to the long wars waged by the powers which disputed the mastery of Italy.

—Curiously enough, within the present century, and especially within the last half of the century, we have seen the obligation of personal service revived and enforced upon a scale which dwarfs all precedent instances in history. The legions of Rome were but a handful to the hosts which are now kept permanently under arms or hourly subject to call from headquarters. Almost universally, the great powers which are prepared to dispute the supremacy of Europe, and the smaller nations that live in apprehension of being overwhelmed by their gigantic neighbors, have abandoned, as too costly and too dilatory, the attempt to keep up armies by a system of voluntary enlistment, and have resorted to the rule of universal personal obligation. England stands almost alone, to-day, in maintaining the system of mercenary soldiery. Within the past eighteen years the "blood tax" has grown to be the greatest tax levied in the world. "It is computed," wrote Mr. Hume, a century ago, "that in all European nations the proportion between soldiers and people does not exceed 1: 100." According to M. le Faure, the armies of Europe, on a war footing, amounted, in 1875, to 9,333,000, the immediately disposable forces of the German empire, alone, being 2,800,000.

—The difference between the cost of armies maintained on the compulsory principle and those kept up by recruiting, is a tax which makes no figure in the budget, and does not enter into the accounts of receipts and expenditure. Yet it is a tax often of the most distressing character. Indeed, the opinion was expressed in the beginning of the present article, that not one of the great military nations of Europe could, by the utmost exertion of its fiscal powers, support its existing army if it were compelled to go into the market for labor and hire the services it now commands. This element is rapidly increasing the difficulty of ascertaining the comparative cost of government, for it is eminently characteristic of taxes by personal service that their real value can never be ascertained. M. Garnier speaks of *impôts lout à fait latents; qui ne rapportent rien au fisc et qui n'en pèsent pas moins sur les populations*. Such, eminently, is the obligation of military service. Of course the weight of it, measured by the loss it inflicts, will vary greatly according to the occupations of the people, whether engaged in manufactures and commerce, or in agriculture; according to the severity with which military requirements are enforced, and penalties for delinquency exacted; according to the spirit which presides over headquarters, and passes down to animate commanders and staff. Even in a purely agricultural community how great a difference will be made by a call to field manœuvres ten days before, or ten days

after, harvest;<sup>87</sup> or by the requirement of brigade and division evolutions, instead of company drill!

—While, thus, one primitive form of tax by personal service has recently sprung into unexampled importance, another, once of vast extent, has sunk almost out of the fiscal system of Europe. This is the road tax. "Up to the reign of Louis XV.," says De Tocqueville, "the highroads were not repaired at all, or were kept in repair at the cost of the state and of the roadside landowners; it was at that period that the plan of keeping them in repair at the expense of the peasantry was commenced. It seemed so excellent a mode of securing good roads without paying for them, that in 1737 a circular of the comptroller general applied it to the whole of France. Thenceforth, proportionately to the extension of trade and the increased desire for good roads, *corvées* were extended and increased. In ceasing to be seigniorial and becoming royal, *corvées* were gradually applied to all public works. In 1719 they were exacted for the construction of barracks. 'The parishes must send their best workmen,' said the ordinance, 'and give up all other work for this.' *Corvées* were also exacted for the conveyance of convicts to the galleys, and of beggars to charitable institutions, and for the transport of military baggage when troops were to be moved from station to station."

—Turgot gives a pitiful account of the burden of this exaction in connection with the removal of troops. "The distance to be traversed is," he says, "often five, six and sometimes ten or fifteen leagues. Three days are consumed for the journey and the return. The sum allowed is not one-fifth the value of the labor. These *corvées* are almost invariably required in the summer, during harvest time. The oxen are almost always overdriven, and often come home sick. The work is done in the most disorderly manner; the peasantry are continually a prey to the violence of the soldiery. Officers habitually exact more than the law allows; they sometimes compel farmers to yoke saddle horses to carts, whereby the animals may be seriously lamed. Soldiers will insist on riding in the carts which are already heavily laden; and, in their impatience at the slow gait of the oxen, will prick them with their swords, while, if the farmer complains, he is roughly handled."

—The above affords an excellent illustration of the remark already made, that the weight of taxes by personal service can never be truly estimated. Were the requisition, in an agricultural region, to fall upon a time when men and teams would otherwise be idle, the actual net sacrifice would be small. If at an inconvenient season, the greatest waste and confusion may ensue; while in a manufacturing or commercial community, it is wholly impossible to compute the mischief that may be effected by the slightest requirement of personal attendance and personal service.

—In the United States the road tax is still "worked out" to a certain extent, with the general result of bad roads; but in all the more prosperous communities the change to labor hired and paid out of the general treasury has been effected.

—2. The second mode of paying taxes is in produce, or, as we say, "in kind." Mr. Merivale thus describes the Roman system of revenue, in this respect. "In many parts of the empire it was most convenient to make the payment in kind, and the

government was long in the habit of accepting large consignments of corn and other raw produce, in place of current coin. These abundant stocks of provisions never wanted consumers while the armies of the republic were maintained on Roman soil; and the urban population, we may believe, were always ready to receive the overflowings of the fiscal granaries, whether government chose to dole them out at a cheaper rate, or to dispense them gratuitously. We may conjecture that the fatal institution of regular distributions of grain originated in this source. The revenues of the state could only be paid in kind; and the ample stocks thus received must sometimes either be given away or thrown away."

—On this system Gibbon remarks: "In the primitive simplicity of small communities, this method may be well adapted to collect the almost voluntary offerings of the people; but it is at once susceptible of the utmost latitude and of the utmost strictness, which, in a corrupt and absolute monarchy, must introduce a perpetual contest between the power of oppression and the arts of fraud."

—In all the English-American colonies this form of contribution to public uses was largely employed. In Massachusetts and Connecticut, for example, taxes might be paid in corn or rye, at fixed rates, or in cattle or beaver; in Maryland and Virginia, tobacco was received. During the war of the revolution, congress, for a brief period, upon the failure of the continental paper money, instituted the system of contribution in kind. On Feb. 25, 1780, it was resolved that the states should be called upon for specific supplies, beef, pork, flour, corn, hay, tobacco, salt, rum, and rice, to be credited at certain fixed rates to the states by which they were furnished. By March, 1781, the scheme of specific supplies had been found so unmanageable that it was abandoned.

—Throughout eastern Europe, in Russia, Hungary, and even in Germany, down to a very recent date, if not to the present time, payments in kind, especially for the support of the army and the church, have formed no inconsiderable portion of the contributions of the peasantry. Mr. Banfield, in his excellent work on the "Organization of Industry," remarks that in Sweden the number of barrels of meal paid away as salaries still "figure in the budget." Mr. Banfield calls attention to the consideration that the system of contributions in kind presupposes an absence of all means of easy and effective communication. "So long as society remains in this state, in which, as all produce is consumed at home, *a produce tax is identical with a tax on consumption*, there is no choice but to draw directly on this fund for taxation."

—In Turkey, today, the onerous taxes of the government, which are, in reality, rent charges by the state as the proprietor of all lands, are largely collected in kind; and administered as the Turkish system is, with despotic brutality, over a helpless population, it constitutes one of the most important causes of the misery which there prevails. The peasant, forbidden to remove the produce from the soil until the officers of the government have made their inspection, and satisfied themselves of the amount to which the state is entitled, may see his whole harvest rot in the fields while the agents of the treasury are making their leisurely rounds.

—The true view of the economical relations of contributions in kind seems to be that intimated by Gibbon. When such a system grows naturally up among a people in a somewhat primitive condition of society and industry, and is maintained and administered, in good faith and good feeling, by officers coming from the people and responsible to the people, it may be, not only unobjectionable, but positively beneficial, as, under similar circumstances, the payment of taxes in personal service, and indeed, for that matter, as the use of truck payments between master and workmen, may be. But, on the other hand, the truck system, the system of contribution by personal service, and the system of taxes in kind, may, under different conditions, be made the means of the most monstrous exactions, far transcending the capabilities of money taxes, in the respects of hardship and injustice.

—3. The third and now usual mode of paying taxes is in money, the contributor of each individual being determined according to some mode of assessment. In its ultimate effect, however, it should never be forgotten that every tax is a requisition by the state upon the services of its citizens. If money is taken, it is only as the most convenient form (convenient to the state, or to the citizen, or to both) of obtaining services and products; and products are, in the last analysis, embodied services. And in the same connection we may add the remark of M. Garnier, that it is an error, which is at once gross and widely spread, to suppose that the state, the moral personification of the body of citizens, acting through men charged to perform public functions and to minister to public-needs, can possess resources transcendental, inexhaustible, or, indeed, any resources whatsoever, other than those of its citizens, any resources beyond the share it takes of their fortunes and of the products of their industry and labor.

—Inasmuch as Mr. Wells discusses, under its appropriate title, the principle of TAXATION, this paper on PUBLIC REVENUE properly comes here to a close.

## REVOLUTION.

REVOLUTION. The word revolution is, in its political signification, so peculiar to the French language, that other languages adopt it without any modification, in default of being able to find a suitable equivalent. The Latin term, which it reproduces phonetically, has never had the same meaning; and the course of things subject to an order of successive changes, as the revolution of the stars, implies a regularity and a kind of predisposition which do not appear to be a necessary condition of political revolutions. The latter, or the changes which take place in public affairs, differ considerably in importance, in extent and in duration, as in their form, their object and their result; but they have generally the characteristic of carrying a certain disturbance into the established order of things, and in our day this disturbance has become a trait sufficiently prominent and grave, for the name of revolution to be applied almost exclusively to political changes in which violence has played a part.

—We must then almost always, in speaking of revolutions, make a distinction between the times preceding and following the French revolution. Before that event, which has become, so to speak, the type with which all others called by the same name are compared, people understood indistinctively by revolutions, either accidental and partial changes in the course of affairs, which all more especially depend on the will of individuals, or the profound and general changes which are brought about by time and the inclinations of the public, and which resemble the *dénouement* or at least the catastrophe of a long drama, in which neither incidents nor characters have been lacking. It is in the former sense that Montesquieu speaks when he says: "Revolutions occur every ten years in France." He evidently designates by these words the capricious changes caused by individual influences and temporary embarrassment in a government in which neither institutions nor characters have any stability. These frequent changes are more particularly met with in absolute monarchies and pure democracies. Montesquieu adopted the second meaning, and expressed a different thought, when he wrote these lines: "Many centuries are sometimes necessary to pave the way for changes. Events ripen, and lo! the revolution breaks forth. Such are the revolutions of empires upon which great minds love to meditate, and which are the principal subject of the political part of Bossuet's "Discourse on Universal History." When we consider them methodically, connecting them with each other, we cause to enter into the general idea of a revolution the idea of a certain order which popular language seems to exclude from it. However contingent may be the events in which human activity plays the chief part, there are in nature and in the destiny of man general causes, unceasingly renewed, which in the long run, combine to produce general effects susceptible of being foreseen in their aggregate, or at least of being explained by the sagacity of the statesman, of the publicist and of the historian; and these real facts appear, after they have been accomplished, impressed with a stamp of a relative necessity which is nothing but *the force of things*, that is to say, the natural bond between causes and their effects. But among these causes it must never be forgotten that the principal one, on this earth of ours, will always be that free cause called man.

—But it is hard to give a date in history to revolutions as thus understood. For their origin is in the depths of the past, and in this sense one might say that they are always preparing and never finished, However, a distinction has been made, and rightly so, between the, so to speak, perpetual revolution which is the slow work of ages, and the distinct manifestations, the special crises which occur in the history of peoples, and which attest in a palpable manner the work of time and the condition to which the course of ages carries powers, laws and customs, or minds and things. Then, *events having ripened*, some incident, a personal mistake, a fortuitous fancy, a profound scheme, in short, a determination of the will of individuals or of the masses, provokes a serious change in the state which concerns either the government or society, and transforms one or the other in a lasting manner. It was outbursts of this kind which men have in mind when they speak of the Dutch, English or American revolution. These names designate various limited series of facts sufficiently connected with each other easily to form a harmony, and which can be connected with direct causes, the date of which is assignable. We can scarcely conceive of this sort of revolution without the intervention of force, acting outside the law. The news so often received in our time of a revolution accomplished at a given moment upon a point of the inhabited globe, suggests immediately the idea of a more or less rapid change, effected either in the government, or in society, and in which violence, or the threat of it, has not been wanting, The same change, lawfully effected, would be called a reform.

—It is this intervention of force, almost inevitable in a trial of this kind, this character of illegality and violence, which makes all revolution a very grave matter for both the conscience and the reason. Even when arising from serious causes, a revolution is always a formidable and extreme measure, which should be neither lightly undertaken, easily accepted, nor blindly amnestied, no matter what the object of it, were it even the restoration of order or that of liberty. These *coups d'état*, even when the work of a nation, are, in internal politics, what war is in international law; and the citizens or the powers who hazard a revolution without necessity or justice, incur the same responsibility as the authors of a war which is neither just nor necessary. Independently, then, of the lawfulness of the end, the first and absolute condition of every political undertaking, the use of force, constitutes the dubious point in all questions of war or of revolution. The nature, the duration, the intensity, the success of a means odious in itself and only exceptionally licit, should be well weighed before solving the problem which is imposed upon whomsoever intends to decide the fate of men by arms.

—The part played by force in all revolutions has made its name suspicious to a large number of upright and dispassionate minds, of whose scruples and weaknesses parties and powers often take advantage. It is thus that a certain school has striven to use this abstract expression of revolution in a bad sense. We often read that such or such a cause, such or such an enterprise, would succeed if *revolution* does not meddle with it. This designedly equivocal form of speech tends to decry with good citizens a certain aggregate of ideas and sentiments which brought about the liberal revolutions of which this age has afforded so many examples. At bottom it is intended, under the name of *revolution* to proscribe the so-called principles of 1789, that is to say, of the revolution of July 14th, in France. This language is a mask which must be torn away.

If, on the contrary, the only object be to put people on their guard against violence in the passions and the acts which is too frequently the accompaniment and the ruin of revolutions, it is not these latter principles which are to be condemned *en masse*, but the *revolutionary spirit*. This last epithet, invented by the English and the Americans, and which is used among them in a neutral sense as the adjective of the noun *revolution*, has, with the French, hardly any but an odious sense. The revolutionary spirit may thus continue to be understood as a spirit which seeks revolutions without scruple, without measure and without choice. As the dictatorial spirit differs from the governmental spirit, and the soldierly spirit from the warlike, so should the liberal spirit be distinguished from the revolutionary spirit. The first dreads revolutions, labors to avoid them, and has recourse to them only in the last extremity; the second seeks them, paves the way for them; it commences with them, and offers to itself as an end what is only a last resort. These distinctions, always ignored, should be always insisted on and constantly called to mind. Thus, in political history, we must distinguish the revolution of the ages, or that long life of humanity, sown with innumerable events which conduct it, as it were, from station to station toward an unknown goal; then, the changes in the divisions of universal society, or in the civil and moral constitution of special political societies, changes which are brought about in the course of centuries, and which are called revolutions; then again we must distinguish those revolutions which are but the crises of the chronic condition which gives a new aspect to affairs, or those abrupt changes, the work of an accidental will or of a fortuitous circumstance. In short, for nearly ninety years, since the era opened by the French revolution, the word revolution designates more especially such of these reformatory changes as have for their object the progress of liberty and equality. The reactions of which they are often the cause are revolutions in an inverse sense, and are often, for this reason, called counter-revolutions. A revolution lawful in its aim, just in its principles, moderate in its acts, happy in its results, and durable in its work, is the political ideal which the nineteenth century seems to be pursuing.

CHARLES DE RÉMUSAT.

## REVOLUTION, The

REVOLUTION, The (IN U. S. HISTORY), the name commonly given in the United States to that which is elsewhere called the American revolution, 1775-83.

—I.: UNTIL 1760. The imperial development of the British constitution was for centuries very steady. The first strain upon it came from the conquest of Ireland. Wales and Scotland were tacitly or formally absorbed in the kingdom of Great Britain, in which the parliament had fairly defined rights: Ireland remained a foreign and allied or subject kingdom, in which the British parliament had all the rights which it could succeed in maintaining. The result was the genesis of the idea that the British parliament was in some sense an imperial parliament, with undefined power to legislate for those portions of the empire which were outside of its original jurisdiction.

—English colonization in America brought with it a far more severe strain, for which the British constitution was totally unprepared. A new order of things, the indefinite extension of the empire, was to be provided for; and unfortunately the task of providing for it was assumed by a legislative body whose constituents and members were equally purchasable in open market, and were equally indifferent to any consideration except present interest. To these the grand idea of an imperial parliament, clothed by the lofty patriotism of Burke and Chatham in language well worthy of it, meant only the opportunity to escape part of the burden of present taxation by transferring it to the colonies. They undertook to make an every-day matter of that which Burke and Chatham would have reserved to meet some overmastering emergency; and they lost the colonies.

—The English colonists in America always insisted that they had lost none of their hereditary rights by migrating from the king's British to the king's American dominions (see UNITED STATES, I.); and that they were still entitled to the "free privileges of free-born Englishmen," which the king's word had confirmed to their fathers and to them, the right to personal liberty, to private property, and to representation in the taxing body. They acknowledged that distance made it practically impossible for them to be represented in parliament; and they therefore insisted that their taxes must be levied by their own parliaments, the colonial assemblies. Two irreconcilable theories of the constitution were thus gradually developed in Great Britain and in America; and, after 1760, circumstances brought them face to face, and compelled a settlement by force.

—*The American Theory.* The American theory really made the empire a confederation, the king being the bond of union. In his kingdom of Great Britain the king had certain prerogatives, such as the power to make peace, war and treaties; while parliament alone had the power to grant or withhold supplies and to levy taxes to provide them. In his other kingdoms, Ireland, New York, Massachusetts, or South Carolina, the respective parliaments had just as much power, and the king just the same prerogatives, as in Great Britain. But in each kingdom the jurisdiction of the

parliament was territorially limited: the parliament of Great Britain had no more rightful jurisdiction in Ireland or in Massachusetts than the parliaments of Ireland or Massachusetts had in Great Britain. Franklin formulates the theory as follows: "Our kings have ever had dominions not subject to the English parliament. At first the provinces of France, of which Jersey and Guernsey remain, always governed by their own laws, appealing to the king in council only, and not to our courts or the house of lords. Scotland was in the same situation before the union. It had the same king, but a separate parliament, and the parliament of England had no jurisdiction over it. Ireland the same in truth, though the British parliament has usurped a dominion over it. The colonies were originally settled in the idea of such extrinsic dominions of the king, and of the king only. Hanover is now such a dominion." "America is not part of the dominions of England, but of the king's dominions. England is a dominion itself, and has no dominions." "Their only bond of union is the king." "The British legislature are undoubtedly the only proper judges of what concerns the welfare of that state; the Irish legislature are the proper judges of what concerns the Irish state; and the American legislatures of what concerns the American states respectively." The Americans felt that the words "colony" and "colonist" were themselves misleading, as importing some superiority of privileges in the Englishmen who had remained at home; and they maintained that every charter granted by the king was a compact between him and the people of a new kingdom.

—*The British Theory*. On the contrary, the whole feeling of Great Britain spoke in Grenville's pithy statement that "colonies are only settlements made in distant parts of the world for the improvement of trade, and that they would be intolerable except on the conditions contained in the acts of navigation." The colonists, then, did not escape from the jurisdiction of parliament by migrating. Parliament might allow them a temporary latitude of self-government; but its absolute power, though latent, could be called forth at any moment, and the colonists, in the view of the law, were still Englishmen and under control of the British parliament. This theory was maintained on the grounds, 1, that the omnipotence of parliament was not limited by the four seas which bounded Great Britain; but that, by the extension of the empire, parliament had acquired a nobler position as an imperial body, with, as Burke expresses it, "a reserved power in the empire to supply any deficiency that may weaken, divide and dissipate the whole"; 2, that the colonies were "virtually represented" in parliament, since each member of that body represented not a particular constituency, but the whole empire and all its interests; 3, that the colonists had no more claim to a more direct representation than Birmingham, Manchester, Leeds, and other unrepresented cities, but must be content with the constitution as it was, 4, that it was patently unjust that the expensive duty of maintaining fleets and armies for the defense of the whole empire should be imposed upon the imperial parliament without the corresponding right to insure proportional contributions from the parts of the empire; and 5, that the colonists themselves had always acknowledged the right of parliament to levy American customs duties, from which the right to levy internal taxes could not logically be distinguished. This last assertion could not be disputed, and when it was seriously advanced as an argument it put an end to the tacit compromise which will next be considered.

—*Compromise*. I will readily be perceived that these two theories were irreconcilable, and that both were equally impracticable. On the American theory it would have required superhuman tact and discretion in the king to avoid constant and ultimately fatal conflicts with his twenty different parliaments; on the British theory, the parliament would have become, under the guise of imperialism, an exasperating instrument of British selfishness. The American Union has solved its similar territorial problem by giving congress the imperial power over the territories, while holding out to the latter the promise of admission to the national government as soon as they shall develop the necessary powers and interests. (See ORDINANCE of 1787, TERRITORIES.) Until 1760 the colonies and the mother country lived under a tacit compromise of a far clumsier sort. The home government made no attempt to assert any power to levy taxes within the limits of the colonies; these were levied by the colonial assemblies, on a requisition, or request, from the king, through one of his secretaries or the governor. The supplies voted were always liberal, and sometimes so lavish that parliament voted to return a part of them. On the other hand, the colonies made no objection to the exercise by parliament of complete control over foreign trade, and in many cases over domestic trade also; and no resistance was made to the abrogation or alteration of the Massachusetts charter in 1685, 1691 and 1724. The navigation act of 1651 confined the colonial export trade to Great Britain in English-built ships; and in 1663 this was extended to the import trade also, so that the colonies could legally trade only to and from Great Britain. (See NAVIGATION LAWS.) In the commercial colonies, however, these laws were felt but little before 1760; smuggling and bribery of custom house officers opened the free foreign trade which the laws forbade. In 1672 duties were imposed on the trade from one colony to another. In 1699 the colonists were prohibited from exporting their wool, yarn or woollen manufactures to any place whatever. In 1719 the house of commons formally condemned all American manufactures as tending to independence. In 1732 the export of American hats was prohibited. In 1750, rolling mills, iron furnaces and forges in the colonies were declared public nuisances, to be suppressed by the governors. At first all these restrictions were submitted to, partly from indifference, as they were not extensively felt, and partly from inability to resist; but for some years after 1760 the right of parliament to impose them was still acknowledged, this being the last point which the colonists were prepared to yield. So late as 1774, congress, in its declaration of rights, "cheerfully consented" to such parliamentary restrictions on commerce as should be intended in good faith to benefit the whole empire. When it was at last found that this concession was only accepted as a basis for further demands, it was withdrawn, and all the colonists were ready to echo Franklin's language: "That is a wicked guardian and a shameless one, who first takes advantage of the weakness incident to minority, cheats and imposes on his pupil, and, when the pupil comes of age, urges those very impositions as precedents to justify continuing them and adding others." This language, though natural, was to a great extent unjust. The fault really lay in that narrow colonial system which was then and long afterward the law of every European nation, and is still a part of the English theory, though it is very seldom enforced in practice.

—II.: 1760-66. The open struggle between the two theories, which began in 1760-63, came from an unlucky combination of causes: the accession of a king who was determined to "reign"; the influence of the old whig notion of the omnipotence of

parliament; the high feeling of a nation flushed with successful foreign war; the increase of the national debt, and the consequent necessity of an increase in the revenue; the increase of wealth in the American colonies; and the comparative meagreness of receipts from that quarter of the empire. The initiation of the struggle was facilitated by the fact that there was practically no denial in Great Britain of the abstract right to tax the colonies. Even when the stamp act was introduced in parliament, the opposition was publicly challenged to make such denial, and not a voice was raised to make it, though many, like Burke, considered it highly impolitic to exercise the right, and wished to restrain the controlling power of parliament to commercial regulations and to cases of supreme necessity. This, indeed, was the original ground of the colonists themselves, but it was a poor barrier to the usurpations of a hungry parliament.

—In 1760 the first effort was made to enforce the navigation act. Instructions were sent to the American custom house officers to spare nothing of the revenue laws, and to obtain from the courts "writs of assistance" in order to enter houses and stores, and search for goods which had not paid duty or were forbidden to be imported. The first application for such writs was at Salem in November, 1760, and their issue and enforcement at once brought a few radical men, like Otis, to deny parliament's right to levy the duties. In the great commercial colony, Massachusetts, colonial and loyalist parties were at once formed. The former was headed by James Otis, Samuel Adams, John Adams, Oxenbridge Thacher, James Bowdoin (afterward governor), and Thomas Cushing. The latter was headed by Francis Bernard, the governor; Thomas Hutchinson, the lieutenant governor, a native and the best historian of Massachusetts, the ablest royalist leader, but unscrupulous in method; Andrew Oliver, Hutchinson's brother-in-law; Jeremiah Gridley, attorney general; and Timothy Ruggles. Behind these stood the great mass of royal officeholders in the colonies; much of the subsequent action of the ministries must be attributed to their persistent advice to establish a regular army in the colonies, and tax the colonies for its support.

—Feb. 23, 1763, Charles Townshend became first lord of trade, with the administration of the colonies, and he inaugurated, with the support of the ministry, the new system of colonial government. It was announced by authority that there were to be no more requisitions from the king to the colonial assemblies for supplies, but that the colonies were to be taxed by act of parliament. Colonial governors and judges were to be paid by the crown; they were to be supported by a standing army of twenty regiments; and all the expenses of this force were to be paid by parliamentary taxation. It is unnecessary to follow all the windings of British politics for the next few years: the above programme was the chart of all the ministries, which each followed as closely as it dared. Gov. Hutchinson tells us that the American use of the terms whig and tory dates from this step. (See AMERICAN WHIGS.)

—In March the naval officers on the American coast were given the duties and fees of custom house officers, in order to enforce the navigation acts. In April the head of the ministry, Bute, retired, and George Grenville took his place under pledge to the programme above. May 5, the lords of trade were requested to sketch for the ministry a safe and easy method of parliamentary taxation of the colonies, but Shelburne, the head of the board of trade, declined to commit himself to any plan. Sept. 23, by

direction of Grenville and North, the first secretary of the treasury (Jenkinson) wrote to the commissioners of stamp duties to draft a bill for extending the stamp duties to the colonies. Close investigation has failed to fix the real authorship of the stamp act, but the responsibility for it rests most probably on Jenkinson. March 9, 1764, Grenville announced that he intended to introduce the stamp act at the next session; and in the meantime he suggested to the colonial agents in London that their assemblies should formally approve it, in order to make a precedent for their being consulted in future taxation, or that they should propose some more palatable mode of parliamentary taxation. But the principle was carefully asserted: a bill of April 5 purported, for the first time, to "grant duties in the colonies and plantations of America."

—The stamp duty was not objected to in itself: it was a convenient mode of making a tax collect itself, and for that reason was employed in 1759 by the Massachusetts assembly, and in subsequent years by the new federal government. The objection lay wholly to parliament's power to tax, which was thus forced into the foreground of discussion. In June the Massachusetts assembly sent a circular letter asking the "united assistance" of the other colonies; and during the year nearly all the colonial assemblies petitioned against the new scheme. But the idea of forcible resistance does not seem to have occurred to the king, to the ministry, to parliament, to the colonial agents, or to the colonial assemblies. All believed that the tax would execute itself. The act was framed, imposing stamp duties on legal documents, marriage licenses, and publications of every description, and making offenses against it cognizable in the admiralty courts, without a jury. Petitions against it were refused a hearing, on account of an ancient and convenient rule forbidding the reception of petitions against a money bill. The bill was passed with hardly any opposition in either house; the king was by this time a lunatic, and his signature was attached by a commission; and with this evil augury the stamp act became law, March 22, 1765. With it went a suggestive act to authorize the quartering of troops in the colonies, and to require the assemblies to furnish them with subsistence.

—The first answer came from the Virginia assembly, which adopted a series of resolutions offered by Patrick Henry, May 30. These declared that the colony had never forfeited and had always enjoyed the right to be taxed by their own representatives; but the assembly rejected two further resolutions, declaring that the people of the colony were not bound to obey the stamp act, and that he who should obey it would be an enemy to the colony. June 8, the Massachusetts assembly took the more important step of calling a congress of all the colonies. (See STAMP ACT CONGRESS.) Through the summer the resistance took the form of an inchoate revolution. Associations, the "Sons of Liberty," were formed; stamp agents were compelled to resign, either by ostracism, or, in some few cases, by actual violence; and the inflammatory resolutions of public meetings were steadily carrying the assemblies to the point of resistance. Nov. 1, 1765, was the day fixed for the operations of the act to begin; but there were by that time neither stamps nor stamp agents in the colonies, and the judges, like the merchants, were compelled to ignore the absence of stamps upon documents. Hutchinson wrote home that the people were "absolutely without the use of reason."

—In the meantime the opponents of the *policy* of taxing the colonies had come into power, under the Rockingham ministry, in July, 1765. Their first design was not to repeal, but to modify the act, and make it more acceptable. But when parliament met, its right to tax the colonies was at last denied by some of its own members, though even these still asserted its power to lay duties and regulate trade. Said Pitt: "In an American tax, what do we do? We, your majesty's commons of Great Britain, give and grant to your majesty—what? Our own property? No! We give and grant to your majesty the property of your majesty's commons in America. It is an absurdity in terms"; and he "rejoiced that America had resisted." The majority, however, followed the ministerial programme. The reception of the petitions of the American congress was evaded. A declaratory house resolution was passed, Feb. 10, 1766, by almost unanimous vote, that the king, with the advice and consent of parliament, "had, hath, and of right ought to have, full power and authority to make laws and statutes of sufficient validity to bind the colonies and people of America, subjects of Great Britain, in all cases whatsoever." This was followed up by four others: that there had been tumults and insurrections in the colonies; that these had been encouraged by the colonial assemblies; that the assemblies must make recompense for property destroyed; and that the house would sustain the lawful authority of the crown and the rights of parliament, and would favor and protect the loyal people of the colonies. Under cover of this hot fire of resolutions the stamp act was repealed, March 18. The repeal was wholly on the ground of policy, and was accompanied by a declaratory act in two clauses: 1, containing the first resolution above named; and 2, declaring null and void the votes and resolutions of the colonial assemblies in regard to taxation. One of the most valuable incidents in the repeal was the examination of Franklin before the house of commons, Feb. 13. The questions put to him numbered 174; and his answers sum up calmly, but fully, the American theory of the connection between Great Britain and the colonies, and the compromise to which the Americans were willing to agree.

—III.: 1766-70. Hutchinson dates the revolt of the colonies from the repeal of the stamp act. As soon as the rejoicings over that event had subsided, premonitory symptoms of trouble again began to appear. The Massachusetts assembly refused to make recompense for the losses in the riots without an accompanying bill of indemnity. Other assemblies refused to comply with the act of 1765 for billeting and subsisting the army. In November, 1766, the first declaration that parliament had no right to "legislate" for the colonies was made in the Massachusetts assembly; and there was a growing party everywhere which held to the advanced doctrine of "*no legislation without representation*." And all this time political events in Great Britain were tending against the colonies. In July, 1766, Chatham had formed a ministry composed mainly of friends of America; but Chatham's continued illness was steadily throwing the real leadership into the hands of the chancellor of the exchequer, Charles Townshend. His political creed he summed up as follows: "I would govern the Americans as subjects of Great Britain. These our children, must not make themselves our allies in time of war, and our rivals in peace." In March, 1767, Chatham really, though not formally, retired from public affairs, and Townshend was master of the situation. He made use now of the parliamentary control over commerce, which colonial assemblies had so often expressly acknowledged: and in July a bill was passed granting duties in America on glass, lead, paints, paper and tea. But the

insidiously perilous feature of the act was, that the proceeds were to go into the exchequer, and were to be distributed at the king's pleasure in paying the salaries of governors, judges, and other civil officers. These would thus be, as they had never been before, completely independent of the American assemblies, and not only able but willing to make political war upon them. By other acts, writs of assistance were legalized, and the New York assembly was suspended altogether, until it should obey the billeting act. In September, Townshend died but his mantle fell on Lord North, his successor.

—It was difficult, at first, to find any means of opposition to the new revenue laws. Isolated agreements were indeed made by the people of various districts, to abstain from the use of any of the articles taxed, but these depending on the persistence of individuals, were no safe reliance. Jan. 12, 1768, the Massachusetts assembly formally protested against the new system; and Feb. 11, it sent a circular letter to the other colonies, asking advice. April 21, the colonial office sent a mandate to each of the governors to prorogue the assembly of his colony rather than allow the circular letter to be discussed. To Massachusetts further orders were sent to prorogue the assembly if it should not recant the letter, and to continue the process indefinitely until submission should be made; and in June this penalty was enforced. June 8, four regiments under Gage were ordered to Boston permanently; five vessels took possession of the harbor; and the fort was repaired and occupied. Every petty disturbance, every expression of popular indignation, had been magnified and distorted by colonial officers, until the ministry really believed a rebellion imminent, and took this sure means to provoke it. Even then, it required seven years' wrangling to break the bond of union.

—Massachusetts, however, was now very close to rebellion. Her assembly, like that of several other colonies, had been dissolved; and a convention of town delegates met, Sept. 22, protested against the revenue laws, and petitioned the king. "I doubt whether they have been guilty of an overt act of treason," said the British attorney general, "but I am sure they have come within a hair's breadth of it." In February, 1769, parliament requested the king to have the ring-leaders in Massachusetts sent to England to be tried for treason, under an old statute of Henry VIII. One step further, an attempt to arrest for that purpose, and the rebellion would have begun; but the step was not taken. Nevertheless the troops were left in Boston, a firebrand near a powder magazine; and the next six years are one long record of bickerings between the townspeople and the military, arrests of soldiers for violations of town laws, indictments of officers, even of the commander-in-chief, for "slandering the town of Boston," and similar legal proceedings, blotted by the Boston massacre of March 5, 1770, in which five lives were lost.

—The whole of the year 1769 was taken up by the full development of the colonial claim of rights. The Virginia assembly, May 16, passed a series of resolutions, declaring its right of taxation, of petition, and of concurrence with other colonies, and the right of its people to a trial by a jury of the vicinage; and these, for which the assembly was dissolved, were copied by other assemblies, and the fault met the same punishment. The Massachusetts assembly absolutely refused to make provision for the troops, and was, for that reason, dissolved. Whenever an assembly was dissolved,

its members at once formed a non-importation league, so that the agreement not to use taxed articles had become much more general than was to be expected. It was effective enough to extort from the ministry a circular letter, in May, 1769, promising to impose no more such duties, and to abandon all those already imposed, except that of three pence per pound on tea, which yielded about \$1,500 per annum of revenue. The repeal, in these terms and to this extent, was formally enacted, April 12, 1770. But there remained the preamble, the declaration of the right and expediency of taxation of the colonies by parliament. This was still to be resisted; and the revolution, as Webster afterward remarked, was fought upon this preamble. The only result of the repeal was the dissolution of the non-importation associations, and the renewal of trade with Great Britain, except in the matter of tea.

—IV.: 1770-83. The first few years of this period are mainly occupied by apparent efforts on the part of the king and the ministry to put the colonists so far in the wrong as to excuse the use of force. The struggle against the carefully guarded and almost pedantically legal methods of the colonies was growing vexatious. In July and September, 1770, the king made preparations to declare martial law in Massachusetts, filled Boston harbor with war vessels, and even seized the castle guarding the harbor, though this had been built by the colony, and the control of it was reserved to the governor by the charter. Still the colonists avoided any open provocation, and there was no fighting except in North Carolina, where the governor, Tryon, provoked and suppressed an "insurrection," and in Rhode Island, where the "Gasper," a revenue cutter, was burned, June 9, 1772, by a boat party from the shore, after she had run aground. The whole period was marked by exasperating legal battles between the governors, under royal instructions, and the various assemblies. In most of the colonies the upper house, or council, was selected by the lower house, with a power of veto by the governor. Whenever persons were selected who had taken part against the parliament, their nominations were vetoed, and the war of retaliation, thus begun, kept the continent in a ferment. In Massachusetts the higher step was taken of paying the salaries of the governor and principal officials directly from the royal treasury, thus not only violating the charter by making them independent of the colony, but provoking a conflict, for it should have been evident that the assembly would never recognize or act with a governor or judges salaried by the crown. This step, like others equally ruinous, was the fruit of constant pressure by the office-holders in America. In December, 1772, Franklin obtained and sent from London to the assembly the treacherous letters of Massachusetts officers, advising these coercive measures, and these did much to undermine all public confidence in the royal civil service. Every one lived in an atmosphere of distrust, more destructive to loyalty than the open excitement produced by the stamp act.

—Nov. 2, 1772, in Boston town meeting, Samuel Adams obtained the appointment of a committee of correspondence with other towns. This was the real opening of the revolution, the installation of the first of those revolutionary bodies which within three years had practically superseded the legitimate governments in the conduct of the struggle. (See NOMINATING CONVENTIONS.) Other towns followed the example; and Virginia laid the basis of the Union, March 12, 1773, by appointing a committee of correspondence with the other colonies.

—All this time the tax on tea had been collected, though it had shrunk to \$400 per year. In April, 1773, the East India company applied for permission to export free of duty the ruinously large stock of tea which it had accumulated. This offered a fair opportunity to settle discontent, but Lord North induced parliament to vote the company a drawback of the duties, the repayment of the duties, after May 10, to the company after collection. The duties would thus be collected, the principle maintained, and yet the price of the tea would not be increased. After all, the meanness of this evasion, and of the trap which it attempted to set, seems to have had much to do with the result. It early led to the appointment of revolutionary committees by other colonies, and thus to a union antecedent to the meeting of congress. Consignments of tea were sent to Charleston, Philadelphia, New York and Boston. At Charleston it was stored in damp cellars, and destroyed; at Philadelphia and New York the ships were forced to return; but at Boston the officers would not permit the ships to return without discharging. Dec. 16, the revolutionary committee took further discussion out of the hands of the town meeting, sent a body of men, and threw the tea into the harbor.

—Boston at once became the focus of interest. It had placed itself in the forefront of resistance, and behind it were the revolutionary committees of all the thirteen colonies. Its conduct was noticed severely in the king's speech, March 7, 1774; and on the 31st the Boston port bill became law. It forbade the landing or shipping of goods in Boston after June 1, until the owners of the tea should be recompensed, and the king should be satisfied of the town's future obedience. Lord North also declared in debate that the act would be enforced by the use of the army and navy. Salem was made the capital of the colony, and Marblehead a port of entry. Gage, the commander in-chief for North America, was made civil governor of Massachusetts, with instructions to bring the ring-leaders to punishment.

—The Boston port bill was followed. May 20, by a bill for the government of Massachusetts, which abrogated a large part of the charter. It took away the choice of the council by the lower house; forbade town meetings, except for elections or on the governor's permission; and gave the appointment of sheriffs to the governor, and the selection of juries to the sheriffs. This might have been fairly termed a bill to transfer the *de facto* government of Massachusetts to revolutionary committees. With it went a supplementary act "for the impartial administration of justice in Massachusetts" by transferring to Nova Scotia or Great Britain the trial of officers or soldiers indicted for murder. Another act legalized the quartering of soldiers in Boston; and another, the "Quebec act," extended the jurisdiction of that province over the whole of that which was afterward called the "Northwest Territory," (see ORDINANCE OF 1787), and to which various colonies laid claim by charter. These were untraceable steps. The first four called for united resistance by all the colonies which had charters, and by all the colonies which desired charters; the last called for united resistance by all, for this territory was already blindly felt to be the common property of the whole, and the basis of future union.

—Gage arrived May 17. The revolutionary committees all over the country had already begun to obtain a popular suspension of commerce with Great Britain; and the New York committee had proposed a general congress. This last measure met with

general approval; and the Massachusetts assembly, June 17, formally proposed it for Sept. 1, at Philadelphia, having first locked the doors to prevent the governor from proroguing them. Two days before, the Rhode Island assembly had chosen delegates to the congress; five days after, Maryland took the still more ultra step of electing delegates by a popular convention or provincial congress. This last step was even more decisive than the calling of a congress. It was imitated in the other colonies during the summer; and though these "provincial congresses" ventured at first no further than the preparation of non-importation agreements, promises of support to the general, or continental, congress, or contributions for the assistance of the people of Boston, they were evidently the germ of rebellion, and within a year were to assume the practical government of their colonies.

—The congress met in Carpenter's hall, Philadelphia, Sept. 5, 1774. (See CONGRESS, CONTINENTAL, for its further history.) Gage had already begun to fortify himself in Boston, and had seized the colony's stores, as if in an enemy's country. False alarms had already led to more than one mustering of the militia of Massachusetts and the neighboring colonies. Nevertheless, the only measure of active resistance adopted by the congress was the preparation of an "American association," Oct. 20, 1774, which was signed by the delegates and then circulated for general signature. It not only bound the signers to non-importation, non-exportation and non consumption of British goods, and to prohibition of the slave trade (see SLAVERY, III.), but it provided for local committees, chosen by popular vote, to enforce the provisions of the association. This was the first effective step toward national union and preparation for war (see EMBARGO), and it is noteworthy that it was taken by general popular action, not by state action; and yet that state lines, and even town boundaries, were carefully observed in its execution. The peculiar combination of national and local government in the United States could hardly be better illustrated. (See NATION, STATE SOVEREIGNTY.)

—From this time revolution in British North America was a certainty. It proceeded steadily at first as a mere protest against, and passive resistance to, the unconstitutional measures of the ministry; then, after April 19, 1775, as a scission of the British empire and the formation of an American nation, George III. being still recognized as its king; then, after July 4, 1776, as the establishment of a self-governing republic under the revolutionary congress, to be succeeded by the articles of confederation and the constitution. (See CONGRESS, CONTINENTAL; FLAG; DECLARATION OF INDEPENDENCE; CONFEDERATION, ARTICLES OF; WARS; CONSTITUTION; UNITED STATES.)

## RHODE ISLAND

RHODE ISLAND, one of the original thirteen states of the American Union. Its settlement was begun at Providence in 1636 by Roger Williams, as a place of refuge for persons banished from Massachusetts. In 1637 a band of antinomians, also banished from Massachusetts, made a settlement on Rhode Island; and the traces of this double settlement are still seen in the official title, "the state of Rhode Island and Providence Plantations," and in the two capitals, Providence and Newport, in which the legislature meets alternately. The title to these and other settlements was at first derived from the Indians by purchase. Parliament was then the ruling power in Great Britain, and its lord high admiral of the colonies, Warwick, granted Williams a patent, March 14, 1643, which was renewed by Charles II. in 1663, as stated below.

—BOUNDARIES. The patent of 1643 assigned as limits the ocean on the south, the Plymouth and Massachusetts patents on the east and north, and the Narragansett Indian territory on the west. The charter of 1663 was more definite. The southern and northern boundaries remained as before. The western boundary was to be the Pawcatuck river to its head, and thence due north to the Massachusetts line. Originally the eastern boundary of Connecticut (see that state) was to have been the Narragansett river or bay; but this charter stipulated, with the consent of the Connecticut agents, that the Pawcatuck river should be "taken and deemed to be" the Narragansett river mentioned in the Connecticut boundary. Connecticut repudiated the action of her agent, claimed jurisdiction over the Narragansett country, east of the Pawcatuck, both by her charter and by conquest from the Indians, and pressed her claim by all legal means, by appeal to the New England union, and by preparations for force. Rhode Island's threat to appeal to the king brought about an agreement May 12, 1703, to run the boundary from the head of the Pawcatuck to the southwest corner of the Warwick purchase, and thence due north to the Massachusetts line. This was confirmed by the crown in 1727, and after sixty-five years of quarreling the line was settled, Sept. 27, 1728, and confirmed by both colonies in 1742. A new survey was made in 1840.

—The eastern boundary assigned was a line from the ocean three miles to the east of Narragansett bay and Seacunck, Blackstone, or Seekonk, river "to the falls called Patuckett falls," and thence due north to the Massachusetts line. But Massachusetts Bay and Plymouth colonies claimed a large part of Rhode Island as lying within their patents; the former claimed Pawtuxet and Warwick; the latter, Aquidneck and the islands. Had these and the Connecticut claims on the west been allowed, very little would have been left of Rhode Island. Only the colony's stubborn resistance carried it safely through a struggle of more than a century, during which feeling ran so high as to exclude Rhode Island from political association with her neighbors. (See NEW ENGLAND UNION.) In 1703 the western boundary was fixed in favor of Rhode Island by royal commissioners, and in 1726 their award was confirmed by the crown. In 1741 the disputed eastern boundary was decided in the same way very nearly in accordance with Rhode Island's claim; and in 1746-7 the award was confirmed by the crown. Rhode Island thus gained its present northeast township, and five others on the southeast. The boundary between the two states was not finally settled until March 1,

1862, when it was so run as to throw Fall River into Massachusetts and Pawtucket into Rhode Island.

—CONSTITUTIONS. The provisions of the charter of 1663 gave the colony a "democratical" form of government. No appeal or veto power was reserved to the crown; and even the clause which forbade the making of laws contrary to the laws of England was only to extend so far as the nature and constitution of the colony would permit. The governor and general assembly were to be chosen by the people, and their statutes were final. Rhode Island was thus from the beginning a self-governing community. At first the legislature had but one house, but in 1696 a law was passed forming two houses: the council, or governor's assistants, as the upper house, and the delegates as the lower house. In 1724 a property qualification was established for the right of suffrage. It was subsequently modified, until in 1762 it was settled at £40 (\$134) freehold, or 40 shillings (\$7.50) annual rent. Only freemen with this qualification could vote or hold office, except that the eldest son of a freeman needed no qualification.

—This charter was the organic law of the colony and state until 1843. It was suspended by common consent during James II.'s *quo warranto* warfare upon the colony charters, but was quietly resumed after his abdication. It was not altered at the revolution, except by a law of the legislature in May, 1776, substituting allegiance to the colony for allegiance to the king.

—A very simple and excellent constitution was framed by a state convention at Newport and East Greenwich, Sept. 12-Nov. 5, 1842. It was ratified, Nov. 21-23, by a popular vote of 7,032 to 59, and went into force in May, 1843. It gave the right of suffrage to males over twenty-one, on the old property qualification of \$134, or on the annual payment of a state tax of one dollar. The governor, a house of representatives of not more than seventy-two members, and a senate of one member from each town or city, were all to be elected annually, and there were few restraints on their action. In 1864 an amendment was made, to allow the state's volunteer soldiers to vote for presidential electors, congressmen and state officers.

—GOVERNORS. Nicholas Cooke, 1775-8; William Greene, 1778-86; John Collins, 1786-90; Arthur Fenner, 1790-1805; Isaac Wilbour, 1805-7; James Fenner, 1807-11; William Jones, 1811-17; N. R. Knight, 1817-21; Wm. C. Gibbs, 1821-4; James Fenner, 1824-31; Lemuel H. Arnold, 1831-3; John B. Francis, 1833-8; William Sprague, 1838-9; Samuel W. King, 1840-43; James Fenner, 1843-5; Charles Jackson, 1845-6; Byron Diman, 1846-7; Elisha Harris, 1847-9; H. B. Anthony, 1849-51; Philip Allen, 1851-3; William W. Hoppin, 1853-7; Elisha Dyer, 1857-9; Thos. G. Turner, 1859-60; William Sprague, 1860-63; James Y. Smith, 1863-6; Ambrose E. Burnside, 1866-9; Seth Padelford, 1869-73; Henry Howard, 1873-5; Henry Lippitt, 1875-7; C. C. Van Zandt, 1877-80; Alfred H. Littlefield, 1880-83; Augustus O. Bourn, 1883-4.

—POLITICAL HISTORY. The natural conformation, by which Narragansett bay penetrates almost every part of the state, had from an early period developed a large commercial interest; but the apportionment of representation in the legislature among the towns gave the agricultural interest complete control of legislation. For twenty

years before the outbreak of the revolution there had been a constant struggle between the town and country, hard money and paper money, parties, led by Samuel Ward and Stephen Hopkins, respectively. The steady and successful struggle of a century against the encroachments of two powerful neighbors had kept up a strong state feeling, which, combined with the rivalry of the state's two great interests, made Rhode Island the brake on every effort at a closer union among the states. On every grant of additional-power for which congress asked (see CONFEDERATION, ARTICLES OF) Rhode Island put a veto which was final, since any change in the articles required the approval of every state. The agricultural representatives were determined, 1, to retain the power of laying duties on imports, in order to lighten state taxes; 2, to retain the power of compelling the commercial classes to accept as a legal tender the depreciated paper currency of the state; and 3, to resist any change in the national constitution which should curtail these privileges. Hence, though the urban population was warmly federalist, the state was not represented in the convention of 1787, and the legislature refused even to call a state convention to consider the new constitution, remitting it to the town meetings, when it was overwhelmingly defeated. The new question increased the division of feeling so much that the legislature passed a bill to compel holders of state securities to accept five shillings in the pound for them, and removed the state judges who pronounced the law unconstitutional; and a country army, headed by a judge of the state supreme court, marched upon Providence to prevent a celebration of the general adoption of the constitution, July 4, 1788. In the latter case, bloodshed was averted by an agreement to have a common banquet, without reference to the constitution. Finally, the state yielded, and ratified the constitution, May 29, 1790. (See SECESSION, I.; STATE SOVEREIGNTY.)

—Having once gained control of the state, the commercial interest kept it federalist for over ten years; and the tendency was assisted by the operation of Hamilton's scheme for the assumption of state debts (see FEDERAL PARTY, I.), under which the holders of state securities recovered that portion which they had lost under the state paper money laws. The governors, legislatures and congressmen were thus federalist; and the state's electoral votes were cast in 1792 for Washington and Adams, in 1796 for Adams and Ellsworth of Connecticut, and in 1800 for Adams and Pinckney, with one vote for John Jay. (See CAUCUS, CONGRESSIONAL, I.) The general democratic success of 1800 encouraged the party in Rhode Island to a new alignment of country against town. It was immediately successful; the state became democratic in 1801, and in 1804 her electoral votes were cast for Jefferson and Clinton. But, as the embargo system began to press more heavily upon agriculture as well as commerce, the small democratic majority disappeared, and the state again became federalist in 1808, casting her electoral votes for Pinckney and King. In the following year the state government also became federalist, and so remained throughout the war. (See EMBARGO; CONVENTION, HARTFORD.)

—The manufacturing interest, which had been developed by the restrictive system and the war, and which was destined to put an end to the federal party (see FEDERAL PARTY, II.), probably grew more rapidly in Rhode Island than in any other state, and has since controlled the state's politics to this day. It gave the state's electoral votes to Monroe and Tompkins, the democratic candidates, in 1816 and 1820; it elected Gov. Knight in 1817 and subsequent years; and, on the break-up of the democratic party in

1824-5, it carried the state into the Adams, or protective tariff, portion, the germ of the whig party. (See WHIG PARTY, I.) From 1824 until 1850 the state's electoral votes were cast for Adams and other whig candidates, with the exception of 1836, when they were given to Van Buren by a majority of 254 out of 5,674 votes. During the same period the governors, legislatures, senators and congressmen were whig, with the exception of a few protective tariff democratic congressmen.

—The charter, an excellent one for a purely agricultural population, had long before 1842 been made obsolete by the growth of other interests. The grievance usually assigned was the property qualification required of voters; but the comparative unimportance of this is shown by the fact that the increase of voting population was 2,947 (51.9 per cent.) from 1836 until 1840, and 3,675 (42.6 per cent.) from 1840 until 1844, after the practical abolition of the property qualification. A more serious grievance was the unequal representation of the towns. While they had varied enormously in their growth, their proportionate representation remained fixed as at first; and the "minority-majority" stubbornly refused to make any change. Representative reform had been unsuccessfully proposed by the growing cities in 1796, 1824 and 1830; and in 1840 the state of affairs seemed unendurable. Providence, with 23,000 inhabitants, had four representatives; Portsmouth, with 1,700, had four, and Newport, with 8,000, had six. Of the whole number of seventy-two representatives, thirty-eight represented towns with 29,020 inhabitants (2,846 voters), and thirty-four represented towns with 79,804 inhabitants (5,776 voters). Party feeling added bitterness to the question. The demand for reform came mainly from the democrats, and was resisted by the whigs; and in other states party organs supported their respective party friends in Rhode Island. The result was the "Dorr rebellion." (See that title, and INSURRECTION, II.) Concurrently with its suppression, the new state constitution was framed and put in force. It removed discontent by slightly relaxing the property qualification: and still more by apportioning representation to population equitably throughout the state on a ratio of one representative to 1,530 inhabitants.

—In 1851 the coalition of democrats and free-soilers (see REPUBLICAN PARTY, I.) elected the governor, a majority of the legislature on joint ballot, one of the two congressmen, and the United States senator: and in the following year the state's electoral votes were given to the democratic candidates, Pierce and King, by a majority of 465 out of 17,005 votes. In the congress of 1853-5, for the first and last time since 1824, all the state's senators and congressmen were democrats. The elections of 1854-5 put an end to the temporary democratic supremacy, and by the end of the latter year there were in the legislature but two democratic senators out of thirty-two, and three democratic representatives out of seventy-two. At first the majority called itself the American party (see that title), but before 1856 it had settled into the republican party. Gov. Hoppin's election in 1855 was almost unanimous. From that time until the present the state has been republican in all elections, presidential, congressional and state. But the state's republicanism has never been ultra: it has been fairly represented by such moderate and conservative members as Anthony, Sprague, Jenckes and Burnside. Until 1861, indeed, the republicans elsewhere looked with some suspicion upon the Rhode-Island delegations, as if commercial interest had made them cautious even to cowardice. In January, 1861, the

legislature even repealed its "personal liberty law" (see that title), as a peace measure. But the call for troops in April showed that the state's caution covered an equally strong determination. Her quota was filled immediately, and the governor literally fulfilled his constitutional function of "captain general and commander-in-chief of the military and naval forces of this state," by heading the state's contingent in person.

—Since the close of the rebellion the republican share of the total vote has been from 60 to 70 per cent., except in 1876, when the vote for Hayes was 15,787, and that for Tilden 10,712. In 1880 Garfield had 18,195 votes, Hancock 10,779, and 261 were scattering. In the state elections there is frequently no popular choice of governor, since the democratic and prohibition votes, each inferior to the republican vote, are together superior to it, and prevent a popular majority for any candidate. Any coalition between the two minority parties is at once followed by a complete republican majority; and their separate existence is followed by no popular majority, and the choice of a republican by the legislature. In the legislature in 1883 the republicans had thirty senators and sixty-five representatives, and the democrats seven senators and seven representatives. In every county the republicans are in a large majority.

—Among the leaders in state politics have been the following: Henry B. Anthony, whig governor 1849-51, republican United States senator 1859-90; Samuel G. Arnold, whig lieutenant governor 1852-3 and 1861-2, republican United States senator 1862-3, and author of the standard history of the state; Tristram Burges, whig congressman 1825-35; Ambrose E. Burnside, major general in the war of the rebellion, republican governor 1866-8, and United States senator 1875-81; Nathan F. Dixon, congressman (whig) 1849-51, and (republican) 1863-71; Job Durfee, federalist congressman 1821-5 and state chief justice; William Ellery, delegate to congress 1776-81, a signer of the declaration of independence, state chief justice 1785-9, and collector of the port of Newport 1790-1820; James Fenner, United States senator 1805-7, governor 1807-11, 1824-31, and 1843-5; David Howell, delegate to congress 1782-5, and federal district judge 1812-24; Thos. A. Jenckes, republican congressman 1863-71, and the first effective promoter of reform in the federal civil service, Stephen Hopkins, chief justice 1751-4, governor 1755-6, 1758-61, 1763-4, and 1767, and delegate to congress 1774-8; Nehemiah R. Knight, governor (democratic) 1817-20, and whig United States senator 1821-41; Francis Malbone, federalist congressman 1793-7, and United States senator, May, June, 1809; Duttee J. Pearce, democratic congressman 1825-37; Elisha R. Potter, whig congressman 1843-5; William Sprague, democratic congressman 1835-7, governor 1838-9, and United States senator 1842-4; William Sprague (nephew of the preceding) republican governor 1860-63, and United States senator 1863-75; and Samuel Ward governor 1762 and 1765-7, delegate to congress 1774-5.

## RICARDO

RICARDO, David. David Ricardo, one of the most celebrated English economists of this century, was born in London in 1772, and died at Gatcom Park, in the county of Gloucester, Sept. 11, 1823. His family is said to have come originally from Lisbon; it is certain that his father, a Dutch Jew, came to England, where he acquired an honorable position by his ability and integrity, at the same time that he made a fortune in financial business and business on 'Change. David Ricardo received a commercial education at a school in Holland, where he remained two years, and, at the age of fourteen, he was placed in his father's office in London. He soon showed, in this struggle with the chances of financial life, a cool and sound judgment, penetrating sagacity, and great skill in calculating mentally the advantages of an operation, in disentangling difficult transactions, and in reaching an exact solution in spite of the most complicated details.

—Business did not wholly absorb him, however, and his mind was preoccupied, on the one hand, with the social and economical questions raised by the situation of Europe in general and his own country in particular, and also by religious questions on the other. His reflections on these last decided him to change his religion, and to join the church of England, in spite of the formal disapprobation of his family and his father, toward whom, however, he never forgot his duty as a respectful son. This event rendered a separation inevitable, and young David Ricardo was obliged to consider how to make his fortune alone. But as he had already given proof of a remarkable aptitude for business, support, means and encouragement were not lacking, and he was able to take a share in very lucrative operations.

—At the age of twenty-five he was rich, and had married Miss Wilkinson. His lot decided, and being no longer absorbed by the cares of fortune, he, like Lavoisier, divided his time into two parts: one for business, the other for scientific studies, toward which an inborn inclination had long drawn him. He resumed the study of mathematics and of the natural sciences, devoting himself especially to chemical research. He was one of the first to introduce gas burners into one of his residences. At the same time he took great pleasure in reading the *chefs-d'-œuvre* of literature, and Fonteyrand heard it related in his family that he plunged with infinite delight into the reading of Shakespeare.

—But he was still more strongly attracted toward political economy, after he had read, as he himself relates, the immortal work of Adam Smith, with which he had first become acquainted in 1799, at Bath, to which place he had accompanied Mrs. Ricardo, whose health had become impaired. Thus it was that, by the nature of his business and the bent of his mind, he was preparing himself theoretically and practically for the financial and economical struggles in which he played so great a part during the last years of his life.

—Ricardo made his first appearance as a writer and economist in 1810, at the age of thirty-eight years, by the publication of his pamphlet, entitled, "The high price of

Bullion a proof of the depreciation of Bank Notes." This pamphlet made a great sensation, because it revealed the true cause of the decline of the English exchange and of the depreciation of bank notes. Ricardo demonstrated that the increase in prices which merchandise of all kinds had undergone was not, as was generally supposed, attributable to the wars, but rather to the depreciation of paper money. The ministry did not want to believe in this depreciation. A bullion committee was appointed by parliament, and Mr. Horner, who made the report, admitted that Ricardo's demonstration was unanswerable, and he proved by the Hamburg exchange that the value of paper was only 25 per cent. that of specie. This was the opinion of Huskisson, Canning and Henry Thornton; but the house of commons made, nevertheless, on the motion of Mr. Vansittart, chancellor of the exchequer, the singular declaration that paper had not undergone any depreciation! At the head of the opponents of the ideas and measures contained in the treatise of Ricardo, and the report of the committee of the house of commons, was Mr. Bosanquet, who maintained his opinion in a pamphlet which provoked a reply from Ricardo, in the course of this same year (1810).

—The next publication of Ricardo was in 1815, at the time when the famous bill relative to the exportation of foreign grain, so often afterward modified and finally withdrawn, on the motion of Sir Robert Peel and by the efforts of the free trade league, was being discussed. In it Ricardo maintained the principles of commercial liberty, and foreshadowed the theory of rent, with which his name is identified. The year following, he published another tract on monetary circulation, and proposed, that, in order to keep paper on the same level as gold and to render it inconvertible, bank notes should be exchanged for ingots or pieces of bullion of the standard weight and measure.

—Ricardo retired from business shortly after the peace of 1815, and applied himself to study with renewed ardor. In 1816 he arranged his ideas on economy and finance in their proper relation to each other in his "Principles of Political Economy and Taxation." It is to be remarked, that, in his preface to this book, he is far from claiming as his own the theory of rent. He declares, "that the true doctrine of rent was published simultaneously by Malthus, in a pamphlet, entitled, 'An Enquiry into the Nature and Progress of Rent,' and by a member of the university of Oxford (Dr. West), in an 'Essay upon the Application of Capital to Land'; that without a profound knowledge of this doctrine it is impossible to conceive of the effect of taxation upon the different classes of society, especially when the things taxed are the direct products of the soil; that Adam Smith and other distinguished writers, not having considered the principle of rent correctly, they had neglected many important truths, the knowledge of which can be acquired only after having thoroughly fathomed the nature of rent." Mr. McCulloch ("Principles of Political Economy," London, 1843), afterward saw that the first idea of this theory was to be met with in a pamphlet published forty years previous, in 1777, by an Englishman, Dr. James Anderson ("An Enquiry into the Corn Laws"), which seems to have escaped the notice of Adam Smith, and which was undoubtedly unknown to Malthus, West and Ricardo. Be that as it may, we are inclined, together with McCulloch, Senior, Rossi, and others, to accord to Ricardo the honor of the complete demonstration of this theory, imperfectly seen by Adam Smith, treated of in part by James Anderson in 1777, treated anew and

more fully in 1815, in the two simultaneous pamphlets of Malthus and West, and finally expounded with wonderful clearness by Rossi in his *Cours d' Economie politique*. (See RENT.)[88](#)

—Thanks to these remarkable publications, to his skin in business, and to a large fortune, which was stated to be twelve millions; thanks also to the independence of his mind and character, Ricardo occupied an important position in his country. In 1818 he was returned to parliament by the electors of Portarlington. Two of his letters testify to his extreme distrust of his own strength. "You have seen," he wrote, April 7, 1814, to one of his friends, "that I have a seat in the house of commons. I fear that I shall not be of much use there. I have twice attempted to speak, but in the most embarrassed manner, and have scarcely any hope of being able to overcome the fright which takes possession of me when I hear my own voice." "I thank you," said he, in another letter, dated June 22, 1814, "for the efforts which you have made to inspire me with a little courage. The indulgence of the house has lessened for me the difficulty of speaking, but I still see so many and such terrible obstacles, that I fear much that it would be wiser to confine myself to silent votes." Everything shows that he was too harsh toward himself in this judgment. This is how Lord Brougham expressed himself with regard to it. "Ricardo's language had a remarkable stamp of distinction, his style was clear, simple, correct, and its woof was enriched with facts and valuable documents. He practiced abstention in questions which had not been the object of his long meditation, and, when he spoke on events and laws concerning the church or of politics in general, he seemed to be acting in obedience to the inveterate frankness of his nature and the indomitable freedom of his spirit. Hence it was that few men ever exercised such real effect on parliament; few men have commanded such lively attention, and as he had neither captivating inspirations nor graceful speech, with which to charm his auditors, this influence may be regarded as the triumph of reason, of integrity, of ability. Besides, he commanded the respect of all parties, even the ministerial, against which he was constantly fighting; but he would not submit to the yoke of any coterie, voting with the opposition, the radicals, or the cabinet, from judgment and not from tactics or ambition. Although he owed part of his fortune to the negotiation of government loans, he more than once combated from the tribune that ruinous practice of governments in general and of the then existing English government in particular."

—Such was the man as a politician. As a scholar he was no less calm, no less independent. During twenty years he debated with Malthus, with Mill, and with J. B. Say, without the antagonism of ideas impairing the friendship which existed between his illustrious opponents and himself. In private life, Ricardo's character was at once firm, mild, simple and amiable; he was an indulgent father, a kind husband, a devoted friend. He particularly liked to collect about him men of talent, and to converse freely on all subjects, but principally on those which were connected with his favorite science. A most pleasant memory of him is preserved by the club of political economy of London, one of the founders of which he was, and at Paris, in the circle which J. B. Say and his amiable consort gathered together once a week. It is also said that his generosity kept pace with his ability: nearly all the charitable institutions of London counted him in the number of their patrons, and he maintained at his own expense an alms-house and two schools in the neighborhood of his residence in the

county of Gloucester. James Stuart Mill has said of him: "His history offers a most encouraging example; he had everything to do, and he performed well his task. Let the young mind which longs to spring beyond the sphere in which it has been placed not despair, in view of his great career, of attaining to the highest place in science or in politics. Ricardo had to make his fortune, to form his mind and even to begin his education, without any guide but his penetrating sagacity, without any encouragement but his energetic will, and it is thus that, while making an immense fortune, he broadened his judgment and endowed his mind with a strength which has never been surpassed."

—Without being robust, Ricardo was gifted with a constitution which seemed to promise him a longer career. But he had for several years a pain in his ear to which he did not pay much attention, and which assumed a very alarming character, in September, 1823, after his return to Gatcom Park at the close of the session. The rupture of an abscess at first afforded him some relief, but inflammation set in again, the brain was attacked, and he died on the 11th of September,[89](#) after two days of great suffering. He was but fifty-one years old.

## RIDERS

RIDERS (IN U. S. HISTORY). In the federal government, and in the state governments also, with some exceptions (see VETO), a limited veto power is given to the executive, the president or the governor. Where a legislative majority is sufficient to pass a bill, but not to overcome the veto, a measure which has good reason to fear a veto is sometimes attached to some very necessary bill, such as an appropriation bill, and the two are passed as a single bill, so as to force the executive either to accept the doubtful measure or to incur the odium of a veto of the more essential bill. Such an addition is commonly called a "rider." It is evidently an invasion of the executive province. In most of the states it is now forbidden, 1, by requiring every bill to relate to but a single subject, and that to be expressed in its title, not in order to lay a ground for adjudication by the courts, but to give the executive a fair excuse for the veto; or 2, far more effectively, by giving the executive the power to veto single clauses in an appropriation bill, while approving the rest. The constitution of the confederate states (see that title) adopted both these remedies; and the second has been suggested as a very proper amendment to the constitution of the United States.

—I. *In the States.* Riders were not familiar in our early history. The only original state constitution which refers to them is that of Maryland, 1776. "That the senate may be at full and perfect liberty to exercise their judgment in passing laws, and that they may not be compelled by the house of delegates either to reject a money bill which the emergency of affairs may require, or to assent to some other act of legislation in their conscience and judgment injurious to the public welfare, the house of delegates shall not on any occasion, or under any pretense, annex to or blend with a money bill any matter, clause or thing not immediately relating to, and necessary for, the imposing, assessing, levying or applying the taxes or supplies to be raised for the support of government, or the current expenses of the state." In Delaware, 1792, provision was made that no "matter or clause not immediately relating to and necessary for raising revenue, be in any manner blended with or annexed to a bill for raising revenue"; and this has been continued in force ever since. Kentucky, 1799, provided that the senate "shall not introduce any new matter, under color of an amendment, which does not relate to raising a revenue," and renewed it in 1850. The language of this latter provision was followed by Louisiana in 1812 and in all subsequent constitutions, and by Maine in 1820. In other states the evil is either still untouched, or has been attempted to be remedied in one of the two modes above specified. The first method, by requiring single subjects for bills, introduced by New Jersey in 1844, has been imbedded in the state constitutions since the following years: Alabama, 1865; Arkansas, 1868; California, 1849; Colorado, 1876; Florida, 1868; Georgia, 1865; Illinois, (private bills and salaries) 1848, (all bills) 1870; Indiana, 1851, Iowa, 1846; Kansas, (Topeka constitution) 1855, (Lecompton) 1837, (Wyandotte) 1859; Kentucky, 1850; Minnesota, 1857; Missouri, 1865; Nebraska, 1866; Nevada, 1864; New Jersey, 1844; New York (private or local bills), 1846; Ohio, 1851; Oregon, 1857; Pennsylvania, 1864, (by amendment), 1873; South Carolina, 1865; Tennessee, 1870; Texas, 1845; Virginia, 1850; West Virginia, 1861; Wisconsin (private and local bills), 1848. In all these it is still in existence. The second method, the extension of the

veto power to single clauses, is in force in the following states, having been introduced by the constitutions of the years named: Alabama, 1875; Arkansas, 1874; California, 1879; Colorado, 1876; Florida (amendment in), 1875; Georgia, 1865; Louisiana, 1879; Missouri, 1875; Nebraska, 1875; New Jersey (amendment in), 1875; New York (amendment in), 1874; Pennsylvania, 1873; Texas, 1866; West Virginia. 1872.

—II. *In the Union.* The power of attaching riders to bills has never been taken away from the national legislature, though it has gradually, by increasing and unnecessary use, come to be looked upon as an illegitimate and possibly dangerous exercise of power. It would not be possible here to specify all the instances in which provisions in the nature of riders have been added: it is only intended to specify the cases in which the rider has attracted general attention as a possible precedent, or has provoked important opposition.

—The first of these was the joining, by the senate in 1820, of the bill for the admission of Maine to the Missouri bill permitting slavery, so as to compel the house to take both or neither. In this case the two bills were finally separated. (See COMPROMISES, IV.)

—In 1849 the territory acquired from Mexico was still unorganized, the house being determined to prohibit slavery therein, against the wish of the senate. (See ANNEXATIONS, IV.; WILMOT PROVISIO; COMPROMISES, V.) In the senate, Feb. 20, while the civil and diplomatic appropriation bill, which the house had already passed, was under consideration, Walker, of Wisconsin, offered as an amendment a provision that the constitution and revenue laws be extended to the still unorganized territory, and that the president be authorized to enforce them; and this was adopted Feb. 26. Its object was to secure the introduction of slaves to the territory, under cover of the constitution, though Webster showed conclusively that the constitution could not thus be made a territorial law. But he resisted the rider mainly on the score of prudence, acknowledging that it was parliamentary, and that he "could not say that, if you had a bill under consideration for abolishing flogging in the navy, you might not introduce an amendment declaring war with Great Britain." The house very ingeniously threw the onus back upon the senate, March 2. It did not reject the rider, but "concurred with the amendment" that the existing (Mexican) laws be continued in the territory until July 4, 1850, unless sooner superseded by organization. As the Mexican law forbade slavery, this would have fixed the status of the territory. After midnight of March 3, the adjournment day, the senate receded from its amendment, thus getting rid of the house amendment with it, and passed the appropriation bill without any rider.

—The dispersion of the Kansas legislature in July, 1856, by federal troops, under the president's order (see KANSAS), was at once brought up in congress, where the new republican party controlled the house (see REPUBLICAN PARTY, I.), while the senate was democratic. When the army appropriation bill came up, the house added to it a rider forbidding the employment of federal troops for the enforcement of the territorial laws of Kansas, and directing the president to protect persons and property, to keep the peace, to disarm the territorial militia, to prevent them from attempting to

enforce the territorial laws, and to recall United States arms distributed in the territory. The senate rejected the amendments; both houses adhered to their position; and the time fixed for adjournment, Aug. 18, came, leaving the army bill still unpassed. The president, by proclamation, at once called a special session for Aug. 21. The house again added its rider, and the senate again rejected it. Finally the house yielded, and passed the bill without the rider by the close vote of 101 to 98; and it became law Aug. 30.

—The great volume of legislation required by the rebellion made this period prolific in riders. Thus, the validation of the president's acts and proclamations of 1861 (see HABEAS CORPUS), after failing as a separate bill, was added as a rider to an act to increase the pay of privates in the regular army, Aug. 6; and generally the words "and for other purposes" in the titles of bills become indicative of some hidden or open rider. None of these provoked special opposition, and they may be passed over. From the first appearance of the conflict of opinion between President Johnson and the majority in congress (see RECONSTRUCTION), it was evident that riders would play an important part. In the senate, May 2, 1866, a rider was attached to the postoffice appropriation bill, forbidding the payment of salaries to officers until their confirmation by the senate (see TENURE OF OFFICE); but this was subsequently reconsidered and rejected. During the next session the conflict became open, and in February, 1867, the army appropriation bill was passed with two important riders. The second section of the bill enacted that the orders of the president and secretary of war to the army should only be given through the general of the army (Gen. Grant); that the latter should not be relieved, removed or transferred from Washington without the previous approval of the senate; and that any officer who should transmit or obey orders, except through the general of the army, should be punishable by imprisonment for from two to twenty years. The sixth section ordered the immediate disbanding of the militia forces of the unreconstructed states. March 2, 1867, the president signed the bill, but protested against the riders, as attempts to deprive him of his functions as commander-in-chief, and ten states of their right to control their own militia, both of which were given by the constitution, not by congress. These sections were preliminary steps to the impeachment of Johnson. (See IMPEACHMENTS, VI.)

—Jan. 13, 1868, while a bill to make five, instead of six, of the supreme court judges a quorum, a most important rider was added, providing that no decision against the constitutionality of a federal law should be valid without the concurrence of two-thirds of the judges therein. The senate did not consider it.

—There was no further important party contest in congress on riders (but see AMNESTY) until 1872. June 7, three days before final adjournment, Senator Kellogg, of Louisiana, suddenly moved to add to the civil appropriation bill a general election law, authorizing the oversight and control of elections by federal supervisors, which the senate had already passed, but which the democratic minority in the house was opposing with a probability of success. There are no rules in the senate to limit debate, but in the case of appropriation bills, and "such amendments as directly relate to the appropriations," the senate minority had agreed to limit each senator to five minutes debate. The democratic senators alleged that the introduction of this amendment was a breach of faith; but the republican majority decided it to be

germane. Sumner, under this ruling, endeavored also to get in his supplementary civil rights bill (see that title), but the senate rejected it, and passed the amendment. Much the same objection was made in the house, but after several conferences the amendment was adopted. It amended an act of Feb. 28, 1871, by allowing the appointment of federal supervisors of election in any county or congressional district where ten citizens should request it from the federal circuit judge, with the proviso that the supervisors appointed under it should "have no power or authority to make arrests," only to witness the election, the counting of the votes, and the making of the returns. The bill was thus passed, under a suspension of the rules, by a vote of 102 to 79, and in the senate by a vote of 39 to 17.

—Feb. 24, 1873, an amendment was moved to the legislative appropriation bill, increasing the salary of the president to \$50,000; those of the vice-president, supreme court justices, secretaries and speaker of the house to \$10,000; and of the senators and representatives to \$7,500 and traveling expenses. It passed both houses, and became law, March 3. The increase of salary to congressmen included the members of the congress which had voted it; and hence the increase, popularly known as "the salary grab," proved to be highly unpopular. (See SALARY GRAB)

—Feb. 25, 1865, an act, introduced by a democratic senator from Kentucky, became law. Originally it forbade, under penalties, the bringing of any troops to an election place in any state "unless it be necessary to repel the armed enemies of the United States," but the republican majority added thereto the words "or to keep the peace at the polls." In this form it became, in 1874, §§ 2002 and 5528 of the Revised Statutes. The general election law of May 30, 1870, amended Feb. 28, 1871, authorized the appointment, by federal circuit judges, of two supervisors of elections for congressmen, to personally count every ballot, but not, as above amended in 1872, to make arrests. Both of these provisions were disliked by the democrats, and they also complained of unfairness shown by clerks of federal courts in making up grand jury lists. During the session of 1876-7 the democratic majority in the house had passed the army appropriation bill with a rider forbidding the employment of the army in sustaining the reconstructed southern state governments. The senate refused to concur, and congress adjourned in March without passing the appropriation bill. The army was unpaid until, at the special session of Oct. 15, an army appropriation bill was passed without the rider. One section of the general election law allowed the marshal or his deputies, in case of resistance to arrest, to call in the *posse comitatus* to assist them; and in 1876 the attorney general decided that the federal troops might be summoned as a *posse*. In 1878 a rider was added to the army appropriation bill, forbidding the use of federal troops as a *posse*, except in cases where it was "expressly authorized by the constitution or by act of congress," and the bill was approved June 18, 1878. This initial success encouraged the democrats to attack the whole body of legislation above specified, in which was contained most of the legislation under which troops could still be employed. Their determination to do so was stimulated by the elections of 1878, which made it certain that the succeeding congress would be democratic in both branches. If the still republican senate should obstinately resist the riders, and force a special session after March, a concurrent house and senate would then be arrayed against the president alone, who had not hitherto had any effective support from his own party. (See HAYES, R. B.) The

struggle began early in February, 1879. The house passed the army appropriation bill, with a rider re-enacting §§ 2002 and 5528, without the words "to keep the peace at the polls," and the legislative, executive and judicial appropriation bill, with riders repealing the essence of the general election law, forbidding the payment of any money to supervisors, etc., and changing the grand jury law so as to have the list arranged by members of both political parties. The senate struck out all the riders; the two houses disagreed; the bills failed to pass; and both parties "appealed to the country" on the final adjournment. March 4, President Hayes called a special session of the new congress for March 18. Its meeting was the signal for a political tournament of about two months, in which the democrats declared their purpose to wipe out the remnants of war legislation, and the republicans charged their opponents with a design to "starve the government to death," since they had failed to "shoot it to death." The principal results of the session were the partial success of the democrats, the renewed support of the president by his party, and the recognition of Garfield as an unusually able party leader. The army bill was first passed with its rider, and was vetoed, April 30, on the grounds that there was plenty of time to pass both political bills and appropriation bills, and that the junction of the two was an attempt to coerce the president, and possibly, in the future, the senate also, and to enable the house to dictate permanently whatever legislation it might see fit to attach to appropriation bills. The democratic majority was but eight in the senate, and seven in the house; so that the bill was not passed over the veto. Another army appropriation bill, omitting the original rider, and substituting another forbidding the use of any money for the transportation or subsistence of troops for service at the polls in any state, was passed toward the end of the session, and approved June 23. The original rider had first been passed as a separate bill, and vetoed May 12. The executive, legislative and judicial appropriation bill, with its riders, was then passed, and was vetoed May 29. June 10-14, two appropriation bills were passed: the first, for the executive and legislative expenses, without any riders, was approved June 21; the second, for the courts alone, with the riders which had caused the veto of the whole bill, was vetoed June 23, on the grounds that there were but two proper methods of overthrowing existing legislation, by repeal, or through the courts, and that the riders simply forbade the executive to execute laws yet unrepealed. July 1, congress adjourned, leaving the courts unprovided for. It was suggested that the president should continue calling special sessions until congress was willing to pass an appropriation bill for the courts; but this extreme, though legitimate, measure was not put in force. The courts and court officers went unpaid until the following session, when the struggle was renewed in a milder form. The democrats passed a judiciary bill, with a proviso that special deputy marshals should be selected from the different political parties, and should be of good moral character. This was also vetoed May 4, 1880, as a bad precedent of an indirect repeal of a law. The bill was then passed without an appropriation for special deputies. The army appropriation bill of May 4, renewed the rider forbidding payment for transportation or subsistence of troops for service at the polls in any state.

## RIU KIU.

RIU KIU. The demands of practical politics in Asia are compelling the issue of a problem that has, especially since the opening of this century, been awaiting solution. The extension of European interests in the far east has had the tendency, not only to force China to define her relations with the nations of the west, but also with those on or near her borders. For many centuries the centre of culture to more than half of the largest, the most populous and the most varied continent of earth, China, has divided the world into two portions: the middle (China), and the foreign (all other nations). The outlying people were "barbarians," and all holding relations with her were reckoned as tributaries or vassals. The investiture bestowed upon each, and the actual reception, by the Chinese "Son of Heaven," of gifts which were considered as marks of homage from almost every country, from the Caspian sea to Japan, and from the Malay archipelago to the frozen *tundras* of Siberia, are recorded in the Chinese court annals. Even the embassies from Rome, India, Venice, and the modern kingdoms of Europe, were registered as "tribute bearers." China's form of the doctrine of the "Divine Right" to rule all nations, is expressed in the title of her emperors, Whang-Ti, Heavenly Dynasty, or Theocratic emperor. Western governments in Christendom have compelled a change in diplomatic language as regards themselves, but the tone of oriental mock-courtesy or real loyalty to the Chinese emperor is still very abject, however independent such countries as Annam or Corea may in actuality be. Almost alone of China's neighbors, Japan has asserted and maintained absolute political independence, though Siam is rapidly following her example. China, now pressed on all sides by European enterprise and ambition, finds that she must maintain her old claims, or suffer the presence of frontagers who, instead of manifesting the demeanor of childlike suppliants, bear the attitude of jealous defiance. Since she lost, by the diplomacy of Ignatieff in 1860, the Amoor region and maritime provinces touching the Pacific and Corea—a territory as large as France—she has firmly resisted all further encroachments. Wresting Ili from Russia, she further manifested her policy by warning off the Japanese from Formosa in 1876, by demanding Riu Kiu from Japan by garrisoning Seoul with her soldiery after the Corean uprising in July, 1880, by military defense of her frontier against suspected Russian aggression, and by informing France of her determination to defend her vassal Tonquin against invasion, annexation or protectorate. The problem is further complicated, not only in the case of Riu Kiu, but in that of others, as in the Indo-Chinese peninsula, by the fact that these petty kingdoms have for centuries rendered homage and paid tribute to two countries: to the nearest and less powerful, and to supreme China—to the distant "Son of Heaven" and "Lord of Ten Thousand Chariots" in Peking. So long as the ordinary conditions of Asiatic statecraft were unvexed with modern and western ideas, this state of things could go on undisturbed. The entrance of Russians, French and British on the scene as neighbors, and extra-territorial residents, has complicated the problem.

—Of Riu Kiu (Sleepy Dragon), a group of thirty-seven sugar and rice producing islands stretching like a long rope (okinawa) from Satsuma to Formosa, with a population of over 166,000 souls, we may say that it needs a Solomon to pronounce upon its parentage. Like a babe between two maternal claimants, it is in danger of the

sword and of division. The Riu Kiu people are, in origin, language and dynasty, true Japanese, but being powerless between the two great rival empires, Japan and China, they have endeavored to keep the friendship of both by tribute and acknowledgment of submission to either. Thirty-six Chinese families from Fu-kien settled in the islands in A. D. 1372, and encouraged trade, friendship and relations of culture and submission to the Chinese court, which were not interrupted by the Japanese. Before this time and afterward, however, Riu Kiu was a feudal dependency of Satsuma, and was so dealt with by the Japanese shoguns, and the junk-load of gifts sent annually to China was permitted as merely "an exchange of neighborly courtesies." On account of their evident reluctance to fill their quota of war material, ordered by Hidéyoshi when about to invade Corea in 1592, the prince of Satsuma, in 1609, after the Corean war and civil trouble in Japan were over, made an expedition to Riu Kiu, and completely subdued the principality, sent the king Shonei as prisoner to Yedo, and after a thorough reformation of administration in the islands, the daimios of Satsuma were confirmed in their possession of Riu Kiu, keeping Shonei as hostage for three years, while the laws and customs of his dominions were being assimilated to those of Japan. Upon his accession to office, each prince of Riu Kiu took an oath of allegiance to the daimio of Satsuma, and Japan treated Riu Kiu as an integral portion of the empire. In time of famine, food was sent to relieve the starving, and indemnity was exacted from the Formosan pirates for depredations upon Riu Kiu sailors. Commodore M. C. Perry, in 1853, acted upon the principle that Riu Kiu was a dependency of Japan, and though modifying his view after a stay of some months in China, he finally made an agreement with the regent of Riu Kiu, which, however, contained no statement of the political status of the island kingdom. In 1872, after the abolition of feudalism in Japan, Riu Kiu was made a province (*han*), and the chief, Sho-tai, a governor (*han-wo*). In 1874, Riu Kiu was brought directly under control of the home department, and the custom of sending presents or tribute to China was forbidden. In the diplomatic correspondence between Peking and Tokio, relative to the Formosan affair in 1874, China distinctly recognized the Riu Kiuans (who had been killed by the Formosan savages) as Japanese subjects. The Chinese envoys to Japan in 1878 protested against the Japanese occupation of Riu Kiu and their interdict on tribute to China, demanding that the old *status quo* of the islands should be restored. Terashima, the mikado's minister (and now envoy at Washington), objecting to their offensive language, cut off further negotiation. On April 4, 1879, the Riu Kiu *han* (province) was abolished, and the okinawa *ken* (prefecture) established, while Sho-tai, the chief, was ordered to reside, like the former daimios, or feudal chiefs now retired, in Tokio. The discussion was now opened at Peking, but with little progress, until, in 1879, Prince Kung referred the matter to Gen. U. S. Grant, then visiting China and about to go to Japan. After his arrival in Tokio, and consideration of the evidence on both sides, Gen. Grant advised the withdrawal of previous dispatches and the appointment of plenipotentiary commissioners to settle the difficulty. The commission began its sittings in Peking, Aug. 15, 1880, and the negotiations continued during three months. On Oct. 21 the drafts of the treaty which was expected to end the controversy were ready for signature. It provided that the boundary line between the two empires should be drawn at about the twenty-fifth parallel of north latitude; that Yayé-yama and Miako islands should belong to China, but all northward should belong to Japan. The treaty, as agreed upon by the high commissioners, was to be signed within ten days; but after sixteen days had elapsed, the Tsung-li Yamen

notified Mr. Shishido, the mikado's envoy, that by imperial order the treaty was to be submitted to the northern and southern superintendents of trade, and others, for consideration and further report. This amazing violation, by the Peking government, of the principles of international law and common courtesy, in remanding the solemn decisions of a plenipotentiary commission—to which, on the recommendation of an eminent American citizen, Japan had, in good faith and covenant with China, submitted her case—to other parties, is thus adjudged by the Hon. J. B. Angell, minister of the United States to China: "Even if they [the Chinese] have justice on their side, in opposing the seizure of the islands by Japan, they could not well contrive a better way to alienate the sympathy of all civilized nations from them in the assertion of their rights than by the course which, if we accept the statement of Mr. Shishido, they have now seen fit to take in their negotiations with Japan." On Jan. 20, 1881, nearly five months after the commission had finished its labors, and after repeated remonstrances, Mr. Shishido, the mikado's commissioner, left Peking, since which time the Japanese government have steadily refused to reopen the question with China. Whether by war, by diplomacy, or by arbitration, the solution of the long-standing problem of China's claim to sovereignty over pupil or neighbor nations seems probable, and may take place before the end of this century. Neither Japan, with her new sense of nationality, nor European nations in this age of liberty, are inclined to respect a claim that seems more antiquated and anachronistic as such a figment as the holy Roman empire and such a doctrine as the divine right of kings to reign settle below the world's horizon.

## ROMAN CATHOLIC CHURCH.

ROMAN CATHOLIC CHURCH. The object of the present article is, in the first place, to present a condensed exposition of all those provisions of the constitution of the Catholic church which are of any importance for the political understanding of ecclesiastical questions, and then of those principles of that same constitution which have to do with the relation of the Catholic church to the state and to other confessions, etc.: the whole from the point of view, and according to the teaching, of the Catholic church itself.[90](#)

—I. *Nature and Mission of the Church.* The Catholic church, according to its own dogmatic teaching is the body or community of all those who are united in the faith in Jesus Christ, a community founded by Jesus Christ, the Son of God, to the end that, within its fold, the individual may work out his eternal salvation. To effect this his purpose, Christ—for the continuation of the functions which he performed during his earthly life, and for the application of the spiritual means of the sacraments bequeathed by him to this community—at the same time established his apostolate, charged with the task and endowed with the power of appointing successors who should, unto the end of time, labor toward the restoration willed by Christ, and purchased for them by his incarnation and death, viz., the restoration of all nations to the true faith, and effecting through that faith, their entrance into the kingdom of God. To preserve the true faith unaltered forever, God promised and sent the Holy Ghost, the divine Spirit, to the church, to remain with it throughout all time. The Catholic Church, founded by Christ, is the only true (*unica, una*) one; it is of direct divine institution, built on the apostles chosen by Christ himself, and on their successors, descended from them, in an uninterrupted series, by spiritual generation or ordination (*ecclesia apostolica*); it has been called to be universal (*catholica*) both in time and space, and to receive into its bosom all those who fulfill the conditions which Christ attached to entrance into his community; unto it is granted, through its instruments of grace, the power to make man the child of God, to help him to fulfill his religious destiny and to sanctify him (*ecclesia sancta*). But, to do this, the church must be everywhere recognizable, external and visible (*ecclesia externa, visibilis*). To this end it has received, in the fundamental features of it, a definite constitution, with the church's central point in the bishop of Rome, the successor to the priority conferred by Christ on Peter, that is to say, to the primacy among the apostles, and therefore, in the bishop of Rome as the visible vicar of Christ. Hence the church is an *ecclesia, catholica, apostolica Romana*. In order that the church may not err in matters pertaining to the faith, that is, in general, in its teaching, concerning all those doctrines on the acceptance of which membership in the Christian community depends (the dogmas of the church), or in those precepts the observance of which is a condition to the salvation of the individual (the fundamental doctrines of morals), it is, by the constant dwelling within it of the Holy Ghost, endowed with infallibility for all time (*ecclesia infallibilis*). Thus, the Catholic church represents itself, not merely as a *subjective* community of Christian believers, but also as an *objective* community, as the *only external visible* institution founded by Christ for the *realization of his kingdom*. Its foundation is the doctrine of faith and morals proclaimed by Christ

himself, and preserved, first, in the recognized sacred books of the New Testament (Bible), which, according to the universal belief of the church, were written under divine inspiration, and secondly, in the oral tradition of the church. The church is, accordingly, the fulfillment of the promise made by God after the fall, the institution for which he prepared the way under the old dispensation; so that Christianity is not the abolition but the fulfillment of Judaism; and therefore the sacred books of the latter (the Old Testament) in as far as they do not exclusively relate to national, ceremonial and like affairs, preserve their authority in Christianity.

—Hence the aim and object of the church is not the establishment of an earthly kingdom; it is not a kingdom of this world; its interests are not secular, but religious and spiritual; its mission is to restore harmony between the cravings of the sensitive faculty and the commands of God, to bring it to pass that the individual, through faith, and through the grace accorded by God to all, may *will* his own salvation, and with freedom, by works conformable to the faith, labor for his salvation. According to the teaching of the Catholic church, it is not mere faith in Christ that insures salvation, but faith in Christ, and works corresponding to that faith: a life in, and conformable to, the faith. Although, according to its dogmas, entrance into its communion is a condition to salvation (*extra ecclesiam nulla salus*), the attaching of the consequences which follow the non-fulfillment of that condition presupposes knowledge, and an act of the will refusing to enter it. Hence the church does not condemn those of a faith other than its own.

—In this world, the church fulfills its task through the mediation of a visible institution, and through means, connected with visible symbols and forms; visible, because intended for men who, as visible, external beings, are bound to and can not escape such forms. Those of the church who have ended their earthly career, immediately enter into a state of perfection, of beatitude in the contemplation of God (church triumphant), or remain in a middle state of purification (purgatory), (the church suffering). These, together with the faithful in this world still working out their salvation in the earthly struggle (church militant), constitute the communion of saints (*communio sanctorum*); through this communion the merits of the saints may be applied to those on earth, and the prayers of the living avail those undergoing the purification of purgatory. Only the church on earth (the church militant) has anything to do with human law. It enters into the domain of law because of the action which it desires to and must exercise on men, even on all men, because of the external means it employs, and finally because of its compact, visible organization. But its mission, nevertheless, is not an earthly and human one; hence, by its very nature, it is not dependent on any power whatever, nor conditioned by any such power; the church *must* fulfill its mission, wherever and as soon as it has the means to fulfill it; because with the possibility to fulfill it comes its duty to fulfill it. As regards the individual Catholic, the external fulfillment of his duty consists in the life in the church, and according to the teachings of the church. And this supposes: participation in external divine worship (*cultus*); participation in the means of grace, in each according to the circumstances of life (the sacraments); the fulfillment of the commands which the church teaches as directly divine, or which it proclaims itself by virtue of the power granted it (profession of the dogmas of the church, and observance of the precepts of morals). When the acts of individuals are external, they become subject to human law

(*forum externum*); but when these acts are entirely internal, they belong to the domain of conscience (*forum internum*).

—II. *Constitution and Administration of the Church.* 1. *Persons.* The constitution of the church, or of the society which constitutes the church, is that of a *societas inæqualis*, as it was called even in the middle ages. That society is divided into two different and separate classes: first, the clergy, the body which embraces all persons chosen to guide the church, to administer the means of grace left it, and to act as mediators of salvation to individuals; and secondly, the laymen, the people, the collective body of the faithful, subject to the guidance of the clergy. Sometimes the former are called the teaching, ruling or governing church, and the latter the learning or obeying church. The mark that distinguishes these classes each from the other, is ordination, bestowed on the clergy by a bishop, which is, as it were, an act of spiritual generation, and of itself confers the faculty (*facultas spiritualis*) of administering or dispensing the spiritual means of grace bequeathed to the church. There is a gradation in holy orders, according as this administration of the sacraments, or means of grace, by the very nature of that administration, supposes a power which does not reside in man as such, and which, therefore, can not be acquired or conferred without the indwelling capacity to confer it, in the person who confers it; or according as it may be exercised by purely human faculties. The priests (*presbyteri, sacerdotes*), through the sacrament of holy orders (the external sign consisting in the imposition of hands by the bishop, the invocation of the Holy Ghost, and anointment), receive the grace and especially the power of changing the bread and wine into the body and blood of Christ, and hence of performing the sacred function which is the central point of divine worship in the Catholic church. They are intrusted with the guidance of the life of the church in detail. Above the priests stand the bishops, as successors of the apostles, endowed with the plenitude of the priesthood, a plenitude which manifests itself in the spiritual power to grant admission into the ranks of the clergy, and especially into the priesthood and episcopate. The bishops become such by virtue of a special act called consecration, and are looked upon as the holders, necessarily and unconditionally called for the government of the church, of the fullness of power deposited in the church. From the bishops the other members of the clergy derive their powers, as well as the external right (called *jurisdictio* in the language of the church) of exercising the spiritual faculties which have been granted them. The episcopate is, therefore, the exclusive guide and ruler of the church, and this by virtue of its position in the church; its power is the ordinary, and hence is also called, by way of eminence, *jurisdictio ordinaria*; if any one else is invested with an analogous authority, it is only by way of fiction. The priestly and episcopal dignity is indelibly stamped on the individual; or, in theological language, it impresses on the soul a *character indelebilis*, so that the priest or the bishop may, in deed, be deprived of his right as such, but never of his purely spiritual power. Hence there always exists between them and laymen a profound spiritual ineffaceable difference. Below the priests, there are six other grades of the clergy (deacons, subdeacons, acolytes, exorcists, lectors, ostiaries), the members of which have no similar specific functions to perform, and to whom, on that account, the indelible character of the priesthood is not imputed. Their duties, in our day, in the church, are practically nothing; but in themselves these duties consist in talking care of the poor, attending the sick, and in discharging the humbler services in the church. Among the clergy are reckoned, moreover, all who

have received the tonsure, and who are thus externally distinguished from laymen. The clergy are further divided into the *secular* clergy, and the *regular* clergy, belonging to the religious orders. The former embrace all who are subject only to the law applicable to the clergy, and, speaking relatively, to the law applicable to all the faithful in general; the latter include all those who live in accordance with a particular rule (*regula*, hence *clerus regularis*) obligatory upon them only by virtue of their own voluntary act. A person belonging to a religious or monastic body need not have received any of the degrees of holy orders, so that here the difference is not a practical one.

## κατ' ἐξοχήν

—The seven degrees of holy orders are divided into the higher orders (priests, deacons and subdeacons) and minor orders. All of them confer certain rights and impose duties which it is not necessary to enumerate here.

—At the summit of the episcopate, as head of the church, is the pope. The pope and the bishops are the necessary, independent rulers of the church. They represent the teaching, governing church. Their representation of the church takes place in a general council; such council can not, in the very nature of things, be always nor even frequently assembled. Hence, from the beginning, the guidance of the church by the episcopate was practically this: each bishop obtained (and obtains) a portion of the domain of the church, as his exclusive field of activity, within which he executes the mission of the church as teacher, priest and administrator of its laws. To the episcopal office, the only and fundamental one in the government of the church, there have in time been associated other authorities or bodies, the existence of which, not resting on any necessity, is a result of historical development, and consequently remains subject to that development in the future.

—Hence the constitutional and administrative organism of the church is the following: The territorial domain of the church is divided into dioceses. The occupant and ruler of each diocese or see is a bishop (*episcopus diœcesanus, ordinarius*). Several dioceses constitute an ecclesiastical province (*provincia ecclesiastica*) under a metropolitan, who, however, is only a judge of second resort, who is empowered to visit the dioceses of his suffragans, governed by clearly defined provisions, who has besides a few other powers, but whose office has by no means a complete intermediate degree of authority. In the early days of the church, several provinces constituted a patriarchate (Italy, the Roman; one at Constantinople, and one at Jerusalem, Antiochia and Alexandria respectively). The modern patriarchates, those just mentioned, those of Venice and Lisbon, and that of the Armenians and Maronites, are merely nominal, and without any juridical importance.

—The union of the bishops with the pope is effected by the constant intercourse that naturally results from the ever-recurring need of papal acts and decisions for the several dioceses, and also by the duty of the ordinaries of presenting themselves from time to time before the pope, to give an account of the condition of their dioceses in everything that pertains to the church; by the sending out of papal legates; but, above

all by the oath of fidelity or oath of obedience, which every bishop takes to the pope at his consecration. Finally, the intercourse of the pope with the faithful (both ecclesiastics and laymen) affords him a means of obtaining information concerning the condition of the several churches, since every one is free, subject, of course, to rational rules, to communicate with the pope.

—In the guidance and government of the dioceses the bishops are assisted, *so far as the entire diocese is concerned*: 1. By chapters (metropolitan chapters, cathedral chapters, etc.). These sprung by degrees from the clergy of the bishop's city, and particularly from the clergy of the bishop's church; from the sixth to the ninth century, they led a life in common (*rita communis*), after the pattern of monks, subject to a rule; later they assumed, more and more, the character of independent corporations, a character which they still retain. The bishop is required to obtain their consent to certain acts, and to seek their advice as to others; leaving these cases out of consideration, cases which are distinctly defined in the law of the church, the bishop is not bound by the chapters nor obliged to choose his assistants in the administration of his diocese from among them, although practically he does so everywhere. 2. The vicars general (*vicarii generales*), who were originally, particularly in Germany, appointed as a counterpoise to the excessive jurisdiction of the archdeacons, and who by degrees maintained their position as permanent assistants by reason of the great extent of the dioceses and the frequent absence of the bishops. 3. Suffragan bishops (*vicarii in pontificalibus*). These are real bishops, consecrated with a title to dioceses which formerly existed, but which are now in the hands of the infidels (in Asia and Africa). These bishops are appointed by the pope at the request of the bishop, and, as mandataries of the bishop, perform episcopal spiritual functions. They are given only to cardinal bishoprics, to great dioceses, and to those in which such suffragan bishops are traditional. 4. Officials, with the same historical development and position as the vicars general, but limited to the exercise of juridica authority.

—In our days a formal tribunal for this purpose is usually appointed (with a president and at least four councilors), a tribunal which the bishop constitutes as he wishes. In like manner, there is generally appointed an official body for the administration of the diocese, under the presidency of the ordinary or of his vicar general.

—*For the separate districts*. The dioceses are divided into archdeaneries, deaneries, and district vicariates, at the head of which, named by the bishop (also by the clergy of the diocese, and confirmed by the bishop), there is an arch-priest, dean and district vicar, to whom belongs the supervision of the clergy in their office, of their moral conduct, the administration of the property of the church, and, as a rule, the schools for the children of the people. The dean, etc., is required to visit his district every year, and conscientiously to report its condition and the state of its accounts, and to examine the parish books; he is the medium of communication of the bishop with the clergy, and of the addresses or petitions of the latter to the episcopal authorities. He has no jurisdiction, but only the right to make expostulations, remonstrances, etc. A district of this kind embraces an indefinite number of parishes (*parochiæ*), each governed by a parish priest (*parochus*). The parish priest, accordingly, is the most important helpmate of the bishop. The parish priest has, as assistants, vicars, chaplains, curates, etc., who are appointed and removed by the bishop.

—2. *Objects of the Church's Action.* It clearly follows, from what has been said, that the life of the individual, in its totality, is the proper object of the action of the church, inasmuch as the mission of the church consists in this: to remove all contradiction, in man, between his will and the commands of God, that is, to bring perfect harmony into all his actions. Its efforts, therefore, by no means aim at doing away with natural (national, political) relations or conditions, but only at bringing them into harmony with Christian conditions, that is, at raising the principles, ideas and maxims that move individuals and nations in their doings, to the height of Christian principles, ideas and maxims. Hence it strives not to remove or destroy the external, special, peculiar stamp given to individuals and nations by their character, land and climate; but only to concentrate them, in their final end, on the goal to which religion tends, that is, on the world beyond. This sufficiently explains why the church has endeavored to leave its impress, and actually has left it, on all nations, on their different classes and on their condition, changing and transforming them; why it has endeavored to banish, and, by its influence, for the most part, has banished, from civil, penal, public and international law, every principle which was based on heathen views, or was in conflict with its own principles, or which stood as an external obstacle in the way of the full development of its doctrine. It is intelligible, that the church endeavored to exert, and actually exerted, a direct influence here, because it considered that in this manner it could most fittingly secure the actual operation and enforcement of Christian principles. Thus, during the middle ages, we see an infinity of objects drawn into its domain, with which, at a first glance, it would seem to have nothing to do. Men, in our day, are accustomed to look upon all this as a transcending of power, as evidence of the usurpation of the clergy, and the ambition of popes; they forget, that in looking at it through the spectacles of the nineteenth century they are judging not historically, but only critically. Denied it can not be, that all civilized nations have been educated by the Catholic church; that through it a Christian foundation was given to the state, and a new civilization introduced into all the departments of social life and of the life of the law. How deeply the necessity of the position the church assumed here, was rooted in the circumstances of the time and in the mission of the church and the state, in those ages, is sufficiently evinced by the fact, that this action of the church met with almost no opposition. All resistance before the sixteenth century was directed only against certain matters of detail. But, although the practical action of the church still may extend, or historically has extended, into every sphere, it can not be ignored that its *direct* action, so far as its end and mission are concerned, has not so broad an aim now, and that consequently no place in things non-essential belongs to it, that none such is necessary or can appear necessary to it, and that it has no right to such a place. Rather can the direct, immediate and ever-legitimate aim of the church be this and this only: man in his moral and religious relations. If the church here attains its object, harmony will of itself follow. Nothing, therefore, would be more foolish than for the clergy of the Catholic church to long for the recovery of worldly rights, honors and titles, as did the Jews for the flesh pots of Egypt. If the clergy be truly spiritual, and not worldly, if they keep in view, not only in the pulpit, but in their own body, alone and in connection with others, the honor of God, the salvation of their neighbor, and, finally, their own supreme end and esteem; if they only do all this, honor, and, what is of paramount importance, their own greatest efficiency for the elevation of society, will be better secured than if human laws prescribed that any homage should be paid them.

—Hence, what immediately and necessarily comes within the province of the church is, in the first place, the preaching of the divine word, that is, instruction in the Christian religion. Its founder has imposed on it the imperative duty to preach the word, and, therefore, given it the right to do so. It may, indeed, for a time be prevented, by circumstances beyond its control, from exercising that right, but it can never, in principle, abandon it, nor require any external recognition of it. This task of the church is called the *potestas magisterii*. To it belongs the religious instruction of its members, whether imparted in higher institutions of learning or in public schools, since it would be inconsistent to want the church, and at the same time to question its exclusive right of instruction in the faith. If there be no doubt in this matter, there is a doubt as to how far the influence of the church in the public schools should extend. No one will assert that the public schools have simply the duty to equip the child with knowledge. They are also called upon to educate and to train it, in the proper sense of the word; but education without religious principles is a radically vicious one. It is likewise manifest, that, since the majority of young people, on leaving the schools, cease accumulating fresh stores of knowledge, what they have acquired at school remains with most men the basis of their actions through life. But from this it clearly follows that the church, in respect of the public schools, can not confine itself to the task of merely imparting religious instruction, but must claim and have a considerable influence in the business of education in general.<sup>91</sup> The means employed by the church in the exercise of its functions as teacher, are religious instruction to the youth at school (teaching of the catechism), in the church (Sunday school teaching), sermons, instruction by pastoral letters, etc., and, finally, by books.

—When, through religious teaching, the soil has been prepared for a Christian life, the individual in the Catholic church is kept forever mindful of his duties by the means left by Christ, for the sanctification of the different situations in life. The power to administer these means is the *potestas ordinis*. The means are the seven sacraments (external symbols), instituted by Christ, to which is attached an inward grace; through one of which (baptism) man is introduced into the church after birth; through another of which he is strengthened for the service of God by the Holy Ghost (confirmation); rescued from his lapse into sin, the consequence of human frailty, by a third (penance); by a fourth, the eucharist, he partakes of the body and blood of the incarnate God. By matrimony, a fifth, he is sanctified and strengthened for the natural alliance of the family. By holy orders, the sixth, those called thereto are endowed with the gifts necessary for a particular spiritual alliance with the church. Finally, by extreme unction, on his death bed, the Catholic is prepared for his exit from this world. In a word, in all the situations of life the Catholic is guided by the loving hand of his mother, the church. Besides the sacraments, hereto belong also the whole external divine worship (worship and liturgy), and what is connected with it (sacramentals, ceremonies, etc.).

—The exercise of these two powers, the *potestas magisterii* and the *potestas ordinis*, requires a settled order of things. The establishment and development of the latter, on the basis of the fundamental principles given by Christ, given with the church itself, as well as its enforcement, constitute the third power of the church, the *potestas jurisdictionis*, or government, in the proper sense of the term. This triple power, in its totality, resides in the episcopate, the bishops. The *potestas jurisdictionis*, from the

very nature of the case, is chiefly that activity of the church which is externally apparent, and, for that reason, most capable of juridical development, and which in fact has a part in that development. In the exercise of this power the church enters the domain of law, and comes in contact with states, individuals and religious bodies separated from it. The principal departments of this jurisdiction are the legislation and administration of the church, particularly the creation and filling of ecclesiastical offices, the supervision of the administration of the clergy, the exercise of the judicial authority of the church over the clergy and laity, and the administration of the property of the church.

—3. *Legal Rules for Ecclesiastic Administration.* The ecclesiastical law is the sum total of the principles according to which the church lives and acts in its internal and external relations. Its sources are, in the first place, the positive divine precepts contained in the New Testament, which are, however, as a matter of course, but few, because Christ gave only the broad outlines of the constitution of the church, the development of which, as indeed the development of all law, is the work of time. In the first centuries of the church the customary law, resting for the most part on traditions handed down from the time of the apostles, was the most abundant source of the law of the church, yet one which subsequently receded before other sources, but which, at the same time—because it is the criterion in accordance with which all rules are established (rules required by special circumstances, and which are therefore gradually developed), that traditional customary law, of which we are speaking—is of great importance, exists even at the present day, and continues to modify many laws of the church. It now finds expression in the *eigena ecclesiae disciplina*, which in many points varies considerably from the state of things supposed by the written law, which latter must take into account circumstances and the times. There are, besides, the *canones*, that is, the decrees of the synods, and the papal constitutions.

—III. *Relations of the Catholic Church to Non-Christians.* The church, as has been shown, maintains that membership in the Christian church is a fundamental condition to the attainment of the salvation of the soul. From this it deduces the right and duty of announcing the gospel to non-Christians, and of receiving them into its fold. This activity of the church is designated by the word *mission*. A congregation in Rome, bearing the name *S. Congregatio de Propaganda Fide*, looks after the execution of this task. To this end the congregation has an institution, in which most of the Asiatic and other languages are taught, and large revenues for the support of missionaries. To this congregation, under the guidance of the pope, are subject all countries, in which the church is either not tolerated at all, or in which it has not yet been able to attain the full development of its legal organization. Such countries are called *terrae missionis*, in contradistinction to countries which are ruled by the common law of the church and by the regular hierarchy, and which are *terrae sedis apostolicæ*. The system of church government in missionary countries must, from the very nature of the case, be dictated more by prudence (the circumstances of place, time, climate, political constitution, the stage of civilization of the people) than by the strict letter of the law. As means of conversion, instruction *only* is admitted: all compulsion, etc., is excluded. The violent conversion of certain German tribes (the Saxons), by Charlemagne, that of the Jews in Spain, and other and similar conversions, did not proceed from the church, although a few individual bishops may perhaps have

approved of them. Such conversions are sufficiently explained by the views held in those times, which knew only Christian society (the ecclesiastico-political), and when states considered it a matter of duty to convert all non-Christians, even against their will. But from the point of view of the church, only man's free will can call for admittance into the church.

—It was an altogether different matter, when in many countries, during the middle ages, the Jews were ordered by the popes, at certain seasons of the year, to listen to Christian sermons, that they might become acquainted with Christianity. This was considered legitimate, because the duty of taking care that the truth should not remain hidden from the Jews was acknowledged. The Jews were tolerated and protected by the popes and bishops more than by any others, so that, relatively speaking, there are now more Jews living in countries formerly Catholic, and particularly in countries ruled by dignitaries of the church, than in others. But non-Christians, because they have not received baptism, stand in no relation to the church. For the same reason they are not subject to the laws of the church, nor can they, as such, be judged by the church. But the church, nevertheless, considers non-Christians bound by the laws which it calls divine, because engraved on the heart of every man. When, accordingly, there is question in its forum of the rightfulness of any act, the church does not decide it by its positive laws, but by the dictates of the *jus divinum*; for instance, it considers the marriage of non-Christians indissoluble. The matrimonial impediments created by the divine law (as, for instance, the impediments between those in the ascending and descending lines, between brothers and sisters, etc.) the church regards as binding on non-Christians. With regard to the admission of grown-up non-Christians to her fold, the church maintains that religious conviction only is necessary, but not any definite age or further requirements. Since all compulsion must be regarded as illegitimate, it is not permitted by the Catholic church to baptize the children of non-Christians, as for instance, those of Jewish parentage, against the will of their parents, but it insists that a baptized child shall receive a Christian education.

—Dating from the early centuries of the Christian era, and from the middle ages, there still exist a number of laws which forbid the intercourse of Catholics with non-Christians, or which restrict such intercourse to the absolutely necessary; but which forbid, above all, certain kinds of familiar intercourse with such persons (as the service as house maids, man servants, nurses, etc.), and which further absolutely forbid such intercourse with the Jews. Prohibitions of this kind existed until recent times in a few states (in Austria until the summer of 1859, but they were not enforced), and they still exist in several Italian states, in Spain, etc. The reason of such prohibitions, dating from early times, was the danger to the faith which that intercourse necessarily involved, so long as the Christian religion had not attained to full recognition, and so long as paganism had not entirely disappeared. With the Christian state this reason ceased to exist, when in the Neo-Latin, Germanic and Slavonic states the heathen religion was no longer tolerated. As reasons for the maintenance and renewal of these prohibitions in case of the Jews, may be alleged the embarrassing situations in which servants might be placed, the danger that they might become indifferent to their religion, particularly when not kept to the observance of it, or that they should be compelled to hear it ridiculed, etc. The civil condition of the Jews does not concern the church. For, although the state in many of its laws relating

to the emancipation of the Jews places itself in contradiction with the principles of the Christian state, this implies no injury to the church so long as such laws do not affect the development of the church, and so long as the Christian foundations of states receive no injury from them. For I consider that the state has indeed the power but not the right to put itself in such contradiction.<sup>92</sup> Yet it implies no injury to the church that the state does not impose any legal restrictions on intercourse with Jews, the church having always tolerated such intercourse, and considered it unavoidable. On the other hand, the Catholic church can not be forbidden to employ suitable means to prevent her children from being exposed to unnecessary danger to their faith, and hence can not be prohibited to warn them against the familiar intercourse referred to above. I am, however, of opinion, that we ought to regard the ecclesiastical laws which punish this intercourse with censures (ecclesiastical punishments) as abrogated by a *desuetudo generalis* (general disuse), by reason of the altered circumstances of the times, as well as because of the modern development of the state.

—IV. *Relation of the Catholic Church toward the Greek, Protestant and other Christian Sects.* It follows from what has been said, that the Catholic church considers itself as *the* church, and consequently as the only church founded by Christ; that it maintains its doctrine to be *the Christian* doctrine, and every deviation from it as *error*; that its fundamental constitution, according to its dogma, is the one which was given by Christ to his church, and that the non-recognition of the latter and of the historically developed powers of the church implies unlawful opposition to Christ and to his church. Since the church not only exacts an inward, but also an external, visible acceptance of Christianity, any deviation from its teachings, or non-recognition of it, not only bears the character of a sin, but is the subversion of the legal order of things, and hence has the character of a crime. From the nature of the case, it is impossible to admit a will in opposition to the church, knowing it to be the only true church. For this reason the church looks upon the voluntary rejection of its doctrine as the crime of *heresy* (from, to choose), that is, the non-acceptance of its entire dogma, and on the rejection of the constitution of the church (especially of the primacy of the bishop of Rome) as the crime of *schism*, and punishes the same by exclusion from the church; and prescribes to the Christian state the obligation on its part to take action against such crimes. Such is the view that was maintained in all Christian states, after the pagan religion had been prohibited in the Roman empire, until the sixteenth century; in Catholic countries this view continued to be taken by the Italian states until the revolution of 1859, and by Spain and Portugal; in non-Catholic states, by Russia, practically; by Sweden, as to the abandonment of the Lutheran faith; and it is well known, that England retained the same view in part as regards the Anglican church. But in Germany this view was changed after the Passau decree of the states of the empire (1552), that of Augsburg (1555), and the peace of Westphalia (1648). Owing to the events of the sixteenth century, the effects of which were confirmed by the laws of the empire above referred to, there arose a condition of things which had for consequence not only the individual freedom of belonging to any one of the three Christian confessions (Catholic, Lutheran and Reformed), but which also brought about the complete political equality of Catholics and of the Catholic church on the one hand, and of the Protestants and the Protestant church on the other, and even the individual freedom of Christians, to not belong to any Christian confession. At the same time, by the peace of Westphalia and the establishment of the normal year,

1624, a definite limit was put to the external jurisdiction of both the Catholic and Protestant church over foreign yet kindred religious bodies in the separate territories of the empire. In consequence of events since 1803, all jurisdiction of the kind has generally ceased to exist in Germany.

## αἰρεῖν

—In this way was developed the equality of individuals and confessions. As a consequence of this, the rule of the canon law has naturally ceased to exist in respect to Germany, to France, England, Holland, Belgium, the United States, etc.; because it is impossible to regard as criminals persons who are born and educated in a Christian religious community, tolerated by the state, on an equal footing with, or even with greater privileges than, the Catholic body.<sup>93</sup> The church, therefore, regards dissenters from her teaching only as erring, as *hæretici materiales*, as they are called in the language of the church. For this reason also the penal laws of the church, as well as the validity of older prohibitions, respecting the intercourse of Catholics with heretics, have ceased to have any force. What is said here of heretics applies also to the non-united Greek church and its adherents. That this is practically so, and that this view has been maintained by the popes, is well known to every one acquainted with the government of the Catholic church. Herewith has also ceased the external jurisdiction of the Catholic church over Protestants and non-united Greeks. But so far as persons who secede from the Catholic church to the Greek, or to any other Christian confession or sect, are concerned, the Catholic church maintains, even externally, its own dogmatic view, which is, the notion of criminal schism, and of heresy, and the applicability of the laws of the church above referred to. The external application of these laws is naturally limited to the infliction of censures (excommunication), for the reason that the employment of other and temporal punishments, which were formerly always inflicted by the state, has now been abandoned. Practically these ecclesiastical penalties play no part, except when an individual wishes to return to the church which he had abandoned. Thus, although Protestants and members of the Greek church are no longer, as such, subject to the external jurisdiction of the Catholic church, still the view of the Catholic church concerning its own domain remains the same. By baptism, every one, from the church's own point of view, becomes a member of the society founded by Christ, that is, of the Catholic church, and is subject to its regulations, whether they rest on the divine law or on the positive laws of the church, enacted by virtue of the constitution of the church, and of the power bequeathed to it by Christ. Hence, when, in the church's forum, there is question of an act done, it does not apply those principles which non-Catholics regard as controlling the case, but its own. Practically this is of importance only as regards marriage, and the questions resulting therefrom in the several spheres of church life. For instance: the marriage of a Protestant separated from his wife, during the lifetime of the latter, is regarded by the Catholic church as void; and a son, the offspring of such a marriage, could not, without dispensation, be admitted to holy orders, *propter irregularitatem e defectu natalium*. It obviously follows from what has been said, that as regards Greeks and Protestants, in non-Catholic countries, the church must look upon the task it has to perform as a missionary one. And so it is in reality.

—For the admission of dissenters to the church, which, from the point of view of the laws of the Catholic church, is only a return to it, the absolute inadmissibility, in accordance with the above exposition, because of the circumstances of our times and of the obsolescence of the older laws of the church, of all compulsion, or the employment of any means but instruction, must be considered as settled.

—The clergy of the Catholic church are under no obligation to exercise the functions of their office for the benefit of persons of a belief different from their own. In practice this can be asked of them only as to baptism, marriage and burial, because their other functions can not be performed in favor of persons not Catholic. As a matter of course, the church has no objection to the baptism, by a priest, of children of Protestants, at the request of the parents. In regard to matrimony, the church *forbids* the marriage of a Catholic to a non-Catholic, without, however, attaching to such marriage any definite, external, ecclesiastical penalty, but it does not permit the marriage of a Catholic to a non-Christian, on account of the matrimonial impediment of difference of religion. The present state of things in this regard, resting on modern papal constitutions, is to the effect that a mixed marriage may be allowed when it is promised that the education of the children shall be in the Catholic religion, and when the non-Catholic party promises not to disturb the other in the exercise of his or her religion.<sup>94</sup> In such a case, that is, in the case of a mixed marriage, a dispensation is granted, and the nuptial ceremony of the Catholic church is allowed to be performed. But if the guarantees above referred to are not given, the Catholic priest grants only his so-called passive assistance in the nuptial ceremony. The Catholic priest may also attend the burial of non-Catholic Christians, in his priestly character, but only with the omission of all ceremonies, which, by their very nature, can be performed only over deceased members of the church. But there is no duty to perform such ceremonies, on the part of the Catholic priest, as that would manifestly imply unqualified compulsion, in view of the fact that purely political considerations do not demand ecclesiastical burial. For this same reason the state can not compel the church to officiate at the burial of nominal Catholics, whom the law of the church deprives of this benefit, or to accord them Christian burial. Catholic cemeteries, *campi sancti*, are considered as things ecclesiastical. Secession from the Catholic church, and going over to another confession, the Catholic church necessarily regards as apostasy and crime. Hence its law admits of no mode of leaving the Catholic church. The Catholic church makes admission to its fold dependent only on the knowledge of its doctrine, on the free will of the individual, uncontaminated by impure motives (as far as can be ascertained, for it is unable to examine hearts), and on the fulfillment of its precepts. When these conditions exist, it can not but admit the individual. But on this very account the church does not require for admission to its fold any definite age, any more than it does the consent of parents, guardians or of married people, to the change of the faith of either; because the conviction of the truth is an entirely individual matter, which, by reason of its consequences to the individual, can not depend on the pleasure of a second or third party. As regards the religious education of Catholic children, the Catholic church exacts unconditionally their education in accordance with its doctrines, and does not admit of any exception of whatever kind to this rule; a matter which has frequently been made a subject of reproach to it, but which manifestly is the natural consequence of its principles and convictions. The political point of view is here a different one from that of the church.

—V. *Relation of the Church to the State.* It is impossible to enter here into the historical and philosophical exposition of this relation, or to support the views here developed by historical proofs. All we are concerned with at present is to describe the relation of the Catholic church from the point of view of *principle*, taking into consideration, at the same time, the principles proclaimed by the Catholic church itself. All the decrees and tenets which constitute the sources of ecclesiastical law on the relation of church and state, are, from the standpoint of principle, just as little prescriptive as the decrees of secular laws. For all such decrees and tenets did not proceed from the whole church; they have not the character of dogmas, but sprung from the circumstances of the times in which they originated, and in which they all find their sufficient justification and necessary explanation. To make these tenets of the middle ages, or the general condition of those ages, an absolute standard for all time, is an absurdity which neither has a rational basis nor is even of any advantage to the church itself, but which, on the contrary, arouses a host of enemies against it, and thereby causes no little damage. The principles which result from Catholic teaching and from the development of its law, and which have no reference to special conditions, are these: the church is a power independent of the state, and self-dependent; its domain is a spiritual one, and therefore different from the political domain; it rests on divine institution; and hence, as to the powers bequeathed to it, and as to the means granted it for the fulfillment of its mission in the world, it is not dependent on any earthly power and requires no political commission. It is, therefore, subject to no state. It is not *of* the world but *in* the world, to lead mankind to eternal salvation. The Catholic church as the *one* church, the mystic visible body of Christ, the community of all Christian believers spread throughout all lands, is not the subject of the action or influence of any state, and is not, because it is the mystic, visible body of Christ, bound to obey the laws of any state. The Catholic church knows no limits, no nation, but only humanity united in the faith. But the worldly position and the worldly relation of individuals do not, therefore, cease to exist. Christ did not prescribe to his church the attainment of its end in any new way by the creation of artificial social relations previously unknown to the world, or of new political institutions or constitutions. The church's means for the reaching of its end are purely spiritual, moral and religious. Hence, the mission of the church is decidedly not a political one. That through the acceptance of Christianity, all social, and hence all political, relations should be gradually transformed as they actually were, was not the aim of Christianity, but the indirect result of its action, because through its influence humanity itself was renovated in a moral way. It therefore follows that the church in different countries does not and can not require that the people should abandon their political and social relations or circumstances, but, on the contrary, that individuals, each in the position in which Providence has placed him, should fulfill his duty, and, like a true Christian, whether as a citizen or official or soldier, as father or mother, as son or daughter, etc., merit heaven. Religious duties should not interfere with *human* duties, whether civil or political, and there should arise no conflict between civil and church duties. The task of the Christian state consists in the attainment of this end.

—From what has been said, it follows, in the first place, that the church accepts the political order as resting on the divine will, and that the authorities of the state rule by divine right. All, accordingly, are bound to obey the latter. But it follows, too, that no definite form of political authority or of political constitution, no single political

system, can be regarded as the one specially instituted by God, but that the church recognizes the actual lawfully existing political authority of a state as the one divinely established. Not the church, but international law and history, must decide when any definite political authority can be said to exist *by right*; in other words, that decision lies outside the jurisdiction of the church. It is therefore perfectly true that the Catholic church as such is cosmopolite, and knows no special country; but it is wrong, on this account, to deny to Catholics individually, from the pope to the layman, the right of, or the capacity for, patriotism. Differences of political opinion and deep attachment to home, country and nation, are as natural to Catholics as to any others.

—Thus, the church is not divided into state churches. History shows that there is nothing more crippling or deadening to the inward life and action of the church than a condition in which it becomes the instrument of state administration, even when it happens that it is the predominant religion in that state. Nor is the Catholic church a state within the state. This is not possible from the very nature of its existence in most states, and of its constitution, which is the same in all states, the centre of which (its constitution), even in the interest of all states having Catholic population, should not be subject to a state foreign to any other states. It is, however, no contradiction to what has been said, that the church partakes in the sufferings and joys of every individual state, in so far as its members belong politically to such state.

—Within its own domain the church demands freedom of movement and autonomy, just as in the present day does every private individual, every community, every society, and every confession. The Catholic church can not on principle lay claim to privileges or rights of a secular or political nature; the loss of the old ones it possessed was, therefore, in principle no violation of right. But it can not be denied that the practical settlement of the relation of church and state, especially in Europe, is best with great difficulties, because our age has broken with history in respect to the development of the political domain, and because the church and the state, in most European countries, have a too intimate and historical connection to render it possible soon to find the right solution in the conflict of opposing parties, one of which desires to retain the condition of things historically developed, another of which finds the right solution in the absolute dechristianization of the state, and a third in the freedom of the church within its own sphere, the like freedom of the state, within its sphere, and in the action in common of both on a common ground. There are still other parties which do not well know what they want.<sup>95</sup> (For the proper solution of the question of the relation of church and state, see CHURCH AND STATE, in Vol. I. of this work.

## RUSH

RUSH, Richard, was born at Philadelphia, Aug. 29, 1780, and died there July 30, 1859. He was graduated at Princeton in 1797, was admitted to the bar in 1800, and became attorney general of Pennsylvania in 1811, and attorney general of the U. S. in 1814. He was minister to Great Britain, 1817-25, and secretary of state under John Quincy Adams. In 1828 he was the candidate of the Adams republicans for vice-president. (See WHIG PARTY, I.) He was minister to France, 1847-56. See his *Residence at the Court of London*, and *Court and Government of Louis Philippe*.

## RUSSIA

RUSSIA. This empire comprises three distinct states: Russia, Poland, and the grand duchy of Finland. Its area, according to the imperial almanac of 1872, is 19,152,725 square kilometres, divided as follows: Russia in Europe, 4,390,829 square kilometres; Poland, 123,738; Finland, 350,541; the lieutenancy of the Caucasus, 407,597; Siberia, 11,425,715; and Central Asia, 2,454,305.

—The population in 1867 amounted to 81,745,307, as follows: Russia in Europe and Poland, 69,364,541; Finland, 1,843,253; the lieutenancy of the Caucasus, 4,583,640; Siberia, 3,327,627; and Central Asia, 2,626,246. The increase in the population can only be estimated on absolute bases since 1835; the following are the figures given by M. Schnitzler (*Empire des Tzars*): 1835, 59,000,000; 1851, 69,000,000; 1860, 75,000,000. The 81,000,000 of 1867, distributed over the whole surface, gives only 4.2 inhabitants to the square kilometre. The most populous part is Poland, nineteen inhabitants to the square kilometre, while in Siberia there is only one inhabitant per 3.3 square kilometres.

—The empire embraces nine distinct races: 1, the Slaves, who are the most numerous and who inhabit the centre of Russia; 2, the Lettes or Lithuanians; 3, the Finns, who inhabit the north of Russia and Siberia; 4, the Germans of Livonia, Esthonia and Courland; 5, the Turks, who inhabit the southeast; 6, the Caucasians; 7, the Jews; 8, the Mongols, or Tartars; 9, the Mandchous of Siberia.[96](#)

—I. *Social and Political Condition*. The sovereign, as his title of emperor and autocrat of all the Russias indicates, is invested with a power without limit or control; not only is he supreme chief and legislator, but it is even only under his authority and by virtue of his delegation that the synod, charged with governing the national church, acts. In a vast country composed, like Russia, of heterogeneous elements more or less behind the times, this autocracy serves to give them the necessary cohesion, and, when it falls to a sovereign who is animated by love of the public welfare, may accelerate the progress of civilization; thus it allowed the emperor Alexander II. to bring about reforms and to found new institutions which are destined to be the glory of his reign.

—The monarchy is hereditary in the males, in the order of primogeniture. When there is no male branch, the princess who is the nearest relation of the last sovereign, succeeds him; the others are called to the throne only in case she leaves no direct heir. (Family law of 1797.) The emperor has the power to provide for the case of his leaving, at his death, an heir who is a minor, and to appoint a regent and a guardian. If he dies without having taken this measure, the regency devolves on the empress dowager or on the nearest agnate, to the exclusion of the father-in-law or mother-in-law of the new sovereign, and the regent has to form a council of regency of six members. The sovereign attains his majority at sixteen years of age; the other princes of the family at eighteen. Their wives are not qualified to share their rank, and the children which they bear can not be called to the throne, unless they belong to a sovereign house and profess the orthodox Greek religion.

—The dotation of the crown is fixed by the emperor. It consists of imperial appanages and of a civil list.

—*Nobility*. There is a nobility of birth and a nobility of service. Peter the Great subordinated the first to the second, and classed by ranks the civil and military functions. There are fourteen classes, as follows: 1, chancellor of the empire, field marshal, admiral general, privy councilor of the first class; 2, general-in-chief, admiral, privy councilor of the second class; 3, lieutenant general, vice-admiral, privy councilor; 4, major general, rear admiral, councilor of state of the first class; 5, councilor of state. The next four classes include the colonels, lieutenant colonels, majors, staff captains, and some civil functionaries. In the last five are ranged the inferior officers, with certain functionaries. Nobility is hereditary in the first five classes, and personal only in the next four; the functionaries of the last five classes become personal nobles by advancement. Every noble owes a personal service to the state, under penalty of forfeiture of nobility, if three generations pass without this condition being fulfilled. The titles are those of prince, count and baron. There were, in 1867, 591,266 hereditary nobles and 327,764 personal nobles. By a manifesto of April 2, 1801, no noble can, without a regular trial and sentence, be deprived of nobility, honor, life or property. A noble can be tried only by a tribunal composed of nobles, and if the sentence is loss of nobility, honor or life, it must be confirmed by the senate and by the sovereign. The nobles are exempted from all corporal punishment, if only non-commissioned officers or soldiers. If they are deprived of their property, it goes to the nearest heir. Their houses are exempt from all quartering of soldiers. In each government the nobles possessing at least 300 *déciatines* of land (328 hectares) or a house worth 15,000 roubles (60,000 francs), or else who are included in the first five classes, have the right to assemble in the chief town every three years. Those who do not fulfill these conditions, meet in each district to elect delegates to the assembly of the government. This assembly elects a marshal and district marshals, charged with watching over the interests of the nobility and representing it at the central administration. The same assembly elects the judges and assessors of the tribunals, as well as the chief of police of each district; it attends to the distribution of the taxes and deliberates as to the interests of the province. It also exercises a disciplinary power over the members of the nobility; it examines the titles, judges the nobles who are accused of dissipating their fortune, and places them under guardianship if occasion requires. The nominations of functionaries are submitted to the approval of the emperor or of the governor according to the importance of the function.

—*Bourgeoisie*. The bourgeoisie, established by a statute of April 24, 1785, is divided into six classes: 1, owners of immovable property; 2, members of guilds; 3, domiciled foreign merchants; 4, notable bourgeois (see below); 5, artisans, members of trade corporations; 6, small tradesmen, small manufacturers, lesser employés, etc. A manifesto of 1832 established a *notable* bourgeoisie, for life or hereditary. The first can be conferred upon former students of universities who have obtained a certificate of having made good progress in studies, and upon artisans furnished with a diploma from the academy of fine arts. The hereditary bourgeoisie may be obtained by merchants fulfilling certain conditions, doctors of a Russian university, pupils of the academy of fine arts furnished with a diploma, and foreign savants, artists, merchants

or workers of industry after ten years' residence in the country. The sons of personal nobles are notable bourgeois by right of birth. The senate examines the titles and delivers the diplomas. It may confer notable bourgeoisie for life upon foreign savants, artists, merchants or manufacturers.

—*Peasants.* The inhabitants of the rural districts form nine-tenths of the total population; they are distributed through about 300,000 villages or hamlets, and are subject to a poll tax. In 1861, when serfdom was abolished, the peasants of the domains of the state and of the imperial appanages, to the number of 25,000,000, were already almost all freed, and there were 23,000,000 others attached to the soil. These latter owed their respective lords three days' labor a week; the other four days were at their disposal to cultivate a lot of land the products of which were given to them to supply the wants of themselves and their families. They could not change their residence without permission from their lord. The latter could sell them or mortgage them for so much per head, with the piece of land to which they were attached: he had over them the authority of a father; he could impose a profession upon them, permit or forbid them to marry, and inflict corporal punishments, death excepted, upon them. The serfs of a domain formed, under the guardianship of the lord, a rural commune, administered by an assembly composed of heads of families and by a chief called *staroste*, whom they elected from among their own number. It was to the commune that the land was granted by the lord, and it was charged with dividing it among the families according to the number of able-bodied workmen they contained, and, consequently, according to the amount of days' labor they could furnish. Where the land did not furnish enough to support the peasants, the lord rented it and gave up his right to enforced labor. Besides the serfs employed in the cultivation of the land, there were those who were attached, as domestics, to the service of the lord, and others whom he could authorize, in consideration of a sum paid, called *obrok*, to carry on some trade, either in the domain or elsewhere. In return for the revenue which the work of the serfs procured for him, the lord was bound to protect them and to help them in case of need; he was subject, therefore, to the expense and trouble of administration which this obligation involved, and he was responsible for the payment of the taxes.

—The number of owners of serfs was estimated at 103,195, of whom 3,700 possessed no land. (See the statistical work of M. Troïnzki.) The 103,195 owners were divided as follows: 42,978 possessing from 1 to 21 male serfs, in all, 339,586 serfs; 36,194, from 21 to 100 male serfs, 1,697,914; 20,165, from 101 to 500 male serfs, 3,974,629; 2,462, from 501 to 1,000 male serfs, 1,597,691; 1,396, possessing 1,001 male serfs and more; in all, 3,074,033. Thus, among the small proprietors, the one who possessed twenty serfs derived from them, at eight roubles per head, only 640 francs a year, to which were added the products of the land. A large proprietor received, for 1,000 serfs, 32,000 francs. The number of those who possessed from 20,000 to 50,000 was very small. In 1850, 44,166 estates, with 7,107,184 serfs, were mortgaged in the banks for 425,503,061 roubles, 1,500,000,000 francs. (See the work of M. Schnitzler.)

—The law, in freeing the serfs, regulated: 1, their rights and those of the former proprietors; 2, the means of existence of the freedmen; 3, the conditions by which they could become proprietors of the lands which they cultivated. The lords were

freed from their duties of guardianship. They preserved their rights of property in the lands which belonged to them, but on condition of allowing the peasants, by the payment of a sum fixed by the law, to enjoy the pieces of ground which they occupied and also a quantity of land which varied according to its productive quality. These lands were intended to furnish the peasants with a living, and to place them in a position to fulfill the obligations which were imposed upon them for their redemption from serfdom.

—It was not to the peasants but to the commune that these lands were granted. They belong to it in perpetuity, to be exploited in common according to immemorial custom or in separate lots. This second method is only the exception; it can be substituted for exploitation in common only with the consent of two-thirds of the inhabitants of the commune and of the proprietor.

—The commune is charged with indemnifying the proprietor either with labor or in money, as the parties choose; moreover, it is responsible to the treasury for the payment of the taxes. From this double responsibility proceeds the right of using force against peasants who do not fulfill their obligations. Besides the ordinary proceedings, the commune has the right to hire out a man in arrears or some one of his family for outside work, in the same district or in a neighboring district, and the wages paid for his work must be given to the commune. Those who do not fulfill their obligations, through obstinacy, idleness, or in consequence of intemperance, can be hired out in other governments, provided the decision of the communal assembly be confirmed by the justice of the peace. In case the land is enjoyed in lots, the responsibility is personal, and may lead to expulsion from the commune and the sale of the lots granted. When it is arranged that the indemnity due the proprietor is to be paid in forced labor, such labor is limited to two days a week for both men and women. The dues are eight to twelve roubles for each grantee. The peasants who were subjected to the *corvée* have the right to pay money instead, without the proprietor being able to constrain them thereto.

—The pieces of ground occupied by the peasants must be granted to them in full ownership as soon as they demand it; the price of sale is fixed by law. As for the lands the enjoyment of which had to be allowed them, the proprietors are at liberty to consent to the sale, or to refuse it and to hold to the stipulations fixing the *corvée* or the dues. When the sale has taken place, and the purchasers, whether peasants or the commune, can not pay the price, the government intervenes; it capitalizes the dues at 6 per cent., and gives the sum to the proprietor, half in special certificates, issued in the name of the latter at 5½ per cent., and not negotiable at the Bourse, and half in bonds payable to the bearer at 5 per cent., and negotiable like the Russian public stocks; 20 per cent. of the capital is retained to cover the expenses of collection, arrears and worthless debts. If the sale is made with the consent of the peasants, the 20 per cent. must be paid by them; in the contrary case, it is charged to the proprietor; and, if the state institutions of credit hold a mortgage upon the property, the sum is taken out of the price of sale. The purchasers discharge their indebtedness to the state by paying, for forty-nine years, an annuity of 6 per cent., of which 5 represents the interest and 1 the amortizement. As long as the peasants are indebted either to the proprietor, if they have treated directly with him, or to the state, if it has paid for them

the price of redemption, they can not leave the commune without the consent of the proprietor and of the commune, and without justifying by depositing in the communal treasury a sum equal to the dues or fine capitalized at 6 per cent.

—According to the official returns, the acts and transactions of redemption amounted to 79,599 on Jan. 1, 1873; 21,201 were concluded privately. The peasants who had become proprietors of the lands they cultivated, numbered 6,858,334, the extent of these lands was 21,120,152 *déciatines* (23,088,550 hectares), and the sums lent by the state amounted to 630,467,115 roubles. Of the sum of 41,222,629 roubles, which the peasants had to pay in 1872, there remained in arrears only 316,604 roubles. As in certain districts the amount fixed for reimbursement evidently exceeded the resources of the debtors, the government reduced their annual payments. The serfs called *dvorovyé*, attached to the service of the lords, or authorized by them to practice a trade in consideration of the payment of the *obrok*, were freed at the expiration of two years.

—The government, wishing to be informed of the changes produced by the emancipation, charged a commission to institute an inquiry, the results of which were published in 1873. The condition of the peasants has sensibly improved, both materially and morally, in the northwest, with the exception of the marshy districts of Pinsk and the banks of the Pripet. In the south, well-being increased without any advance in morality. No improvement has been produced in Little Russia. In the rest of the empire, the increase of well-being is scarcely apparent, and the intellectual and moral faculties are as little developed as before. Finally, in Great Russia the consumption of brandy has considerably increased. Exploitation in common continues to prevail; the peasant is bound to the commune as long as he has not paid the price of redemption, and, in the meanwhile, he has scarcely effected anything but to exchange the guardianship of the lord for that of the commune. Now it would appear that there was little to boast of in the communal administration and in the administration of justice. Their burdens have increased; the communes expending much more than formerly, their taxes have reached (1874) a total of 30,000,000 roubles; the provincial taxes have increased in a similar manner; the state taxes have not diminished, and both weigh almost exclusively upon the peasants. Therefore the commission recommended new reforms to bring emancipation to a good result. (For the effects produced upon agriculture and upon the condition of the proprietors, see IX. *Resources*.)

—In Poland the serfs numbered about 3,700,000. By virtue of four ukases of 1864, they acquired the ownership of the lands and buildings of which they had the usufruct, in consideration of *corvées*, prestations and dues of all kinds. All these charges, those which were arbitrary or exceptional being deducted, were converted into a land tax, and they served as a basis for the indemnity which was paid to the proprietors in bonds bearing 4 per cent. interest, and redeemable by an annual drawing by lot.

—II. *Administration*. Below the emperor, to whom belongs the plenitude of executive power, the highest administrative authority is the council of the empire. The matters within its jurisdiction are the discussion and drawing up of legislative acts, the interpretation of the laws in case the tribunals do not catch the true sense of them, the

establishment of the budget, new measures in the administration of the finances, the examination of the annual accounts rendered by the ministers, the solution of litigious questions relative to the administration or expropriation for public utility, finally, the political affairs upon which the council is consulted by the emperor. The ministers have a seat in the council, by right; the other members are unlimited as to number; the emperor chooses them as he pleases, and gives the presidency to one of the first personages of the state. The president is assisted by a secretary of the empire, an intermediary between the emperor and the council, and charged with the preparatory labors and the recording of the deliberations, copying the records of them, etc.

—Another great body of state is the directing senate, which was established in 1718, and reorganized in 1802. It is at once a supreme court of appeal, judging in the last resort, with the exception of appeals to the emperor, in all civil and criminal matters, a supreme administrative tribunal, and a high political court in special cases. It is charged, besides, with seeing to the execution of the laws; it has the right to demand account of their management of all the functionaries, including the ministers; it watches over the collection of the taxes and the employment of public funds; it has the care of the archives; it appoints to a great number of offices; it orders all measures necessary to the maintenance of order, subject to the right, which belongs to the emperor, of annulling these decisions; finally, it is charged with promulgating the acts emanating from the emperor.

—The senate is divided into ten departments, of which five sit at St. Petersburg, three at Moscow, and two at Warsaw. In connection with each department there is a high imperial procurator, who has the right of control over the deliberations, and whose signature is necessary for a judgment to be executory. The senators are appointed by the emperor.

—The ministries date only from 1802. They are twelve in number, namely: 1, the ministry of the imperial court, which includes the imperial orders, the appanages, the revenues of the emperor, the ceremonial, the imperial theatres and other establishments dependent on the crown; 2, the minister of war; 3, of foreign affairs; 4, of the navy; 5, of the interior; 6, of public instruction; 7, of postoffices and telegraphs; 8, of the finances, comprising the mines and salt works, the metallurgic factories, manufactures and domestic commerce; 9, of the domains of the state, comprising the inspection of farming, the direction of the agricultural schools and of the model farms, and the forests; 10, of justice, including the corps of surveyors, the schools of surveying, and the law school; 11, of the means of communication and public edifices; 12, of the control charged with the examination of civil and military accounts. The emperor has his own chancellery, which is charged, among other duties, with the publication of the laws, with political police, and the establishments of charity and instruction placed under the direction of the empress. To the same chancellery is attached the commission of requests or petitions.

—*Territorial Administration.* Poland and the grand duchy of Finland each form a separate government. In the first, affairs are directed by a lieutenant of the emperor, assisted by a council of government. Under his presidency sits a deliberative assembly, called a council of state, and composed of fifteen permanent members and

seven temporary members, appointed by the emperor. Finland is administered by a governor general, assisted by a senate, the members of which are appointed by the emperor. The legislative power belongs to the diet, composed of deputies of the nobility, of the Lutheran clergy, of the inhabitants of cities, and of peasants. The presidency belongs to the president of the nobility, who is appointed by the emperor. The decisions have the force of law only with the imperial approval. The rest of the empire is divided into fifty-eight governments, three city territories (Odessa, Taganrog and Kertch-Jénikalé), two countries (of the Cossacks of the Don and of the Tchernomorie), eleven oblasthes (provinces not as yet regularly organized), and three districts in the country of the Kirghises.

—The six governments of the region of the Caucasus are placed under the direction of a lieutenant of the emperor.

—Ten governors general, established at St. Petersburg, Moscow, Odessa, Kief, Riga, Wilna, Orenburg, Tobolsk and Irkoutsk, have under their orders the civil and military heads of the governments comprised in their circumscription. Each civil governor is assisted by a council composed of three titular members and of one or more assessors. With this council, which is purely consultative, sit a government attorney and two deputies, charged with defending the interests of the crown and watching over the execution of the laws. At St. Petersburg the city and the suburbs are separated, since 1873, from the provincial government, and fall within the jurisdiction of a prefecture.

—The governments are subdivided into districts, which are administered by a court composed of a president and two assessors elected by the nobility, of two other assessors elected by the inhabitants of the country, and of a substitute of the procurator of the government. This court serves, besides, as a tribunal of the first resort for the district.

—Each government has, as a deliberating body, the assembly of the nobility, of which mention was made above, and provincial, government and district assemblies, created by a law of Jan. 13, 1864. Each government assembly is composed of delegates of the district assemblies. Moreover, in the governments which embrace imperial appanages, or domains of the state, the chiefs of the councils of administration of these appanages and domains are members by right of the provincial assemblies. The members of each district assembly are elected by three categories of electors, which assemble and act separately: these are, 1, the proprietors (nobles or not); 2, the inhabitants of cities; and 3, the inhabitants of rural communes. They must all be fully twenty-five years of age. To be an elector as proprietor, it is necessary to possess, outside of the cities, from 200 to 800 *déciatines* of land, or of immovable property, having at least a value of 1,500 roubles, or to carry on an industrial establishment doing a business of at least 6,000 roubles yearly, or to be a permanent holder of determinate church property. The electors may be represented by mandatories of their choice, but the holders of church property are always obliged to be represented. Small proprietors, who have not the required number of *déciatines*, can join together, so as to reach (two or more uniting) the electoral property qualification, and appoint a mandatory to represent them. The inhabitants of cities must, to be electors, produce a merchant's license, or possess an industrial establishment doing an annual business of at least 6,000 roubles, or

immovable property worth from 500 to 3,000 roubles, according to the amount of the city's population. As for the rural communes, their representatives are appointed by electors, which the district assembly itself chooses. Minors, absentees and women can delegate their right to vote to a mandatory. The members of the assemblies are elected for three years, and receive no remuneration. The government assemblies come together once a year for twenty days, and the district assemblies for ten days. Each of these assemblies is presided over by the marshal of the nobility. Their duties comprise: 1, the administration of the property, capital and revenues of the province; 2, the construction and maintenance of buildings belonging to the province, and of roads which are in its charge, 3, measures useful for the welfare of the population; 4, measures of public assistance, the administration of charitable institutions and the construction of churches; 5, the administration of mutual insurance companies established in the province; 6, measures proper to develop commerce and industry therein; 7, measures concerning popular instruction, public health and prisons; 8, measures to be taken against epidemics and the ravages of noxious animals; 9, the distribution of certain state taxes, the voting and distribution of local taxes, and the application of the product of these taxes to the expenses of the government and the district; 10, the choice of members of the permanent executive commission, which sits in the absence of the assembly. The government commission is composed of a president, and of two to six members, elected for three years, who receive a salary fixed by the assembly. The district commissions are composed of two or three members. The presidents must be confirmed by the minister of the interior. This organization is not yet applied to all the governments; in some of them the anterior system is retained for various reasons.

—*Municipal Administration*. Each city has its municipal body, composed of the *golova* (mayor), deputies, and a deliberative assembly. All the members of the municipal body are elected by an assembly, composed. 1, of owners of immovable property paying a tax to the city; 2, of proprietors and directors of commercial and industrial establishments; 3, of all persons domiciled in the city for at least two years, and able to prove that they pay a tax to the city. The duties of the municipal body include, besides the management of municipal affairs, the maintenance of order, the taking of measures of public safety and health, making regulations concerning the ports, markets, exchanges and institutions of credit; the organization of charitable establishments and hospitals, the foundation of libraries, museums and theatres, and measures suited to develop public instruction, commerce and local industry. A council of six members, elected in the municipal body, performs the functions of a police court, of a chamber of commerce and a tribunal of commerce, taking cognizance of litigation among the inhabitants.

—*Rural Communes*. The rural commune is, as before the emancipation of the serfs, an association of peasants exploiting a fixed territory. The great seignioral and private estates are outside of the communes and within the jurisdiction of the provincial administration. The cities are likewise classed apart. The heads of families form an assembly which elects the *staroste*, chief of the commune, as well as his various functionaries, the treasurer and collector of taxes, the trustee of the school or schools, the delegate to the reserve warehouses of wheat, the hospital inspector, or, the rural guard, the forest guard, and the scribe. The assembly draws up the budget of the

commune, fixes the taxes necessary for the payment of expenses, and regulates the apportionment of the taxes due the state. If the enjoyment of the land is in common, as is most frequently the case, the assembly divides the lots among the families; if it is in individual lots, the division is limited to the lots which are not in process of cultivation. The assembly gives their dismissal to peasants who wish to live elsewhere, on their fulfilling the prescribed conditions; it decides as to the admission and settlement of new heads of families; it gives guardians to minors, and authorizes family divisions; finally, it sits as a police court and deals out penalties, from the simplest fine to the expulsion of peasants judged "harmful or vicious" from the commune. The decisions are made by the absolute majority, except in certain cases in which a two-thirds vote is required: for example, the substitution of individual enjoyment of the land for enjoyment in common, the renewing of the lots, and exclusion from the commune. In the rural communes in which the dues are paid in money and in labor, the inhabitants subject to the *obrok* and those subject to the *corvée* may form separate assemblies.

—The *staroste* is the president of the assembly, and sees to the execution of its decisions. He takes all simple police measures; he pays into the proper hands the taxes and the payments for redemption; he controls the employment of the communal funds; finally, he is the representative of the commune in the *volosth* (see below), and with the authorities of the district, the province and the state.

—Above the commune is the *volosth* or canton, which includes many communes belonging to the same district, or comprises only a single commune when the population is large enough. The administration of the *volosth* is composed of a chief called *starchina*, of two or three assistants, of an assembly of delegates of the communes (one to every ten families), and of a council in conjunction with the *starchina*, to assist him in his functions, and composed of his assistants, the *starostes* of the communes of the *volosth*, and collectors of the taxes. The assembly comes together in the most central or the most important village; it regulates the common interests of the *volosth*, decrees the measures of public assistance, controls the accounts, and fixes the taxes and the dues. The duties of the *starchina* are similar to those of the *staroste*, but of a higher degree. He decides, in the last resort, on cases of simple offenses against the police regulations. To be eligible to the office of *starchina*, *staroste*, assistant, collector of taxes, or as a member of the *council of regency*, it is necessary to be at least twenty-five years of age. The term of office is three years; office can not be refused unless one can prove that he is sixty years old or has serious infirmities, or unless he has already filled it. Substitutes are appointed to avoid the occurrence of vacancies.

—III. *Religion*. The population of Russia in Europe, in 1874, was divided, as regards religion, as follows: Orthodox Greeks, 58,169,019; Dissenters (*raskolniks*), 926,631. United Greeks, 229,260; Gregorian Armenians, 37,136; Roman Catholics, 7,209,434; Protestants, 2,565,354; Israelites, 2,612,019; Mohammedans, 2,359,372; Pagans, 255,975. The inhabitants of the grand duchy of Finland (1,843,253) are nearly all Lutherans. For Asia, the almanac of the empire gives the following figures: Orthodox Greeks, 4,936,917; Dissenters (*raskolniks*), 166,985; Gregorian Armenians, 560,684; Roman Catholics, 54,106; Protestants, 16,337; Israelites, 34,857; Mohammedans,

3,267,650; Pagans, Guebres, Shamanists, 295,734. The orthodox Greek religion is the religion of the state; but other creeds, as well as the Pagans, enjoy an equal liberty.

—The national church is governed by a college called the very holy synod, under the authority of the emperor and by virtue of his delegation. Peter the Great established this college in 1721, and at the same time sanctioned the laws which govern the church. The synod is composed of titular members and of assistant members; the first, to the number of eight or nine, are the principal prelates of the empire, metropolitans, archbishops or archimandrites; the second are prelates who leave in turn their dioceses or monasteries to attend the sessions, as well as three laymen, one of whom is a high agent invested with powers by the emperor, and the two others functionaries by whom he is assisted. The first metropolitans and the exarch of Groussia are members by right and for life; the others are appointed by the emperor for a certain time. The acts emanating from the holy synod are valid only on condition of their receiving the imperial approval. The candidates for ecclesiastical offices are presented by the holy synod for appointment by the emperor, who can displace or remove a priest whom he judges unworthy of his office. But he does not decide in matters of faith; in case of disagreement upon a question of doctrine, he refers the matter either to the holy synod or to a special synod.

—The dioceses number fifty-two; they comprised, in 1872, 38,809 churches and 3,534 chapels. In each diocese is a consistory, subordinate to the holy synod. These consistories preside over the acts of the civil state, watch over the exercise of worship, the police of the churches, the conduct of members of the clergy, and decide in all matters ecclesiastical.

—The metropolitans receive 3,000 roubles at most, the archbishops 2,500, the bishops 2,000, and the coadjutors 500. The salary of the curates does not reach 100 roubles; but they receive fees; in the country, they have a house, from twenty to forty *déciatines* of land, and wood is furnished them gratuitously. The churches receive legacies and possess property in most of the dioceses.

—The clergy is divided into secular or white, and into regular or black. The latter are forbidden to marry; they live in monasteries, and from among them the prelates are chosen. The nobles, therefore, who embrace an ecclesiastical career, enter the ranks of the black clergy. The white clergy are recruited almost entirely from among the sons of *popes*, or *curates*; they must be married before ordination, and they generally take their wives from the families of priests, so that this clergy forms a veritable caste. The secular clergy was composed, in 1872, of 1,160 archpriests, 36,440 priests, 13,250 deacons, and 56,886 curates. The convents numbered 532, of which 383 were for men and 149 for women. They contained 5,810 monks and 3,280 nuns, with 5,617 lay brothers and 11,258 lay sisters. Each monk receives an annual pension of from twelve to fifteen roubles; the nuns are not paid anything except in exceptional cases; most of them live on alms and the product of their labor.

—Missionaries are established in Siberia and in the region of the Volga, to labor for the conversion of the Pagans and Mohammedans. (See CHURCH, GREEK.)[97](#)

—IV. *Justice*. The organization and administration of justice commenced, during the reign of Nicholas I., to receive improvements, which were continued and completed during the reign of Alexander II. In 1833 Nicholas I. had collected, arranged and published, under the name of *svod*, 36,000 civil and criminal laws made by his predecessors; he promulgated in 1845 a penal code, and in 1846 a criminal code. Alexander II. regulated the judicial organization and criminal and civil practice. The judicial power is entirely separate from the other two; it is exercised by the tribunals of the *volosth*, the police courts of the cities, the justices of the peace, the assemblies of justices of the peace, the district tribunals, the courts of justice, and the senate in its quality of supreme court of appeal. The tribunals of the *volosth* are composed, according to the population, of from four to twelve judges, elected by the assembly and taken from that body. Their functions are gratuitous. They take cognizance of controversies among peasants, unless another person is interested therein; in this latter case the affair is referred to the ordinary court. Judgment is not given until after an effort at conciliation has been made; the decisions are then final and without appeal. Moreover, the peasants are authorized, when there is no crime or misdemeanor in question, and when the interests of minors are not engaged in a controversy, to refer it to a third person. This arbitration is executory, after it has been recorded in a register deposited with the *council of regency* of the *volosth*, and it can not be appealed from.

—The justices of the peace exercise three orders of functions: 1, a power of conciliation; 2, extra-judicial functions, such as the placing and removal of seals, etc.; 3, judicial functions. They take cognizance of personal matters and cases involving personal property, without appeal, up to the value of thirty roubles, and with the privilege of appeal up to the value of fifty roubles. In real estate cases they have no jurisdiction; they can only pronounce the re-establishment in their rights of proprietors dispossessed six months before at the most. In criminal cases the limit of their jurisdiction is determined by the punishment to be inflicted; reprimand, remonstrance, a fine of thirty roubles at the most, detention for three months, or imprisonment for a year at most. An appeal is not allowed when the penalty does not exceed three days' detention or five roubles' fine. Appeals are brought before the assemblies of justices of the peace, except recourse is had to the court of cassation.

—Each district tribunal is divided into two sections, one civil and the other criminal. The proceedings are public. When the penalty inflicted carries with it loss of civil rights, and there is no question of a crime against the faith or against the state, nor of a press offense, the tribunal is assisted by juries selected from among persons of all classes, and their verdict is subject only to be reversed by the court of cassation. Press matters are brought before the court of justice of the government. In case of a crime against the state, the court of justice that tries it is assisted by the marshal of the nobility of the government, by a marshal of the district, and by a *golova* or *staroste*.

—Civil procedure is oral. The assistance of advocates or barristers, optional before the justices of the peace, is obligatory before the superior courts. The advocates or barristers are subject to the disciplinary power of a syndical chamber.

—Connected with each tribunal and each court there is an imperial attorney, with one or more substitutes; and to each department of the court of appeals there is attached a superior procurator.

—In 1863, Alexander II. modified the system of corporal and correctional punishments, and abolished the use of the knout, as well as that of rods or sticks. The punishment of the *plète*, a whip composed of several twisted straps, remains. The death penalty is reserved for military justice and for cases of an attempt against the state or against the person of the sovereign. But condemnation to forced labor in the mines is fully equivalent to the last punishment, and simple transportation to Siberia, which is always preceded by corporal punishment, is extremely rigorous. Only the women and the sick are transported in wagons or by train; the men have to make the journey on foot, loaded down with chains. Some are condemned to temporary deportation to a fortress for a year at least, others to transportation to a penal colony, and others to transportation with forced labor, temporary or perpetual. Forced labor "in perpetuity" can not exceed, except in case of a second offense, twenty years; after this period the condemned is set at liberty, and placed, if he can be utilized, among the colonists of Siberia. The number of exiles in 1874 was about 100,000.

—V. *Public Instruction*. Public instruction commenced only in 1863 to be organized according to a studied plan and one comprising the different kinds of instruction. There are now nine universities established at St. Petersburg, Moscow, Kharkof, Kasan, Dorpat, Kief, Warsaw, Odessa and Helsingfors. There were about 6,800 students and 600 free attendants on the lectures in 1874. The best attended courses are law and medicine. 2,400 students are admitted gratuitously. Each university is administered by a rector and a council over which he presides. The rector and the members of the council are elected for four years by the professors. There are, besides, the imperial institute of history and philosophy, established at St. Petersburg in 1867; the Lazareff institute, for instruction in the oriental languages; the two academies of agriculture and forestry of Warsaw and Pétrovskoé; a law school; a school of engineering; three medical schools, at St. Petersburg, Moscow and Wilna; three veterinary schools, at Kharkof, Dorpat and Warsaw; and an institute of technology at St. Petersburg.

—In 1872 the state established commercial and industrial schools. There were, the same year, 123 gymnasia and 23 progymnasia, in which Latin and Greek were taught; the number of pupils was 42,791. The expenses amounted to 4,467,644 roubles, of which 3,215,887 were charged to the state, 513,534 to the provinces and cities, and 738,223 to the pupils. For girls, there were 54 gymnasia, 108 progymnasia, and 24 other schools. The pupils numbered 23,400.

—Superior primary instruction is given in the district schools, and elementary primary instruction in the parish and village schools. The number of the latter is estimated at 24,000, and the number of pupils at 870,000. The state established, in 1872, ten normal primary schools, which brought the number of these institutions up to twenty-five. Grants are voted annually by the provincial assemblies for the establishment and maintenance of primary and normal schools, and to these grants are added the private contributions, which, from 1865 to 1871, amounted to the sum of 1,183,540 roubles.

Every one feels that the emancipation of the serfs has rendered the spread of primary instruction still more urgent.[98](#)

—VI. *Army and Navy*. The organization of the army and of military service was reformed by a ukase of Jan. 1, 1874. "The service," it is said in this act, "weighed exclusively upon the bourgeois class and the peasants, and a large part of the Russian subjects were freed from a duty equally sacred to all. This system does not answer the military exigencies of the age. Contemporaneous events have proven that the strength of states does not consist alone in the numerical value of the army, but principally in its intellectual and moral qualities, which only reach their highest degree of development when the defense of the fatherland becomes the common work of the nation; when all, without distinction of rank and class, unite for the accomplishment of this sacred task."

—In accordance with these principles, the emperor sanctioned a number of laws in 224 articles, the principal provisions of which are as follows: The male population, without distinction of class, shall be subject to military service. The paying of a sum of money to escape the service, and substitution, are hereby forbidden. The armed force of the empire shall be composed of a standing army and a militia; the latter shall be called into service only in extraordinary circumstances in time of war. The standing army shall consist: 1, of the active army, recruited by levies of men throughout all the empire; 2, of the reserve, which serves to complete the effective force of the troops, and is composed of men sent on leave till the end of their term of service; 3, of Cossack troops; 4, of troops formed of foreigners. The naval army is composed of the fleet and of its reserve; the number of men necessary to complete the effective force of the army and the fleet is fixed by law each year.

—Entrance into the service is determined by a drawing of lots. The individuals whose numbers do not call them into the active service are enrolled in the militia. Each year the young men who have attained the age of twenty years by the first of January, are liable to service. For the marine the young men best fitted for that service are chosen. In the land army the term of service is fifteen years, six in active service and nine in the reserve. In the marine the term is ten years, seven of active service, and three in the reserve. In war time all the men remain in active service as long as the needs of the state demand it. The soldiers and marines can be sent into the reserve before their term of active service expires. The men of the reserve are subject to the ordinary laws, and enjoy the rights peculiar to their station. When they are called into active service, in case of war, their families are supported by the city or rural corporations, in which they are domiciled. Soldiers incapable of continuing in service and deprived of resources, receive from the treasury three roubles a month, or are placed in the hospitals. The militia comprises the men who do not form part of the standing army, but who are capable of bearing arms, from the age when they are liable to be conscripted up to forty years completed.

—Besides the exemptions for bodily defects or for family reasons, reprieves are granted as follows: 1, two years, at the most, for individuals who personally manage their landed property or who direct the commercial or industrial establishments belonging to them, excepting dealers in strong liquors; 2, from two to seven years, to

pupils of various ecclesiastical, collegiate or artistic establishments, divided into five classes. Moreover, the term of active service is reduced, according to circumstances, to four years, three years, and even to six months, and that of the reserve to eleven years, in favor of young men who have graduated at certain establishments of public instruction. Members of the Christian clergy only are completely exempt. Young men who have the rank of doctor of medicine or of licentiate in the veterinary art or in pharmacy, or who are pensioners of the academy of fine arts sent to a foreign land, or who are professors in establishments of public instruction, are enrolled at once in the reserve for fifteen years. There are also certain temporary exemptions in the fleet, and reductions of service from one to two years in certain cases.

—Volunteers are received into the land army, on their proving, 1, that they are at least seventeen years of age; 2, that they are minors, and that their parents or guardians have consented to their enlistment; 3, that they have passed an examination in the complete course of studies in an establishment of public instruction, or a special examination determined by the ministers of war and of public instruction. They serve for three months, if they have passed the examination in an establishment of the first class; for six months, if in an establishment of the second class; and for two years, if they have only passed the special examination. At the expiration of these terms they are allowed, in time of peace, if they are not officers, to remain in the active service or to pass into the militia, where they are kept for nine years. Volunteers admitted into the guard or into the cavalry must support themselves at their own expense; in the other troops they are supported by the state. In the navy the special examination is appropriate for that service; volunteers are held for two years' active service and five years in the reserve.

—The annual contingent is divided among the provinces by the minister of war; then that of each province is divided among the subdivisions by a recruiting board. In each district or city a committee is charged with drawing up the lists of names, subject to the drawing by lot, with visiting the young men, and deciding upon their admission or exemption. The provincial assembly controls the operations, examines the complaints, and decides upon or refers them to superior authority.

—The ukaso does not apply to Cossacks and the other population whose military obligations are determined by special provisions.

—The regular army presented, on a peace footing, Jan. 1, 1872, an effective force of 760,000 men, of which 28,000 were officers of all ranks, and 732,000 non-commissioned officers and soldiers, forming 82 battalions of infantry and 281 squadrons of cavalry. The 732,000 non-commissioned officers and soldiers were thus divided: infantry, 572,400; cavalry, 61,700; artillery, 80,500; engineer corps, 17,400. To these figures must be added 560,000 men on leave, who could be called for in case of war.

—The naval forces were composed, in 1870, of 216 vessels of all classes, 194 of which were steamships, and 22 sailing vessels, carrying 1,464 pieces of ordnance. There were eight iron-clad frigates, three bomb-protected batteries, thirteen iron-clad batteries, five ships, twelve frigates, and fifteen corvettes. The effective force of the

military marine was 75 admirals, vice-admirals and rear admirals, 2,340 officers, and 20,986 marines and sailors. There are two admiralties, one at St. Petersburg for the fleet of the Baltic, and one at Nicolaïef for the fleet of the Black sea. The principal dock yards are in these two cities, and at Okhta, Cronstadt, Kherson and Archangel. A great arsenal is established at Kolpina, near St. Petersburg.<sup>99</sup>

—VII. *Finances.* Peter the Great, according to historians, had, to meet all his enterprises, a revenue of only 5,000,000 roubles, with tributes in kind, and the expenses were proportioned to the receipts. Both increased after his reign, but the expenses chiefly. Catherine II., having exhausted all other expedients, had recourse to a paper currency, which, in 1817, amounted to 210,000,000 roubles. To reduce it, recourse was had to internal loans; then, this recourse not being sufficient, in 1820, foreign loans were negotiated. In 1847, the debt bearing interest reached the sum of 315,000,000, with 184,000,000 of paper money in circulation; and in 1860, in consequence of the increase in the military expenses and the construction of the first railways, the amount of the debt was more than doubled. But the emperor brought about improvements in the management of the finances; he wished to have a regular budget, and for the first time that of 1863 was given to the public. This was, according to L. Faucher's expression, a veritable revolution. According to the financial accounts, the ordinary receipts in the years 1864 and 1871, in roubles, were as follows:

ITEMS.	1864.	1871.
Direct taxes.....	35,760,000	94,470,000
Licenses.....	9,630,000	12,230,000
Indirect taxes :		
Liquors.....	127,800,000	149,780,000
Salt.....	9,830,000	12,680,000
Tobacco.....	4,010,000	8,390,000
Beet-root sugar.....	580,000	8,480,000
Customs.....	35,670,000	47,320,000
Stamps.....	5,490,000	7,590,000
Registration.....	2,530,000	5,170,000
Passports, maritime duties and tolls.....	5,280,000	6,110,000
Regalian rights :		
Mines.....	2,500,000	8,720,000
Coinage.....	2,500,000	4,060,000
Postoffice.....	7,700,000	9,700,000
Telegraphs.....	1,960,000	3,920,000
Domains of the state.....	53,230,000	35,010,000
Miscellaneous receipts.....	38,250,000	54,060,000
Revenue of Transcaucasus.....	3,450,000	5,240,000

The only diminution is in connection with the domains of the state, and is a result of the emancipation of the peasants. If the expenses of collection and the anticipated deficit in receipts are deducted, viz., 42,000,000 for 1864 and 52,000,000 for 1871,

we find, for the first of these years, a total of 304,246,000, and for the second a total of 487,966,000. But as the budget of Poland has been joined to that of the empire, 30,000,000 must be added to the first of the two totals, and by adding them we find an increase in the receipts, of 153,720,000 roubles, without any increase in taxes except upon liquors. The following table shows the ordinary expenditure for the years named, in roubles:

ITEMS.	1864.	1871.
Public debt.....	59,630,000	85,060,000
Grand body or corps of the state....	1,200,000	2,450,000
Clergy.....	5,340,000	9,220,000
Imperial household.....	7,750,000	10,950,000
Foreign affairs.....	2,090,000	2,470,000
War.....	119,950,000	159,250,000
Navy.....	21,680,000	21,140,000
Domains of the empire.....	9,120,000	9,680,000
Interior.....	23,490,000	42,400,000
Public instruction.....	6,240,000	10,810,000
Means of communication.....	25,160,000	34,020,000
Justice.....	6,480,000	10,700,000
General control of the empire.....	320,000	1,910,000
The stud.....	590,000	640,000
Expenses of Poland.....		1,310,000
Administration of the Caucasus....	3,610,000	6,600,000

Deducting the expenses of Poland, we have for 1864 a total of 351,346,000 roubles, and for 1871 a total of 498,422,000 roubles, consequently an increase which is not the result alone of the increase in the debt and the military expenses, but also of the improvements made in the different services.

—The expenditure of 1864, compared with the receipts, presents a deficit of 47,000,000; in 1871 we find 10,000,000 deficit, but we shall see, further on, that the debt had increased.

—The expenses connected with the construction of railways and of certain ports, are paid separately from a special fund raised by means of loans. The budget of 1874 was thus fixed: receipts from all sources, 539,851,656 roubles; expenses, 536,683,836 roubles.

—The debt is divided into the public debt properly speaking, or consolidated debt, the floating debt, and the paper currency. The consolidated debt is composed of loans effected at different periods since 1798, at different rates and under different forms, some domestic and some foreign; some to be liquidated or redeemable at a fixed time, others at no determinate period; lastly, some to reduce the paper currency, others to cover the deficits, and others to pay the expense of the construction of railways or of

advances for the redemption of serfs. In 1863, this debt amounted to 759,000,000 roubles, and, Jan. 1, 1872, to 966,000,000. It had, therefore, increased 207,000,000. Moreover, the debt of Poland having been charged to the treasury, in 1869, and this debt amounting to 92,000,000 in 1872, the debt of Russia was therefore increased to 1,058,000,000. The floating debt is composed of treasury bonds, of fifty roubles each. It amounted, in 1863, to 189,000,000 roubles; from 1866 to 1872 it remained fixed at 216,000,000. The paper currency consists of credit notes put into forced circulation by the bank of Russia. They do not bear interest, and are not guaranteed by a metallic reserve, like the other credit notes issued by the same bank for its own operations. In 1863, after 118,000,000 roubles had been retired from circulation or burned, there remained 643,000,000. In 1872 there were 724,000,000, and adding the notes issued to replace those of the former institutions of credit to which the bank of Russia succeeded in 1860, the circulation amounted to 959,000,000. As to the debt arising from the redemption of the serfs, the advances made by the treasury amounted, from 1861 to Jan. 1, 1871, to the sum of 559,931,289 roubles, out of which 251,500,000 were retained for the mortgage debts of the former owners. [100](#)

—VIII. *Means of Communication.* When Peter the Great tried to remedy the enormous greatness of the distances which separated and still separate the groups of habitations, it was by means of interior waters, seas, lakes, streams and rivers that he undertook to create means of communication. He commenced the junction of the Volga with the basin of the Neva and that of the Dwina of the north, by a system of navigation which was continued by his successors; and is composed to-day of three branches, measuring, altogether, 3,460 kilometres, 553 of which are of canal. This system unites the Caspian sea with the Baltic and the White sea. In the west the Baltic is placed in communication with the Black sea by three lines of navigation, composed, one of the western Dwina, and the canals of the Beresina and the Dnieper; the second of the Chara, a tributary of the Niemen, and of the Pripet, a tributary of the Dnieper; the third, of the Vistula, the Boug and the Pripet. The south does not fare so well, the Caspian sea has no direct communication with the Black sea, and the basin of the sea of Azof is entirely isolated. There are in all 30,337 kilometres of natural navigable lines, connected by 1,381 kilometres of canals. There are navigation and steam-towage companies upon the Volga, the Neva, the Dnieper and the Vistula. But the rivers are only open usually six months in the year in the north, and eight to nine months in the south, and the cold closes the canals even longer. The transports are subject to a tax of a quarter of 1 per cent. of the value declared; this tax is applied to the maintenance of navigation works. According to the official *Vremennik* of 1866, the quantities of merchandise carried by water in that year were:

	Foods.
Basin of the Volga...	170,258,765
Basin of the Neva...	145,750,265
Basin of the Dnieper...	20,354,041
Basin of the Duna...	8,257,734
Basin of the Dwina...	6,952,839
Basin of the Niemen...	3,748,440
Total...	355,322,084

—*Highways*. The roads practicable in all seasons date only from 1816. They were in 1867, in Russia in Europe, only 8,416 kilometres in length. The post roads had, in 1874, an extent of 94,000 kilometres. Transportation is possible on wheels during four months of the summer, and on runners over the snow during four months of the winter. There are not more than 200 days in the year when communication is easy; but in proportion as the roads are insufficient, horses, cattle and fodder are procurable at a small price, so that grain and the products of the mines are carried considerable distances for a less price than that of transportation in more favored climates. The principal highways are those from St. Petersburg to the Chinese frontier, by way of Irkoutsk (6,616 kilometres), from St. Petersburg to the Prussian frontier, via Warsaw (1,173 kilometres) and via Tilsit (816 kilometres), and from St. Petersburg to Abo (613 kilometres).

—*Railways*. The first was that from St. Petersburg to Tsarskoé-Sélo, which is only twenty-six kilometres long; it was built by the state and finished in 1835. The state commenced in 1842 the railroad from St. Petersburg to Moscow, 643 kilometres long, and opened it in 1851. Since 1856, the undertakings of new lines have been granted to private individuals, and in 1858 the state gave up the management of those under its control. The railroads in running order Jan. 1, 1872, represented a total length of 14,003 kilometres; the lines in course of construction had 1,454 kilometres. (See note at the end of IX.)

—IX. *Resources*.

—*Agriculture*. Russia, from the agricultural point of view, has one hundred and seventy-five millions of hectares in arable lands and meadows, one hundred and eighty-eight millions in forests, fifty-seven millions in steppes which can be utilized as pasturage, and eighty millions in non-productive lands. Of the first one hundred and seventy-five millions, ninety-eight, situated between the fifty-first and fifty-fourth degrees of latitude to the west, and between the fifty-seventh and fifty-fourth to the east, constitute the region called the region of the black earth, and which is especially productive. In Finland the extent devoted to rural economy is estimated at thirty-one millions of hectares, and in Poland at ten and a half millions.

—The progress of agriculture is trammelled by various unfavorable circumstances: the lack of capital, the lack of hands, absenteeism, and, above all, communism applied to the lands. Labor, besides, because of the climate, is suspended during seven months of the year, and extremely hurried during four others; which greatly restricts cultivation. Serfdom has disappeared, but ignorance and carelessness continue. A very great number of proprietors, whose property was weighed down with mortgages, found themselves greatly impoverished when the *corvées* failed them. The laborers, whom it was necessary to employ and pay, have shown, it is said, in general, little zeal and even little good faith in the execution of their engagements. Moreover, they did not have the knowledge which less rude methods demanded. Some proprietors have tried to farm out their lands, but good farmers are only found in the southwest. The proprietors are contented, under these circumstances, with small rents on long leases, and the rent is double for leases by the year. In a great part of the empire the proprietors have been compelled to divide up their estates and lease them by the year

in small lots; cultivation has not been improved thereby. Another system consists in having the work done by contract with the implements of the cultivator; sometimes the seeds are furnished by the proprietor, sometimes by the cultivator, and the latter is paid either in money, or by the grant of a piece of land. Finally, in the south the metayer system exists.

—Live-stock does not receive the care necessary to insure its increase and improvement. Little attention is paid to the development of artificial prairies. Manure is not much used, and the low price of meat on the premises does not encourage production. Hence cattle, in the twenty years from 1851 to 1871, increased only by 640,000 head, of ordinary quality. The increase is larger among sheep and hogs; but horses have diminished from 16,155,000 to 15,540,000.

—Two-thirds of the forests belong to the crown. Those belonging to individuals had already suffered much by bad management, when the emancipation of the serfs necessitated considerable clearing. A great number of proprietors were forced to sell wood to procure the means they needed; taxes, besides, are often very heavy in comparison with the revenue, and it is difficult to prevent theft and incendiarism. The consumption of wood is enormous; the annual exploitation of it is estimated at 135,000,000 roubles.

—*Industry.* For the seven or eight months during which work in the field is suspended, the peasants carry on various industries in their villages; such as, weaving of cloth, oil pressing, wood work, the manufacture of tar, turpentine and potash, the making of mats, drying and salting of fish, preparation of glue and caviar, tanning, horse-hair work, charcoal burning, basket work, working of quarries, and the manufacture of woolen stuffs. The sheep-skin pelisses give occupation to entire villages. In one place, furniture is made; in another, pictures are painted; in a third, boots and shoes are manufactured. Some families do filigree work; thousands of hands make lace. One village is devoted to iron foundries; another to locksmiths' work or cutlery. There are turners, fullers, and boat and raft makers.

—The gold mines have been worked since 1814. The product amounted to 22,000 kilogrammes in 1841, and since then it has varied from 23,000 to 24,000 kilogrammes. The iron mines are abundant; but the working of them is difficult, because of their distance from inhabited places and the lack of means of communication. The yield of the copper mines is estimated at 51,000 metric quintals. There are four coal basins in course of exploitation; the product has considerably increased of late; it amounted, in 1871, to 830,000 tons. The salt mines, the salt marshes and the salt works give 4,637,000 metric quintals. Many of the provinces, because of the distances, are obliged to procure their provisions from abroad. There are numerous naphtha and petroleum wells, whose product (1874) is 100,000 metric quintals.

—Of all the industries, the most lucrative is that of spirits; the manufacture is estimated at 300,000,000 roubles. According to an abstract prepared in 1863, the consumption in Russia in Europe was then more than 107,000,000 hectolitres, and it has increased since that time.

—The manufacture of beet-root sugar has diminished; the number of sugar factories was 427 in 1860, but fell, in 1872, to 233. Honey is preferred in consumption, hence apiculture has greatly increased.

—The cotton factories had, in 1867, 1,600,000 spindles, a great number of which were worked day and night. They used 46,000,000 kilogrammes of cotton, and spun only to No. 50. The weaving employs 12,000 looms, run by machinery, and seven or eight times as many run by hand. Red and blue calicoes of good quality are manufactured. The spinning and weaving of flax and hemp are not sufficient for the consumption, especially of the upper classes. At Moscow are manufactured rich silk stuffs, worked and embroidered with gold and silver, for priests' vestments. The white embroideries of the Caucasus are highly praised. Tanning remains backward, but Morocco leather manufacture is renowned. Nijni-Novgorod manufactures beautiful cutlery of excellent steel from the mines of the Oural. The jewelry and gold and silver work are of the best, both in design and execution.

—*Commerce.* The domestic commerce of Russia is five or six times greater than its foreign commerce. The two principal commercial seats are Moscow and Warsaw. After these two cities come those in which fairs are held, notably Nijni-Novgorod, the principal one, in which the merchandise sold amounted to 128,000,000 roubles. M. Schnitzler estimates the whole of the domestic commerce at 6,000,000,000 francs. The merchants are divided into three classes: 1, the members of the three guilds; 2, the persons engaged in industry with certificates or licenses; 3, the tradesmen of the villages. The members of the first guild must have a capital of 15,000 roubles at least; the declaration which they make as to the amount of their capital serves as a basis for the credit which the banks open to them. They can carry on wholesale commerce, banking, insurance business, and equip merchant vessels. The same rights are conferred upon the members of the second guild, except that they can not obtain from abroad merchandise worth more than 90,000 roubles, nor carry on banking or insurance business. Their capital must be at least 6,000 roubles. Those of the third guild must have a capital of 2,400 roubles at least; they can carry on retail commerce, keep inns, and have transport boats and weaving looms. Failure, with aggravating circumstances, involves expulsion. The total of the members of the three guilds was 200,760 in 1874, and their capital was estimated at 2,400,000,000 francs.

—The certificates or licenses issued annually, to the number of about 190,000, give those who obtain them the right to carry on small industries or commerce on a very small scale. In the villages the peasants may, without paying any tax, sell objects of customary consumption.

—The following is the amount of the commercial movement in the years mentioned, in roubles:

YEARS.	Imports.	Exports.	Total.
1869 .....	839,860,000	270,690,000	610,550,000
1870 .....	832,330,000	375,110,000	707,440,000
1871 .....	867,920,000	379,330,000	747,250,000

Russia in Asia is included in these results for a total movement of 28,880,000 roubles in 1870, and of 24,830,000 in 1871.

—Considering the movement of precious metals, since 1861, by itself, we find, at that time, an importation of seven millions, which fell off gradually to two in 1866, rose to thirty-three millions in 1867, and to thirty-nine in 1868; then diminished again to two millions in 1869 and 1870, and rose to seven in 1871. The exportation, which was fifteen millions in 1861, rose to thirty-seven in 1862 and to sixty-seven in 1863; then it fell to fourteen in 1867, and to five in 1868, to rise again to fifteen in 1869 and to seventeen in 1871.

—The maritime commerce is about two-thirds of the land commerce. From 1863 to 1867 it amounted, without Finland, to an average of 266,000,000 roubles in Europe, and to 11,000,000 in Asia. There were, in 1869, 2,532 sailing vessels and 114 steamships; 753 sea-going ships and 1,893 coasting vessels.

—The principal article of exportation consists of cereals. This trade commenced to be developed in 1817; it is subject to great fluctuations; sometimes grain forms 30 per cent. of the total exports, and sometimes only 6 per cent. In 1839 the greatest quantity was exported; it represented 332,000,000 roubles. The ten years previous to 1867 gave an average of 58,000,000. In 1870 the exportation was 163,000,000, and 183,000,000 in 1871. Next comes flax, 49,000,000 roubles in 1871; linseed, 28,000,000; wool, 7,000,000; tallow, which decreased from 12,000,000 before 1867 to 4,600,000 in 1871; wood, which increased from 6,500,000 before 1867, to 14,000,000 in 1871; hemp, 12,000,000; hogs' bristles, 9,000,000; hides, 2,000,000; live stock, 6,000,000; unmanufactured metals, 1,800,000 in 1870 and 1,200,000 in 1871; oleaginous seeds, 3,400,000.

—The principal article of importation is raw cotton. Before 1867 the average of ten years was 18,000,000 roubles; in 1870, 31,000,000 was imported, and in 1871, 48,000,000. Unmanufactured metals also increased from 4,500,000 roubles before 1867, to 17,000,000 in 1868, 30,000,000 in 1870, and 31,000,000 in 1871. Machinery, from an average of 8,000,000 before 1868 rose to 25,000,000 in 1870. An increase has also taken place in the following: metal works, 18,000,000 in 1871; tea, 20,000,000; paints, 16,000,000; oils, 12,000,000; wines and liquors, 11,000,000, (three-fourths coming from France); wool, 13,000,000; woolen fabrics, 10,000,000; fruits, 8,000,000; spun cotton, 8,000,000; coffee, chemical products, plants and seeds, 5,000,000; silk textile fabrics, 5,000,000; fish, 4,000,000.

—The different countries participated (1874) in the foreign commerce of Russia in the following proportions: Great Britain, 160,000,000 roubles in 1866, 269,000,000 in 1871; Prussia, 98,000,000 in 1866, 203,000,000 in 1871; France, 46,000,000 in 1871; Austria, 30,000,000; Hanseatic cities, 22,000,000; Turkey, 21,000,000; The Netherlands, 20,000,000; Italy, 18,000,000; the United States, 17,000,000; Belgium, 14,000,000; China, 10,000,000. ## SALARY GRAB

SALARY GRAB (IN U. S. HISTORY), the popular name for the general increase of federal salaries in 1873.

—The constitution provides that "the senators and representatives shall receive a compensation for their services, to be ascertained by law, and paid out of the treasury of the United States"; that the president "shall, at stated times, receive for his services a compensation, which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them"; and that the judges of all federal courts "shall, at stated times, receive for their services a compensation, which shall not be diminished during their continuance in office." The act of March 3, 1873, provided that, on and after March 4, 1873 (the beginning of President Grant's second term), the salary of the president should be \$50,000 a year, of the chief justice \$10,500, of the vice-president, cabinet officers, associate justices, and speaker of the house, \$10,000, and of senators, representatives and delegates in congress, \$7,500; and that the salaries of employés of both houses should be increased in various proportions. The salaries named had previously been as follows: president, \$25,000; chief justice, \$8,500; other officers, \$8,000; and senators, representatives and delegates, \$5,000. Although the act was in other respects to go into force "on and after March 4, 1873," the members of the congress which passed it were to be included in the increased salary, so that the act, as to them, was retroactive for the two years just closing. This was the essence of the "salary grab," which excited so much popular indignation that many of the members were moved to repay their increase to the treasury. The act was repealed, as to all except the president and the justices, by act of Jan. 20, 1874, and salaries reverted to the former standard. The increase of the salaries of the president and justices was retained.

—The acts to ascertain and fix the compensation of members of congress have been as follows: The act of Sept. 22, 1789, fixed the salaries of senators and representatives at \$6 per day, and \$6 for every twenty miles of travel, until March 4, 1795, after which date senators were to receive \$7 per day, and \$7 for every twenty miles of travel. The act of March 10, 1796, fixed the salaries of both senators and representatives at the rate fixed in 1789. The act of March 19, 1816, increased this salary to \$1,500 per annum for "this and every future congress." This "salary grab" excited so much popular feeling that it was repealed by act of Feb. 6, 1817. The act of Jan. 22, 1818, fixed the salary at \$8 per day, and \$8 for every twenty miles of travel, dating the increase back to March 3, 1817. The act of Aug. 16, 1856, increased the salary to \$3,000 per annum, and mileage as before, and enacted further, that "this law shall apply to the present congress." In all these ascertainments of salary, the speaker's salary had been double that of the other members. The act of July 28, 1866, increased the salary of members to \$5,000 per annum, and that of the speaker to \$8,000. All these increases had been retroactive, and it is probable that the criticism on the increase of 1873 came mainly from the lavish generosity of congress in increasing so

many salaries, heightened by the unfortunate fact that the congressional increase alone was retroactive.

—See 1 *Stat. at Large*, 70, 448 (for acts of Sept. 22, 1789, and March 10, 1796); 3 *Stat. at Large*, 257, 345, 404 (acts of March 19, 1816, Feb. 6, 1817, and Jan. 22, 1818); 11 *Stat. at Large*, 48 (act of Aug. 16, 1856); 14 *Stat. at Large* (act of July 28, 1866); 17 *Stat. at Large*, 486 (act of March 3, 1873); and 18 *Stat. at Large*, 4 (act of Jan. 20, 1874).

## SAN DOMINGO

SAN DOMINGO. The republic of San Domingo (*Republica Dominicana*), founded in 1844, is governed under a constitution bearing date Nov. 18, 1844, reproclaimed, with changes, Nov. 14, 1865, after a revolution which expelled the troops of Spain, who held possession of the country for the two previous years. By the terms of the constitution, the legislative power of the republic is vested in a national congress of two houses, called the *consejo conservador*, and the *tribunado*, the first consisting of twelve, and the second of fifteen members. The members of both houses are chosen in indirect election, with restricted suffrage, for the term of four years. But the powers of the national congress only embrace the general affairs of the republic; and the individual states, five in number, have separate legislatures.

—The executive authority is vested in a president, chosen in indirect election for the term of four years. Constant insurrections have allowed very few presidents to serve the full term of office. The administrative affairs of the republic are in charge of a ministry appointed by the president, with the approval of the *consejo conservador*. The ministry is composed of the heads of the departments of the interior and police, finance, justice, war and marine, and foreign affairs.

—The financial estimates of the republic for the year 1882 set down the revenue as \$1,500,000, or £300,000, with an expenditure to the same amount. The branches of expenditure were as follows:

Interior and police...	\$ 253,514
Foreign affairs...	146,486
Justice, etc....	255,832
Finance, etc....	144,168
War and marine...	437,823
Extraordinary expenses...	102,177
Balance...	160,000
Total...	\$1,500,000

The revenue for 1883 is estimated at \$1,750,000, mainly derived from customs duties, which average 40 per cent., while a large part of the annual expenditure is for the maintenance of a standing army. Besides a large internal debt, of unknown amount, San Domingo has a foreign debt, contracted at the London stock exchange in 1869. The debt, to the nominal amount of £757,700 at 6 per cent., was issued at the price of 80; but it was stated officially that the government had actually received only between \$190,000 and \$250,000 from the contractors for the loan. ("Report of the Select Committee on Loans to Foreign States," 1875.) It is officially stated that the government is now (January, 1883) engaged in ascertaining the amount of the debt, and a commission has been appointed for the purpose.

—The area of San Domingo, which embraces the eastern portion of the island of Hayti (the western division forming the republic of Hayti), is estimated at 18,045 English square miles, with a population, in 1880, of 300,000 inhabitants, or sixteen to the square mile.

—The republic is divided into the five provinces, or states, mutually independent, of San Domingo, Azna de Compostela, Santa Cruz del Seybo, Santiago de los Caballeros, and Concepcion de la Vega, besides four maritime districts. The population, like that of the neighboring Hayti, is composed mainly of negroes and mulattoes, but the whites, or European-descended inhabitants, are comparatively numerous, and, owing to their influence, the Spanish language is the prevailing dialect. The capital of the republic is the city of San Domingo, founded in 1494, at the mouth of the river Ozama, with 10,000 inhabitants.

—The commerce of the republic is small, owing in part to customs duties of a prohibitory character. The principal articles of export are lignum vitæ, logwood, coffee and sugar. Cocoa is also cultivated. In 1881 the value of the imports amounted to £352,263, and of the exports to £338,215, the foreign commerce being shared by the ports of San Domingo and Puerta Plata. The commerce of the republic is mainly with the United States and Great Britain.

—The country is stated to be making rapid progress. A railway is being constructed between Samaná and Santiago, embracing the whole of the rich provinces in the northern portion of the republic, and another line will soon be made between Barahona and the salt mountain of "Cerro de Sal." Large sugar plantations and factories are stated to be now in full work in the southern and western parts of the republic, and a large factory for concrete owned by an English company.

—The bay of Samaná, on the northeast coast of San Domingo, one of the greatest natural harbors in the world, thirty miles long and ten miles broad, was ceded, with the surrounding country, to a company formed in the United States, by a treaty signed by the president of the republic, Jan. 10, 1873. Under another decree, passed March 25, 1874, the rights of the company were confiscated, on the ground of non-payment of a stipulated annual rent.

F. M.

—In 1869 a movement took shape for the annexation of San Domingo to the United States. Much of the impelling force of the movement undoubtedly lay in the selfish interests of various American citizens in San Domingo, in their loans to the republic, their claims against it, and their unproductive grants from it; but a further incentive was the naval importance of the bay of Samaná, as a coaling station for United States

vessels, and a commanding position for the Mona passage, the eastern avenue to the gulf of Mexico. In July, 1869, Gen. Babcock was sent to San Domingo by President Grant; and, on his favorable report, a treaty for the annexation of the republic was made, Nov. 29, 1869, with a convention for the lease of the bay and peninsula of Samaná to the United States. The treaty was ratified by popular vote in San Domingo; but in the United States it met instant opposition. A new article was added to the treaty, May 14, 1870, in order to remove some of the reasons for opposition, and President Grant, in a special message of May 31, urged the ratification of the whole treaty. He believed that it would maintain the Monroe doctrine, prevent the acquisition of Samaná by a European power, build up our lost merchant marine, abolish slavery at once in Cuba and Porto Rico, and ultimately in Brazil, support a population of 10,000,000 in luxury, and pay off the foreign debt of the United States. Nevertheless, the senate rejected the treaty, June 30.

—In his annual message of Dec. 5, 1870, President Grant proposed that congress should authorize a commission to negotiate an annexation treaty with San Domingo, and reiterated his former arguments in favor of the project. Congress went with the president far enough to pass a resolution, Jan. 12, 1871, authorizing the appointment of a commission to examine into the condition of San Domingo, but added the proviso "that nothing in these resolutions contained shall be held, understood or construed as committing congress to the policy of annexing the territory of the said republic of Dominica." The commissioners, B. F. Wade, Andrew D. White and S. G. Howe, visited San Domingo in January-March, 1871, and made an exhaustive and rather favorable report. They specially reported that they could find no trace of the corrupt grants of land to United States officials which had been declared by common report to be the real moving cause of the treaty. But the "San Domingo scheme," with its accompanying charges of fraud, corruption, bargain and jobbery, had by this time become highly unpopular, and the president, in a special message of April 5, 1871, abandoned the question to congress, appealing to the candor and intelligence of the people for a justification of his own action. No further action was taken in the matter. President Baez, of San Domingo, had been the most efficient agent of the proposed annexation; and his government was completely overthrown by a successful revolution, 1872-3.

—One of the most active opponents of annexation was Senator Charles Sumner (see his name). The controversy between him and the president became personal and angry, and in 1871 he was removed from his place of chairman of the senate committee on foreign relations, at the request of the president, by vote of the other republican senators. From that time he was in opposition to the administration until his death, in 1874.

## SANDWICH ISLANDS

SANDWICH ISLANDS. These islands are situated in the Pacific ocean, at an equal distance from the shores of America and Japan, between  $19^{\circ}$  and  $22\frac{1}{4}^{\circ}$  of north latitude and  $155^{\circ}$  and  $160^{\circ}$  of Paris longitude. The archipelago is composed of fifteen islands, of which only seven are inhabited or inhabitable. Their names and respective area in square kilometres are as follows: Hawaii, 12,620, Maoui, 1,966; Oahu, 1,822; Molokai, 468; Kaouai, 2,010; Nihaou, 308; Kahoulai, 94. On a total area of 19,756 square kilometres, the number of inhabitants was, in 1872, 56,897, of which 40,044 were natives. Since 1798, the date of the discovery of these islands by Cook, their population has been constantly diminishing. It amounted at that time to at least 300,000; in 1823, Mr. Ellis found less than 150,000, of whom 85,000 were in the great island of Hawaii. The statements of subsequent censuses have shown still further diminutions: in 1832, the population was 130,313, in 1836, 108,579; in 1849, 84,163; in 1853, 71,019; in 1860, 67,979. These diminutions are attributed to the dissolute habits of the inhabitants. The introduction of civilization and Christianity has not yet succeeded in establishing the institution of the family there. Marriage exists only in name. The children are, for the most part, brought up by persons other than by those who begot them. The children brought up by their parents are no better taken care of. The father scarcely able to exist, his protection is almost entirely lacking. The mother, desirous of preserving her charms, which nursing children might destroy, and especially her freedom, hastens to rid herself of her progeny. The children, born spite of attempts at abortion, are, notwithstanding all the severity of the criminal laws, regularly put to death during the first year after their birth. The practices of abortion and infanticide are common in all classes of society. In the lower classes, births are very numerous; but, despite the advantages and exemptions from taxes granted to families which have more than two children, it is rare to find a family which has more than one.

—The governmental and social system was for a long time a sort of feudal communism. The union of the islands under the sole rule of Kamehameha I in the beginning brought about no change in this state of affairs. The sovereign alone was proprietor of the land. It was not until 1848 that the right of possessing landed property was granted to individuals.

—In 1838 all power was concentrated in the hands of royalty. At that time Kamehameha III., yielding to the advice of American missionaries, made himself a constitutional king. The constitution of 1840, which created a chamber of nobles, composed of sixteen persons, five of whom were women, with the king for president, did not prove very successful. It was necessary to revise it in 1848, and to confide the executive power to a council of ministers, presided over by the minister of the interior. This new constitution, which recognized an order of nobility, has also been reformed. The two parts of the national representation were replaced by a privy council, composed of the king, the queen, the ministers, the governors of the four largest islands, the chancellor, the judges of the supreme court, and of eight elected members; but since that time the constitution of Aug. 4, 1864, doubled the number of

the elected members of the privy council, eight of whom are chosen from among the natives, and eight from among foreigners. This parliament deliberates at will in the native or in the English language.. After the death of king Kamehameha V., the author of the constitution of 1872, a descendant, in the female line, of the chief of the dynasty of Lunalilo I. was elected king, not, as has been stated, by universal suffrage, but by a vote of parliament. (He only reigned two years.)

—The press plays a great part in the political system of the islands. The government is represented by the "Polynesian," a journal whose chief editor is appointed by the government, with the title of director of the press; the opposition, by the "Commercial Advertiser," the "Friend," and the "Star of the Pacific."

—Almost all public offices are in the hands of English or American naturalized Hawaiian subjects, The constitution of 1840 accorded freedom of conscience; no religion has succeeded in improving the population; the ministers of all religious sects are agreed in acknowledging that their flock is Christian only in name. Schools, however, are numerous.

—During 1859-60, the revenues amounted to \$656,006, and the expenditures to \$643,000. During 1870-72 the receipts amounted to \$964,956, and the expenditures to \$969,784. The customs figured in the receipts for \$396,418, the domestic taxes for \$98,983, the direct taxes for \$215,962, the *regalian* rights, postoffice, renting of domains, etc., for \$124,071. The national debt was estimated, in 1874, at \$177,971.

—The soil is very fertile, and its present products would be sufficient to feed a population five times as large as that now occupying the islands. To the native nutritious plants have been added the cultivation of tobacco, indigo, potatoes and sugar cane. The exports, in 1860, amounted to more than \$1,200,000; those of 1871, to \$2,145,000, of which \$1,403,000 were native products. Oils and whalebone, sugar, coffee, wool and peltry formed the principal articles of export. The imports represented an amount of more than \$1,500,000. Six-tenths were furnished by the United States, and the other fourteenths by England, the Hanseatic cities, Sweden and Russia. The Sandwich islands are connected with all these countries and with France by commercial treaties. The independence of this archipelago was, in 1863, the object of a special recognition, in which the United States joined the following year.[102](#)

## SANITARY SYSTEM

SANITARY SYSTEM. I. *Public Health*. The administrative organization of the sanitary regimen, in Europe, may be divided into three distinct systems: the French system, the English system and the German system. Other states adopt one or the other of these systems, with some modifications.

—1. *The French System*. This is characterized by the institution of collective authorities, under the name of councils of public health, and by the purely consultative powers with which they are invested. The right of execution belongs to the prefect, who is president *ex officio* of these councils. From the time of the new organization of police in the city of Paris, in 1667, the first magistrate charged with this administration, De La Reynie, formed a commission of physicians to consult upon a question relative to the making of bread. The opinions were found to be so diverse that he appealed to the faculty of medicine, which, at that time, embraced the entire medical body. In this assembly the disagreement was no less, and a commission, composed this time of six physicians and six "notable and expert" citizens, had to decide the question. Afterward, recourse was had again, more than once, to the advice of this commission, and, toward the end of the last century, the state of the sanitary police of the capital of France was relatively superior, and it filled with enthusiasm J. P. Frank, who may be considered as the founder of scientific hygiene. "I found there," he exclaimed, "a model of those courageous applications of *heroic* remedies, which will never escape criticism in certain German provinces. For many centuries the enlightened vigilance of the magistrates of this immense city has descended to the slightest details, and an eminently salutary (*segensvoll*) order of things confirms the value of most of the prescriptions which have their origin there."

—The royal society of medicine was religiously faithful to that part of its duties, the usefulness of its work, in the domain of public health, extended far beyond the precincts of Paris, and has outlived the existence itself of the illustrious company. Whoever has had to treat any subject of hygiene, notably of endemics or epidemics, appreciates with real gratitude, in the memoirs of the society published from 1779 to 1790, the instructive developments of its programmes and the wealth of material it has bequeathed to students.

—M. Dubois, prefect of police, took up these excellent traditions, when, by a decree dated the 18th Messidor, year VIII. (July 6, 1802), he established a board of health, composed of four paid members. Since then, this board, consulted as to all questions relating to public health, has seen the number and importance of the affairs submitted to its deliberation increase in proportion as Paris has increased. Its organization was fixed by the decree of the prefect of police of Dec. 24, 1832, somewhat modified in 1838 and 1844. The decree of Dec. 15, 1851, only confirmed the existing institution. The powers of this board extend only over Paris, but there are, in each of the arrondissements of the city of Paris and in those of Sceaux and Saint Denis, health commissions; with less extensive powers.

—The example given by the capital was slowly enough followed by the administrations of the principal cities of France. From 1822 to 1832, Lyons, Marseilles, Lille, Nantes, Troyes, Rouen, Bordeaux, Toulouse and Versailles were provided with boards of health. In 1836 the government thought of a general and definitive organization of the sanitary régime in France. The academy of medicine joined eagerly in this effort with a long and remarkable report by Dr. Marc; but these projects were not realized. They were revived by the revolution of February. In the midst of the ardent aspirations for the well-being of the masses, which agitated this epoch, public health could not be forgotten. A plan was drawn up under the direction of M. Tourret, then minister of agriculture and commerce, and became the decree of Dec. 18, 1848. This act applied only to the departments; it organized commissions of health in each department, arrondissement and canton, composed of physicians, apothecaries, architects and other specialists. Their powers extended over the healthfulness of the public highways, houses, workshops, schools, etc.; over the slaughterhouses, factories and other industrial establishments, the nuisances of all kinds, dangerous animals, cemeteries, epidemic and endemic diseases, as well as over epizootics. Their powers also extended to the surveillance of the quality of the foods, beverages, condiments and medicines of commerce. The decree mentions also many other points; but, as they seem to be entirely neglected, we may pass them over in silence. In fact, the occupation of the boards of health consists chiefly, as M. Tardieu admits, in examining demands for the licensing, removing or abolishing dangerous, unhealthy or incommodious establishments, governed by the decrees of Oct. 15, 1810, and Dec. 31, 1866. The committees find at times useful auxiliaries in the *physicians of epidemics* and the *cantonal physicians*. The first, established since May 2, 1805, in each arrondissement, must, at the first request which they receive from the subprefect, go to the localities in which an epidemic has broken out, examine into the circumstances of the situation, the habits of the people, etc., which might have caused it to originate or which favor it, and prescribe the measures proper to arrest its progress, as well as the method of treatment. The cantonal physicians date from April 13, 1835, and are as yet in only a certain number of departments.

—The organization of the *Comité consultatif d'hygiène publique de France* was regulated by the decrees dated Aug. 10, 1848, Oct. 23, 1856, and Nov. 5, 1869. It is composed of physicians, a chemist, an engineer of roads and bridges or of mines, an architect, and various functionaries. The province of the committee extends to quarantines and to the service of the sanitary physicians established in the orient; to the measures to be taken to prevent and combat epidemics; to the improvement of the thermal establishments, and to means of rendering the use of them more accessible to invalids who are poor.

—The law of April 13, 1850, also instituted, besides, "in each commune where the municipal council shall have declared it necessary," commissions of unhealthy houses, furnished with the power necessary to bring about the purification of such houses.

—The academy of medicine is the completion of the aggregate of the institutions with which we have to deal here. It encourages by honorary rewards the study of epidemics, centralizes the results which this study produces, and presents annually, in

its learned memoirs, a tableau of the diseases which have prevailed in the different parts of France. The care of propagating vaccine, and the centralization of the observations made in the establishments of thermal or mineral waters, are also confided to it.

—Italy, Belgium and Spain follow, in their sanitary system, the way of the French. But it would be departing from the truth to place these countries in the same line. In the middle ages, Italy had already preceded other countries on this road, and to-day it still occupies an honorable rank among countries which give their attention to public health.
